Chapter 1 Interconnect

1.1 Overview

The chip-level interconnect enables communication among the modules and subsystems in the device. It supports the following features:

- Cross-bar exchange network
- Four embedded DDR schedulers for transaction reorder to maximum DDR efficiency
- Priority management for quality of service (QoS), especially for real-time IP
- Transaction statistics for bandwidth analysis

1.2 Block Diagram

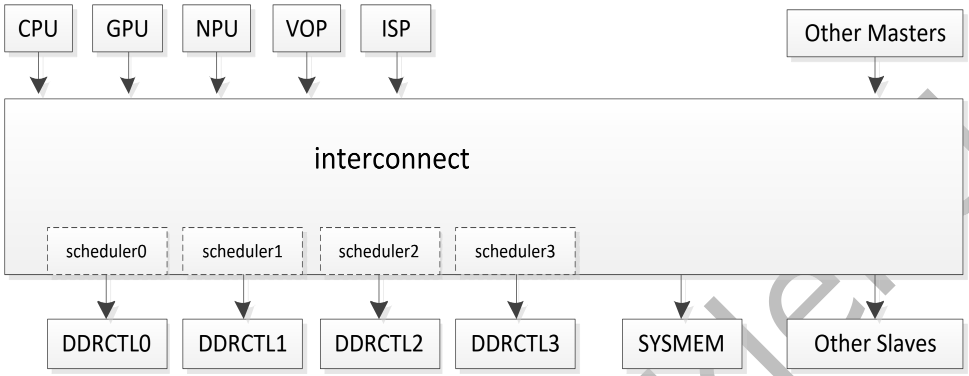

Fig. 1-1 Interconnect Diagram

1.3 Function Description

1.3.1 DDR Scheduler

There are four DDR schedulers in system, their address range size are 8K bytes and their base address are shown as follows.

Table 1-1 DDR scheduler address map

DDRSCH	Base Address
Channel0 DDRSCH	0xFE000000
Channel1 DDRSCH	0xFE002000
Channel2 DDRSCH	0xFE004000
Channel3 DDRSCH	0xFE006000

The DDR scheduler is an interface to DDR controllers. The scheduler is a special unit case multiplexing several transport interfaces feeding a single DDR controller target, with a special arbitration scheme, configurable for optimizing DRAM bandwidth efficiency from the DDR controller.

The scheduler optimizes DRAM efficiency by choosing the best transaction to execute inside each port input queue: the scheduler can reorder requests across queues, and within a queue as long as they do not have conflicting addresses or ordering constraints. The process for choosing the next transaction to issue to the controller is based on a model of the DRAM behavior (in terms of timings for pages, banks, bank groups, and data bus), a user configuration of arbitration criteria, and a DDR configuration setup representing the current assignment of DRAM banks, bank groups, and page bits to the incoming addresses. It also makes sure that output queues never overflow.

The scheduler arbitration criteria take into account the priority characteristics of the transactions, providing a trade-off between QoS requirements of each data flow, and the global DDR efficiency: for example, an urgent read request may take precedence over less urgent write requests, even though there may be a global efficiency loss due to DRAM bus turnaround.

The DDR scheduler is connected to DDR controller, through a simple, ordered interface. A simple DDR controller BIU converts the generic interface output of the scheduler to the appropriate DDR controller protocol, and optionally provides access to DDR controller registers. It is the responsibility of the controller to fully handle the DRAM state machine.

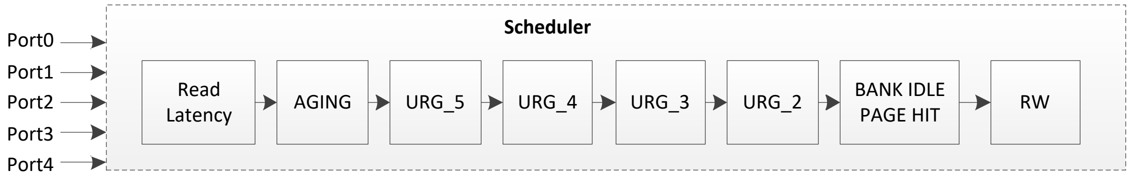

Fig. 1-2 DDR Scheduler Diagram

The arbitration criteria is shown above.

Read Latency: The scheduler monitors the latency of read accesses sent to DDR controller, and uses this latency in a feedback loop to control scheduler behavior. When the ceiling is exceeded, the scheduler stalls requests until it obtains the responses of previous reads from the controller. This mechanism thus prevents scheduler–controller misalignment and maintains scheduler–controller system stability, for example, when a DRAM refresh occurs.

AGING: Biases arbitration towards requests that exceed the aging threshold set by register Aging(n) for port (n).

URG5, URG4, URG3, URG2: Biases arbitration in favor of urgency bits in packets. Three bits QoS level will be map to seven bits Urgency level in packets as Table 1-2. URG5 means the packets with fifth bit of Urgency field(Urgency[4]) is 1’b1 will be chosen by this arbiter stage.

Table 1-2 QoS and Urgency map

QoS generator(internal) Press/Hurry(external)	Urgency
3'b0	7’b0000000
3'b1	7’b0000001
3'b2	7’b0000011
3'b3	7’b0000111
3'b4	7’b0001111
3'b5	7’b0011111
3'b6	7’b0111111
3'b7	7’b1111111

***Note**: There is a command queue in DDR controller, although the high priority request will be sent to DDR controller first, it does not mean that it can be served by DDR immediately. The request in DDR controller command queue will be executed in order taking no account of priority.*

BANK_IDLE_PAGE_HIT: Biases arbitration in favor of requests whose target bank is idle or whose target row is equal to the active row of the selected bank. The following method is used to estimate the state of the bank: Two counters *ActCnt* and *CmdCnt* are associated with each DDR bank, the bank number being obtained from the address using the "B" bits in the selected DDR configuration, set by register ‘DeviceConf’. These counters are decremented at each DDR scheduler clock cycle and saturated at 0. A bank is considered idle when both counters are null. The ActCnt counter is loaded with ActToAct – 1 each time a new page is accessed in that bank. The CmdCnt counter is loaded with:
RdtoMiss + max(BurstLen, N) – BurstLen – 1 each time an N-word read is sent, and with WrtoMiss + max(BurstLen, N) – 1 each time an N-word write is sent.
When the DDR configuration contains bank groups, also known as "G" bits, the following counters are added to each bank group in a device:
***Note: CcdLCnt** —— The counter is loaded with the result of tCCD_L−1 each time a new request is granted, and decremented every clock cycle by 1. **RrdCntL** —— The counter is loaded with the result of tRRD_L – 1*

each time a new page is accessed, and decremented every clock cycle by 1.

RW: Biases arbitration in favor of requests whose RD or WR opcode type matches the type in the last-issued requests. The criterion is used to estimate the importance of keeping RD and WR transactions together, according to the following method:
Counter *RdWrCnt* and bit PrvOpc are used to represent the DDR read–write state. The counter is decremented at each scheduler clock cycle and saturated at 0.
Arbitration is biased in favor of WR when:
PrvOpc = WR or (PrvOpc = RD and RdWrCnt > RdToWr)
The counter is then loaded with:
WrToRr + max(BurstLen, N) – 1
where N is the number of words of the WR request.
Arbitration is biased in favor of RD when:
PrvOpc = RD or (PrvOpc = WR and RdWrCnt > WrToRd)
The counter is then loaded with WrToRd + max(BurstLen, N) – 1, where N is the number of words of the RD request.

When the DDR configuration contains bank groups, also known as "G" bits, counter *RdWrCntL* is added to each device and bank group. The counter is loaded with the result of RdToWr + max(BurstLen, N) – 1 each time a read request is granted, and with WrToRdL + max(BurstLen, N) – 1 each time a write is granted. The counter is decremented every clock cycle by 1.

1.3.2 Priority Management

As mentioned above, the DDR scheduler will consider the priority of each request to ensure desired quality of service. The priority of each request is configurable through the internal QoS generator in each master BIU. The QoS generator address of each master BIU and default priority are shown below. When configuring the register of QoS generator of a certain master BIU，the corresponding clock of the master BIU should be alive.

Table 1-3 Master BIU information

Except the internal priority control, some masters can also change their priority dynamic by their internal register according to buffer status. In order to make this work, ExtControl register of the corresponding BIU must be set to 0x1. In this case, the interconnect will choose the highest priority from the external and internal register. It is better to set the internal priority same as the other master BIUs and external priority higher so that the DDR scheduler has more opportunity to optimal DDR efficiency. As shown in Table1-1, because the arbiter stages ordering is: URG5, URG4, URG3, URG2, the valid values of internal and external works in scheduler are 0, 2, 3, 4 and 5.

1.3.3 Shaping

Shaping limits the number of pending packets between master and scheduler. When shaping is applied and the number of packets pending on a route to scheduler reaches the programmed limit, flow control prevents further transmission of request packets to the BIU by de-asserting signal Ready until a complete response packet returns on the route. The default shaping value is 255, and address of the shaping control register for each master is shown in Table1-3.

1.3.4 Probe

The interconnect provides a service called probe to trace packet and compute traffic statics. There are totally 12 probes to monitor the DDR schedule traffic statics, and each can be programmed by their registers. They are listed in Table1-3. Which probe should be used to measure the bandwidth of a certain master can be find in Table1-3. The bandwidth of DSU should be measured by all the probes of Port4, and the sum of the 4 probes is the total bandwidth.

Table 1-4 Bandwidth Probe Base Address

Probe	Base Address
Port0 Probe0	0xfdf50000
Port0 Probe1	0xfdf50400
Port1 Probe0	0xfdf50800
Port1 Probe1	0xfdf50c00
Port2 Probe0	0xfdf51000
Port2 Probe1	0xfdf51400
Port3 Probe0	0xfdf51800
Port3 Probe1	0xfdf51c00
Port4 Probe0	0xfe008c00
Port4 Probe1	0xfe009000
Port4 Probe2	0xfe009400
Port4 Probe3	0xfe009800

1.3.5 Channel Address Space

When work in 4 channels interleave mode, CENTER_GRF_CON4[8:4] should be set to 5’b0000. If not work in interleave mode, CENTER_GRF_CON4[8:4] should be config according to the size of each channel, as showed in Table1-5.

Table 1-5 Channel Address

CENTER_GRF_CON4[8:4]	base address				channel size
	channel 0	channel 1	channel 2	channel 3	
5'b00000	0x0_0000_0000	0x2_0000_0000	0x4_0000_0000	0x6_0000_0000	8GB

1.4 Register Description

1.4.1 DDRSCH Registers Summary

Name	Offset	Size	Reset Value	Description
DDRSCH_Id_CoreId	0x0000	W	0x215FB002	Core id
DDRSCH_Id_RevisionId	0x0004	W	0x3C9D4E00	Revision id
DDRSCH_DeviceConf	0x0008	W	0x00000000	Register DeviceConf stores selectors to the predefined list of DDR configuration to be programmed at initialization phase.
DDRSCH_DeviceSize	0x000C	W	0x00004040	Register DeviceSize is used to set the size of DDR ranks.
DDRSCH_DdrTimingA	0x0010	W	0xFF361D33	Register DdrTimingA of timing register bank n stores timing settings used by DDR schedulers to compute bank and page states.
DDRSCH_DdrTimingB	0x0014	W	0x1B081306	Register DdrTimingB of timing register bank n stores timing settings used by DDR schedulers to compute penalties pertaining to bank and page states.
DDRSCH_DdrTimingC	0x0018	W	0x00000006	Register DdrTimingC of timing register bank n: Stores timing settings used by DDR schedulers to compute penalties pertaining to DRAM commands. It is used to configure the clock of the register bank.
DDRSCH_DdrTimingL	0x001C	W	0x00000000	Long timing for DDR4 Bank Group support
DDRSCH_DevToDev	0x0020	W	0x00000663	Register DevToDev of timing register bank n contains supplementary timing penalties that are incurred when changing data-bus ownership of up to four devices. The penalties are expressed in scheduler clock cycles.
DDRSCH_DdrMode	0x0024	W	0x0000002C	Register DdrMode stores the controller behaviour description.
DDRSCH_AgingX	0x002C	W	0x00000004	Aging threshold multiplicator
DDRSCH_Aging0	0x0030	W	0x000000FF	AGING slice threshold for port0
DDRSCH_Aging1	0x0034	W	0x000000FF	AGING slice threshold for port1
DDRSCH_Aging2	0x0038	W	0x000000FF	AGING slice threshold for port2

Name	Offset	Size	Reset Value	Description
DDRSCH_Aging3	0x003C	W	0x000000FF	AGING slice threshold for port3
DDRSCH_Aging4	0x0040	W	0x000000FF	AGING slice threshold for port4

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

1.4.2 DDRSCH Detail Registers Description

DDRSCH_Id_CoreId

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:8	RO	0x215fb0	CoreChecksum Field containing a checksum of the parameters of the IP.
7:0	RO	0x02	CoreTypeId Field identifying the type of IP.

DDRSCH_Id_RevisionId

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:8	RW	0x3c9d4e	BuildId Field containing the build revision of the software used to generate the IP HDL code.
7:0	RW	0x00	UserId Field containing a user defined value, not used anywhere inside the IP itself.

DDRSCH_DeviceConf

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description

DDRSCH_DeviceSize

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RW	0x40	Rank1 Rank1 size. The granule size is 64MB.
7:0	RW	0x40	Rank0 Rank0 size. The granule size is 64MB.

DDRSCH_DdrTimingA

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:24	RW	0xff	ReadLatency Maximum delay between a read request and the first data response. 0 delay disable the Read Latency control.
23	RO	0x0	reserved
22:16	RW	0x36	WrToMiss Minimum number of scheduler clock cycles between the last DRAM Write command and a new Read or Write command in another page of the same bank. The field must be set to the following value, rounded to an integer number of scheduler clock cycles: (WL*tCkD + tWR + tRP + tRCD) / tCkG
15:14	RO	0x0	reserved
13:8	RW	0x1d	RdToMiss Minimum number of scheduler clock cycles between the last DRAM Read command and a new Read or Write command in another page of the same bank. The field must be set to the following value, round to an integer number of scheduler clock cycles: (tRTP + tRP + tRCD - BL*tCkD/2) / tCkG
7	RO	0x0	reserved
6:0	RW	0x33	ActToAct Minimum number of scheduler clock cycles between two consecutive DRAM Activate commands on the same bank. The field must be set to the following value, rounded to an integer number of scheduler clock cycles: tRC / tCkG

DDRSCH_DdrTimingB

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:24	RW	0x1b	Faw Number of cycle of the FAW period. The field must be set to the following value, rounded to an integer number of scheduler clock cycles: tFAW / tCkG
23:20	RO	0x0	reserved
19:16	RW	0x8	Rrd Number of cycle between two consecutive Activate commands on different Banks of the same device. The field must be set to the following value, rounded to an integer number of scheduler clock cycles: tRRD / tCkG
15:13	RO	0x0	reserved
12:8	RW	0x13	WrToRd Minimum number of scheduler clock cycles between the last DRAM Write command and a Read command. The field must be set to the following value, rounded to an integer of scheduler clock cycles: ((WL + 1)*tCkD + tWTR) / tCkG, for LPDDR4 memories.
7:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4:0	RW	0x06	RdToWr Minimum number of scheduler clock cycles between the last DRAM Read command and a Write command. The field must be set to the following value, rounded to an integer number of scheduler clock cycles: (RL + RoundUp(tDQSCK(max) / tCKD) + tRPST - WL + tWPRE) tCkD / tCKG, for LPDDR4 memories.

DDRSCH_DdrTimingC
Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13:8	RW	0x00	WrToMwr Number of scheduler clock cycles between the last write data to the first data of a masked write command on the same bank. This field must be set to 3xBurstPenalty for LPDDR4, and must be set to zero for the other DRAM.
7:4	RO	0x0	reserved
3:0	RW	0x6	BurstPenalty DRAM burst duration on the DRAM data bus in scheduler clock cycles. The field must be set to Nd /Ns, where: Nd is the number of DRAM cycles needed to process a DRAM burst of determined size, expressed in bytes. Ns is the minimum number of scheduler cycles to process a DRAM burst of the same size.

DDRSCH_DdrTimingL
Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	RW	0x0	RrdL Register field RrdL sets the minimum time, expressed in scheduler clock cycles of the tRRD timing for LPDDR4 devices. This is the timing of access to the same bank group for RD after RD.
7:3	RW	0x00	WrToRdL Register field WrToRdL sets the minimum time, expressed in scheduler clock cycles, of the tWrToRd timing for LPDDR4 devices. This is the timing of access to the same bank group, WR to RD.
2:0	RW	0x0	CcdL Register field CcdL sets the minimum time, expressed in scheduler clock cycles of the tCCD LPDDR4 devices. This is the timing of access to the same bank group.

DDRSCH_DevToDev
Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14:12	RW	0x0	BusWrToWr Number of cycle between the last write data to a device and the first write data of another device.
11:8	RW	0x6	BusWrToRd Number of cycle between the last write data to a device and the first read data of another device.

Bit	Attr	Reset Value	Description
7:4	RW	0x6	BusRdToWr Number of cycle between the last read data of a device and the first write data to another device.
3	RO	0x0	reserved
2:0	RW	0x3	BusRdToRd Number of cycle between the last read data of a device and the first read data of another device.

DDRSCH_DdrMode

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0x00	ForceOrderState Force execution order internal state.
15:8	RW	0x00	ForceOrder When bit n of register field ForceOrder is set to 1, DRAM commands are executed in the order they arrive at scheduler port n. When field bits are set to 1, and BypassFiltering is also set to 1, command execution order is guaranteed for the corresponding scheduler port.
7	RO	0x0	reserved
6:5	RW	0x1	MwrSize Register MwrSize sets LPDDR4 and LPDDR5 data width, which is used for masked-write split control. The following table shows the field values according to DDR type. 2'b00: Reserved 2'b01: LPDDR4 & LPDDR5, 16 bits. 2'b10: LPDDR4 & LPDDR5, 32 bits. 2'b11: LPDDR4 & LPDDR5, 32 bits. Identical to value 2'b10.
4:3	RW	0x1	BurstSize Register field Burst Size sets the DDR burst size, in bytes, as shown by the following table. 2'b00: 16 2'b01: 32 2'b10: 64 2'b11: 128 NOTE: For LPDDR4 memories, the field must be set to the number of bytes required by BL16 transactions.
2	RW	0x1	FawBank Register field FawBank indicates the number of banks of a given device involved in the FAW period during which four banks can be active. It must be set to 0 for 2-bank memories, and 1 for memories with four banks or more.

Bit	Attr	Reset Value	Description
1	RW	0x0	BypassFiltering When register field BypassFiltering is set to 1, arbiter filters are bypassed and timing register outputs are internally set to an idle value. The field can be useful during DRAM initialization, when training or calibration sequences are performed, and scheduler arbitration is not needed. When the field is set to 0, scheduler arbitration is fully functional, this is the functional usage mode. NOTE: When the field is set to 1, the final arbitration level continues to elect transactions among those presented to the arbiter. Set field ForceOrder to ensure that transactions are executed in order, for instance during DRAM initialization.
0	RW	0x0	AutoPrecharge When set to one, pages are automatically closed after each access, when set to zero, pages are left opened until an access in a different page occurs.

DDRSCH_AgingX

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RW	0x4	AgingX Aging threshold multiplicator.

DDRSCH_Aging0

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0xff	Aging0 Aging slice threshold for port 0.

DDRSCH_Aging1

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0xff	Aging1 Aging slice threshold for port 1.

DDRSCH_Aging2

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0xff	Aging2 Aging slice threshold for port 2.

DDRSCH_Aging3

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0xff	Aging3 Aging slice threshold for port 3.

DDRSCH_Aging4

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0xff	Aging4 Aging slice threshold for port 4.

1.4.3 QoS Generator Registers Summary

Name	Offset	Size	Reset Value	Description
QoSGenerator_Id_CoreId	0x0000	W	0x67B76E04	Core ID and checksum
QoSGenerator_Id_RevisionId	0x0004	W	0x3C9D4E00	Revision ID
QoSGenerator_Priority	0x0008	W	0x80000000	Priority register
QoSGenerator_Mode	0x000C	W	0x00000003	QoS generate mode
QoSGenerator_Bandwidth	0x0010	W	0x00000000	bandwidth threshold
QoSGenerator_Saturation	0x0014	W	0x00000040	Saturation counter
QoSGenerator_ExtControl	0x0018	W	0x00000000	External control register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

1.4.4 QoS Generator Detail Registers Description

QoSGenerator_Id_CoreId

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:8	RO	0x67b76e	CoreChecksum Field containing a checksum of the parameters of the IP. Reset value is different for each QoS generator.
7:0	RO	0x04	CoreTypeId Field identifying the type of IP.

QoSGenerator_Id_RevisionId

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:8	RO	0x3c9d4e	BuildId Field containing the build revision of the software used to generate the IP HDL code.
7:0	RO	0x00	UserId Field containing a user defined value, not used anywhere inside the IP itself.

QoSGenerator_Priority

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31	RO	0x1	Mark Backward compatibility marker when 0.
30:11	RO	0x00000	reserved
10:8	RW	0x0	P1 In Regulator mode, defines the HIGH hurry level. In Fixed/Limiter mode, defines the Urgency level for READ transactions.
7:3	RO	0x00	reserved
2:0	RW	0x0	P0 In Regulator mode, defines the LOW hurry level. In Fixed/Limiter mode, defines the Urgency level for WRITE transactions.

QoSGenerator_Mode

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x3	Mode Functional Mode 2'b00: Fixed 2'b01: Limiter 2'b10: Bypass 2'b11: Regulator

QoSGenerator_Bandwidth

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	Bandwidth Defines the bandwidth threshold in 1/256th-byte-per-cycle units. In other words, the desired rate in MBps is divided by frequency in MHz of the BIU, and then multiplied by 256. Reset value is different for each QoS generator.

QoSGenerator_Saturation

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9:0	RW	0x040	Saturation Defines the size of the bandwidth counter, that is, the measurement window, in 16-byte units. In other words, the desired number of bytes divided by 16.

QoSGenerator_ExtControl

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	ExtLimitEn When register field ExtLimitEn is set, the bandwidth limiter is enabled when input signal ExtThr is asserted. When the signal is not asserted, the limiter is disabled: bandwidth is not limited, and the counter is stuck to 0. When the bit is cleared, the limiter operates normally and ignores ExtThr.
2	RW	0x0	IntClkEn When set to 1, register field IntClkEn causes the QoS generator to use the BIU clock for bandwidth calculation. When set to 0, and if configuration parameter useExternalReference is set to True, an external reference clock at the socket is used for bandwidth calculation.
1	RW	0x0	ExtThrEn When register field ExtThrEn is set, internal signals Urgency, Press and Hurry are driven, when input signal ExtThr is low, by the value in register Priority field P0. When ExtThr is high, they are driven by the value in register Priority field P1.
0	RW	0x0	SocketQosEn Register field SocketQosEn determines how priority levels are driven when QoS generators and socket interfaces alternatively drive the levels for Urgency, Pressure, and Hurry signals: When set to 0, the QoS generator drives the levels. When set to 1, internal signals Pressure and Hurry are driven by the greater of the two levels from the socket interface or the QoS generator.

1.4.5 Shaping Registers Summary

Name	Offset	Size	Reset Value	Description
Shaper_NbPktMax0	0x0008	W	0x000000FF	Max pending packet number register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

1.4.6 Shaping Detail Registers Description

Shaper_NbPktMax0

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0xFF	NbPktMax0 Max transport packet pending for route to scheduler.

1.4.7 Probe Registers Summary

Name	Offset	Size	Reset Value	Description
Probe_Id_CoreId	0x0000	W	0x194C4006	Stores the Core Id and core checksum.
Probe_Id_RevisionId	0x0004	W	0x3C9D4E00	Revision ID
Probe_MainCtl	0x0008	W	0x00000000	Register MainCtl contains probe global control bits.
Probe_CfgCtl	0x000C	W	0x00000000	Stores global enable and active bits.
Probe_FilterLut	0x0014	W	0x00000000	Controls the filter look-up table (LUT), which is used to select which filters are used and in what logical combination.
Probe_TraceAlarmEn	0x0018	W	0x00000000	Enables hits from either trace filters or the LUT to be recorded in the trace alarm status register TraceAlarmStatus.
Probe_TraceAlarmStatus	0x001C	W	0x00000000	Register TraceAlarmStatus is a read-only register that indicates which LUT or filter has been matched by a packet.
Probe_TraceAlarmClr	0x0020	W	0x00000000	Setting a bit to 1 in register TraceAlarmClr clears the corresponding bit in register TraceAlarmStatus.
Probe_StatPeriod	0x0024	W	0x00000000	Register StatPeriod is a 5-bit register that sets a period ranging from 2 cycles to 2 gigacycles of the probe clock, during which statistics are collected before being dumped automatically.
Probe_StatGo	0x0028	W	0x00000000	Writing to the 1-bit pulse register StatGo generates a statistics dump.
Probe_StatAlarmMin	0x002C	W	0x00000000	Register StatAlarmMin specifies the lower threshold used to trigger the statistics alarm.
Probe_StatAlarmMax	0x0034	W	0x00000000	Register StatAlarmMax specifies the upper threshold used to trigger the statistics alarm.

Name	Offset	Size	Reset Value	Description
Probe_StatAlarmStatus	0x003C	W	0x00000000	StatAlarmStatus is a 2-bit read-only register relative to statistics counter.
Probe_StatAlarmClr	0x0040	W	0x00000000	State alarm clear register.
Probe_StatAlarmEn	0x0044	W	0x00000001	StatAlarm output signals enable register.
Probe_Filters_0_RouteIdBase	0x0080	W	0x00000000	Specifies which value of RouteId should be used to filter packets.
Probe_Filters_0_RouteIdMask	0x0084	W	0x00000000	Specifies the mask used on RouteId to filter packets.
Probe_Filters_0_AddrBase_Low	0x0088	W	0x00000000	Specifies the values of the lower transport address bits, used in conjunction with register Filters_N_WindowSize, to filter packets.
Probe_Filters_0_AddrBase_High	0x008C	W	0x00000000	Specifies the values of the upper transport address bits, used in conjunction with register Filters_N_WindowSize to filter packets.
Probe_Filters_0_WindowSize	0x0090	W	0x00000000	Specifies the encoded address mask used to filter packets.
Probe_Filters_0_SecurityBase	0x0094	W	0x00000000	Specifies, for filter n, the values to be matched against bits in the packet header field Security of transport packets.
Probe_Filters_0_SecurityMask	0x0098	W	0x00000000	Specifies, for filter n, which bits of packet header field Security are used to filter transport packets.
Probe_Filters_0_Opcode	0x009C	W	0x00000000	Contains four fields that control which packet opcodes are used to select packets by Filter N.
Probe_Filters_0_Status	0x00A0	W	0x00000000	A 2-bit register that sets criteria for filter n based on packet status type.
Probe_Filters_0_Length	0x00A4	W	0x00000000	Register Filters_N_Length is 4-bit register that selects candidate packets if the number of bytes is less than or equal to 2*FILTERS_N_LENGTH.
Probe_Filters_0_Urgency	0x00A8	W	0x00000000	Specifies the minimum urgency level used to filter packets.
Probe_Filters_0_UserBase	0x00AC	W	0x00000000	Specifies, for filter n, the values to be matched against the lower bits in the packet header field User of transport packets.
Probe_Filters_0_UserMask	0x00B0	W	0x00000000	Specifies, for filter n, which lower bits of packet header field User are used to filter transport packets.
Probe_Filters_1_RouteIdBase	0x00E0	W	0x00000000	Specifies which value of RouteId should be used to filter packets.
Probe_Filters_1_RouteIdMask	0x00E4	W	0x00000000	Specifies the mask used on RouteId to filter packets.

Name	Offset	Size	Reset Value	Description
Probe_Filters_1_AddrBase_Low	0x00E8	W	0x00000000	Specifies the values of the lower transport address bits, used in conjunction with register Filters_N_WindowSize, to filter packets.
Probe_Filters_1_AddrBase_High	0x00EC	W	0x00000000	Specifies the values of the upper transport address bits, used in conjunction with register Filters_N_WindowSize to filter packets.
Probe_Filters_1_WindowSize	0x00F0	W	0x00000000	Specifies the encoded address mask used to filter packets.
Probe_Filters_1_SecurityBase	0x00F4	W	0x00000000	Specifies, for filter n, the values to be matched against bits in the packet header field Security of transport packets.
Probe_Filters_1_SecurityMask	0x00F8	W	0x00000000	Specifies, for filter n, which bits of packet header field Security are used to filter transport packets.
Probe_Filters_1_Opcode	0x00FC	W	0x00000000	Contains four fields that control which packet opcodes are used to select packets by Filter N.
Probe_Filters_1_Status	0x0100	W	0x00000000	A 2-bit register that sets criteria for filter n based on packet status type.
Probe_Filters_1_Length	0x0104	W	0x00000000	Register Filters_N_Length is 4-bit register that selects candidate packets if the number of bytes is less than or equal to 2*FILTERS_N_LENGTH.
Probe_Filters_1_Urgency	0x0108	W	0x00000000	Specifies the minimum urgency level used to filter packets.
Probe_Filters_1_UserBase	0x010C	W	0x00000000	Specifies, for filter n, the values to be matched against the lower bits in the packet header field User of transport packets.
Probe_Filters_1_UserMask	0x0110	W	0x00000000	Specifies, for filter n, which lower bits of packet header field User are used to filter transport packets.
Probe_Filters_2_RouteIdBase	0x0140	W	0x00000000	Specifies which value of RouteId should be used to filter packets.
Probe_Filters_2_RouteIdMask	0x0144	W	0x00000000	Specifies the mask used on RouteId to filter packets.
Probe_Filters_2_AddrBase_Low	0x0148	W	0x00000000	Specifies the values of the lower transport address bits, used in conjunction with register Filters_N_WindowSize, to filter packets.
Probe_Filters_2_AddrBase_High	0x014C	W	0x00000000	Specifies the values of the upper transport address bits, used in conjunction with register Filters_N_WindowSize to filter packets.

Name	Offset	Size	Reset Value	Description
Probe_Filters_2_WindowSize	0x0150	W	0x00000000	Specifies the encoded address mask used to filter packets.
Probe_Filters_2_SecurityBase	0x0154	W	0x00000000	Specifies, for filter n, the values to be matched against bits in the packet header field Security of transport packets.
Probe_Filters_2_SecurityMask	0x0158	W	0x00000000	Specifies, for filter n, which bits of packet header field Security are used to filter transport packets.
Probe_Filters_2_Opcode	0x015C	W	0x00000000	Contains four fields that control which packet opcodes are used to select packets by Filter N.
Probe_Filters_2_Status	0x0160	W	0x00000000	A 2-bit register that sets criteria for filter n based on packet status type.
Probe_Filters_2_Length	0x0164	W	0x00000000	Register Filters_N_Length is 4-bit register that selects candidate packets if the number of bytes is less than or equal to 2*FILTERS_N_LENGTH.
Probe_Filters_2_Urgency	0x0168	W	0x00000000	Specifies the minimum urgency level used to filter packets.
Probe_Filters_2_UserBase	0x016C	W	0x00000000	Specifies, for filter n, the values to be matched against the lower bits in the packet header field User of transport packets.
Probe_Filters_2_UserMask	0x0170	W	0x00000000	Specifies, for filter n, which lower bits of packet header field User are used to filter transport packets.
Probe_Filters_3_RouteIdBase	0x01A0	W	0x00000000	Specifies which value of RouteId should be used to filter packets.
Probe_Filters_3_RouteIdMask	0x01A4	W	0x00000000	Specifies the mask used on RouteId to filter packets.
Probe_Filters_3_AddrBase_Low	0x01A8	W	0x00000000	Specifies the values of the lower transport address bits, used in conjunction with register Filters_N_WindowSize, to filter packets.
Probe_Filters_3_AddrBase_High	0x01AC	W	0x00000000	Specifies the values of the upper transport address bits, used in conjunction with register Filters_N_WindowSize to filter packets.
Probe_Filters_3_WindowSize	0x01B0	W	0x00000000	Specifies the encoded address mask used to filter packets.
Probe_Filters_3_SecurityBase	0x01B4	W	0x00000000	Specifies, for filter n, the values to be matched against bits in the packet header field Security of transport packets.
Probe_Filters_3_SecurityMask	0x01B8	W	0x00000000	Specifies, for filter n, which bits of packet header field Security are used to filter transport packets.

Name	Offset	Size	Reset Value	Description
Probe_Filters_3_Opcode	0x01BC	W	0x00000000	Contains four fields that control which packet opcodes are used to select packets by Filter N.
Probe_Filters_3_Status	0x01C0	W	0x00000000	A 2-bit register that sets criteria for filter n based on packet status type.
Probe_Filters_3_Length	0x01C4	W	0x00000000	Register Filters_N_Length is 4-bit register that selects candidate packets if the number of bytes is less than or equal to 2*FILTERS_N_LENGTH.
Probe_Filters_3_Urgency	0x01C8	W	0x00000000	Specifies the minimum urgency level used to filter packets.
Probe_Filters_3_UserBase	0x01CC	W	0x00000000	Specifies, for filter n, the values to be matched against the lower bits in the packet header field User of transport packets.
Probe_Filters_3_UserMask	0x01D0	W	0x00000000	Specifies, for filter n, which lower bits of packet header field User are used to filter transport packets.
Probe_Counters_0_Src	0x0204	W	0x00000000	Specifies, for counter m, the type of event source used to increment the counter.
Probe_Counters_0_Alarm Mode	0x0208	W	0x00000000	Defines statistics alarm counter behavior.
Probe_Counters_0_Val	0x020C	W	0x00000000	Contain the statistics counter values.
Probe_Counters_1_Src	0x0214	W	0x00000000	Specifies, for counter m, the type of event source used to increment the counter.
Probe_Counters_1_Alarm Mode	0x0218	W	0x00000000	Defines statistics alarm counter behavior.
Probe_Counters_1_Val	0x021C	W	0x00000000	Contain the statistics counter values.
Probe_Counters_2_Src	0x0224	W	0x00000000	Specifies, for counter m, the type of event source used to increment the counter.
Probe_Counters_2_Alarm Mode	0x0228	W	0x00000000	Defines statistics alarm counter behavior.
Probe_Counters_2_Val	0x022C	W	0x00000000	Contain the statistics counter values.
Probe_Counters_3_Src	0x0234	W	0x00000000	Specifies, for counter m, the type of event source used to increment the counter.
Probe_Counters_3_Alarm Mode	0x0238	W	0x00000000	Defines statistics alarm counter behavior.
Probe_Counters_3_Val	0x023C	W	0x00000000	Contain the statistics counter values.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

1.4.8 Probe Detail Registers Description

Probe_Id_CoreId

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:8	RO	0x194c40	CoreChecksum Field containing a checksum of the parameters of the IP. Reset value is different for each probe.
7:0	RO	0x06	CoreTypeId Field identifying the type of IP.

Probe_Id_RevisionId
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:8	RO	0x3c9d4e	BuildId Field containing the build revision of the software used to generate the IP HDL code.
7:0	RO	0x00	UserId Field containing a user defined value, not used anywhere inside the IP itself.

Probe_MainCtl
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	FiltByteAlwaysChainableEn When set to 0, filters are mapped to all statistic counters when counting bytes or enabled bytes. Therefore, only filter events mapped to even counters can be counted using a pair of chained counters. When set to 1, filters are mapped only to even statistic counters when counting bytes or enabled bytes. Thus events from any filter can be counted using a pair of chained counters.
6	RW	0x0	IntrusiveMode When set to 1, register field IntrusiveMode enables trace operation in Intrusive flow-control mode. When set to 0, the register enables trace operation in Overflow flow-control mode.
5	RW	0x0	StatCondDump When set, register field StatCondDump enables the dump of a statistics frame to the range of counter values set for registers StatAlarmMin, StatAlarmMax, and AlarmMode. This field also renders register StatAlarmStatus inoperative. When parameter statisticsCounterAlarm is set to False, the StatCondDump register bit is reserved.
4	RW	0x0	AlarmEn When set, register field AlarmEn enables the probe to collect alarm-related information. When the register field bit is null, both TraceAlarm and StatAlarm outputs are driven to 0.
3	RW	0x0	StatEn When set to 1, register field StatEn enables statistics profiling. The probe sends statistics results to the output for signal ObsTx. All statistics counters are cleared when the StatEn bit goes from 0 to 1. When set to 0, counters are disabled.
2	RW	0x0	PayloadEn Register field PayloadEn, when set to 1, enables traces to contain headers and payload. When set to 0, only headers are reported.
1	RW	0x0	TraceEn Register field TraceEn enables the probe to send filtered packets (Trace) on the ObsTx observation output.

Bit	Attr	Reset Value	Description
0	RW	0x0	ErrEn Register field ErrEn enables the probe to send on the ObsTx output any packet with Error status, independently of filtering mechanisms, thus constituting a simple supplementary global filter.

Probe_CfgCtl

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RO	0x0	Active Register field Active is used to inform software that the probe is active. Probe configuration is not allowed during the active state. This bit is raised when bit GlobalEn is set, and is cleared a few cycles after setting GlobalEn to zero (probe is Idle).
0	RW	0x0	GlobalEn Enables or disables the tracing and statistics collection subsystems of the packet probe.

Probe_FilterLut

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	FilterLut Register FilterLut contains a look-up table that is used to combine filter outputs in order to trace packets. Packet tracing is enabled when the FilterLut bit of index (FNout ... F0out) is equal to 1. The number of bits in register FilterLut is determined by the setting for parameter nFilter, calculated as 2**nFilter. When parameter nFilter is set to None, FilterLut is reserved.

Probe_TraceAlarmEn

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4:0	RW	0x00	TraceAlarmEn Register TraceAlarmEn controls which lookup table or filter can set the TraceAlarm signal output once the trace alarm status is set. The number of bits in register TraceAlarmEn is determined by the value set for parameter nFilter + 1. Bit nFilter controls the lookup table output, and bits (nFilter-1:0) control the corresponding filter output. When parameter nFilter is set to None, TraceAlarmEn is reserved.

Probe_TraceAlarmStatus

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4:0	RO	0x00	TraceAlarmStatus Register TraceAlarmStatus is a read-only register that indicates which lookup table or filter has been matched by a packet, independently of register TraceAlarmEn bit configuration. The number of bits in TraceAlarmStatus is determined by the value set for parameter nFilter + 1. When nFilter is set to None, TraceAlarmStatus is reserved.

Probe_TraceAlarmClr

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4:0	RW	0x00	TraceAlarmClr Setting a bit to 1 in register TraceAlarmClr clears the corresponding bit in register TraceAlarmStatus. The number of bits in register TraceAlarmClr is equal to (nFilter + 1). When nFilter is set to 0, TraceAlarmClr is reserved. NOTE: The written value is not stored in TraceAlarmClr. A read always returns 0.

Probe_StatPeriod

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4:0	RW	0x00	StatPeriod Register StatPeriod is a 5-bit register that sets a period, within a range of 2 cycles to 2 gigacycles, during which statistics are collected before being dumped automatically. Setting the register implicitly enables automatic mode operation for statistics collection. The period is calculated with the formula: N_Cycle = 2**StatPeriodWhen register StatPeriod is set to its default value 0, automatic dump mode is disabled, and register StatGo is activated for manual mode operation. Note: When parameter statisticsCollection is set to False, StatPeriod is reserved.

Probe_StatGo

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	StatGo Writing a 1 to the 1-bit pulse register StatGo generates a statistics dump. The register is active when statistics collection operates in manual mode, that is, when register StatPeriod is set to 0. The written value is not stored in StatGo. A read always returns 0.

Probe_StatAlarmMin

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	StatAlarmMin Register StatAlarmMin contains the minimum count value used in statistics alarm comparisons.

Probe_StatAlarmMax

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	StatAlarmMax Register StatAlarmMax contains the maximum count value used in statistics alarm comparisons.

Probe_StatAlarmStatus

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	StatAlarmStatus Register StatAlarmStatus is a read-only 1-bit register indicating that at least one statistics counter has exceeded the programmed values for registers StatAlarmMin or StatAlarmMax. Output signal StatAlarm is equal to the values stored in register MainCtl fields StatAlarmStatus and AlarmEn.

Probe_StatAlarmClr
Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	StatAlarmClr Register StatAlarmClr is a 1-bit register. Writing a 1 to this register clears the StatAlarmStatus register bit. When parameter statisticsCounterAlarm is set to False, StatAlarmClr is reserved. NOTE The written value is not stored in StatAlarmClr. A read always returns 0.

Probe_StatAlarmEn
Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x1	StatAlarmEn Register StatAlarmEn is a 1-bit register. When set to 0 it masks StatAlarm and CtiTrigOut(1) signal interrupts.

Probe_Filters_0_RouteIdBase
Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:0	RW	0x0000000	Filters_0_RouteIdBase Register RouteIdBase contains the RouteId-lsbFilterRouteId bits base used to filter packets.

Probe_Filters_0_RouteIdMask
Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:0	RW	0x0000000	Filters_0_RouteIdMask Register RouteIdMask contains the RouteId-lsbFilterRouteId mask used to filter packets. A packet is a candidate when packet.RouteId>>lsbFilterRouteId & RouteIdMask = RouteIdBase & RouteIdMask.

Probe_Filters_0_AddrBase_Low
Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Filters_0_AddrBase_Low Address LSB register.

Probe_Filters_0_AddrBase_High
Address: Operational Base + offset (0x008C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	Filters_0_AddrBase_High Address MSB register.

Probe_Filters_0_WindowSize

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x00	Filters_0_WindowSize Register WindowSize contains the encoded address mask used to filter packets. The effective Mask value is equal to ~(2max(WindowSize, packet.Len) - 1). A packet is a candidate when packet.Addr & Mask = AddrBase & Mask. This allows filtering of packets having an intersection with the AddrBase/WindowSize burst aligned region, even if the region is smaller than the packet.

Probe_Filters_0_SecurityBase

Address: Operational Base + offset (0x0094)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_0_SecurityBase Register SecurityBase contains the security base used to filter packets.

Probe_Filters_0_SecurityMask

Address: Operational Base + offset (0x0098)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_0_SecurityMask Register SecurityMask is contains the security mask used to filter packets. A packet is a candidate when: packet. Security & SecurityMask = SecurityBase & SecurityMasks.

Probe_Filters_0_Opcode

Address: Operational Base + offset (0x009C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	UrgEn Selects URG packets (urgency).
2	RW	0x0	LockEn Selects RDX-WR, RDL, WRC and Linked sequence.
1	RW	0x0	WrEn Selects WR packets.
0	RW	0x0	RdEn Selects RD packets.

Probe_Filters_0_Status

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	RspEn Selects RSP and FAIL-CONT status packets.

Bit	Attr	Reset Value	Description
0	RW	0x0	ReqEn Selects REQ status packets.

Probe_Filters_0_Length
Address: Operational Base + offset (0x00A4)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	Filters_0_Length Register Length is 4-bit register that selects candidate packets if their number of bytes is less than or equal to 2**Length.

Probe_Filters_0_Urgency
Address: Operational Base + offset (0x00A8)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RW	0x0	Filters_0_Urgency Register Urgency contains the minimum urgency level used to filter packets. A packet is a candidate when its socket urgency is greater than or equal to the urgency specified in the register.

Probe_Filters_0_UserBase
Address: Operational Base + offset (0x00AC)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:0	RW	0x00	Filters_0_UserBase Register UserBase is available when parameter useUserFilter is set to True. Register size is determined by parameter wUser. The register stores a user base value that is employed in filtering packets.

Probe_Filters_0_UserMask
Address: Operational Base + offset (0x00B0)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:0	RW	0x00	Filters_0_UserMask Register UserMask is available when parameter useUserFilter is set to True. Register size is determined by parameter wUser. The register stores a user mask that is employed in filtering packets. A packet is a candidate for trace or statistic collection when packet.User & UserMask = UserBase & UserMask.

Probe_Filters_1_RouteIdBase
Address: Operational Base + offset (0x00E0)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:0	RW	0x0000000	Filters_1_RouteIdBase Register RouteIdBase contains the RouteId-IsbFilterRouteId bits base used to filter packets.

Probe_Filters_1_RouteIdMask
Address: Operational Base + offset (0x00E4)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved

Bit	Attr	Reset Value	Description
25:0	RW	0x0000000	Filters_1_RouteIdMask Register RouteIdMask contains the RouteId-lsbFilterRouteId mask used to filter packets. A packet is a candidate when packet.RouteId>>lsbFilterRouteId & RouteIdMask = RouteIdBase & RouteIdMask.

Probe_Filters_1_AddrBase_Low
Address: Operational Base + offset (0x00E8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Filters_1_AddrBase_Low Address LSB register.

Probe_Filters_1_AddrBase_High
Address: Operational Base + offset (0x00EC)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	Filters_1_AddrBase_High Address MSB register.

Probe_Filters_1_WindowSize
Address: Operational Base + offset (0x00F0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x00	Filters_1_WindowSize Register WindowSize contains the encoded address mask used to filter packets. The effective Mask value is equal to ~(2max(WindowSize, packet.Len) - 1). A packet is a candidate when packet.Addr & Mask = AddrBase & Mask. This allows filtering of packets having an intersection with the AddrBase/WindowSize burst aligned region, even if the region is smaller than the packet.

Probe_Filters_1_SecurityBase
Address: Operational Base + offset (0x00F4)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_1_SecurityBase Register SecurityBase contains the security base used to filter packets.

Probe_Filters_1_SecurityMask
Address: Operational Base + offset (0x00F8)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_1_SecurityMask Register SecurityMask is contains the security mask used to filter packets. A packet is a candidate when: packet.Security & SecurityMask = SecurityBase & SecurityMasks.

Probe_Filters_1_Opcode
Address: Operational Base + offset (0x00FC)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
3	RW	0x0	UrgEn Selects URG packets (urgency).
2	RW	0x0	LockEn Selects RDX-WR, RDL, WRC and Linked sequence.
1	RW	0x0	WrEn Selects WR packets.
0	RW	0x0	RdEn Selects RD packets.

Probe_Filters_1_Status
Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	RspEn Selects RSP and FAIL-CONT status packets.
0	RW	0x0	ReqEn Selects REQ status packets.

Probe_Filters_1_Length
Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	Filters_1_Length Register Length is 4-bit register that selects candidate packets if their number of bytes is less than or equal to 2**Length.

Probe_Filters_1_Urgency
Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RW	0x0	Filters_1_Urgency Register Urgency contains the minimum urgency level used to filter packets. A packet is a candidate when its socket urgency is greater than or equal to the urgency specified in the register.

Probe_Filters_1_UserBase
Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:0	RW	0x00	Filters_1_UserBase Register UserBase is available when parameter useUserFilter is set to True. Register size is determined by parameter wUser. The register stores a user base value that is employed in filtering packets.

Probe_Filters_1_UserMask
Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
6:0	RW	0x00	Filters_1_UserMask Register UserMask is available when parameter useUserFilter is set to True. Register size is determined by parameter wUser. The register stores a user mask that is employed in filtering packets. A packet is a candidate for trace or statistic collection when packet.User & UserMask = UserBase & UserMask.

Probe_Filters_2_RouteIdBase

Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:0	RW	0x0000000	Filters_2_RouteIdBase Register RouteIdBase contains the RouteId-lsbFilterRouteId bits base used to filter packets.

Probe_Filters_2_RouteIdMask

Address: Operational Base + offset (0x0144)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:0	RW	0x0000000	Filters_2_RouteIdMask Register RouteIdMask contains the RouteId-lsbFilterRouteId mask used to filter packets. A packet is a candidate when packet.RouteId>>lsbFilterRouteId & RouteIdMask = RouteIdBase & RouteIdMask.

Probe_Filters_2_AddrBase_Low

Address: Operational Base + offset (0x0148)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Filters_2_AddrBase_Low Address LSB register.

Probe_Filters_2_AddrBase_High

Address: Operational Base + offset (0x014C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_2_AddrBase_High Address MSB register.

Probe_Filters_2_WindowSize

Address: Operational Base + offset (0x0150)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_2_WindowSize Register WindowSize contains the encoded address mask used to filter packets. The effective Mask value is equal to ~(2max(WindowSize, packet.Len) - 1). A packet is a candidate when packet.Addr & Mask = AddrBase & Mask. This allows filtering of packets having an intersection with the AddrBase/WindowSize burst aligned region, even if the region is smaller than the packet.

Probe_Filters_2_SecurityBase

Address: Operational Base + offset (0x0154)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_2_SecurityBase Register SecurityBase contains the security base used to filter packets.

Probe_Filters_2_SecurityMask
Address: Operational Base + offset (0x0158)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_2_SecurityMask Register SecurityMask is contains the security mask used to filter packets. A packet is a candidate when: packet.Security & SecurityMask = SecurityBase & SecurityMasks.

Probe_Filters_2_Opcode
Address: Operational Base + offset (0x015C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	UrgEn Selects URG packets (urgency).
2	RW	0x0	LockEn Selects RDX-WR, RDL, WRC and Linked sequence.
1	RW	0x0	WrEn Selects WR packets.
0	RW	0x0	RdEn Selects RD packets.

Probe_Filters_2_Status
Address: Operational Base + offset (0x0160)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	RspEn Selects RSP and FAIL-CONT status packets.
0	RW	0x0	ReqEn Selects REQ status packets.

Probe_Filters_2_Length
Address: Operational Base + offset (0x0164)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	Filters_2_Length Register Length is 4-bit register that selects candidate packets if their number of bytes is less than or equal to 2**Length.

Probe_Filters_2_Urgency
Address: Operational Base + offset (0x0168)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RW	0x0	Filters_2_Urgency Register Urgency contains the minimum urgency level used to filter packets. A packet is a candidate when its socket urgency is greater than or equal to the urgency specified in the register.

Probe_Filters_2_UserBase

Address: Operational Base + offset (0x016C)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:0	RW	0x00	Filters_2_UserBase Register UserBase is available when parameter useUserFilter is set to True. Register size is determined by parameter wUser. The register stores a user base value that is employed in filtering packets.

Probe_Filters_2_UserMask

Address: Operational Base + offset (0x0170)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:0	RW	0x00	Filters_2_UserMask Register UserMask is available when parameter useUserFilter is set to True. Register size is determined by parameter wUser. The register stores a user mask that is employed in filtering packets. A packet is a candidate for trace or statistic collection when packet.User & UserMask = UserBase & UserMask.

Probe_Filters_3_RouteIdBase

Address: Operational Base + offset (0x01A0)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:0	RW	0x0000000	Filters_3_RouteIdBase Register RouteIdBase contains the RouteId-lsbFilterRouteId bits base used to filter packets.

Probe_Filters_3_RouteIdMask

Address: Operational Base + offset (0x01A4)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:0	RW	0x0000000	Filters_3_RouteIdMask Register RouteIdMask contains the RouteId-lsbFilterRouteId mask used to filter packets. A packet is a candidate when packet.RouteId>>lsbFilterRouteId & RouteIdMask = RouteIdBase & RouteIdMask.

Probe_Filters_3_AddrBase_Low

Address: Operational Base + offset (0x01A8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	Filters_3_AddrBase_Low Address LSB register.

Probe_Filters_3_AddrBase_High

Address: Operational Base + offset (0x01AC)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	Filters_3_AddrBase_High Address MSB register.

Probe_Filters_3_WindowSize

Address: Operational Base + offset (0x01B0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
5:0	RW	0x00	Filters_3_WindowSize Register WindowSize contains the encoded address mask used to filter packets. The effective Mask value is equal to ~(2max(WindowSize, packet.Len) - 1). A packet is a candidate when packet.Addr & Mask = AddrBase & Mask. This allows filtering of packets having an intersection with the AddrBase/WindowSize burst aligned region, even if the region is smaller than the packet.

Probe_Filters_3_SecurityBase

Address: Operational Base + offset (0x01B4)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_3_SecurityBase Register SecurityBase contains the security base used to filter packets.

Probe_Filters_3_SecurityMask

Address: Operational Base + offset (0x01B8)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	Filters_3_SecurityMask Register SecurityMask is contains the security mask used to filter packets. A packet is a candidate when: packet.Security & SecurityMask = SecurityBase & SecurityMasks.

Probe_Filters_3_Opcode

Address: Operational Base + offset (0x01BC)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	UrgEn Selects URG packets (urgency).
2	RW	0x0	LockEn Selects RDX-WR, RDL, WRC and Linked sequence.
1	RW	0x0	WrEn Selects WR packets.
0	RW	0x0	RdEn Selects RD packets.

Probe_Filters_3_Status

Address: Operational Base + offset (0x01C0)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	RspEn Selects RSP and FAIL-CONT status packets.
0	RW	0x0	ReqEn Selects REQ status packets.

Probe_Filters_3_Length

Address: Operational Base + offset (0x01C4)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
3:0	RW	0x0	Filters_3_Length Register Length is 4-bit register that selects candidate packets if their number of bytes is less than or equal to 2**Length.

Probe_Filters_3_Urgency
Address: Operational Base + offset (0x01C8)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RW	0x0	Filters_3_Urgency Register Urgency contains the minimum urgency level used to filter packets. A packet is a candidate when its socket urgency is greater than or equal to the urgency specified in the register.

Probe_Filters_3_UserBase
Address: Operational Base + offset (0x01CC)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:0	RW	0x00	Filters_3_UserBase Register UserBase is available when parameter useUserFilter is set to True. Register size is determined by parameter wUser. The register stores a user base value that is employed in filtering packets.

Probe_Filters_3_UserMask
Address: Operational Base + offset (0x01D0)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:0	RW	0x00	Filters_3_UserMask Register UserMask is available when parameter useUserFilter is set to True. Register size is determined by parameter wUser. The register stores a user mask that is employed in filtering packets. A packet is a candidate for trace or statistic collection when packet.User & UserMask = UserBase & UserMask.

Probe_Counters_0_Src
Address: Operational Base + offset (0x0204)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
4:0	RW	0x00	IntEvent Internal packet event 5'h00: OFF, counter disabled. 5'h01: CYCLE, probe clock cycles. 5'h02: IDLE, idle cycles during which no packet data is observed. 5'h03: XFER, transfer cycles during which packet data is transferred. 5'h04: BUSY, busy cycles during which the packet data is made available by the transmitting agent but the receiving agent is not ready to receive it. 5'h05: WAIT, wait cycles during a packet in which the transmitting agent suspends the transfer of packet data. 5'h06: PKT, packets. 5'h07: LUT, packets selected by the LUT. 5'h08: BYTE, total number of payload bytes. 5'h09: PRESS, clock cycles with pressure level > 0. 5'h0A: PRESS, clock cycles with pressure level > 1. 5'h0B: PRESS, clock cycles with pressure level > 2. 5'h0C: FILT0, packets selected by Filter 0. 5'h0D: FILT1, packets selected by Filter 1. 5'h0E: FILT2, packets selected by Filter 2. 5'h0F: FILT3, packets selected by Filter 3. 5'h10: CHAIN, carry from counter 2m to counter 2m + 1. 5'h11: LUT_BYTE_EN, enabled payload byte in packets selected by the LUT. 5'h12: LUT_BYTE, total number of payload bytes in packets selected by the LUT. 5'h13: FILT_BYTE_EN, enabled payload byte in packets selected by the associated filter. 5'h14: FILT_BYTE, total number of payload bytes in packets selected by the associated filter. Others: Reserved

Probe_Counters_0_AlarmMode

Address: Operational Base + offset (0x0208)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x0	Counters_0_AlarmMode Register AlarmMode is a 2-bit register that defines the statistics-alarm behavior of the counter. 2'b00: OFF, the comparison is disabled. 2'b01: MIN, if the value of the counter is less than the StatAlarmMin register at the dump period, the StatAlarmStatus bit is set. 2'b10: MAX, if the value of the counter is greater than the StatAlarmMax register at the dump period, the StatAlarmStatus bit is set. 2'b11: MIN_MAX, if the value of the counter is less than the StatAlarmMin register or greater than the StatAlarmMax register at the dump period, the corresponding StatAlarmStatus bit is set.

Probe_Counters_0_Val

Address: Operational Base + offset (0x023C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RO	0x0000	Counters_3_Val Register Val is a read-only register that is always present. The register contains the statistics counter value either pending StatAlarm output, or when statistics collection is suspended subsequent to triggers or signal statSuspend.

1.5 Application Notes

1.5.1 Idle Request

The main interconnect supports flushing the ongoing transaction when the software need to do so. If the GPU power domain needs to disconnect from the main interconnect, Idle request has to be sent to GPU BIU, the BIU will respond an "ACK", and when it's ready to be disconnect, one Idle signal will be sent out. Then, if GPU still has transaction to be sent to the DDR scheduler, it will be stalled by the BIU.

If the GPU system power domain is disconnected as the above flow, then CPU wants to access to the GPU system, it will response error or held to CPU according to the corresponding GRF register setting.

The sequence is like following figure shows:

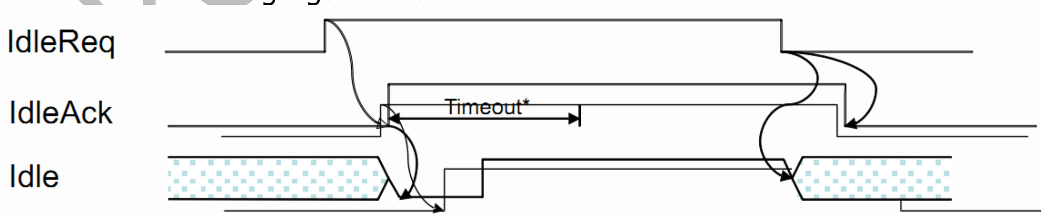

Fig. 1-3 Idle request

The idle request is controlled by PMU.

1.5.2 Counting Packets Over a Fixed Period

The following programming sequence counts packets at a given probe point using statistic counter 0.

- Select the interesting probe listed in Table 1-3.
- Set field *StatEn* to 1 in register *MainCtl.*
- Set register *Counters_0_Src* to 0x6 (PKT) to count packets.
- Specify the period during which the packets should be counted by setting register StatPeriod to: $\log_2$(interval expressed in number of probe clock cycles).
- Set field *GlobalEn* of register *CfgCtl* to 1 to enable packet counting.

Once time $2^{StatPeriod}$ has elapsed, the number of packets counted is dumped to the observer and can be read from *Counters_0_Val.*

1.5.3 Configuring and Managing the Statistics Alarm

The following programming sequence asserts the statistics alarm signal StatAlarm if the number of packets exceeds a specified threshold when the statistics dump occurs.

- Set register StatAlarmMax to the number of packets that should trigger the statistics alarm.
- Set the counter alarm mode to MAX by setting register Counters_0_AlarmMode to 2. This triggers the alarm if the count value is greater than StatAlarmMax.
- Set field StatCondDump to 0 in register MainCtl to generate a statistics alarm event and freeze the statistic counter value if the statistic counter exceeds the value of StatAlarmMax when a statistics dump occurs.
- Set field AlarmEn to 1 in register MainCtl and ensure that bit 0 of register StatAlarmEn is set to its default value of 1 to activate signal StatAlarm in the event of a statistics alarm. In the event that StatAlarm is asserted when the statistics dump period expires, the interrupt service routine should:
  1. Read the number of packets contained in register Counters_0_Val.
  2. Clear the statistics alarm by setting bit 0 to 1 in register StatAlarmClr.

Alternatively, the statistics alarm function can be configured to not drive signal StatAlarm when a statistics alarm event occurs. This signal can be disabled by clearing bit 0 of register StatAlarmEn to 0.

1.5.4 Counting Filtered Packets Over a Fixed Period

The following programming sequence counts hits from packet filter 2 using statistic counter 0.

- Set field StatEn to 1 in register MainCtl.
- Set register Counters_0_Src to 0xE (FILT2) to count packets from filter 2.
- Specify the period during which the packets should be counted by setting register StatPeriod to: $\log_2$(interval expressed in number of probe clock cycles).
- Set field GlobalEn of register CfgCtl to 1 to enable packet counting.

Once time $2^{StatPeriod}$ has elapsed, the number of packets counted is dumped to the observer and can be read from Counters_0_Val.

1.5.5 Measuring Bandwidth

The following programming sequence example shows how a packet probe can be used to measure bandwidth at a probe point.

Some important points to note about this example are:

- Statistics counters are chained together to support the maximum theoretical bandwidth. Counter 0 is configured to count bytes; counter 1 increments when counter 0 rolls over.
- The counter values are dumped to an observer after time $2^{StatPeriod}$.
- A maximum bandwidth threshold is defined. A statistics alarm signal is asserted if this threshold is exceeded when statistics data is dumped. The comparison is made against the concatenated value of the two counters.

The programming sequence is as follows:

- Select the interested probe listed in Table 1-3.
- Set field StatEn to 1 in register MainCtl.
- Set register *Counters_0_Src* to 0x8 (BYTES) to count bytes.
- Set register *Counters_1_Src* to 0x10 (CHAIN) to increment when counter 0 wraps.
- Specify the period during which the bytes should be counted by setting register *StatPeriod* to: $\log_2$(interval expressed in number of probe clock cycles).
- Set register Counters_0_AlarmMode to 0x2 (MAX) and Counters_1_AlarmMode to 0x0 (OFF). A statistics alarm will be raised if the combined count of counter 0 and counter 1 is greater than the value specified in register StatAlarmMax.
- Set register StatAlarmMax to a value corresponding to the upper bandwidth limit required to trigger the statistics alarm.

- Set field AlarmEn to 1 in register MainCtl. Ensure bit 0 of register StatAlarmEn is set to 1 (default value) if the alarm output signal StatAlarm is required.
- Set field *GlobalEn* of register *CfgCtl* to 1 to enable the counting of bytes.

In the event that StatAlarm is asserted, the interrupt service routine should:

- Optionally read the number of packets contained in registers Counters_0_Val and Counters_1_Val.
- Clear the statistics alarm by setting bit 0 to 1 in StatAlarmClr. The signal StatAlarm will be de-asserted.

Measuring bandwidth of certain master

If a certain master's bandwidth needs to be measured, the probe corresponding to this master can be find in Table 1-3.

- The register Counters_0_Src should be set to 0x14 (FILT_BYTE) to count payload bytes in packets selected by the associated filter: Filter_0.
- Filters_0_opcode should be set to 0xf to enable all kinds of operation packets.
- Filters_0_status should be set to 0x3 to enable request and response packets.
- Filters_0_length should be set to 0xf to enable all packets whose payload length is less than 2**16 bytes.
- Filters_0_usemask should be set to 0x7f to match the MID field in the packets.
- Filters_0_usebase should be set to the MID value of the master, the MID value of each master can be find in Table 1-3.

1.5.6 Address Hash and DDR Channel Interleave

The interleave granule and address hash control of DSU can be configured by setting DSU_SGRF registers: SGRF_DDR_HASH_CON0 - SGRF_DDR_HASH_CON7. The interleave granule and address hash control of other masters except DSU can be configured by setting BUS_SGRF registers: DDR_BANK_HASH_CTRL - DDR_RANK_MASK0.

Chapter 2 Dynamic Memory Interface (DMC)

2.1 Overview

The DMC includes LPDDR4/4X/5 controller (DDRCTL) and DDRPHY which are a complete memory interface solution for DDR memory subsystems.
The DDRCTL SoC application bus interface supports AXI interface, with flexible address mapper logic allow application-specific mapping of row, column, bank, bank group and rank bits to achieve industry leading high-efficiency, low-latency and high-performance from memory interface.
The DDRPHY provides control features to ease the customer implementation of digitally controlled features of the PHY such as CBT, DQS clean, read training, write training, dvfs training, periodic training and programmable configuration controls.
The DMC supports the following features:

- Support LPDDR4/4X/5
- Support LPDDR4 protocol up to LPDDR4-4267 speed grade and LPDDR5 protocol up to LPDDR5-5500
- Support up to 4-channel interleaving with a maximum of 32GB capacity in total, 2 ranks for each channel
- Support optional 2-channel interleaving with a maximum of 16GB capacity in total, 2 ranks for each channel
- Support scalable and software-controlled 1:2:2(LPDDR4/4X) or 1:1:2/1:1:4 (LPDDR5) frequency ratio
- Support 64-bit DDR data bus width for 4-channel interleaving
- Support 32-bit DDR data bus width for 2-channel interleaving
- Support up to 8-type address mapping
- Support burst16 for LPDDR4/4X/5
- Support different CL/WL latency
- Support 16 bank mode and BG mode for LPDDR5
- Support Link ECC for LPDDR5
- Support open, close, intelligent pre-charge paging policy
- Support advance refresh control
- Support LPDDR4/4X/5 software controlled frequency change
- Support DFI PHY master interface
- Support MC-initiated requests and PHY-initiated requests interface
- Support DFI data low power and ctrl low power interface
- Support hardware low power interface to gate DDRCTL core clock and AXI clock
- Support auto or SW issue entry or exit clock stop/power-down/self-refresh/deep sleep mode
- Support PMU controlled ddrphy entry or exit retention mode
- Support scrambling and descrambling of data written to or read from DDR SDRAM
- Support DDR monitor for following features
  - AMBA 32-bit APB slave interface
  - Each DDR channel embedded with one DDR monitor module
  - Support to monitor DDR read or write address within 8GB address range for each channel
  - Support to observe whether DDR access address within a specified range
  - Support to do the following statistics during a programmed number of time through hardware mode or software mode
    - Statistics about DDR idle cycles
    - Statistics about SR/PD/CKSTOP/SRPD/DFI data low power/DFI ctrl low power for LPDDR4/4X
    - Statistics about SR/PD/CKSTOP/SRPD/DFIDLP/DFICLP/DSM for LPDDR5
    - Statistics about number of activate, read and write cycles for a designated rank or bank
    - Statistics about number of activate, read and write cycles for all banks and ranks in one DDR channel
    - Statistics about read to read, read to write, write to write and write to read page

hit or page miss for a designated rank or bank
- Support monitor interrupt

2.2 Block Diagram

Following is the 4-channel interleaving DMC block diagram.

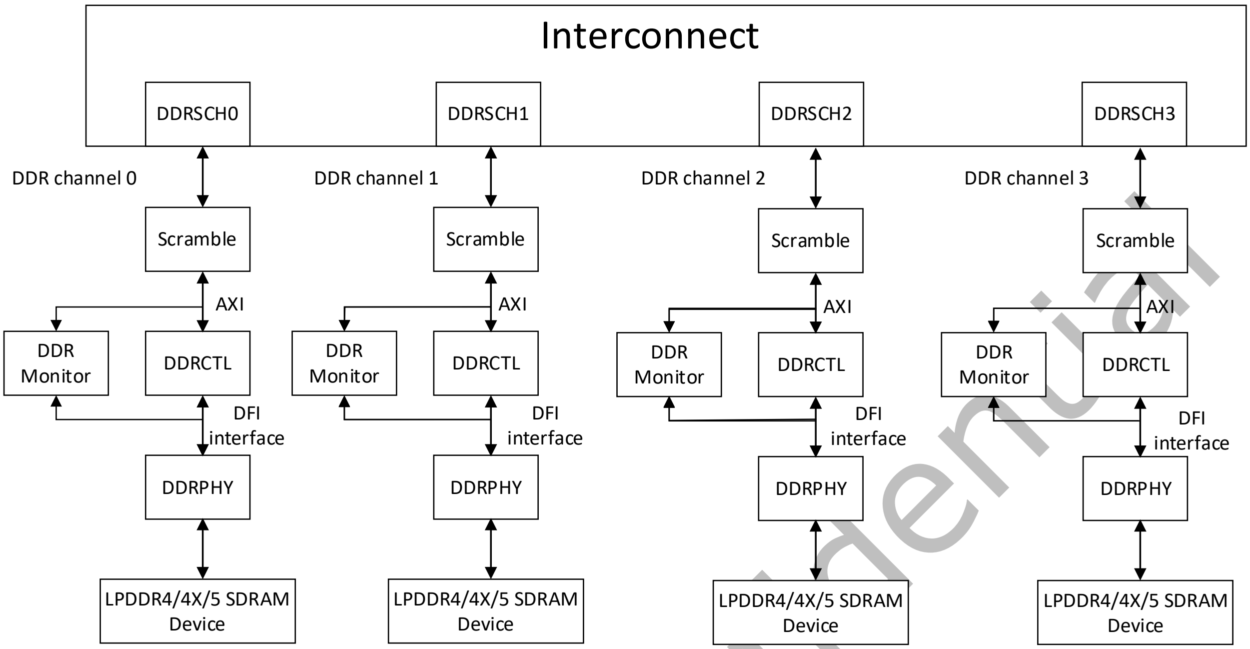

Fig. 2-1 DMC Block Diagram

Please refer to the other chapter for more information about interconnect.

2.3 Function Description

2.3.1 DDRCTL

DDRCTL supports only one AXI Port, it receives AXI transactions from memory schedule (DDRSCH0~3) of interconnect directly or from Scramble module. These transactions are queued internally and scheduled for access in order to the SDRAM while satisfying SDRAM protocol timing requirements. It in turn issues commands on the DFI interface to the DDRPHY block which launches and captures data to and from the SDRAM.

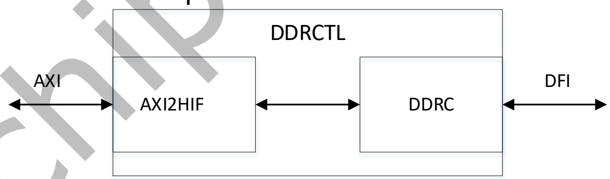

Fig. 2-2 DDRCTL Block Diagram

DDRCTL contains the following main components.

- AXI2HIF block: This block provides the AXI interface to system level and HIF interface to DDRC block. It provides bus protocol handing, data buffering, data bus size conversion and memory burst alignment. Read is stored in a SRAM, read re-order buffer and return in order to the AXI Port.
- DDRC block: This block issues the read/write commands in order, carries out the DRAM page management, issues DRAM maintenance commands, and implement the DFI interface. Write data is stored in an SRAM until its associated command is issued to the PHY. Read data is handled by the response engine in the DDRC and is returned in order on the HIF.

2.3.2 DDRPHY

DDRPHY supports LPDDR4/4X/5 SDRAM and provides physical interface solutions for DDRCTL requiring access to JEDEC compatible SDRAM devices. It is optimized for low power and high speed (up to 4267Mbps for LPDDR4/4X and up to 5500Mbps for LPDDR5) applications with robust timing and small silicon area in14nm process. It supports all JEDEC DDR3/DDR3L/DDR4/LPDDR3/LPDDR4 SDRAM components in the market. The PHY components contain DDR specialized functional and utility SSTL I/Os up to 2133MHz in SMIC 14nm, critical timing synchronization module (TSM) and a low power/jitter DLLs with programmable fine-grain control for any SDRAM interface.

2.3.3 Scramble

The function of Scramble module is to scramble and descramble data written to or read from DDR SDRAM. This module is defaultly bypassed. If it is enabled, it receives data from DDR memory scheduler (DDRSCH0~3), scramble written data and then send it to the AXI port of DDRCTL. It also descrambles date received from AXI port of DDRCTL and send it back to DDR memory scheduler.

2.4 Register Description

Slave address can be divided into different length for different usage, which is shown as follows.

2.4.1 Registers Summary For DDRCTL

Name	Offset	Size	Reset Value	Description
DDRCTL_DRAMSET1TMG0_FREQ0	0x0000	W	0x0F101B0F	SDRAM Timing Register 0 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG1_FREQ0	0x0004	W	0x00080414	SDRAM Timing Register 1 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG2_FREQ0	0x0008	W	0x0305060D	SDRAM Timing Register 2 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG3_FREQ0	0x000C	W	0x00040404	SDRAM Timing Register 3 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG4_FREQ0	0x0010	W	0x05040405	SDRAM Timing Register 4 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG5_FREQ0	0x0014	W	0x05050403	SDRAM Timing Register 5 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG6_FREQ0	0x0018	W	0x00000005	SDRAM Timing Register 6 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG7_FREQ0	0x001C	W	0x00000000	SDRAM Timing Register 7 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG8_FREQ0	0x0020	W	0x00004405	SDRAM Timing Register 8 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG9_FREQ0	0x0024	W	0x0004040D	SDRAM Timing Register 9 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG12_FREQ0	0x0030	W	0x00020000	SDRAM Timing Register 12 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG13_FREQ0	0x0034	W	0x1C200004	SDRAM Timing Register 13 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG14_FREQ0	0x0038	W	0x000800A0	SDRAM Timing Register 14 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG23_FREQ0	0x005C	W	0x00000000	SDRAM Timing Register 23 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG24_FREQ0	0x0060	W	0x000F0F0F	SDRAM Timing Register 24 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG25_FREQ0	0x0064	W	0x00000000	SDRAM Timing Register 25 belonging to Timing Set 1
DDRCTL_DRAMSET1TMG30_FREQ0	0x0078	W	0x00000000	SDRAM Timing Register 30 belonging to Timing Set 1

Name	Offset	Size	Reset Value	Description
DDRCTL_INITMR0_FREQ0	0x0500	W	0x00000510	SDRAM Initialization MR Setting Register 0
DDRCTL_INITMR1_FREQ0	0x0504	W	0x00000000	SDRAM Initialization MR Setting Register 1

2.4.2 Detail Register Description For DDRCTL

DDRCTL_DRAMSET1TMG0_FREQ0

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:24	RW	0x0f	wr2pre Minimum time between write and precharge to same bank. Specifications: WL + BL/2 + tWR where: WL = write latency BL = burst length. This must match the value programmed in the BL bit of the mode register to the SDRAM. BST (burst terminate) is not supported at present. tWR = Write recovery time. This comes directly from the SDRAM specification. Add one extra cycle for LPDDR4/5 for this parameter. For DDR5, add one extra cycle when CRCPARCTL1.wr_crc_enable = 1. Note that, depending on the PHY, if using LRDIMM, it may be necessary to adjust the value of this parameter to compensate for the extra cycle of latency through the LRDIMM. Unit: DRAM clock cycles. Value After Reset:0xf Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

Bit	Attr	Reset Value	Description
23:16	RW	0x10	t_faw tFAW: At most 4 banks must be activated in a rolling window of tFAW cycles. Unit: DRAM clock cycles. Value After Reset: 0x10 Volatile: true Programming Mode:Quasi-dynamic Group 2, Group 4
15:8	RW	0x1b	t_ras_max tRAS(max): Maximum time between activate and precharge to same bank. This is the maximum time that a page can be kept open t_ras_max must be set to RoundDown(tRAS(max)/tCK/1024). Unit: 1024 DRAM clock cycles. Value After Reset: 0x1b Volatile: true Programming Mode:Quasi-dynamic Group 2, Group 4
7:0	RW	0x0f	t_ras_min tRAS(min): Minimum time between activate and precharge to the same bank. Unit: DRAM clock cycles. Value After Reset: 0xf Volatile: true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DRAMSET1TMG1_FREQ0

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:22	RW	0x000	Reserved0 Reserved Field:Yes
21:16	RW	0x08	t_xp tXP: Minimum time after power-down exit to any operation. DDR4 (C/A parity not enabled): tXP DDR4 (C/A parity enabled): (tXP+PL) DDR5: tXP DDR5 RDIMM: max (tXP, tRPDX) LPDDR4 (tCKELPD is defined in spec): larger of tXP and tCKELPD instead. LPDDR4 (tCKELPD is not defined in spec): tXP. LPDDR5: tXP + tCSH Unit: DRAM clock cycles. Value After Reset:0x8 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

Bit	Attr	Reset Value	Description
15:8	RW	0x04	rd2pre tRTP: Minimum time from read to precharge of same bank. DDR4: Max of following two equations: tAL + max (RoundUp(tRTP/tCK), 4) or, RL + BL/2 - tRP (*). DDR5: tRTP LPDDR4 - BL/2 + max(RoundUp(tRTP/tCK),8) - 8 LPDDR5(BG mode): BL/n_min + RU(tRBTP/tCK) LPDDR5(16B mode): BL/n + RU(tRBTP/tCK) (*) When both DDR4 SDRAM and ST-MRAM are used simultaneously, use SDRAM's tRP value for calculation. Unit: DRAM clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4
7:0	RW	0x14	t_rc tRC: Minimum time between activates to same bank. Unit: DRAM clock cycles. Value After Reset:0x14 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DRAMSET1TMG2_FREQ0

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31	RW	0x0	Reserved1 Reserved Field:Yes
30:24	RW	0x03	write_latency Set to WL Time from write command to write data on SDRAM interface. This must be set to WL. Note that, depending on the PHY, if using RDIMM/LRDIMM, it may be necessary to adjust the value of WL to compensate for the extra cycle of latency through the RDIMM/LRDIMM. For all protocols, in addition to programming this register field, it is necessary to program DFITMG0 and DFITMG1 to control the read and write latencies Unit: DRAM clock cycles. Value After Reset:0x3 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4
23	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
22:16	RW	0x05	read_latency Set to RL Time from read command to read data on SDRAM interface. This must be set to RL. Note that, depending on the PHY, if using RDIMM/LRDIMM, it may be necessary to adjust the value of RL to compensate for the extra cycle of latency through the RDIMM/LRDIMM. In addition to programming this register field, it is necessary to program DFITMG0 and DFITMG1 to control the read and write latencies Unit: DRAM clock cycles. Value After Reset:0x5 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

Bit	Attr	Reset Value	Description
15:8	RW	0x06	rd2wr DDR4: RL + BL/2 + 1 + WR_PREAMBLE - WL DDR5: CL - CWL + BL/2 + 2 - (Read DQS offset) + (RD_POSTAMBLE-0.5) + WR_PREAMBLE LPDDR4(DQ ODT is Disabled): RL + BL/2 + RU(tDQSCKmax/tCK) + WR_PREAMBLE + RD_POSTAMBLE - WL LPDDR4(DQ ODT is Enabled) : RL + BL/2 + RU(tDQSCKmax/tCK) + RD_POSTAMBLE - ODTLon - RD(tODTon(min)/tCK) + 1 LPDDR5 (BG mode && DQ ODT is Disabled): RL + BL/n_max + RU(tWCKDQO(max)/tCK) - WL LPDDR5 (BG mode && DQ ODT is Enabled) : RL + BL/n_max + RU(tWCKDQO(max)/tCK) + RD(tRPST/tCK) - ODTLon - RD(tODTon(min)/tCK) + 1 LPDDR5 (16B mode && DQ ODT is Disabled): RL + BL/n + RU(tWCKDQO(max)/tCK) - WL LPDDR5 (16B mode && DQ ODT is Enabled) : RL + BL/n + RU(tWCKDQO(max)/tCK) + RD(tRPST/tCK) - ODTLon - RD(tODTon(min)/tCK) + 1 Minimum time from read command to write command. Include time for bus turnaround and all per-bank, per-rank, and global constraints. Please see the relevant PHY databook for details of what must be included here. Where: WL = write latency BL = burst length. This must match the value programmed in the BL bit of the mode register to the SDRAM RL = read latency = CAS latency WR_PREAMBLE = 1 (1tCK write preamble), 2 (2tCK write preamble). RD_POSTAMBLE = 0.5 (0.5tCK read postamble), 1.5 (1.5tCK read postamble). After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. For LPDDR4, if derating is enabled (DERATECTL0.derate_enable=1), derated tDQSCKmax must be used. Note that, depending on the PHY, if using LRDIMM, it may be necessary to adjust the value of this parameter to compensate for the extra cycle of latency through the LRDIMM. Unit: DRAM clock cycles. Value After Reset:0x6 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

Bit	Attr	Reset Value	Description
7:0	RW	0x0d	wr2rd DDR4: CWL + PL + BL/2 + tWTR_L DDR5: CWL + BL/2 + tWTR_L LPDDR4: WL + BL/2 + tWTR + 1 LPDDR5(BG mode): WL + BL/n_max + RU(tWTR_L/tCK) LPDDR5(16B mode): WL + BL/n + RU(tWTR/tCK) In DDR4, minimum time from write command to read command for same bank group. In others, minimum time from write command to read command. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. Please see the relevant PHY databook for details of what must be included here. Where: CWL = CAS write latency WL = Write latency PL = Parity latency BL = burst length. This must match the value programmed in the BL bit of the mode register to the SDRAM tWTR_L = internal write to read command delay for same bank group. This comes directly from the SDRAM specification. tWTR = internal write to read command delay. This comes directly from the SDRAM specification. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Add one extra cycle for LPDDR4 operation. WTR_L must be increased by one if DDR4 2tCK write preamble is used. Unit: DRAM clock cycles. Value After Reset:0xd Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

DDRCTL_DRAMSET1TMG3_FREQ0

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
22:16	RW	0x04	t_mr Time from MRW/MRS to valid command DDR4: Set this to the larger of tMOD + AL and tMRD. If C/A parity is enabled, tMOD_PAR(tMOD+PL) + AL and tMRD_PAR(tMOD+PL) and used instead. If CAL mode is enabled, tCAL must be added to the above. Note that if using RDIMM/LRDIMM, depending on the PHY, it may be necessary to adjust the value of this parameter to compensate for the extra cycle of latency applied to mode register writes by the RDIMM/LRDIMM chip. Also note that if using LRDIMM, the minimum value of this register is tMRD_L2. DDR5: Set this to the larger of tMRR, tMRW, tMRWPD, tMRD and tMPC_DELAY. LPDDR4:Set this to the larger of tMRR, tMRW, tMRWCKEL and tMRD. LPDDR5:Set this to the larger of tMRR, tMRW, tMRWPD and tMRD. Unit: DRAM clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
15:8	RW	0x04	rd2mr Time from Read to MRW/MRR command. LPDDR4: RL + BL/2 + RU(tDQSCKmax/tCK) + RD(tRPST) + max(RU(7.5ns/tCK),8nCK) + nRTP - 8 LPDDR5: RL + RU(tWCKDQO(max)/tCK)) + BL/n_max + MAX[RU(7.5ns/tCK),4nCK] + nRBTP Unit: DRAM clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
7:0	RW	0x04	wr2mr Time from Write to MRW/MRR command. LPDDR4: WL + 1 + BL/2 + max(RU(7.5ns/tCK),8nCK) + nWR LPDDR5: WL + BL/n_max + MAX[RU(7.5ns/tCK),4nCK] + nWR Unit: DRAM clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DRAMSET1TMG4_FREQ0

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:24	RW	0x05	t_rcd tRCD - tAL: Minimum time from activate to read or write command to same bank. Note: For DDR5, it is recommended to set this value as multiple of MEMC_FREQ_RATIO to improve the performance. Unit: DRAM clock cycles. Value After Reset:0x5 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4
23:22	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
21:16	RW	0x04	t_ccd This is the minimum time between two reads or two writes. DDR4: tCCD_L LPDDR4: tCCD LPDDR5: BL/n Don't Care for DDR5 (see DRAMSET1TMG26.t_ccd_r/t_ccd_w in DDR5). Unit: DRAM clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
15:14	RW	0x0	Reserved1 Reserved Field:Yes
13:8	RW	0x04	t_rrd For DDR4/DDR5/LPDDR5(BG mode): Minimum time between activates from bank "a" to bank "b" for same bank group. For LPDDR4/LPDDR5(16B mode): Minimum time between activates from bank "a" to bank "b". DDR4/5: tRRD_L LPDDR4: RU(tRRD/tCK) LPDDR5(BG mode): RU(tRRD_L/tCK) LPDDR5(16B mode): RU(tRRD/tCK) Unit: DRAM clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
7	RW	0x0	Reserved0 Reserved Field:Yes
6:0	RW	0x05	t_rp tRP: Minimum time from single-bank precharge to activate of same bank. t_rp must be set to RoundUp(tRP/tCK). Unit: DRAM clock cycles. Value After Reset:0x5 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DRAMSET1TMG5_FREQ0

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	Reserved3 Reserved Field:Yes
29:24	RW	0x05	t_cksrx This is the time before Self Refresh Exit that CK is maintained as a valid clock before issuing SRX. Specifies the clock stable time before SRX. Recommended settings: LPDDR4: tCKCKEH LPDDR5: tCKCSH DDR4: tCKSRX DDR5: tCKSRX Unit: DRAM clock cycles. Value After Reset:0x5 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

Bit	Attr	Reset Value	Description
23	RW	0x0	Reserved2 Reserved Field:Yes
22:16	RW	0x05	t_cksre This is the time after Self Refresh Down Entry/Power Down Entry that CK is maintained as a valid clock. Specifies the clock disable delay after SRE/PDE. Recommended settings: LPDDR4: tCKELCK LPDDR5: tCSLCK DDR4: tCKSRE (+ PL(parity latency)(*)) DDR5: tCKLCS (*)Only if CRCPARCTL1.caparity_disable_before_sr=0, this register must be increased by PL. Unit: DRAM clock cycles. Value After Reset:0x5 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
15	RW	0x0	Reserved1 Reserved Field:Yes
14:8	RW	0x04	t_ckesr Minimum CKE low width for Self refresh or Self refresh power down entry to exit timing in memory clock cycles. Recommended settings: LPDDR4: max(tCKE, tSR) LPDDR5: tSR DDR4: tCKESR (+ PL(parity latency)(*)) DDR5: Don't care (*)Only if CRCPARCTL1.caparity_disable_before_sr=0, this register must be increased by PL. Unit: DRAM clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
7:6	RW	0x0	Reserved0 Reserved Field:Yes
5:0	RW	0x03	t_cke Delay time between PDE and PDX. LPDDR4: tCKE LPDDR5: tCSPD DDR4: tPD (+ PL(parity latency)(*)) DDR5: Don't care (*)Only if CRCPARCTL1.caparity_disable_before_sr=0, this register must be increased by PL. Unit: DRAM clock cycles. Value After Reset:0x3 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DRAMSET1TMG6_FREQ0

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:6	RW	0x0000000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
5:0	RW	0x05	t_ckcsx This is the time before Clock Stop Exit that CK is maintained as a valid clock before issuing Clock Stop Exit. Specifies the clock stable time before next command after Clock Stop Exit. Recommended settings: LPDDR4/5: tXP + 2 This is only present for designs supporting LPDDR devices. Unit: DRAM clock cycles. Value After Reset:0x5 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

Bit	Attr	Reset Value	Description
31:21	RW	0x000	Reserved1 Reserved Field:Yes
20:16	RW	0x04	t_ccd_s tCCD_S: This is the minimum time between two reads or two writes for different bank group. For bank switching (from bank "a" to bank "b"), the minimum time is this value + 1. Note: This register field is only applicable for designs supporting DDR4/LPDDR5 SDRAM memories. Unit: DRAM clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
15:14	RW	0x0	Reserved0 Reserved Field:Yes
13:8	RW	0x04	t_rrd_s tRRD_S: Minimum time between activates from bank "a" to bank "b" for different bank group. Note: This register field is only applicable for designs supporting DDR4/DDR5/LPDDR5 SDRAM memories. Unit: DRAM clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
7:0	RW	0x0d	wr2rd_s Minimum time from write command to read command for different bank group. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. Applicable only in designs configured to support DDR SDRAM memories or LPDDR5 SDRAM memories. DDR4/DDR5 designs: CWL + PL + BL/2 + tWTR_S Minimum time from write command to read command for different bank group. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. Where: CWL = CAS write latency PL = Parity latency BL = burst length. This must match the value programmed in the BL bit of the mode register to the SDRAM tWTR_S = internal write to read command delay for different bank group. This comes directly from the SDRAM specification. WTR_S must be increased by one if DDR4 2tCK write preamble is used. LPDDR5 designs: WL + BL/n_min +RU(tWTR_S/tCK) Where: WL = Write Latency BL/n_min = Effective Burst Length tWTR_S = internal write to read command delay for different bank group. Unit: DRAM clock cycles. Value After Reset:0xd Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

DDRCTL_DFITMG0_FREQ0

Address: Operational Base + offset (0x0580)

Bit	Attr	Reset Value	Description
31:29	RW	0x0	Reserved3 Reserved Field:Yes
28:24	RW	0x07	dfi_t_ctrl_delay Specifies the number of DFI clock cycles after an assertion or de-assertion of the DFI control signals that the control signals at the PHY-DRAM interface reflect the assertion or de-assertion. If the DRAM clock and the memory clock are not phase-aligned, this timing parameter must be rounded up to the next integer value. Note that if using RDIMM/LRDIMM, it is necessary to increment this parameter by RDIMM's/LRDIMM's extra cycle of latency in terms of DFI clock. Unit: DFI clock cycles. Value After Reset:0x7 Volatile:true Programming Mode:Quasi-dynamic Group 4
23	RW	0x0	Reserved2 Reserved Field:Yes
22:16	RW	0x02	dfi_t_rddata_en Time from the assertion of a read command on the DFI interface to the assertion of the dfi_rddata_en signal. Refer to PHY specification for correct value. This corresponds to the DFI parameter trddata_en. Note that, depending on the PHY, if using RDIMM/LRDIMM, it may be necessary to use the adjusted value of CL in the calculation of trddata_en. This is to compensate for the extra cycle(s) of latency through the RDIMM/LRDIMM. Unit: DRAM data clock cycles. Value After Reset:0x2 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
15:14	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
13:8	RW	0x00	dfi_tphy_wrdata Specifies the number of clock cycles between when dfi_wrdata_en is asserted to when the associated write data is driven on the dfi_wrdata signal. This corresponds to the DFI timing parameter tphy_wrdata. Refer to PHY specification for correct value. Note, max supported value is 8. Unit: DRAM data clock cycles. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 4
7:6	RW	0x0	Reserved0 Reserved Field:Yes
5:0	RW	0x02	dfi_tphy_wrlat Write latency Number of clocks from the write command to write data enable (dfi_wrdata_en). This corresponds to the DFI timing parameter tphy_wrlat. Refer to PHY specification for correct value. Note that, depending on the PHY, if using RDIMM/LRDIMM, it may be necessary to use the adjusted value of CL in the calculation of tphy_wrlat. This is to compensate for the extra cycle(s) of latency through the RDIMM/LRDIMM. For LPDDR4, dfi_tphy_wrlat>60 is not supported. Unit: DRAM data clock cycles. Value After Reset:0x2 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DFITMG1_FREQ0

Address: Operational Base + offset (0x0584)

Bit	Attr	Reset Value	Description
31:21	RW	0x000	Reserved2 Reserved Field:Yes
20:16	RW	0x00	dfi_t_wrdata_delay Specifies the number of DFI clock cycles between when the dfi_wrdata_en signal is asserted and when the corresponding write data transfer is completed on the DRAM bus. This corresponds to the DFI timing parameter twrdata_delay. For LPDDR5, this should be set to "twck_delay + BL/n_max - BL/n_min" instead of twrdata_delay. twck_delay specifies the time from dfi_wck_en deassertion to when WCK transfer completes on the DRAM bus and is defined by the PHY Refer to PHY specification for correct value. When TMGCFG.frequency_ratio is set to 0(1:2 Mode), divided the value by 2 and round it up to the next integer value. When TMGCFG.frequency_ratio is set to 1(1:4 Mode), divided the value by 4 and round it up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 4
15:13	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
12:8	RW	0x04	dfi_t_dram_clk_disable Specifies the number of DFI clock cycles from the assertion of the dfi_dram_clk_disable signal on the DFI until the clock to the DRAM memory devices, at the PHY-DRAM boundary, maintains a low value. If the DRAM clock and the memory clock are not phase aligned, this timing parameter must be rounded up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 4
7:5	RW	0x0	Reserved0 Reserved Field:Yes
4:0	RW	0x04	dfi_t_dram_clk_enable Specifies the number of DFI clock cycles from the de-assertion of the dfi_dram_clk_disable signal on the DFI until the first valid rising edge of the clock to the DRAM memory devices, at the PHY-DRAM boundary. If the DRAM clock and the memory clock are not phase aligned, this timing parameter must be rounded up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 4

7:5	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
4:0	RW	0x00	dfi_lp_wakeup_data Indicates the value in DFI clock cycles to drive on dfi_lp_data_wakeup signal when data bus is idle. Determines the DFI's tlp_wakeup time: 0x00 - 1 cycle 0x01 - 2 cycles 0x02 - 4 cycles 0x03 - 8 cycles 0x04 - 16 cycles 0x05 - 32 cycles 0x06 - 64 cycles 0x07 - 128 cycles 0x08 - 256 cycles 0x09 - 512 cycles 0x0A - 1024 cycles 0x0B - 2048 cycles 0x0C - 4096 cycles 0x0D - 8192 cycles 0x0E - 16384 cycles 0x0F - 32768 cycles 0x10 - 65536 cycles 0x11 - 131072 cycles 0x12 - 262144 cycles 0x13 - Unlimited Unit: DFI clock cycles. Value After Reset:0x0 Programming Mode:Static

DDRCTL_DFIUPDTMG0_FREQ0
Address: Operational Base + offset (0x05A8)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Reserved1 Reserved Field:Yes
25:16	RW	0x040	dfi_t_ctrlup_max Specifies the maximum number of DFI clock cycles that the dfi_ctrlupd_req signal can assert. Lowest value to assign to this variable is 0x40. Unit: DFI clock cycles. Value After Reset:0x40 Programming Mode:Static
15:10	RW	0x00	Reserved0 Reserved Field:Yes
9:0	RW	0x003	dfi_t_ctrlup_min Specifies the minimum number of DFI clock cycles that the dfi_ctrlupd_req signal must be asserted. The DDRCTL expects the PHY to respond within this time. If the PHY does not respond, the DDRCTL will de-assert dfi_ctrlupd_req after dfi_t_ctrlup_min + 2 cycles. Lowest value to assign to this variable is 0x1. Unit: DFI clock cycles. Value After Reset:0x3 Programming Mode:Static

DDRCTL_DFIUPDTMG1_FREQ0
Address: Operational Base + offset (0x05AC)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	Reserved1 Reserved Field:Yes
23:16	RW	0x01	dfi_t_ctrlupd_interval_min_x1024 This is the minimum amount of time between DDRCTL initiated DFI update requests (which is executed whenever the DDRCTL is idle). Set this number higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the DDRCTL is idle. Minimum allowed value for this field is 1. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x1 Programming Mode:Static
15:8	RW	0x00	Reserved0 Reserved Field:Yes
7:0	RW	0x01	dfi_t_ctrlupd_interval_max_x1024 This is the maximum amount of time between DDRCTL initiated DFI update requests. This timer resets with each update request; when the timer expires dfi_ctrlupd_req is sent and traffic is blocked until the dfi_ctrlupd_ackx is received. PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors. Updates are required to maintain calibration over PVT, but frequent updates may impact performance. Minimum allowed value for this field is 1. Note: Value programmed for DFIUPD1.dfi_t_ctrlupd_interval_max_x1024 must be greater than DFIUPD1.dfi_t_ctrlupd_interval_min_x1024. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x1 Programming Mode:Static

DDRCTL_DFIMSGTMG0_FREQ0

Address: Operational Base + offset (0x05B0)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
7:0	RW	0x04	dfi_t_ctrlmsg_resp This is the maximum amount in DFI clock cycles between the assertion of the dfi{0/1}_ctrlmsg_req signal to the assertion of the dfi{0/1}_ctrlmsg_ack signal. If the PHY does not acknowledge the request within dfi_t_ctrlmsg_resp cycles, the PHY must not acknowledge the request at all. In this case, the controller should de-assert the corresponding dfi{0/1}_ctrlmsg_req signal. The timing values might vary based on the frequency ratio and user must reprogram if there is any change in the frequency ratio. Refer to PHY databook for recommended values Unit: DFI clock cycles. Value After Reset:0x4 Programming Mode:Static

DDRCTL_RFSHSET1TMG0_FREQ0

Address: Operational Base + offset (0x0600)

Bit	Attr	Reset Value	Description
31	RW	0x0	t_refi_x1_sel Specifies whether RFSHSET1TMG0.t_refi_x1_x32 and RFSHSET1TMG0.refresh_to_x1_x32 register values are x1 or x32. 0 - x32 register values are used, 1 - x1 register values are used. This applies only when per-bank refresh is enabled (RFSHMOD0.per_bank_refresh=1); if per-bank refresh is not enabled, the x32 register values are used and this register field is ignored. This register field does not exist for configurations which do not support LPDDR4/5. For such configurations, the value of this register field can be assumed to be 0, so that RFSHSET1TMG0.t_refi_x1_x32 and RFSHSET1TMG0.refresh_to_x1_x32 are interpreted as x32 register fields Value After Reset:0x0 Programming Mode:Dynamic - Refresh Related
30:28	RW	0x0	Reserved2 Reserved Field:Yes
27:24	RW	0x2	refresh_margin Threshold value in number of DRAM clock cycles before the critical refresh or page timer expires. A critical refresh is to be issued before this threshold is reached. It is recommended that this not be changed from the default value, currently shown as 0x2. It must always be less than internally used t_refi/32. Note that internally used t_refi is equal to RFSHSET1TMG0.t_refi_x1_x32 * 32 if RFSHSET1TMG0.t_refi_x1_sel = 0. If RFSHSET1TMG0.t_refi_x1_sel = 1, internally used t_refi is equal to RFSHSET1TMG0.t_refi_x1_x32. Note that, internally used t_refi may be divided by four if derating or TCR is enabled. Unit: Multiples of 32 DRAM clock cycles. Value After Reset:0x2 Programming Mode:Dynamic - Refresh Related
23:22	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
21:16	RW	0x10	refresh_to_x1_x32 If the refresh timer has expired at least once (i.e. >tREFI period elapses, and there are postponed refreshes), then a speculative refresh may be performed. A speculative refresh is a refresh performed at a time when refresh would be useful. When there are no transactions pending in the CAM for a period of time determined by this RFSHSET1TMG0.refresh_to_x1_x32 and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed. Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTL. This is also used for non speculative refresh when LPDDR per-bank refresh (REFpb) or DDR5 same-bank refresh (REFsb) is enabled. The controller observes the period of time determined by this for each bank, and a priority of bank address is determined. For non-DDR5, this should be programmed to tREFI based value in controller's current refresh mode. For DDR5, this should be always programmed to tREFI1 based value even in FGR mode. The controller calculates this according to current refresh mode. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on RFSHSET1TMG0.t_refi_x1_sel. Value After Reset:0x10 Programming Mode:Dynamic - Refresh Related
15:12	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
11:0	RW	0x062	t_refi_x1_x32 Average time interval between refreshes per rank (Specification: 7.8us for DDR4, 3.9us for DDR5. See JEDEC specification for LPDDR4). set this register to RoundDown(tREFI/tCK) if RFSHSET1TMG0.t_refi_x1_sel = 0, divide the above result by 32 and round down. For LPDDR controller: if using all-bank refreshes (RFSHMOD0.per_bank_refresh = 0), use tREFIab in the above calculations if using per-bank refreshes (RFSHMOD0.per_bank_refresh = 1), use tREFIpb in the above calculations For DDR controller, tREFI value is different depending on FGR mode. In DDR4 mode, if using FGR 1x mode (RFSHMOD1.fgr_mode = 000), use tREFI1 in the above calculations In DDR4 mode, if using FGR 2x mode (RFSHMOD1.fgr_mode = 001), use tREFI2 in the above calculations In DDR4 mode, if using FGR 4x mode (RFSHMOD1.fgr_mode = 010), use tREFI4 in the above calculations In DDR5 mode, always use tREFI1 in the above calculations Note that: RFSHSET1TMG0.t_refi_x1_x32 must be greater than 0x1. if RFSHSET1TMG0.t_refi_x1_sel == 1, RFSHSET1TMG0.t_refi_x1_x32 must be greater than RFSHSET1TMG1.t_rfc_min if RFSHSET1TMG0.t_refi_x1_sel == 0, RFSHSET1TMG0.t_refi_x1_x32 * 32 must be greater than RFSHSET1TMG1.t_rfc_min In non-DDR4 or DDR4 Fixed 1x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0xFFE. In DDR4 Fixed 2x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0x7FF. In DDR4 Fixed 4x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0x3FF. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on RFSHSET1TMG0.t_refi_x1_sel. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x62 Programming Mode:Dynamic - Refresh Related

DDRCTL_SCHEDTMG0_FREQ0
Address: Operational Base + offset (0x0C00)

Bit	Attr	Reset Value	Description
31:15	RW	0x00000	Reserved0 Reserved Field:Yes
14:8	RW	0x00	rdwr_idle_gap When the preferred transaction store is empty for these many clock cycles, switch to the alternate transaction store if it is non-empty. The read transaction store (both high and low priority) is the default preferred transaction store and the write transaction store is the alternative store. When prefer write over read is set this is reversed. 0x0 is a legal value for this register. When set to 0x0, the transaction store switching will happen immediately when the switching conditions become true. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles. Value After Reset:0x0 Programming Mode:Static
7:0	RW	0x00	pageclose_timer This field works in conjunction with SCHED.pageclose. It only has meaning if SCHED.pageclose==1. If SCHED.pageclose==1 and pageclose_timer==0, then an auto-precharge may be scheduled for last read or write command in the CAM with a bank and page hit. Note, sometimes an explicit precharge is scheduled instead of the auto-precharge. See SCHED.pageclose for details of when this may happen. If SCHED.pageclose==1 and pageclose_timer>0, then an auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. Instead, a timer is started, with pageclose_timer as the initial value. There is a timer on a per bank basis. The timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to pageclose_timer value if the next read or write in the CAM to a bank is a page hit. Once the timer has reached zero, an explcit precharge will be attempted to be scheduled. Unit: DRAM clock cycles. Value After Reset:0x0 Programming Mode:Static

DDRCTL_RANKTMG0_FREQ0
Address: Operational Base + offset (0x0D04)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
15:8	RW	0x06	diff_rank_wr_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive writes to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_wrcsgap (see PHY databook for value of tphy_wrcsgap) If CRC feature is enabled, must be increased by 1. If write preamble is set to 2tCK(DDR4 only), must be increased by 1. Write preamble is always set to 2tCK for LPDDR4, refer to PHY databook to see if this is already factored into tphy_wrcsgap value or if it needs to be increased by 1. If write postamble is set to 1.5tCK(LPDDR4 only), must be increased by 1. ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during writes. For LPDDR4, with DQ ODT enabled, diff_rank_wr_gap must be a minimum of ODTLoff - ODTLon - BL/2 + 1 For other cases, diff_rank_wr_gap must be a minimum of ODTCFG.wr_odt_hold - BL/2 Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Note that, if using DDR4-LRDIMM, refer to TWRWR timing requirements in JEDEC DDR4 Data Buffer (DDR4DB01) Specification. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles. Value After Reset:0x6 Volatile:true Programming Mode:Quasi-dynamic Group 2

Bit	Attr	Reset Value	Description
7:0	RW	0x06	diff_rank_rd_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive reads to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_rdcsgap (see PHY databook for value of tphy_rdcsgap) ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during reads: Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Note that, if using DDR4-LRDIMM, refer to TRDRD timing requirements in JEDEC DDR4 Data Buffer (DDR4DB01) Specification. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles. Value After Reset:0x6 Volatile:true Programming Mode:Quasi-dynamic Group 2

DDRCTL_RANKTMG1_FREQ0
Address: Operational Base + offset (0x0D08)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	Reserved0 Reserved Field:Yes
15:8	RW	0x0f	rd2wr_dr Minimum time from read command to write command for different rank. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. The value must be larger than or equal to the value of DRAMSET1TMG2.rd2wr. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles Value After Reset:0xf Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

Bit	Attr	Reset Value	Description
7:0	RW	0x0f	wr2rd_dr Minimum time from write command to read command for different rank. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles Value After Reset:0xf Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

DDRCTL_PWRTMG_FREQ0

Address: Operational Base + offset (0x0D0C)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Reserved1 Reserved Field:Yes
25:16	RW	0x040	selfref_to_x32 After this many clocks of the DDRC command channel being idle the DDRCTL automatically puts the SDRAM into Self Refresh. The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled in the PWRCTL.selfref_en. FOR PERFORMANCE ONLY. Unit: Multiples of 32 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x40 Volatile:true Programming Mode:Quasi-dynamic Group 4
15:7	RW	0x000	Reserved0 Reserved Field:Yes
6:0	RW	0x10	powerdown_to_x32 After this many clocks of the DDRC command channel being idle the DDRCTL automatically puts the SDRAM into power-down. The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled in the PWRCTL.powerdown_en. FOR PERFORMANCE ONLY. Unit: Multiples of 32 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x10 Volatile:true Programming Mode:Quasi-dynamic Group 4

DDRCTL_MSTR0

Address: Operational Base + offset (0x10000)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Reserved5 Reserved Field:Yes

Bit	Attr	Reset Value	Description
25:24	RW	0x3	active_ranks Only present for multi-rank configurations. Each bit represents one rank. For two-rank configurations, only bits[25:24] are present. 1 - populated 0 - unpopulated LSB is the lowest rank number. For 2 ranks following combinations are legal: 01 - One rank 11 - Two ranks Others - Reserved. For 4 ranks following combinations are legal: 0001 - One rank 0011 - Two ranks 0101 - Two ranks are populated in Rank0 and Rank2 (DDR5 Only). 1111 - Four ranks Note: the four rank populated config 4'b0101 can only be supported with heterogenous rank support enable. Value After Reset:0x3 Programming Mode:Static
23:21	RW	0x0	Reserved4 Reserved Field:Yes
20:16	RW	0x04	burst_rdwr SDRAM burst length used: 00100 - Burst length of 8 01000 - Burst length of 16 All other values are reserved. This controls the burst size used to access the SDRAM. This must match the burst length mode register setting in the SDRAM. For DDR4, this must be set to 0x00100 (BL8). For LPDDR4/LPDDR5/DDR5, this must be set to 0x01000 (BL16). Value After Reset:0x4 Programming Mode:Static
15:14	RW	0x0	Reserved3 Reserved Field:Yes
13:12	RW	0x0	data_bus_width Selects proportion of DQ bus width that is used by the SDRAM 00 - Full DQ bus width to SDRAM 01 - Half DQ bus width to SDRAM 10 - Quarter DQ bus width to SDRAM 11 - Reserved. Note that half bus width mode is only supported when the SDRAM bus width is a multiple of 16, and quarter bus width mode is only supported when the SDRAM bus width is a multiple of 32 and the configuration parameter MEMC_QBUS_SUPPORT is set. Bus width refers to DQ bus width (excluding any ECC width). Value After Reset:0x0 Programming Mode:Static
11:4	RW	0x00	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
3	RW	0x0	lpddr5 Select LPDDR5 SDRAM 1 - LPDDR5 SDRAM device in use. 0 - non-LPDDR5 device in use Present only in designs configured to support LPDDR5 SDRAM memories. Value After Reset:0x0 Programming Mode:Static
2	RW	0x0	Reserved1 Reserved Field:Yes
1	RW	0x0	lpddr4 Select LPDDR4 SDRAM 1 - LPDDR4 SDRAM device in use. 0 - non-LPDDR4 device in use Present only in designs configured to support LPDDR4 SDRAM memories. Value After Reset:0x0 Programming Mode:Static
0	RW	0x0	Reserved0 Reserved Field:Yes

DDRCTL_MSTR2

Address: Operational Base + offset (0x10008)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	Reserved0 Reserved Field:Yes
1:0	RW	0x0	target_frequency This field specifies the target frequency. 0 - Frequency 0/Normal 1 - Frequency 1/FREQ1 2 - Frequency 2/FREQ2 3 - Frequency 3/FREQ3 All other values are reserved. Note: If the target frequency can be changed through Hardware Low Power Interface only, this field is not needed. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 2

DDRCTL_MSTR4

Address: Operational Base + offset (0x10010)

Bit	Attr	Reset Value	Description
31:1	RW	0x00000000	Reserved0 Reserved Field:Yes
0	RW	0x0	wck_on WCK always ON mode 0: WCK Always On mode disabled 1: WCK Always On mode enabled In case of multi-rank system, the controller issues CAS-WS_FS to all ranks to sets DRAM in sync state simultaneously. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 2

DDRCTL_STAT

Address: Operational Base + offset (0x10014)

Bit	Attr	Reset Value	Description
31:17	RW	0x0000	Reserved3 Reserved Field:Yes
16	RO	0x0	selfref_cam_not_empty Self refresh with CAMs not empty. Set to 1 when Self Refresh is entered but CAMs are not drained. Cleared after exiting Self Refresh. Value After Reset:0x0 Programming Mode:Static
15	RW	0x0	Reserved2 Reserved Field:Yes
14:12	RO	0x0	selfref_state Self refresh state. This indicates self refresh or self refresh power down state or Deep Sleep Mode (LPDDR5 only). This register is used for frequency change and MRR/MRW access during self refresh. 000 - SDRAM is not in Self Refresh. 001 - Self refresh 1 010 - Self refresh power down 011 - Self refresh 2 100 - Deep Sleep Mode (LPDDR5 only) Value After Reset:0x0 Programming Mode:Static
11:6	RW	0x00	Reserved1 Reserved Field:Yes
5:4	RO	0x0	selfref_type Flags if Self Refresh (except LPDDR4/5) or SR-Powerdown (LPDDR4/5) is entered and if it was under Automatic Self Refresh control only or not. 00 - SDRAM is not in Self Refresh (except LPDDR4/5) or SR-Powerdown (LPDDR4/5). If CA parity retry is enabled by RETRYCTL0.capar_retry_enable, this also indicates SRE command is still in parity error window or retry is in-progress. 11 - SDRAM is in Self Refresh (except LPDDR4/5) or SR-Powerdown (LPDDR4/5), which was caused by Automatic Self Refresh only. If retry is enabled, this guarantees SRE command is executed correctly without parity error. 10 - SDRAM is in Self Refresh (except LPDDR4/5) or SR-Powerdown (LPDDR4/5), which was not caused solely under Automatic Self Refresh control. It could have been caused by Hardware Low Power Interface and/or Software (PWRCTL.selfref_sw). If retry is enabled, this guarantees SRE command is executed correctly without parity error. 01 - SDRAM is in Self Refresh, which was caused by PHY Master Request. For LPDDR54 and DDR4, only bit[5:4] are used. For DDR5, self-refresh per rank control is supported. bit[5:4] - rank 0 selfref_type bit[7:6] - rank 1 selfref_type bit[9:8] - rank 2 selfref_type bit[11:10] - rank 3 selfref_type Value After Reset:0x0 Programming Mode:Static
3	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
2:0	RO	0x0	operating_mode Operating mode. DDR4/DDR5 designs: 000 - Init 001 - Normal 010 - Power-down (For DDR4, this means all ranks are in power-down state. For DDR5, this means at least one rank is in power-down state, check powerdown_state for details) 011 - Self refresh (For DDR4/DDR5, this means all ranks are in self refresh state, check selfref_type for details) 1XX - Maximum Power Saving Mode (For DDR4 only) LPDDR4/LPDDR5designs: 000 - Init 001 - Normal 010 - Power-down 011 - Self refresh / Self refresh power-down Value After Reset:0x0 Programming Mode:Static

DDRCTL_MRCTRL0

Address: Operational Base + offset (0x10080)

Bit	Attr	Reset Value	Description
31	RW	0x0	mr_wr Setting this register bit to 1 triggers a mode register read or write operation. When the MR operation is complete, the DDRCTL automatically clears this bit. The other register fields of this register must be written in a separate APB transaction, before setting this mr_wr bit. It is recommended NOT to set this signal if in Init, Deep power-down or MPSM operating modes. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
30:25	RW	0x00	Reserved3 Reserved Field:Yes
24	RW	0x0	mrr_done_clr If this bit is set, mrr_done will be cleared by the controller. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
23:16	RW	0x00	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
15:12	RW	0x0	mr_addr Address of the mode register that is to be written to. 0000 - MR0 0001 - MR1 0010 - MR2 0011 - MR3 0100 - MR4 0101 - MR5 0110 - MR6 0111 - MR7 This signal is also used for writing to control words of the register chip on RDIMMs/LRDIMMs. In that case, it corresponds to the bank address bits sent to the RDIMM/LRDIMM. In case of DDR4, the bit[3:2] corresponds to the bank group bits. Therefore, the bit[3] as well as the bit[2:0] must be set to an appropriate value which is considered both the Address Mirroring of UDIMMs/RDIMMs/LRDIMMs and the Output Inversion of RDIMMs/LRDIMMs. Don't Care for LPDDR4/5 (see MRCTRL1.mr_data for mode register addressing in LPDDR4/5). Don't Care for DDR5 (see CMDCTL.cmd_ctrl for MRW/MRR access in DDR5). Value After Reset:0x0 Programming Mode:Dynamic
11:6	RW	0x00	Reserved1 Reserved Field:Yes
5:4	RW	0x3	mr_rank Controls which rank is accessed by MRCTRL0.mr_wr. Normally, it is desired to access all ranks, so all bits must be set to 1. However, for multi-rank UDIMMs/RDIMMs/LRDIMMs which implement address mirroring, it may be necessary to access ranks individually. Examples (assume DDRCTL is configured for 4 ranks): 0x1 - select rank 0 only 0x2 - select rank 1 only 0x5 - select ranks 0 and 2 0xA - select ranks 1 and 3 0xF - select ranks 0, 1, 2 and 3 Don't Care for DDR5. Value After Reset:0x3 Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
3	RW	0x0	sw_init_int Indicates whether Software intervention is allowed via MRCTRL0/MRCTRL1 before automatic SDRAM initialization routine or not. For DDR4, this bit can be used to initialize the DDR4 RCD (MR7) before automatic SDRAM initialization. For LPDDR4/5, this bit can be used to program additional mode registers before automatic SDRAM initialization if necessary. In LPDDR4 dual channel mode, note that this must be programmed to both channels beforehand. Note that this must be cleared to 0 after completing Software operation. Otherwise, SDRAM initialization routine will not re-start. 0 - Software intervention is not allowed 1 - Software intervention is allowed Don't Care for DDR5. Value After Reset:0x0 Programming Mode:Dynamic
2:1	RW	0x0	Reserved0 Reserved Field:Yes
0	RW	0x0	mr_type Indicates whether the mode register operation is read or write. 0 - Write 1 - Read Only used for LPDDR4/LPDDR5/DDR4. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_MRCTRL1
Address: Operational Base + offset (0x10084)

Bit	Attr	Reset Value	Description
31:18	RW	0x0000	Reserved0 Reserved Field:Yes
17:0	RW	0x00000	mr_data Mode register write data for DDR4 mode. For LPDDR4/5, MRCTRL1[15:0] are interpreted as [15:8] MR Address [7:0] MR data for writes, don't care for read This is 18-bit wide in configurations with DDR4 support and 16-bits for the LPDDR5/4 controller. Don't Care for DDR5 (see CMDCTL.cmd_ctrl for MRW access in DDR5). Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_MRSTAT
Address: Operational Base + offset (0x10090)

Bit	Attr	Reset Value	Description
31:17	RW	0x0000	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
16	RO	0x0	mr_done This signal goes high when the controller received MRR data which is triggered by MRCTRL0.mr_wr. This signal is cleared by mrr_done_clr Value After Reset:0x0 Programming Mode:Dynamic
15:1	RW	0x0000	Reserved0 Reserved Field:Yes
0	RO	0x0	mr_wr_busy The SoC core may initiate a MR write operation only if this signal is low. This signal goes high in the clock after the DDRCTL accepts the MRW/MRR request. It goes low when the MRW/MRR command is issued to the SDRAM. It is recommended not to perform MRW/MRR commands when 'MRSTAT.mr_wr_busy' is high. 0 - Indicates that the SoC core can initiate a mode register write operation 1 - Indicates that mode register write operation is in progress Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_MRRDATA0

Address: Operational Base + offset (0x10094)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	mrr_data_lwr MRR data for DQ[31:0] This register is updated when the controller issued MRR command triggered by MRCTRL register. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_MRRDATA1

Address: Operational Base + offset (0x10098)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	mrr_data_upr MRR data for DQ[63:32] This register is updated when the controller issued MRR command triggered by MRCTRL register. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_DERATECTL0

Address: Operational Base + offset (0x10100)

Bit	Attr	Reset Value	Description
31:5	RW	0x0000000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
4	RW	0x1	dis_trefi_x0125 Disables 0.125 x tREFI refresh rate for derating. When this register filed is set to 1, controller behaves like 0.25 x tREFI refresh rate mode although in 0.125 x tREFI refresh rate mode. And controller asserts interrupt signal "derate_temp_limit_intr" when receives MR4 OP[4:0] = 01110 or 01111. 0 - Enable 0.125 x tREFI refresh rate 1 - Disable 0.125 x tREFI refresh rate Note: This register field is only applicable for designs supporting LPDDR5 SDRAM. This register bit is required to set 1 if per-bank refresh "RFSHMOD0.per_bank_refresh=1" and derating "DERATECTL0.derate_enable=1" are enabled. Value After Reset:0x1 Programming Mode:Static
3	RW	0x1	dis_trefi_x6x8 Disables 8x tREFI and 6x tREFI refresh rate for derating.When this register filed is set to 1, controller behaves like 4x tREFI refresh rate mode even though in 8x tREFI and 6x tREFI mode. 0 - Enable 6x tREFI and 8x tREFI refresh rate 1 - Disable 6x tREFI and 8x tREFI refresh rate Note: This register field is only applicable for designs supporting LPDDR5 SDRAM. This register bit is required to set 1 if LPDDR5 is used. Value After Reset:0x1 Programming Mode:Dynamic - Refresh Related
2	RW	0x0	derate_mr4_pause_fc Pauses automatic MRR to MR4. For more details, see description of DERATECTL0.derate_enable. Value After Reset:0x0 Programming Mode:Dynamic
1	RW	0x0	lpddr4_refresh_mode Selects the LPDDR4 refresh mode 0 - Legacy refresh mode 1 - Modified refresh mode (Unsupported) Value After Reset:0x0 Programming Mode:Static
0	RW	0x0	derate_enable Enables derating 0 - Timing parameter derating is disabled 1 - Timing parameter derating is enabled using MR4 read value. Note that, once DERATECTL0.derate_enable is set to 1, it has to keep 1. Otherwise, the refresh rate and other timing parameters revert to their nominal values. To stop automatic MRR to MR4 temporarily after setting DERATECTL0.derate_enable =1, DERATECTL0.derate_mr4_pause_fc needs to be set to 1 without changing DERATECTL0.derate_enable. Setting DERATECTL0.derate_mr4_pause_fc=0 without changing DERATECTL0.derate_enable restarts automatic MRR to MR4. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_DERATECTL1
Address: Operational Base + offset (0x10104)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	Reserved0 Reserved Field:Yes
3:0	RW	0x0	active_derate_byte_rank0 Indicates which byte of the MRR data is used for derating in rank0. The each bit corresponds each byte. If the multiple register bits are enabled, controller compares refresh rate of the corresponding devices and chooses the worst refresh rate among them This register only supports LPDDR4, LPDDR5 and DDR5. For LPDDR4 and LPDDR5: Valid width is MEMC_DRAM_DATA_WIDTH/8. This bit[n]=1 means that DQ[8*n+:8] is valid MRR data. All "0"s is invalid, if DERATECTL0.derate_enable=1. For DDR5: Valid width is MEMC_DRAM_TOTAL_DATA_WIDTH/device DQ width. Device DQ width is based on MSTR0.device_config register value. Value After Reset:0x0 Programming Mode:Static

DDRCTL_DERATECTL2

Address: Operational Base + offset (0x10108)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	Reserved0 Reserved Field:Yes
3:0	RW	0x0	active_derate_byte_rank1 Indicates which byte of the MRR data is used for derating in rank1. The each bit corresponds each byte. If the multiple register bits are enabled, controller compares refresh rate of the corresponding devices and chooses the worst refresh rate among them. This register only supports LPDDR4, LPDDR5 and DDR5. For LPDDR4 and LPDDR5: Valid width is MEMC_DRAM_DATA_WIDTH/8. This bit[n]=1 means that DQ[8*n+:8] is valid MRR data. All "0"s is invalid, if DERATECTL0.derate_enable=1. For DDR5: Valid width is MEMC_DRAM_TOTAL_DATA_WIDTH/device DQ width. Device DQ width is based on MSTR0.device_config register value. Value After Reset:0x0 Programming Mode:Static

DDRCTL_DERATECTL5

Address: Operational Base + offset (0x10114)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	Reserved0 Reserved Field:Yes
2	RW	0x0	derate_temp_limit_intr_force Interrupt force bit for derate_temp_limit_intr. Setting this register to 1 will cause the derate_temp_limit_intr output pin to be asserted. At the end of the interrupt force operation, the DDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
1	RW	0x0	derate_temp_limit_intr_clr Interrupt clear bit for derate_temp_limit_intr. At the end of the interrupt clear operation, the DDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
0	RW	0x1	derate_temp_limit_intr_en Interrupt enable bit for derate_temp_limit_intr output pin. 1 Enabled 0 Disabled Value After Reset:0x1 Programming Mode:Dynamic

DDRCTL_DERATECTL6
Address: Operational Base + offset (0x10118)

Bit	Attr	Reset Value	Description
31:1	RW	0x00000000	Reserved0 Reserved Field:Yes
0	RW	0x0	derate_mr4_tuf_dis Disable use of MR4 TUF flag (MR4[7]) bit. 0 - Use MR4 TUF flag (MR4[7]) 1 - Do not use MR4 TUF Flag (MR4[7]) It is recommended to set this register to 1. This affects both the periodic refresh rate update and asserting interrupt signal derate_temp_limit_intr. (i.e. In derate_mr4_tuf_dis==1, the contoller can update the refresh rate, and assert the derate_temp_limit_intr if it exceeds the thresholds irrespective of tha value of TUF flag.) Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DERATESTAT0
Address: Operational Base + offset (0x1011C)

Bit	Attr	Reset Value	Description
31:1	RW	0x00000000	Reserved0 Reserved Field:Yes
0	RO	0x0	derate_temp_limit_intr Derate temperature interrupt indicating SDRAM temperature operating limit is exceeded. In LPDDR4, this register field is set to 1 when the value read from MR4[2:0] is 3'b000 or 3'b111. In LPDDR5, this register field is set to 1 when the value read from MR4[4:0] is 5'b00000 or 5'b11111 or invalid value. In DDR5, this register field is set to 1 when the value read from MR4[2:0] is the thresholds programmed by DERATECTL2.derate_low_temp_limit and DERATECTL2.derate_high_temp_limit. Cleared by register DERATECTL1.derate_temp_limit_intr_clr. Value After Reset:0x0 Testable:readOnly Programming Mode:Static

DDRCTL_DERATEDBGCTL

Address: Operational Base + offset (0x10124)

Bit	Attr	Reset Value	Description
31:6	RW	0x0000000	Reserved1 Reserved Field:Yes
5:4	RW	0x0	dbg_mr4_rank_sel MR4 rank select in case of multi ranks Value After Reset:0x0 Programming Mode:Static
3	RW	0x0	Reserved0 Reserved Field:Yes
2:0	RW	0x0	dbg_mr4_grp_sel MR4 data group select based on 4 device MRR read data Value After Reset:0x0 Programming Mode:Static

DDRCTL_DERATEDBGSTAT

Address: Operational Base + offset (0x10128)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	dbg_mr4_byte3 Byte 3 of selected 32 bits MR4 data. LPDDR4/LPDDR5 use 5 bits and DDR5 uses 8 bits. This register is updated when the controller issues MRR for MR4 automatically. For LPDDR4 and LPDDR5: It is occurred only if derating is enabled. (DERATECTL0.derate_enable=1) Value After Reset:0x0 Programming Mode:Dynamic
23:16	RO	0x00	dbg_mr4_byte2 Byte 2 of selected 32 bits MR4 data. LPDDR4/LPDDR5 use 5 bits and DDR5 uses 8 bits. This register is updated when the controller issues MRR for MR4 automatically. For LPDDR4 and LPDDR5: It is occurred only if derating is enabled. (DERATECTL0.derate_enable=1) Value After Reset:0x0 Programming Mode:Dynamic
15:8	RO	0x00	dbg_mr4_byte1 Byte 1 of selected 32 bits MR4 data. LPDDR4/LPDDR5 use 5 bits and DDR5 uses 8 bits. This register is updated when the controller issues MRR for MR4 automatically. For LPDDR4 and LPDDR5: It is occurred only if derating is enabled. (DERATECTL0.derate_enable=1) Value After Reset:0x0 Programming Mode:Dynamic
7:0	RO	0x00	dbg_mr4_byte0 Byte 0 of selected 32 bits MR4 data. LPDDR4/LPDDR5 use 5 bits and DDR5 uses 8 bits. This register is updated when the controller issues MRR for MR4 automatically. For LPDDR4 and LPDDR5: It is occurred only if derating is enabled. (DERATECTL0.derate_enable=1) Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_PWRCTL

Address: Operational Base + offset (0x10180)

Bit	Attr	Reset Value	Description
31:19	RW	0x0000	Reserved4 Reserved Field:Yes
18	RW	0x0	dsm_en A value of 1 to this register causes system to move to Deep Sleep Mode state immediately. 1 - Entry to Deep Sleep Mode 0 - Exit from Deep Sleep Mode Value After Reset:0x0 Programming Mode:Dynamic
17	RW	0x0	lpddr4_sr_allowed Indicates whether transition from SR-PD to SR and back to SR-PD is allowed. This register field cannot be modified while PWRCTL.selfref_sw==1. 0 - SR-PD -> SR -> SR-PD not allowed 1 - SR-PD -> SR -> SR-PD allowed Value After Reset:0x0 Programming Mode:Dynamic
16	RW	0x0	dis_cam_drain_selfref Indicates whether skipping CAM draining is allowed when entering Self-Refresh. This register field cannot be modified while PWRCTL.selfref_sw==1. 0 - CAMs must be empty before entering SR 1 - CAMs are not emptied before entering SR (unsupported) Note, PWRCTL.dis_cam_drain_selfref=1 is unsupported in this release. PWRCTL.dis_cam_drain_selfref=0 is required. Value After Reset:0x0 Programming Mode:Dynamic
15	RW	0x0	stay_in_selfref Self refresh state is an intermediate state to enter to Self refresh power down state or exit Self refresh power down state for LPDDR4/5. This register controls transition from the Self refresh state. 1 - Prohibit transition from Self refresh state 0 - Allow transition from Self refresh state Value After Reset:0x0 Programming Mode:Dynamic
14:12	RW	0x0	Reserved3 Reserved Field:Yes
11	RW	0x0	selfref_sw A value of 1 to this register causes system to move to Self Refresh state immediately, as long as it is not in INIT or DPD/MPSM operating mode. This is referred to as Software Entry/Exit to Self Refresh. 1 - Software Entry to Self Refresh 0 - Software Exit from Self Refresh Value After Reset:0x0 Programming Mode:Dynamic
10	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
9	RW	0x0	en_dfi_dram_clk_disable Enable the assertion of dfi_dram_clk_disable whenever a clock is not required by the SDRAM. If set to 0, dfi_dram_clk_disable is never asserted. Assertion of dfi_dram_clk_disable is as follows: In DDR4, can be asserted in following: in Self Refresh in Maximum Power Saving Mode In LPDDR4, can be asserted in following: in Self Refresh Power Down in Power Down during Normal operation (Clock Stop) In DDR5, can be asserted in following: in Self Refresh In DDR5 RDIMM, the value of this field need to be same as DIMMCTL.dimm_selfref_clock_stop_mode. Value After Reset:0x0 Programming Mode:Dynamic
8:5	RW	0x0	Reserved1 Reserved Field:Yes
4	RW	0x0	powerdown_en If true then the DDRCTL goes into power-down after a programmable number of cycles "maximum idle clocks before power down" (PWRTMG.powerdown_to_x32). This register bit may be re-programmed during the course of normal operation. For LPDDR4/5 and DDR4, only bit[4] is used. For DDR5, powerdown per rank enable is supported. bit[4] - rank 0 powerdown_en bit[5] - rank 1 powerdown_en bit[6] - rank 2 powerdown_en bit[7] - rank 3 powerdown_en Value After Reset:0x0 Programming Mode:Dynamic
3:1	RW	0x0	Reserved0 Reserved Field:Yes
0	RW	0x0	selfref_en If true then the DDRCTL puts the SDRAM per rank into Self Refresh after a programmable number of cycles "maximum idle clocks before Self Refresh (PWRTMG.selfref_to_x32)". This register bit may be re-programmed during the course of normal operation. For LPDDR4/5 and DDR4, only bit[0] is used. For DDR5, self-refresh per rank enable is provided. Current self-refresh need to be enabled for all ranks. For DDR5 RDIMM, self-refresh need to be enabled for all ranks of both channels. bit[0] - rank 0 selfref_en bit[1] - rank 1 selfref_en bit[2] - rank 2 selfref_en bit[3] - rank 3 selfref_en Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_HWLPCTL

Address: Operational Base + offset (0x10184)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	Reserved0 Reserved Field:Yes
1	RW	0x1	hw_lp_exit_idle_en When this bit is programmed to 1 the cactive_in_ddrc pin of the DDRC can be used to exit from the automatic clock stop, automatic power down or automatic self-refresh modes. Note, it will not cause exit of Self-Refresh that was caused by Hardware Low Power Interface and/or Software (PWRCTL.selfref_sw). Value After Reset:0x1 Testable:readOnly Programming Mode:Static
0	RW	0x1	hw_lp_en Enable for Hardware Low Power Interface. Value After Reset:0x1 Volatile:true Programming Mode:Quasi-dynamic Group 2

DDRCTL_CLKGATECTL

Address: Operational Base + offset (0x1018C)

Bit	Attr	Reset Value	Description
31:6	RW	0x0000000	Reserved0 Reserved Field:Yes
5:0	RW	0x3f	bsm_clk_on Indicates whether the output signal bsm_clk_en [MEMC_NUM_RANKS-1:0] become 0 for each corresponding DDRCTL internal state: 0: bsm_clk_en become 0 in case where DDRCTL is in corresponding state described below 1: bsm_clk_en remain 1 in case where DDRCTL is in corresponding state The bsm_clk_en [MEMC_NUM_RANKS-1:0] indicates that clock can be removed when corresponding rank of this signal is 0. Each corresponding DDRCTL internal state is as follows: [0] Unpopulated rank control [1] Controller initialization state (until dfi0_init_start/dfi0_init_complete handshake is done) [2] Self Refresh mode [3] Self Refresh Powerdown mode [4] Powerdown mode [5] Deep Sleep Mode (LPDDR5 Only) bit[5:1] indicates behavior of the bsm_clk_en for each corresponding DDRCTL internal state. For example, if this field is set to 6'b00_0100, bsm_clk_en becomes 1 when it is in self refresh mode. This implies that bsm_clk is not removed while it is in self refresh mode, but the bsm_clk is removed by external clock gating logic in other modes above. If bit 0 (Unpopulated rank control) is set to 1, behavior of the bsm_clk_en is determined by other fields in this register irrespective of MSTR.active_ranks. If the bsm_clk_en[1]=0 is needed in case of single rank (MSTR.active_ranks=1), bit 0 has to be set to 0. To maximize power-saving, this field needs to be set to 6'b00_0000. Value After Reset:0x3f Programming Mode:Static

DDRCTL_RFSHMOD0

Address: Operational Base + offset (0x10200)

Bit	Attr	Reset Value	Description
31:9	RW	0x000000	Reserved1 Reserved Field:Yes
8	RW	0x0	per_bank_refresh 1 - Per bank refresh 0 - All bank refresh Per bank refresh allows traffic to flow to other banks. Value After Reset:0x0 Programming Mode:Static
7:6	RW	0x0	Reserved0 Reserved Field:Yes
5:0	RW	0x00	refresh_burst The programmed value + 1 is the number of refresh timeouts that is allowed to accumulate before traffic is blocked and the refreshes are forced to execute. Closing pages to perform a refresh is a one-time penalty that must be paid for each group of refreshes. Therefore, performing refreshes in a burst reduces the per-refresh penalty of these page closings. Higher numbers for RFSHCTL.refresh_burst slightly increases utilization; lower numbers decreases the worst-case latency associated with refreshes. 0 - single refresh 1 - burst-of-2 refresh 7 - burst-of-8 refresh In DDR4 mode, according to Fine Granularity feature, 8 refreshes can be postponed in 1X mode, 16 refreshes in 2X mode and 32 refreshes in 4X mode. In DDR5 mode, according to Fine Granularity feature, 4 refreshes can be postponed in 1X mode and 8 refreshes can be postponed in 2X mode. In DDR5 mode, if self-refresh operation is expected, then this field shall not be set to the maximum number, for example, according to Fine Granularity feature, it should be smaller than 8 in 2X mode. In per-bank refresh mode of LPDDR4/5 (RFSHMOD0.per_bank_refresh = 1), 64 refreshes can be postponed. If using PHY-initiated updates, care must be taken in the setting of RFSHMOD0.refresh_burst, to ensure that tRFCmax is not violated due to a PHY-initiated update occurring shortly before a refresh burst was due. In this situation, the refresh burst will be delayed until the PHY-initiated update is complete. Value After Reset:0x0 Programming Mode:Dynamic - Refresh Related

DDRCTL_RFSHCTL0

Address: Operational Base + offset (0x10208)

Bit	Attr	Reset Value	Description
31:5	RW	0x0000000	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
4	RW	0x0	refresh_update_level Toggle this signal (either from 0 to 1 or from 1 to 0) to indicate that the refresh register(s) have been updated. refresh_update_level must not be toggled when the DDRC is in reset (core_ddrc_rstn = 0). In DDR5 mode, this can be toggled during self-refresh mode and MPSM in OPS state. The refresh register(s) are automatically updated when exiting reset. Value After Reset:0x0 Programming Mode:Dynamic
3:1	RW	0x0	Reserved0 Reserved Field:Yes
0	RW	0x0	dis_auto_refresh When '1', disable auto-refresh generated by the DDRCTL. When auto-refresh is disabled, the SoC core must generate refreshes using the registers OPREFCTRL*.rankn_refresh. When dis_auto_refresh transitions from 0 to 1, any pending refreshes are immediately scheduled by the DDRCTL. If DDR4 CA parity retry is enabled (RETRYCTL0.capar_retry_enable = 1), disable auto-refresh is not supported, and this bit must be set to '0'. If FGR mode is enabled (RFSHMOD1.fgr_mode > 0), disable auto-refresh is not supported, and this bit must be set to '0'. This register field is changeable on the fly in non-DDR5 mode, and changeable during INIT/DBG/BIST state or self-refresh mode and MPSM during OPS state in DDR5 mode. Value After Reset:0x0 Programming Mode:Dynamic - Refresh Related

DDRCTL_ZQCTL0

Address: Operational Base + offset (0x10280)

Bit	Attr	Reset Value	Description
31	RW	0x0	dis_auto_zq 1 - Disable DDRCTL generation of ZQCS/MPC(ZQ calibration) command. Register OPCTRLCMD.zq_calib_short can be used instead to issue ZQ calibration request from APB module. 0 - Internally generate ZQCS/MPC(ZQ calibration) commands based on ZQSET1TMG1.t_zq_short_interval_x1024. This register field only applys to DDR4, LPDDR4, and LPDDR5. For DDR5, see PASCTL7~PASCTL10 registers Value After Reset:0x0 Programming Mode:Dynamic
30	RW	0x0	Reserved1 Reserved Field:Yes
29	RW	0x0	zq_resistor_shared 1 - Denotes that ZQ resistor is shared between ranks. Means ZQinit/ZQCL/ZQCS/MPC(ZQ calibration) commands are sent to one rank at a time with tZQinit/tZQCL/tZQCS/tZQCAL/tZQLAT timing met between commands so that commands to different ranks do not overlap. 0 - ZQ resistor is not shared. If LPDDR5 is used, this register needs to be set to "0". Value After Reset:0x0 Programming Mode:Static

DDRCTL_SCHED0

Address: Operational Base + offset (0x10380)

Bit	Attr	Reset Value	Description
31	RW	0x0	Reserved2 Reserved Field:Yes
30	RW	0x0	dis_speculative_act Disable speculative Activate. In enhanced read write switching mode, activate commands can be issued to the other direction speculatively. This may have side-effect that the page opened for RD/WR proactively may be required to be closed to serve WR/RD respectively and it can have negative impact on performance due to command bus congestion.This register can limit such a speculative activate for the other direction. 0 Allow speculatibe activates (default) 1 Limit the speculative activates This regitser is effective only DDR4, LPDDR4 and LPDDR5. In this version, the value 1 is not fully verified hence this register must be set to 0. Value After Reset:0x0 Volatile:true Programming Mode:Static
29:17	RW	0x0000	Reserved1 Reserved Field:Yes
16	RW	0x1	lpddr5_opt_act_timing Optimized ACT timing control for LPDDR5. This register is to be used for debug purpose. In LPDDR5, ACTIVATE command is composed of two commands, ACT-1 and ACT-2. When this register is set, ACT-1 can be issued "tRRD-2" cycle after previous ACT-2. If ACT-1 is issued at this timing, the controller does not issue ACT-2 at next cycle due to tRRD. 0 - Disable (only for debug purpose) 1 - Enable (Default) This register is ignored when MSTR0.lpddr5==0. This register field is only applicable for LPDDR5 mode. Value After Reset:0x1 Volatile:true Programming Mode:Static

Bit	Attr	Reset Value	Description
15	RW	0x0	lpddr4_opt_act_timing Optimized ACT timing control for LPDDR4. In LPDDR4, RD/WR/ACT takes 4 cycle. To stream Read/Write, there are only 4 cycle space between Reads/Writes. If ACT is scheduled-out after RD/WR with 1, 2 or 3 cycle gap, next RD/WR may be pushed by 1, 2 or 3 cycle and create a gap on DQ. When this register is set, ACT is not scheduled-out with the gap = 1, 2 and 3 cycle. If enabled, there could be performance impact especially for random traffic. (Latency/Utilization) 1 - Enable this feature 0 - Disable this feature This register is ignored when MSTR0.lpddr4==0. This register field is only applicable for LPDDR4 mode. Value After Reset:0x0 Volatile:true Programming Mode:Static
14:13	RW	0x0	Reserved0 Reserved Field:Yes
12:8	RW	0x10	lpr_num_entries Number of entries in the low priority transaction store is this value + 1. (MEMC_NO_OF_ENTRY - (SCHED.lpr_num_entries + 1)) is the number of entries available for the high priority transaction store. Setting this to maximum value allocates all entries to low priority transaction store. Setting this to 0 allocates 1 entry to low priority transaction store and the rest to high priority transaction store. Note: In ECC configurations, the numbers of write and low priority read credits issued is one less than in the non-ECC case. One entry each is reserved in the write and low-priority read CAMs for storing the RMW requests arising out of single bit error correction RMW operation. Value After Reset:0x10 Volatile:true Programming Mode:Static
7	RW	0x0	autopre_rmw Select behavior of hif_cmd_autopre if a RMW is received on HIF with hif_cmd_autopre=1 1: Apply Autopre only for write part of RMW 0: Apply Autopre for both read and write parts of RMW Value After Reset:0x0 Volatile:true Programming Mode:Static
6	RW	0x0	dis_opt_ntt_by_pre Disable optimized NTT update by Precharge command. This register is debug purpose only. For normal operation, This register must be set to 0. 1: disabled 0: enabled Value After Reset:0x0 Volatile:true Programming Mode:Static

Bit	Attr	Reset Value	Description
5	RW	0x0	dis_opt_ntt_by_act Disable optimized NTT update by Activate command. This register is debug purpose only. For normal operation, This register must be set to 0. 1: disabled 0: enabled Value After Reset:0x0 Volatile:true Programming Mode:Static
4	RW	0x1	opt_wrcam_fill_level Enable the feature of optimized write CAM fill level by switching to write when write CAM reaches certain fill level set in SCHED3.wrcam_highthresh. 1: enabled 0: disabled If MEMC_RDWR_SWITCH_POL_SEL==1 && rdwr_switch_policy_sel==0, this register will be ignored. It is recommended that w_max_starve is programmed as >0 value when opt_wrcam_fill_level=1 to avoid starving extremely. Value After Reset:0x1 Volatile:true Programming Mode:Static
3	RW	0x1	rdwr_switch_policy_sel Select read write switching policy. 1: select "enhanced" read write switching policy 0: select "original" read write switching policy For DDR5, only "enhanced" read write switching policy is supported. Value After Reset:0x1 Volatile:true Programming Mode:Static
2	RW	0x1	pageclose If true, bank is kept open only while there are page hit transactions available in the CAM to that bank. The last read or write command in the CAM with a bank and page hit will be executed with auto-precharge if SCHEDTMG0.pageclose_timer=0. Even if this register set to 1 and SCHEDTMG0.pageclose_timer is set to 0, explicit precharge (and not auto-precharge) may be issued in some cases where there is a mode switch between Write and Read or between LPR and HPR. The Read and Write commands that are executed as part of the ECC scrub requests are also executed without auto-precharge. If false, the bank remains open until there is a need to close it (to open a different page, or for page timeout or refresh timeout) - also known as open page policy. The open page policy can be overridden by setting the per-command-autopre bit on the HIF interface (hif_cmd_autopre). The pageclose feature provids a midway between Open and Close page policies. FOR PERFORMANCE ONLY. Value After Reset:0x1 Volatile:true Programming Mode:Quasi-dynamic Group 3

Bit	Attr	Reset Value	Description
1	RW	0x0	prefer_write If set then the bank selector prefers writes over reads. FOR DEBUG ONLY. Value After Reset:0x0 Programming Mode:Static
0	RW	0x1	dis_opt_wrecc_collision_flush In this release, this register bit is required to set to 1 in software. Value After Reset:0x1 Volatile:true Programming Mode:Static

DDRCTL_SCHED1

Address: Operational Base + offset (0x10384)

Bit	Attr	Reset Value	Description
31	RW	0x0	opt_hit_gt_hpr Optimize the priority between Page-hit LPR and Page-miss HPR 0 - Page-miss HPR has priority (default) 1 - Page-hit LPR has priority This is to choose trade-off between HPR latency and total utilization. If set to 0, HPR latency can be better than 1 because HPR has priority over LPR. If set to 1, DRAM utilization can be better than 0 because number of ACT-PRE is reduced. When this register is set to 1, recommend to enable page-hit limiter so that once page-hit limiter is expired, HPR can have priority. Value After Reset:0x0 Programming Mode:Static
30:28	RW	0x0	page_hit_limit_rd Page-Hit limiter for read. When certain number of read commands are scheduled out without ACT for a bank (schedule page-hit commands), all entries belonging to the bank priority are increased equal to page-hit entry even if these are page-miss so that oldest entry belonging to the bank can be served regardless of page-hit/page-miss. The priority is reset once any ACT/PRE/AP is served to the bank. 0 - Disable this feature 1 - 4 commands 2 - 8 commands 3 - 16 commands 4 - 32 commands else reserved Value After Reset:0x0 Volatile:true Programming Mode:Static

Address: Operational Base + offset (0x10394)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	Reserved2 Reserved Field:Yes
29	RW	0x0	dis_opt_valid_wrecc_cam_fill_level In this release, this register bit, dis_opt_valid_wrecc_cam_fill_level, is required to set to 0 in software. Value After Reset:0x0 Volatile:true Programming Mode:Static

Bit	Attr	Reset Value	Description
28	RW	0x1	dis_opt_loaded_wrecc_cam_fill_level In this release, this register bit, dis_opt_loaded_wrecc_cam_fill_level, is required to set to 0 in software. Value After Reset:0x1 Volatile:true Programming Mode:Static
27:12	RW	0x0000	Reserved1 Reserved Field:Yes
11:8	RW	0x2	wrecc_cam_highthresh The high threshold used in optimized write ECC CAM fill level. When (MEMC_NO_OF_ENTRY/2 - (number of loaded entries) < wrecc_cam_highthresh), switch to write mode and prepare banks for write direction if no Exp-VPR or read collision is there. This feature is enabled when opt_wrcam_fill_level is 1. Value After Reset:0x2 Volatile:true Programming Mode:Static
7:4	RW	0x0	Reserved0 Reserved Field:Yes
3:0	RW	0x4	wrecc_cam_lowthresh The low threshold used in optimize write ECC CAM fill level. When (MEMC_NO_OF_ENTRY/2 - (number of loaded entries) < wrecc_cam_lowthresh), keep to write mode and stop to prepare banks for read direction if no Exp-VPR or read collision is there. This feature is enabled when opt_wrcam_fill_level is 1. Value After Reset:0x4 Volatile:true Programming Mode:Static

DDRCTL_DFILPCFG0

Address: Operational Base + offset (0x10500)

Bit	Attr	Reset Value	Description
31:21	RW	0x000	Reserved4 Reserved Field:Yes
20	RW	0x1	dfi_lp_data_req_en Enables DFI Data Low Power interface. 0 - Disabled. dfi_lp_data_req is not asserted. 1 - Enabled Value After Reset:0x1 Programming Mode:Static
19:17	RW	0x0	Reserved3 Reserved Field:Yes
16	RW	0x0	dfi_lp_en_data Enables DFI Data Low Power interface handshaking during data bus idle. 0 - Disabled 1 - Enabled Value After Reset:0x0 Programming Mode:Static
15:9	RW	0x00	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
8	RW	0x0	dfi_lp_en_dsm Enables DFI Low Power interface handshaking during Deep Sleep Mode Entry/Exit. 0 - Disabled 1 - Enabled This is only present for designs supporting LPDDR5 devices. Value After Reset:0x0 Programming Mode:Static
7:5	RW	0x0	Reserved1 Reserved Field:Yes
4	RW	0x0	dfi_lp_en_sr Enables DFI Low Power interface handshaking during Self Refresh Entry/Exit. 0 - Disabled 1 - Enabled Value After Reset:0x0 Programming Mode:Static
3:1	RW	0x0	Reserved0 Reserved Field:Yes
0	RW	0x0	dfi_lp_en_pd Enables DFI Low Power interface handshaking during Power Down Entry/Exit. 0 - Disabled 1 - Enabled Value After Reset:0x0 Programming Mode:Static

DDRCTL_DFIUPD0
Address: Operational Base + offset (0x10508)

Bit	Attr	Reset Value	Description
31	RW	0x0	dis_auto_ctrlupd 0 - DDRCTL issues dfi_ctrlupd_req periodically. 1 - Disable the automatic dfi_ctrlupd_req generation by the DDRCTL. The core must issue the dfi_ctrlupd_req signal using register OPCTRLCMD.ctrlupd. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3
30	RW	0x0	dis_auto_ctrlupd_srx 0 - DDRCTL issues a dfi_ctrlupd_req before or after exiting self refresh, depending on DFIUPD0.ctrlupd_pre_srx. 1 - Disable the automatic dfi_ctrlupd_req generation by the DDRCTL at self-refresh exit. Value After Reset:0x0 Volatile:true Programming Mode:Static
29	RW	0x0	ctrlupd_pre_srx Selects dfi_ctrlupd_req requirements at SRX: 0 : send ctrlupd after SRX 1 : send ctrlupd before SRX If DFIUPD0.dis_auto_ctrlupd_srx=1, this register has no impact, because no dfi_ctrlupd_req will be issued when SRX. Value After Reset:0x0 Programming Mode:Static

Bit	Attr	Reset Value	Description
28:16	RW	0x0000	Reserved1 Reserved Field:Yes
15	RW	0x1	dfi_phyupd_en Enables the support for acknowledging PHY-initiated updates: 0 - Disabled 1 - Enabled Value After Reset:0x1 Programming Mode:Static
14:0	RW	0x0000	Reserved0 Reserved Field:Yes

DDRCTL_DFIMISC

Address: Operational Base + offset (0x10510)

Bit	Attr	Reset Value	Description
31:18	RW	0x0000	Reserved3 Reserved Field:Yes
17:16	RW	0x0	dfi_channel_mode This field controls how internal DFI data is connected to dfi0_*data* and dfi1_*data*. This must be set to 2'b00. Value After Reset:0x0 Programming Mode:Static
15:13	RW	0x0	Reserved2 Reserved Field:Yes
12:8	RW	0x00	dfi_frequency Indicates the operating frequency of the system. The number of supported frequencies and the mapping of signal values to clock frequencies are defined by the PHY. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1
7	RW	0x0	lp_optimized_write If this bit is 1, LPDDR4 write DQ is set to 8'hF8 if masked write with enabling DBI; otherwise, that value is set to 8'hFF Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3
6	RW	0x0	Reserved1 Reserved Field:Yes
5	RW	0x0	dfi_init_start PHY init start request signal.When asserted it triggers the PHY init start request Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3
4:3	RW	0x0	Reserved0 Reserved Field:Yes
2	RW	0x0	dfi_data_cs_polarity Defines polarity of dfi_wrdata_cs and dfi_rddata_cs signals. 0: Signals are active low 1: Signals are active high Value After Reset:0x0 Programming Mode:Static

Bit	Attr	Reset Value	Description
1	RW	0x0	phy_dbi_mode DBI implemented in DDRC or PHY. 0 - DDRC implements DBI functionality. 1 - PHY implements DBI functionality. Present only in designs configured to support DDR4 and LPDDR4. Value After Reset:0x0 Programming Mode:Static
0	RW	0x1	dfi_init_complete_en PHY initialization complete enable signal. When asserted the dfi_init_complete signal can be used to trigger SDRAM initialisation Value After Reset:0x1 Volatile:true Programming Mode:Quasi-dynamic Group 3

DDRCTL_DFISTAT

Address: Operational Base + offset (0x10514)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	Reserved0 Reserved Field:Yes
2	RO	0x0	dfi_lp_data_ack_stat Stores the value of the dfi_lp_data_ack input to the controller. Value After Reset:0x0 Programming Mode:Dynamic
1	RO	0x0	dfi_lp_ctrl_ack_stat Stores the value of the dfi_lp_ctrl_ack input to the controller. Value After Reset:0x0 Programming Mode:Dynamic
0	RO	0x0	dfi_init_complete The status flag register which announces when the DFI initialization has been completed. The DFI INIT triggered by dfi_init_start signal and then the dfi_init_complete flag is polled to know when the initialization is done. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_DFIPHYMSTR

Address: Operational Base + offset (0x10518)

Bit	Attr	Reset Value	Description
31:24	RW	0x80	dfi_phymstr_blk_ref_x32 The programmed value x32 is the maximum number of DFI clock cycles that allows to send pending refreshes before starting self-refresh entry process. - 0x00 - 0 DFI clock cycles, no delay - 0x01 - 32 DFI clock cycles - ... - 0xFF - 8160 DFI clock cycles Unit: Multiples of 32 DFI clock cycles. Note: Use as default value (0x80). Value After Reset:0x80 Programming Mode:Static
23:1	RW	0x000000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
0	RW	0x1	dfi_phymstr_en Enables the PHY Master Interface: 0 - Disabled 1 - Enabled Value After Reset:0x1 Programming Mode:Static

DDRCTL_DFI0MSGCTL0

Address: Operational Base + offset (0x10520)

Bit	Attr	Reset Value	Description
31	RW	0x0	dfi0_ctrlmsg_req Setting this register bit to 1 triggers a DFI controller message transmission operation. DDRCTL automatically clear this bit when the DFI controller message request (dfi0_ctrlmsg_req) is asserted at the DFI MC to PHY Message port interface. This bit must be programmed separately after programming other register fields appropriately of this register. Note: DFI controller message request can be issued only if DFIPHYMSTR.dfi_phymstr_en = 1 DFI controller message request must not be set during DFI LP mode due to software controlled low power entry. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
30:25	RW	0x00	Reserved0 Reserved Field:Yes
24	RW	0x0	dfi0_ctrlmsg_tout_clr If this bit is set, DFI0MSGSTAT0.dfi0_ctrlmsg_resp_tout is cleared by the controller. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
23:16	RW	0x00	dfi0_ctrlmsg_cmd DFI0 controller message command. Value After Reset:0x0 Programming Mode:Dynamic
15:0	RW	0x0000	dfi0_ctrlmsg_data DFI0 controller message data. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_DFI0MSGSTAT0

Address: Operational Base + offset (0x10524)

Bit	Attr	Reset Value	Description
31:17	RW	0x0000	Reserved1 Reserved Field:Yes
16	RO	0x0	dfi0_ctrlmsg_resp_tout This bit is set if dfi0_ctrlmsg_ack is not asserted by PHY within dfi_t_ctrlmsg_resp after asserting dfi0_ctrlmsg_req Value After Reset:0x0 Programming Mode:Dynamic
15:1	RW	0x0000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
0	RO	0x0	dfi0_ctrlmsg_req_busy The SoC must trigger DFI controller message request only if this signal is low. This signal goes high in the clock after the DDRCTL accepts software triggered DFI controller message request by writing into DFI0MSGCTRL0.dfi0_ctrlmsg_req. It goes low when PHY deasserts dfi0_ctrlmsg_ack or dfi0_ctrlmsg_resp_tout event has triggered. 0 - Indicates that the SoC core can initiate a DFI controller message request operation 1 - Indicates that DFI controller message request operation is in progress Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_POISONCFG

Address: Operational Base + offset (0x10580)

Bit	Attr	Reset Value	Description
31:25	RW	0x00	Reserved5 Reserved Field:Yes
24	RW	0x0	rd_poison_intr_clr Interrupt clear for read transaction poisoning. Allow 2/3 clock cycles for correct value to propagate to core logic and clear the interrupts. DDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
23:21	RW	0x0	Reserved4 Reserved Field:Yes
20	RW	0x1	rd_poison_intr_en If set to 1, enables interrupts for read transaction poisoning Value After Reset:0x1 Programming Mode:Dynamic
19:17	RW	0x0	Reserved3 Reserved Field:Yes
16	RW	0x1	rd_poison_slverr_en If set to 1, enables SLVERR response for read transaction poisoning Value After Reset:0x1 Programming Mode:Dynamic
15:9	RW	0x00	Reserved2 Reserved Field:Yes
8	RW	0x0	wr_poison_intr_clr Interrupt clear for write transaction poisoning. Allow 2/3 clock cycles for correct value to propagate to core logic and clear the interrupts. DDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
7:5	RW	0x0	Reserved1 Reserved Field:Yes
4	RW	0x1	wr_poison_intr_en If set to 1, enables interrupts for write transaction poisoning Value After Reset:0x1 Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
3:1	RW	0x0	Reserved0 Reserved Field:Yes
0	RW	0x1	wr_poison_slverr_en If set to 1, enables SLVERR response for write transaction poisoning Value After Reset:0x1 Programming Mode:Dynamic

DDRCTL_POISONSTAT

Address: Operational Base + offset (0x10584)

Bit	Attr	Reset Value	Description
31:17	RW	0x0000	Reserved1 Reserved Field:Yes
16	RO	0x0	rd_poison_intr_0 Read transaction poisoning error interrupt for port 0. This register is a APB clock copy (double register synchronizer) of the interrupt asserted when a transaction is poisoned on the corresponding AXI port's read address channel. Bit 0 corresponds to Port 0, and so on. Interrupt is cleared by register rd_poison_intr_clr, then value propagated to APB clock. Value After Reset:0x0 Programming Mode:Dynamic
15:1	RW	0x0000	Reserved0 Reserved Field:Yes
0	RO	0x0	wr_poison_intr_0 Write transaction poisoning error interrupt for port 0. This register is a APB clock copy (double register synchronizer) of the interrupt asserted when a transaction is poisoned on the corresponding AXI port's write address channel. Bit 0 corresponds to Port 0, and so on. Interrupt is cleared by register wr_poison_intr_clr, then value propagated to APB clock. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCCFG0

Address: Operational Base + offset (0x10600)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	ecc_region_map_granu Granularity of Selectable Protected Region. Define one region size for ECCCFG0.ecc_region_map 0 - 1/8 of memory spaces 1 - 1/16 of memory spaces 2 - 1/32 of memory spaces 3 - 1/64 of memory spaces Value After Reset:0x0 Programming Mode:Static

Bit	Attr	Reset Value	Description
29	RW	0x0	ecc_region_map_other When ECCCFG0.ecc_region_map_granu>0, there is a region which is not controlled by ecc_region_map. This register defines the region to be protected or non-protected for Inline ECC. 0 - Non-Protected 1 - Protected This register is valid only when ECCCFG0.ecc_region_map_granu>0 && ECCCFG0.ecc_mode=4. Value After Reset:0x0 Programming Mode:Static
28:26	RW	0x0	Reserved3 Reserved Field:Yes
25:24	RW	0x1	ecc_ap_err_threshold Set threshold for address parity error. ECCAPSTAT.ecc_ap_err is asserted if number of ECC errors (correctable/uncorrectable) within one burst exceeds this threshold. This register value must be less than "Total number of ECC checks within one burst" when this feature is used, "Total number of ECC check within one burst" is calculated by (DRAM Data width) x (DRAM BL) / 64. Value After Reset:0x1 Programming Mode:Static
23:22	RW	0x0	Reserved2 Reserved Field:Yes
21:16	RW	0x3f	blk_channel_idle_time_x32 Indicates the number of cycles on HIF interface with no access to protected regions which will cause flush of all the block channels. In order to flush block channel, DDRCTL injects write ECC command (when there is no incoming HIF command) if there is any write in the block and then stop tracking the block address. 0 indicates no timeout (feature is disabled, not supported with this version) 1 indicates 32 cycles 2 indicates 2*32 cycles, etc. Unit: Multiples of 32 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x3f Volatile:true Programming Mode:Quasi-dynamic Group 3
15	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
14:8	RW	0x7f	ecc_region_map Selectable Protected Region setting. Memory space is divided to 8/16/32/64 regions which is determined by ECCCFG0.ecc_region_map_granu. Note: Highest 1/8 memory space is always ECC region. Lowest 7 regions are Selectable Protected Regions. The Selectable Protected Regions can be protected/non-protected selectively by ECCCFG0.ecc_region_map[6:0]. Other upper regions are non-protected region if any. Each bit of ECCCFG0.ecc_region_map[6:0] correspond to each of lowest 7 regions respectively. In order to protect a region with ECC, set the corresponding bit to 1, otherwise set to 0. All "0"s is invalid - there must be at least one protected region if inline ECC is enabled via ECCCFG0.ecc_mode register. All regions are protected with the following setting. ecc_region_map=7'b1111111 ecc_region_map_granu=0 Only first 1/64 region is protected with the following setting. ecc_region_map=7'b0000001 ecc_region_map_granu=3 Value After Reset:0x7f Volatile:true Programming Mode:Quasi-dynamic Group 3
7	RW	0x0	ecc_region_remap_en Enables remapping ECC region feature. Only supported when inline ECC is enabled. 0 - Disable 1 - Enable Value After Reset:0x0 Programming Mode:Static
6	RW	0x1	ecc_ap_en Enable address protection feature. Only supported when inline ECC is enabled. 0: disable 1: enable Value After Reset:0x1 Programming Mode:Static
5:3	RW	0x0	Reserved0 Reserved Field:Yes
2:0	RW	0x0	ecc_mode ECC mode indicator 000 - ECC disabled 100 - ECC enabled - SEC/DED 101 - ECC enabled - Advanced ECC (Illegal value when MEMC_INLINE_ECC=1) all other settings are reserved for future use Value After Reset:0x0 Programming Mode:Static

DDRCTL_ECCCFG1

Address: Operational Base + offset (0x10604)

Bit	Attr	Reset Value	Description
31:13	RW	0x00000	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
12:8	RW	0x03	active_blk_channel Number of active block channels. Total number of ECC block channels are defined by MEMC_NO_OF_BLK_CHANNEL hardware parameter. This register can limit the number of available channels. For example, if set to 0, only one channel is active and therefore block interleaving is disabled. The valid range is from 0 to MEMC_NO_OF_BLK_CHANNEL-1. Value After Reset:0x3 Volatile:true Programming Mode:Quasi-dynamic Group 3
7	RW	0x1	blk_channel_active_term Block Channel active terminate enable. If enabled, block channel is terminated when full block write or full block read is performed (all address within block are written or read) 0 - Disable (only for debug purpose) 1 - Enable (default) This is debug register, and this must be set to 1 for normal operation. Value After Reset:0x1 Volatile:true Programming Mode:Static
6	RW	0x0	Reserved1 Reserved Field:Yes
5	RW	0x1	ecc_region_waste_lock Locks the remaining waste parts of the ECC region (hole) that are not locked by ecc_region_parity_lock. 1: Locked; if this region is accessed, error response is generated. 0: Unlocked; this region can be accessed normally, similar to non-ECC protected region. Value After Reset:0x1 Volatile:true Programming Mode:Quasi-dynamic Group 3
4	RW	0x1	ecc_region_parity_lock Locks the parity section of the ECC region (hole) which is the highest system address part of the memory that stores ECC parity for protected region. 1: Locked; if this region is accessed, error response is generated. 0: Unlocked; this region can be accessed normally, similar to non-ECC protected region. Value After Reset:0x1 Volatile:true Programming Mode:Quasi-dynamic Group 3
3:2	RW	0x0	Reserved0 Reserved Field:Yes
1	RW	0x0	data_poison_bit Selects whether to poison 1 or 2 bits - if 0 -> 2-bit (uncorrectable) data poisoning, if 1 -> 1-bit (correctable) data poisoning, if ECCCFG1.data_poison_en=1. Valid only when MEMC_ECC_SUPPORT==1 or 3 (in SECDED ECC mode i.e ECCCFG0.ecc_mode=3'b100) Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3

Bit	Attr	Reset Value	Description
0	RW	0x0	data_poison_en Enable ECC data poisoning - introduces ECC errors on writes to address specified by the ECCPOISONADDR0/1 registers This field must be set to 0 if ECC is disabled (ECCCFG0.ecc_mode = 0). Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3

DDRCTL_ECCSTAT

Address: Operational Base + offset (0x10608)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Reserved3 Reserved Field:Yes
25	RO	0x0	sbr_read_ecc_ue Indicates the uncorrectable error interrupt is due to read operation by scrubber. This bit is cleared on ECCCTL.ecc_uncorrected_err_clr 0 - Mainline/Demand read uncorrectable error interrupt 1 - Scrubber read uncorrectable error interrupt Value After Reset:0x0 Programming Mode:Static
24	RO	0x0	sbr_read_ecc_ce Indicates the correctable error interrupt is due to read operation by scrubber. This bit is cleared on ECCCTL.ecc_corrected_err_clr 0 - Mainline/Demand read correctable error interrupt 1 - Scrubber read correctable error interrupt Value After Reset:0x0 Programming Mode:Static
23:17	RW	0x00	Reserved2 Reserved Field:Yes
16	RO	0x0	ecc_uncorrected_err Double-bit error indicator. In sideband ECC mode, 1 bit per ECC lane. In inline ECC mode, the register always is 1 bit to indicate uncorrectable error on any lane. Value After Reset:0x0 Programming Mode:Static
15:9	RW	0x00	Reserved1 Reserved Field:Yes
8	RO	0x0	ecc_corrected_err Single-bit error indicator. In sideband ECC mode, 1 bit per ECC lane. In inline ECC mode, the register always is 1 bit to indicate correctable error on any lane. Value After Reset:0x0 Programming Mode:Static
7	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
6:0	RO	0x00	ecc_corrected_bit_num Bit number corrected by single-bit ECC error. See ECC section of architecture chapter for encoding of this field. If more than one data lane has an error, the lower data lane is selected. This register is 7 bits wide in order to handle 72 bits of the data present in a single lane. Value After Reset:0x0 Programming Mode:Static

DDRCTL_ECCCTL
Address: Operational Base + offset (0x1060C)

Bit	Attr	Reset Value	Description
31:19	RW	0x0000	Reserved2 Reserved Field:Yes
18	RW	0x0	ecc_ap_err_intr_force Interrupt force bit for ecc_ap_err_intr. Setting this register will cause the output interrupt to be asserted. DDRCTL automatically clears this bit. There is no interaction between functionally triggering an interrupt and forcing an interrupt (they are mutually exclusive). Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
17	RW	0x0	ecc_uncorrected_err_intr_force Interrupt force bit for ecc_uncorrected_err_intr. Setting this register will cause the output interrupt to be asserted. DDRCTL automatically clears this bit. There is no interaction between functionally triggering an interrupt and forcing an interrupt (they are mutually exclusive). Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
16	RW	0x0	ecc_corrected_err_intr_force Interrupt force bit for ecc_corrected_err_intr. Setting this register will cause the output interrupt to be asserted. DDRCTL automatically clears this bit. There is no interaction between functionally triggering an interrupt and forcing an interrupt (they are mutually exclusive). Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
15:11	RW	0x00	Reserved1 Reserved Field:Yes
10	RW	0x1	ecc_ap_err_intr_en Interrupt enable bit for ecc_ap_err_intr. 1: Enabled 0: Disabled Value After Reset:0x1 Programming Mode:Dynamic
9	RW	0x1	ecc_uncorrected_err_intr_en Interrupt enable bit for ecc_uncorrected_err_intr. 1: Enabled 0: Disabled Value After Reset:0x1 Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
8	RW	0x1	ecc_corrected_err_intr_en Interrupt enable bit for ecc_corrected_err_intr. 1 Enabled 0 Disabled Value After Reset:0x1 Programming Mode:Dynamic
7:5	RW	0x0	Reserved0 Reserved Field:Yes
4	RW	0x0	ecc_ap_err_intr_clr Interrupt clear bit for ecc_ap_err. If this bit is set, the ECCAPSTAT.ecc_ap_err/ecc_ap_err_intr will be cleared. DDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
3	RW	0x0	ecc_uncorr_err_cnt_clr Setting this register bit to 1 clears the currently stored uncorrected ECC error count. The ECCERRCNT.ecc_uncorr_err_cnt register is cleared by this operation. DDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
2	RW	0x0	ecc_corr_err_cnt_clr Setting this register bit to 1 clears the currently stored corrected ECC error count. The ECCERRCNT.ecc_corr_err_cnt register is cleared by this operation. DDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
1	RW	0x0	ecc_uncorrected_err_clr Setting this register bit to 1 clears the currently stored uncorrected ECC error. The following registers are cleared: ECCSTAT.ecc_uncorrected_err ECCSTAT.sbr_read_ecc_ue ADVECCSTAT.sbr_read_advecc_ue ADVECCSTAT.advecc_uncorr_err_kbd_stat ADVECCSTAT.advecc_uncorrected_err ECCUSYN0 ECCUSYN1 ECCUSYN2 ECCUDATA0 ECCUDATA1 ECCSYMBOL.ecc_uncorr_sym_71_64 DDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
0	RW	0x0	ecc_corrected_err_clr Setting this register bit to 1 clears the currently stored corrected ECC error. The following registers are cleared: ECCSTAT.ecc_corrected_err ECCSTAT.sbr_read_ecc_ce ADVECCSTAT.sbr_read_advecc_ce ADVECCSTAT.advecc_corr_err_kbd_stat ADVECCSTAT.advecc_corrected_err ADVECCSTAT.advecc_num_err_symbol ADVECCSTAT.advecc_err_symbol_pos ADVECCSTAT.advecc_err_symbol_bits ECCCSYN0 ECCCSYN1 ECCCSYN2 ECCBITMASK0 ECCBITMASK1 ECCBITMASK2 ECCCDATA0 ECCCDATA1 ECCSYMBOL.ecc_corr_sym_71_64 DDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic

DDRCTL_ECCERRCNT
Address: Operational Base + offset (0x10610)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	ecc_uncorr_err_cnt Number of uncorrectable ECC errors detected. It will saturates at 0xFFFF Value After Reset:0x0 Programming Mode:Dynamic
15:0	RO	0x0000	ecc_corr_err_cnt Number of correctable ECC errors detected. It will saturates at 0xFFFF Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCCADDR0
Address: Operational Base + offset (0x10614)

Bit	Attr	Reset Value	Description
31:25	RW	0x00	Reserved1 Reserved Field:Yes
24	RO	0x0	ecc_corr_rank Indicates the rank number of a read resulting in a corrected ECC error Value After Reset:0x0 Programming Mode:Dynamic
23:18	RW	0x00	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
17:0	RO	0x00000	ecc_corr_row Indicates the page/row number of a read resulting in a corrected ECC error. This is 18-bits wide in configurations with DDR4 support and 16-bits in all other configurations. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCCADDR1
Address: Operational Base + offset (0x10618)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Reserved2 Reserved Field:Yes
25:24	RO	0x0	ecc_corr_bg Bank Group number of a read resulting in a corrected ECC error. Value After Reset:0x0 Programming Mode:Dynamic
23:19	RW	0x00	Reserved1 Reserved Field:Yes
18:16	RO	0x0	ecc_corr_bank Bank number of a read resulting in a corrected ECC error. Value After Reset:0x0 Programming Mode:Dynamic
15:11	RW	0x00	Reserved0 Reserved Field:Yes
10:0	RO	0x000	ecc_corr_col Block number of a read resulting in a corrected ECC error (lowest bit not assigned here). Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCCSYN0
Address: Operational Base + offset (0x1061C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ecc_corr_syndromes_31_0 Data pattern that resulted in a corrected error. For 16-bit ECC, only bits [15:0] are used. This field can be masked by setting the dis_regs_ecc_syndrome input to value 1. This field will be cleared when ecc_corrected_err_clr is set. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCCSYN1
Address: Operational Base + offset (0x10620)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ecc_corr_syndromes_63_32 Data pattern that resulted in a corrected error. For 32-bit ECC and 16-bit ECC, this register is not used. However, for multi-beat ECC, it represents the data pattern of odd SDRAM data beat (ECC lane). This field can be masked by setting the dis_regs_ecc_syndrome input to value 1. This field will be cleared when ecc_corrected_err_clr is set. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCCSYN2

Address: Operational Base + offset (0x10624)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved0 Reserved Field:Yes
7:0	RO	0x00	ecc_corr_syndromes_71_64 Indicates the data pattern that resulted in a corrected error one for each ECC lane, all concatenated together. This register refers to the ECC byte, which is bits [71:64] for 64-bit ECC, [39:32] for 32-bit ECC, or [23:16] for 16-bit ECC. This field can be masked by setting the dis_regs_ecc_syndrome input to value 1. This field will be cleared when ecc_corrected_err_clr is set. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCBITMASK0

Address: Operational Base + offset (0x10628)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ecc_corr_bit_mask_31_0 Mask for the corrected data portion 1 on any bit indicates that the bit has been corrected by the ECC logic 0 on any bit indicates that the bit has not been corrected by the ECC logic This register accumulates data over multiple ECC errors, to give an overall indication of which bits are being fixed. It is cleared by writing a 1 to ECCCTL.ecc_corrected_err_clr. For 16-bit ECC, only bits [15:0] are used Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCBITMASK1

Address: Operational Base + offset (0x1062C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ecc_corr_bit_mask_63_32 Mask for the corrected data portion 1 on any bit indicates that the bit has been corrected by the ECC logic 0 on any bit indicates that the bit has not been corrected by the ECC logic This register accumulates data over multiple ECC errors, to give an overall indication of which bits are being fixed. It is cleared by writing a 1 to ECCCTL.ecc_corrected_err_clr. For 32-bit ECC and 16-bit ECC, this register is not used. However, for multi-beat ECC, it represents the ECC errors of odd SDRAM data beat (ECC lane). Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCBITMASK2

Address: Operational Base + offset (0x10630)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
7:0	RO	0x00	ecc_corr_bit_mask_71_64 Mask for the corrected data portion 1 on any bit indicates that the bit has been corrected by the ECC logic 0 on any bit indicates that the bit has not been corrected by the ECC logic This register accumulates data over multiple ECC errors, to give an overall indication of which bits are being fixed. It is cleared by writing a 1 to ECCCTL.ecc_corrected_err_clr. This register refers to the ECC byte, which is bits [71:64] for 64-bit ECC, [39:32] for 32-bit ECC, or [23:16] for 16-bit ECC Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCUADDR0
Address: Operational Base + offset (0x10634)

Bit	Attr	Reset Value	Description
31:25	RW	0x00	Reserved1 Reserved Field:Yes
24	RO	0x0	ecc_uncorr_rank Rank number of a read resulting in an uncorrected ECC error. Value After Reset:0x0 Programming Mode:Dynamic
23:18	RW	0x00	Reserved0 Reserved Field:Yes
17:0	RO	0x00000	ecc_uncorr_row Page/row number of a read resulting in an uncorrected ECC error. This is 18-bits wide in configurations with DDR4 support and 16-bits in all other configurations. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCUADDR1
Address: Operational Base + offset (0x10638)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Reserved2 Reserved Field:Yes
25:24	RO	0x0	ecc_uncorr_bg Bank Group number of a read resulting in an uncorrected ECC error Value After Reset:0x0 Programming Mode:Dynamic
23:19	RW	0x00	Reserved1 Reserved Field:Yes
18:16	RO	0x0	ecc_uncorr_bank Bank number of a read resulting in an uncorrected ECC error Value After Reset:0x0 Programming Mode:Dynamic
15:11	RW	0x00	Reserved0 Reserved Field:Yes
10:0	RO	0x000	ecc_uncorr_col Block number of a read resulting in an uncorrected ECC error (lowest bit not assigned here) Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCUSYN0
Address: Operational Base + offset (0x1063C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ecc_uncorr_syndromes_31_0 Data pattern that resulted in an uncorrected error, one for each ECC lane, all concatenated together. For 16-bit ECC, only bits [15:0] are used. This field can be masked by setting the dis_regs_ecc_syndrome input to value 1. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCUSYN1
Address: Operational Base + offset (0x10640)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ecc_uncorr_syndromes_63_32 Data pattern that resulted in an uncorrected error, one for each ECC lane, all concatenated together. For 32-bit ECC and 16-bit ECC, this register is not used. However, for multi-beat ECC, it represents the data pattern of odd SDRAM data beat (ECC lane). This field can be masked by setting the dis_regs_ecc_syndrome input to value 1. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCUSYN2
Address: Operational Base + offset (0x10644)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved0 Reserved Field:Yes
7:0	RO	0x00	ecc_uncorr_syndromes_71_64 Data pattern that resulted in an uncorrected error one for each ECC lane, all concatenated together. This register refers to the ECC byte, which is bits [71:64] for 64-bit ECC, [39:32] for 32-bit ECC, or [23:16] for 16-bit ECC. This field can be masked by setting the dis_regs_ecc_syndrome input to value 1. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ECCPOISONADDR0
Address: Operational Base + offset (0x10648)

Bit	Attr	Reset Value	Description
31:25	RW	0x00	Reserved1 Reserved Field:Yes
24	RW	0x0	ecc_poison_rank Rank address for ECC poisoning Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3
23:12	RW	0x000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
11:0	RW	0x000	ecc_poison_col Indicates the column address for ECC poisoning. Note that this column address must be burst aligned: In full bus width mode, ecc_poison_col[2:0] must be set to 0 In half bus width mode, ecc_poison_col[3:0] must be set to 0 In quarter bus width mode, ecc_poison_col[4:0] must be set to 0 Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3

DDRCTL_ECCPOISONADDR1

Address: Operational Base + offset (0x1064C)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	Reserved2 Reserved Field:Yes
29:28	RW	0x0	ecc_poison_bg Bank Group address for ECC poisoning Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3
27	RW	0x0	Reserved1 Reserved Field:Yes
26:24	RW	0x0	ecc_poison_bank Bank address for ECC poisoning Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3
23:18	RW	0x00	Reserved0 Reserved Field:Yes
17:0	RW	0x00000	ecc_poison_row Row address for ECC poisoning. This is 18-bits wide in configurations with DDR4 support and 16-bits in all other configurations. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 3

DDRCTL_ECCAPSTAT

Address: Operational Base + offset (0x10664)

Bit	Attr	Reset Value	Description
31:1	RW	0x00000000	Reserved0 Reserved Field:Yes
0	RO	0x0	ecc_ap_err Indicates the number of ECC errors (correctable/uncorrectable) within one burst exceeded the threshold.(ECCCFG0.ecc_ap_err_threshold) Value After Reset:0x0 Programming Mode:Static

DDRCTL_LNKECCCTL0

Address: Operational Base + offset (0x10980)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
1	RW	0x0	rd_link_ecc_enable Enable LPDDR5 Read Link ECC feature. 0 - Disabel LPDDR5 Read Link ECC 1 - Enable LPDDR5 Read Link ECC When non-LPDDR5 devices are used, this register must be set to 0. Value After Reset:0x0 Volatile:true Programming Mode:Static
0	RW	0x0	wr_link_ecc_enable Enable LPDDR5 Write Link ECC feature. 0 - Disabel LPDDR5 Write Link ECC 1 - Enable LPDDR5 Write Link ECC When non-LPDDR5 devices are used, this register must be set to 0. Value After Reset:0x0 Volatile:true Programming Mode:Static

DDRCTL_LNKECCCTL1

Address: Operational Base + offset (0x10984)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved0 Reserved Field:Yes
7	RW	0x0	rd_link_ecc_uncorr_intr_force Interrupt force bit for rd_linkecc_uncorr_err_intr. Setting this register will cause the output interrupt to be asserted. DDRCTL automatically clears this bit. There is no interaction between functionally triggering an interrupt and forcing an interrupt (they are mutually exclusive). Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
6	RW	0x0	rd_link_ecc_uncorr_cnt_clr Clear all Read Link-ECC uncorrectable error count. If this bit set, LNKECCERRCNT0.rd_link_ecc_uncorr_cnt will be cleared. LPDDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
5	RW	0x0	rd_link_ecc_uncorr_intr_clr Clear Read Link-ECC uncorrectable error interrupt. If this bit set, rd_linkecc_uncorr_err_intr will be cleared. LPDDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
4	RW	0x0	rd_link_ecc_uncorr_intr_en Interrupt enable bit for Read Link-ECC uncorrectable error. Value After Reset:0x0 Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
3	RW	0x0	rd_link_ecc_corr_intr_force Interrupt force bit for rd_linkecc_corr_err_intr. Setting this register will cause the output interrupt to be asserted. DDRCTL automatically clears this bit. There is no interaction between functionally triggering an interrupt and forcing an interrupt (they are mutually exclusive). Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
2	RW	0x0	rd_link_ecc_corr_cnt_clr Clear all Read Link-ECC correctable error count. If this bit set,LNKECCERRCNT0.rd_link_ecc_corr_cnt will be cleared. LPDDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
1	RW	0x0	rd_link_ecc_corr_intr_clr Clear Read Link-ECC correctable error interrupt. If this bit set, rd_linkecc_corr_err_intr will be cleared. LPDDRCTL automatically clears this bit. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
0	RW	0x0	rd_link_ecc_corr_intr_en Interrupt enable bit for Read Link-ECC correctable error. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_LNKECCPOISONCTL0
Address: Operational Base + offset (0x10988)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Reserved2 Reserved Field:Yes
25:24	RW	0x0	linkecc_poison_byte_sel Select target byte(s) of Data for Write Link ECC poisoning. This is bit map indicator. Bit N corresponding to Data[N*8+:8]. Value After Reset:0x0 Programming Mode:Dynamic
23:18	RW	0x00	Reserved1 Reserved Field:Yes
17:16	RW	0x0	linkecc_poison_dmi_sel Select target DMI(s) of Data for Write Link ECC poisoning. This is bit map indicator. Bit N corresponding to DMI[N]. Value After Reset:0x0 Programming Mode:Dynamic
15:3	RW	0x0000	Reserved0 Reserved Field:Yes
2	RW	0x0	linkecc_poison_rw Indicates whether the Link-ECC poisoning operation is Read or Write. 0 - Write 1 - Read Value After Reset:0x0 Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
1	RW	0x0	linkecc_poison_type Indicates whether the Link-ECC poisoning operation is Single-bit error or Double bit error. 0 - Single bit Error 1 - Double bit Error Value After Reset:0x0 Programming Mode:Dynamic
0	RW	0x0	linkecc_poison_inject_en Setting this register bit to 1 triggers the Link-ECC poisoning. Once Link-ECC is poisoned to a ECC code, the ECC poisoning is completed automatically and LNKECCPOISONSTAT.linkecc_poison_complete becomes 1. Please make sure that LNKECCPOISONSTAT.linkecc_poison_complete==0 before writing this register to 1. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_LNKECCPOISONSTAT

Address: Operational Base + offset (0x1098C)

Bit	Attr	Reset Value	Description
31:1	RW	0x00000000	Reserved0 Reserved Field:Yes
0	RO	0x0	linkecc_poison_complete Indicates Link-ECC poisoning operation is done. 0 - Link-ECC poisoning is not completed 1 - Link-ECC poisoning is completed Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_LNKECCINDEX

Address: Operational Base + offset (0x10990)

Bit	Attr	Reset Value	Description
31:6	RW	0x0000000	Reserved1 Reserved Field:Yes
5:4	RW	0x0	rd_link_ecc_err_rank_sel Select of which rank status output to LNKECCERRCNT.rd_link_ecc_uncorr_cnt, rd_link_ecc_corr_cnt and rd_link_ecc_err_syndrome. The value must be less than MEMC_NUM_RANKS. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1
3	RW	0x0	Reserved0 Reserved Field:Yes
2:0	RW	0x0	rd_link_ecc_err_byte_sel Select of which data byte status output to LNKECCERRCNT.rd_link_ecc_uncorr_cnt, rd_link_ecc_corr_cnt and rd_link_ecc_err_syndrome. The value must be less than MEMC_DRAM_DATA_WIDTH/8. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1

DDRCTL_LNKECCERRCNT0

Address: Operational Base + offset (0x10994)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	rd_link_ecc_uncorr_cnt Indicates double bit error count. Value After Reset:0x0 Programming Mode:Dynamic
23:16	RO	0x00	rd_link_ecc_corr_cnt Indicates single bit error count. Value After Reset:0x0 Programming Mode:Dynamic
15:9	RW	0x00	Reserved0 Reserved Field:Yes
8:0	RO	0x000	rd_link_ecc_err_syndrome Indicates ECC syndrome from most recent single bit error. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_LNKECCERRSTAT

Address: Operational Base + offset (0x10998)

Bit	Attr	Reset Value	Description
31:12	RW	0x00000	Reserved1 Reserved Field:Yes
11:8	RO	0x0	rd_link_ecc_uncorr_err_int Indicates double bit error for Read Link-ECC. If double bit error happens, this interrupt bit is set. It remains set until cleared by LNKECCCTL1.rd_link_ecc_uncorr_intr_clr. Each bit represents one rank. (LSB is the lowest rank number.) Value After Reset:0x0 Programming Mode:Static
7:4	RW	0x0	Reserved0 Reserved Field:Yes
3:0	RO	0x0	rd_link_ecc_corr_err_int Indicates single bit error for Read Link-ECC. If signle bit error happens, this interrupt bit is set. It remains set until cleared by LNKECCCTL1.rd_link_ecc_corr_intr_clr. Each bit represents one rank. (LSB is the lowest rank number.) Value After Reset:0x0 Programming Mode:Static

DDRCTL_OPCTRL0

Address: Operational Base + offset (0x10B80)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved2 Reserved Field:Yes
7	RW	0x0	dis_max_rank_wr_opt Disable optimized max_rank_wr and max_logical_rank_wr feature. This register is debug purpose only. For normal operation, This register must be set to 0. Value After Reset:0x0 Volatile:true Programming Mode:Static

Bit	Attr	Reset Value	Description
6	RW	0x0	dis_max_rank_rd_opt Disable optimized max_rank_rd and max_logical_rank_rd feature. This register is debug purpose only. For normal operation, This register must be set to 0. Value After Reset:0x0 Volatile:true Programming Mode:Static
5	RW	0x0	Reserved1 Reserved Field:Yes
4	RW	0x0	dis_collision_page_opt When this is set to '0', auto-precharge is disabled for the flushed command in a collision case. Collision cases are write followed by read to same address, read followed by write to same address, or write followed by write to same address with OPCTRL0.dis_wc bit = 1 (where same address comparisons exclude the two address bits representing critical word). FOR DEBUG ONLY. CAN ONLY BE SET TO 1. Value After Reset:0x0 Programming Mode:Static
3:1	RW	0x0	Reserved0 Reserved Field:Yes
0	RW	0x0	dis_wc When 1, disable write combine. FOR DEBUG ONLY Value After Reset:0x0 Programming Mode:Static

DDRCTL_OPCTRL1

Address: Operational Base + offset (0x10B84)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	Reserved0 Reserved Field:Yes
1	RW	0x0	dis_hif When 1, DDRCTL asserts the HIF command signal hif_cmd_stall. DDRCTL will ignore the hif_cmd_valid and all other associated request signals. This bit is intended to be switched on-the-fly. Value After Reset:0x0 Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
0	RW	0x0	dis_dq When 1, DDRCTL will not de-queue any transactions from the CAM. Bypass is also disabled. All transactions are queued in the CAM. No reads or writes are issued to SDRAM as long as this is asserted. This bit may be used to prevent reads or writes being issued by the DDRCTL, which makes it safe to modify certain register fields associated with reads and writes (see Programming Chapter for details). After setting this bit, it is strongly recommended to poll OPCTRLCAM.wr_data_pipeline_empty and OPCTRLCAM.rd_data_pipeline_empty, before making changes to any registers which affect reads and writes. This will ensure that the relevant logic in the DDRC is idle. This bit is intended to be switched on-the-fly. Note: This bit is not applicable for designs working in DDR5 mode. In DDR5 mode, use sofeware command interface command DisDqRef to achieve the same funtion as this bit. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_OPCTRLCAM
Address: Operational Base + offset (0x10B88)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	Reserved4 Reserved Field:Yes
29	RO	0x0	wr_data_pipeline_empty This bit indicates that the write data pipeline on the DFI interface is empty. This register is intended to be polled at least twice after setting OPCTRL1.dis_dq, to ensure that all remaining commands/data have completed. Value After Reset:0x0 Reset Mask:0x0 Volatile:true Programming Mode:Dynamic
28	RO	0x0	rd_data_pipeline_empty This bit indicates that the read data pipeline on the DFI interface is empty. This register is intended to be polled at least twice after setting OPCTRL1.dis_dq, to ensure that all remaining commands/data have completed. Value After Reset:0x0 Reset Mask:0x0 Volatile:true Programming Mode:Dynamic
27	RW	0x0	Reserved3 Reserved Field:Yes

Bit	Attr	Reset Value	Description
26	RO	0x0	dbg_wr_q_empty When 1, all the Write command queues and Write data buffers inside DDRC are empty. This register is to be used for debug purpose. An example use-case scenario: When Controller enters Self-Refresh using the Low-Power entry sequence, Controller is expected to have executed all the commands in its queues and the write and read data drained. Hence this register must be 1 at that time. Value After Reset:0x0 Reset Mask:0x0 Volatile:true Programming Mode:Dynamic
25	RO	0x0	dbg_rd_q_empty When 1, all the Read command queues and Read data buffers inside DDRC are empty. This register is to be used for debug purpose. An example use-case scenario: When Controller enters Self-Refresh using the Low-Power entry sequence, Controller is expected to have executed all the commands in its queues and the write and read data drained. Hence this register must be 1 at that time. Value After Reset:0x0 Reset Mask:0x0 Volatile:true Programming Mode:Dynamic
24	RO	0x0	dbg_stall Stall FOR DEBUG ONLY Value After Reset:0x0 Programming Mode:Dynamic
23:22	RW	0x0	Reserved2 Reserved Field:Yes
21:16	RO	0x00	dbg_w_q_depth Write queue depth The last entry of WR queue is reserved for ECC SCRUB operation. This entry is not included in the calculation of the queue depth. Value After Reset:0x0 Programming Mode:Dynamic
15:14	RW	0x0	Reserved1 Reserved Field:Yes
13:8	RO	0x00	dbg_lpr_q_depth Low priority read queue depth The last entry of Lpr queue is reserved for ECC SCRUB operation. This entry is not included in the calculation of the queue depth. Value After Reset:0x0 Programming Mode:Dynamic

5:0	RO	0x00	dbg_hpr_q_depth High priority read queue depth Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_OPCTRLCMD

Address: Operational Base + offset (0x10B8C)

Bit	Attr	Reset Value	Description
31:18	RW	0x0000	Reserved1 Reserved Field:Yes
17	RW	0x0	ctrlupd Setting this register bit to 1 indicates to the DDRCTL to issue a dfi_ctrlupd_req to the PHY. When this request is stored in the DDRCTL, the bit is automatically cleared. This operation must only be performed when DFIUPD0.dis_auto_ctrlupd=1. Note: This field is not applicable for DDR5. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
16	RW	0x0	zq_calib_short Setting this register bit to 1 indicates to the DDRCTL to issue a ZQCS (ZQ calibration short)/MPC(ZQ calibration) command to the SDRAM. When this request is stored in the DDRCTL, the bit is automatically cleared. This operation can be performed only when ZQCTL0.dis_auto_zq=1. It is recommended NOT to set this register bit if in Init, in Self-Refresh(except LPDDR4/5) or SR-Powerdown(LPDDR4/5) or Deep Sleep Mode or Maximum Power Saving Mode. For Self-Refresh(except LPDDR4/5) or SR-Powerdown(LPDDR4/5) it will be scheduled after SR(except LPDDR4/5) or SRPD(LPDDR4/5) has been exited. For Deep Sleep Mode, it will be scheduled after DSM and/or SRPD has been exited. For Maximum Power Saving Mode, it will not be scheduled, although OPCTRLSTAT.zq_calib_short_busy will be de-asserted. Note: This field is not applicable for DDR5. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic
15:0	RW	0x0000	Reserved0 Reserved Field:Yes

DDRCTL_OPCTRLSTAT

Address: Operational Base + offset (0x10B90)

Bit	Attr	Reset Value	Description
31:18	RW	0x0000	Reserved1 Reserved Field:Yes
17	RO	0x0	ctrlupd_busy SoC core may initiate a ctrlupd operation only if this signal is low. This signal goes high in the clock after the DDRCTL accepts the ctrlupd request. It goes low when the ctrlupd operation is initiated in the DDRCTL. It is recommended not to perform ctrlupd operations when this signal is high. 0 - Indicates that the SoC core can initiate a ctrlupd operation 1 - Indicates that ctrlupd operation has not been initiated yet in the DDRCTL Note: This field is not applicable for DDR5. Value After Reset:0x0 Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
16	RO	0x0	zq_calib_short_busy SoC core may initiate a ZQCS (ZQ calibration short) operation only if this signal is low. This signal goes high in the clock after the DDRCTL accepts the ZQCS request. It goes low when the ZQCS operation is initiated in the DDRCTL. It is recommended not to perform ZQCS operations when this signal is high. 0 - Indicates that the SoC core can initiate a ZQCS operation 1 - Indicates that ZQCS operation has not been initiated yet in the DDRCTL Note: This field is not applicable for DDR5. 15:0	RW	0x0000	Reserved0 Reserved Field:Yes

DDRCTL_OPCTRLCAM1
Address: Operational Base + offset (0x10B94)

Bit	Attr	Reset Value	Description
31:6	RW	0x0000000	Reserved0 Reserved Field:Yes
5:0	RO	0x00	dbg_wrecc_q_depth Write ECC queue depth FOR DEBUG ONLY Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_OPREFCTRL0
Address: Operational Base + offset (0x10B98)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	Reserved0 Reserved Field:Yes
1	RW	0x0	rank1_refresh Setting this register bit to 1 indicates to the DDRCTL to issue a refresh to rank 1. Writing to this bit causes OPREFSTAT0.rank1_refresh_busy to be set. When OPREFSTAT0.rank1_refresh_busy is cleared, the command has been stored in the DDRCTL. For 3DS configuration, refresh is sent to logical rank index 1. This operation can be performed only when RFSHCTL0.dis_auto_refresh=1. It is recommended NOT to set this register bit if in Init or Maximum Power Saving Mode. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic

Bit	Attr	Reset Value	Description
0	RW	0x0	rank0_refresh Setting this register bit to 1 indicates to the DDRCTL to issue a refresh to rank 0. Writing to this bit causes OPREFSTAT0.rank0_refresh_busy to be set. When OPREFSTAT0.rank0_refresh_busy is cleared, the command has been stored in the DDRCTL. For 3DS configuration, refresh is sent to logical rank index 0. This operation can be performed only when RFSHCTL0.dis_auto_refresh=1. It is recommended NOT to set this register bit if in Init or Maximum Power Saving Mode. Value After Reset:0x0 Testable:readOnly Programming Mode:Dynamic

DDRCTL_OPREFSTAT0

Address: Operational Base + offset (0x10BA0)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	Reserved0 Reserved Field:Yes
1	RO	0x0	rank1_refresh_busy SoC core may initiate a rank1_refresh operation (refresh operation to rank 1) only if this signal is low. This signal goes high in the clock after OPREFCTRL0.rank1_refresh is set to one. It goes low when the rank1_refresh operation is stored in the DDRCTL. It is recommended not to perform rank1_refresh operations when this signal is high. - 0 - Indicates that the SoC core can initiate a rank1_refresh operation 1 - Indicates that rank1_refresh operation has not been stored yet in the DDRCTL Value After Reset:0x0 Programming Mode:Dynamic
0	RO	0x0	rank0_refresh_busy SoC core may initiate a rank0_refresh operation (refresh operation to rank 0) only if this signal is low. This signal goes high in the clock after OPREFCTRL0.rank0_refresh is set to one. It goes low when the rank0_refresh operation is stored in the DDRCTL. It is recommended not to perform rank0_refresh operations when this signal is high. - 0 - Indicates that the SoC core can initiate a rank0_refresh operation 1 - Indicates that rank0_refresh operation has not been stored yet in the DDRCTL Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_SWCTL

Address: Operational Base + offset (0x10C80)

Bit	Attr	Reset Value	Description
31:1	RW	0x00000000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
0	RW	0x1	sw_done Enable quasi-dynamic register programming outside reset. Program register to 0 to enable quasi-dynamic programming. Set back register to 1 once programming is done. Value After Reset:0x1 Programming Mode:Dynamic

DDRCTL_SWSTAT
Address: Operational Base + offset (0x10C84)

Bit	Attr	Reset Value	Description
31:1	RW	0x00000000	Reserved0 Reserved Field:Yes
0	RO	0x1	sw_done_ack Register programming done. This register is the echo of SWCTL.sw_done. Wait for sw_done value 1 to propagate to sw_done_ack at the end of the programming sequence to ensure that the correct registers values are propagated to the destination clock domains. Value After Reset:0x1 Programming Mode:Static

DDRCTL_RANKCTL
Address: Operational Base + offset (0x10C90)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	Reserved1 Reserved Field:Yes
15:12	RW	0x0	max_rank_wr Only present for multi-rank configurations. Background: Writes to the same rank can be performed back-to-back. Writes to different ranks require additional gap dictated by the register RANKCTL.diff_rank_wr_gap. This is to avoid possible data bus contention as well as to give PHY enough time to switch the delay when changing ranks. The DDRCTL arbitrates for bus access on a cycle-by-cycle basis; therefore after a write is scheduled, there are few clock cycles (determined by the value on RANKCTL.diff_rank_wr_gap register) in which only writes from the same rank are eligible to be scheduled. This prevents writes from other ranks from having fair access to the data bus. This parameter represents the maximum number of writes that can be scheduled consecutively to the same rank. After this number is reached, - DDR4/LPDDR: a delay equal to RANKCTL.diff_rank_wr_gap is inserted by the scheduler to allow all ranks a fair opportunity to be scheduled. Higher numbers increase bandwidth utilization, lower numbers increase fairness. - DDR5: writes to the same rank are blocked until read-write mode turn around or writes are issued to other ranks. This feature can be DISABLED by setting this register to 0. When set to 0, the Controller will stay on the same rank as long as commands are available for it. Minimum programmable value is 0 (feature disabled) and maximum programmable value is 0xF. FOR PERFORMANCE ONLY. Value After Reset:0x0 Programming Mode:Static

Bit	Attr	Reset Value	Description
11:4	RW	0x00	Reserved0 Reserved Field:Yes
3:0	RW	0xf	max_rank_rd Only present for multi-rank configurations. Background: Reads to the same rank can be performed back-to-back. Reads to different ranks require additional gap dictated by the register RANKCTL.diff_rank_rd_gap. This is to avoid possible data bus contention as well as to give PHY enough time to switch the delay when changing ranks. The DDRCTL arbitrates for bus access on a cycle-by-cycle basis; therefore after a read is scheduled, there are few clock cycles (determined by the value on RANKCTL.diff_rank_rd_gap register) in which only reads from the same rank are eligible to be scheduled. This prevents reads from other ranks from having fair access to the data bus. This parameter represents the maximum number of reads that can be scheduled consecutively to the same rank. After this number is reached, - DDR4/LPDDR: a delay equal to RANKCTL.diff_rank_rd_gap is inserted by the scheduler to allow all ranks a fair opportunity to be scheduled. Higher numbers increase bandwidth utilization, lower numbers increase fairness. - DDR5: reads to the same rank are blocked until read-write mode turn around or reads are issued to other ranks. This feature can be DISABLED by setting this register to 0. When set to 0, the Controller will stay on the same rank as long as commands are available for it. Minimum programmable value is 0 (feature disabled) and maximum programmable value is 0xF. FOR PERFORMANCE ONLY. Value After Reset:0xf Programming Mode:Static

DDRCTL_DBICTL

Address: Operational Base + offset (0x10C94)

Bit	Attr	Reset Value	Description
31:3	RW	0x00000000	Reserved0 Reserved Field:Yes
2	RW	0x0	rd_dbi_en Read DBI enable signal in DDRC. 0 - Read DBI is disabled. 1 - Read DBI is enabled. This signal must be set the same value as DRAM's mode register. DDR4: MR5 bit A12. When x4 devices are used, this signal must be set to 0. DDR5: This signal must be set to 0. LPDDR4/LPDDR5: MR3[6]. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1

Bit	Attr	Reset Value	Description
1	RW	0x0	wr_dbi_en Write DBI enable signal in DDRC. 0 - Write DBI is disabled. 1 - Write DBI is enabled. This signal must be set the same value as DRAM's mode register. DDR4: MR5 bit A11. When x4 devices are used, this signal must be set to 0. DDR5: This signal must be set to 0. LPDDR4/LPDDR5: MR3[7]. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1
0	RW	0x1	dm_en DM enable signal in DDRC. 0 - DM is disabled. 1 - DM is enabled. This signal must be set the same logical value as DRAM's mode register. DDR4: Set this to same value as MR5 bit A10. When x4 devices are used, this signal must be set to 0. DDR5: Set this to same value as MR5[5]. When x4 devices are used, this signal must be set to 0. LPDDR4/LPDDR5: Set this to inverted value of MR13[5] which is opposite polarity from this signal. Value After Reset:0x1 Volatile:true Programming Mode:Static

DDRCTL_ODTMAP

Address: Operational Base + offset (0x10C9C)

Bit	Attr	Reset Value	Description
31:14	RW	0x00000	Reserved3 Reserved Field:Yes
13:12	RW	0x2	rank1_rd_odt Indicates which remote ODTs must be turned on during a read from rank 1. Each rank has a remote ODT (in the SDRAM) which can be turned on by setting the appropriate bit here. Rank 0 is controlled by the LSB; rank 1 is controlled by bit next to the LSB, etc. For each rank, set its bit to 1 to enable its ODT. Present only in configurations that have 2 or more ranks Value After Reset:0x2 Programming Mode:Static
11:10	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
9:8	RW	0x2	rank1_wr_odt Indicates which remote ODTs must be turned on during a write to rank 1. Each rank has a remote ODT (in the SDRAM) which can be turned on by setting the appropriate bit here. Rank 0 is controlled by the LSB; rank 1 is controlled by bit next to the LSB, etc. For each rank, set its bit to 1 to enable its ODT. Present only in configurations that have 2 or more ranks Value After Reset:0x2 Programming Mode:Static
7:6	RW	0x0	Reserved1 Reserved Field:Yes
5:4	RW	0x1	rank0_rd_odt Indicates which remote ODTs must be turned on during a read from rank 0. Each rank has a remote ODT (in the SDRAM) which can be turned on by setting the appropriate bit here. Rank 0 is controlled by the LSB; rank 1 is controlled by bit next to the LSB, etc. For each rank, set its bit to 1 to enable its ODT. Value After Reset:0x1 Programming Mode:Static
3:2	RW	0x0	Reserved0 Reserved Field:Yes
1:0	RW	0x1	rank0_wr_odt Indicates which remote ODTs must be turned on during a write to rank 0. Each rank has a remote ODT (in the SDRAM) which can be turned on by setting the appropriate bit here. Rank 0 is controlled by the LSB; rank 1 is controlled by bit next to the LSB, etc. For each rank, set its bit to 1 to enable its ODT. Value After Reset:0x1 Programming Mode:Static

DDRCTL_DATACTL0

Address: Operational Base + offset (0x10CA0)

Bit	Attr	Reset Value	Description
31:19	RW	0x0000	Reserved1 Reserved Field:Yes
18	RW	0x0	wr_data_x_en Write Data X 1: Enable Write X 0: Write X This feature is not supported at present. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 2

Bit	Attr	Reset Value	Description
17	RW	0x0	wr_data_copy_en Write Data Copy 1: Enable Write Data Copy X 0: Disable Write Data Copy X This feature is not supported at present. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 2
16	RW	0x0	rd_data_copy_en Read Data Copy 1: Enable Read Data Copy X 0: Disable Read Data Copy X This feature is not supported at present. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 2
15:0	RW	0x0000	Reserved0 Reserved Field:Yes

DDRCTL_SWCTLSTATIC
Address: Operational Base + offset (0x10CA4)

Bit	Attr	Reset Value	Description
31:1	RW	0x00000000	Reserved0 Reserved Field:Yes
0	RW	0x0	sw_static_unlock Enables static register programming outside reset. Program this register to 1 to enable static register programming. Set register back to 0 once programming is done. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_INITTMG0
Address: Operational Base + offset (0x10D00)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	skip_dram_init If lower bit is enabled the SDRAM initialization routine is skipped. The upper bit decides what state the controller starts up in when reset is removed 00 - SDRAM Initialization routine is run after power-up 01 - SDRAM Initialization routine is skipped after power-up. Controller starts up in Normal Mode 11 - SDRAM Initialization routine is skipped after power-up. Controller starts up in Self-refresh Mode 10 - Reserved. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 2
29:26	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
25:16	RW	0x002	post_cke_x1024 Cycles to wait after driving CKE (CS in DDR5) high to start the SDRAM initialization sequence. DDR5: tINIT4 of 2 us (min) - simulation only. LPDDR4 typically requires this to be programmed for a delay of 2 us. Unit: Multiples of 1024 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x2 Programming Mode:Static
15:13	RW	0x0	Reserved0 Reserved Field:Yes
12:0	RW	0x004e	pre_cke_x1024 Cycles to wait after reset before driving CKE (CS in DDR5) high to start the SDRAM initialization sequence. DDR5: tINIT3 of 4 ms (min) - simulation only. LPDDR4: tINIT3 of 2 ms (min) For DDR4 RDIMMs, this must include the time needed to satisfy tSTAB. Unit: Multiples of 1024 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x4e Programming Mode:Static

DDRCTL_INITTMG1

Address: Operational Base + offset (0x10D04)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Reserved1 Reserved Field:Yes
25:16	RW	0x000	dram_rstn_x1024 Number of cycles to assert SDRAM reset signal during init sequence. Unit: Multiples of 1024 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x0 Programming Mode:Static
15:0	RW	0x0000	Reserved0 Reserved Field:Yes

DDRCTL_DDRCTL_VER_NUMBER

Address: Operational Base + offset (0x10FF8)

Bit	Attr	Reset Value	Description
31:0	RO	0x3130312a	ver_number Indicates the Device Version Number value. This is in ASCII format, with each byte corresponding to a character of the version number Value After Reset:0x3130312a Programming Mode:Static

DDRCTL_DDRCTL_VER_TYPE
Address: Operational Base + offset (0x10FFC)

Bit	Attr	Reset Value	Description
31:0	RO	0x6c633031	ver_type Indicates the Device Version Type value. This is in ASCII format, with each byte corresponding to a character of the version type Value After Reset:0x6c633031 Programming Mode:Static

DDRCTL_PCCFG
Address: Operational Base + offset (0x20000)

Bit	Attr	Reset Value	Description
31:5	RW	0x0000000	Reserved1 Reserved Field:Yes
4	RW	0x0	pagematch_limit Page match four limit. If set to 1, limits the number of consecutive same page DDRC transactions that can be granted by the Port Arbiter to four when Page Match feature is enabled. If set to 0, there is no limit imposed on number of consecutive same page DDRC transactions. Value After Reset:0x0 Programming Mode:Static
3:1	RW	0x0	Reserved0 Reserved Field:Yes
0	RW	0x0	go2critical_en If set to 1 (enabled), sets co_gs_go2critical_wr and co_gs_go2critical_lpr/co_gs_go2critical_hpr signals going to DDRC based on urgent input (awurgent, arurgent) coming from AXI master. If set to 0 (disabled), co_gs_go2critical_wr and co_gs_go2critical_lpr/co_gs_go2critical_hpr signals at DDRC are driven to 1b'0. Value After Reset:0x0 Programming Mode:Static

DDRCTL_PCFGR
Address: Operational Base + offset (0x20004)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	Reserved3 Reserved Field:Yes
23:20	RW	0x0	rrb_lock_threshold Specifies the RRB lock threshold in configurations that disable read data interleaving. Threshold is specified in terms of the HIF bursts that belong to the same AXI transaction. RRB locks onto VC only when this specified number of HIF bursts are returned by DDRC. RRB lock occurs earlier in cases where the axi transaction itself is shorter and the total number of corresponding HIF bursts are below the programmed threshold and all of them are returned by DDRC. When N is programmed in this field, the threshold will be set to N+1 bursts. Max thresholding is up to 16 bursts. Value After Reset:0x0 Programming Mode:Static
19:17	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
16	RW	0x0	rdwr_ordered_en Enable ordered read/writes. If set to 1, preserves the ordering between read transaction and write transaction issued to the same address, on a given port. In other words, the controller ensures that all same address read and write commands from the application port interface are transported to the DFI interface in the order of acceptance. This feature is useful in cases where software coherency is desired for masters issuing back-to-back read/write transactions without waiting for write/read responses. Note that this register has an effect only if necessary logic is instantiated via the UMCTL2_RDWR_ORDERED_n parameter. Value After Reset:0x0 Volatile:true Programming Mode:Static
15	RW	0x0	Reserved1 Reserved Field:Yes
14	RW	0x1	rd_port_pagematch_en If set to 1, enables the Page Match feature. If enabled, once a requesting port is granted, the port is continued to be granted if the following immediate commands are to the same memory page (same bank and same row). See also related PCCFG.pagematch_limit register. Value After Reset:0x1 Programming Mode:Static
13	RW	0x0	rd_port_urgent_en If set to 1, enables the AXI urgent sideband signal (arurgent). When enabled and arurgent is asserted by the master, that port becomes the highest priority and co_gs_go2critical_lpr/co_gs_go2critical_hpr signal to DDRC is asserted if enabled in PCCFG.go2critical_en register. Note that arurgent signal can be asserted anytime and as long as required which is independent of address handshaking (it is not associated with any particular command). Value After Reset:0x0 Programming Mode:Static
12	RW	0x1	rd_port_aging_en If set to 1, enables aging function for the read channel of the port. Value After Reset:0x1 Programming Mode:Static
11:10	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
9:0	RW	0x01f	rd_port_priority Determines the initial load value of read aging counters. These counters will be parallel loaded after reset, or after each grant to the corresponding port. The aging counters down-count every clock cycle where the port is requesting but not granted. The higher significant 5-bits of the read aging counter sets the priority of the read channel of a given port. Port's priority will increase as the higher significant 5-bits of the counter starts to decrease. When the aging counter becomes 0, the corresponding port channel will have the highest priority level (timeout condition - Priority0). For multi-port configurations, the aging counters cannot be used to set port priorities when external dynamic priority inputs (arqos) are enabled (timeout is still applicable). For single port configurations, the aging counters are only used when they timeout (become 0) to force read-write direction switching. In this case, external dynamic priority input, arqos (for reads only) can still be used to set the DDRC read priority (2 priority levels: low priority read - LPR, high priority read - HPR) on a command by command basis. Note: The two LSBs of this register field are tied internally to 2'b00. Value After Reset:0x1f Programming Mode:Static

DDRCTL_PCFGW

Address: Operational Base + offset (0x20008)

Bit	Attr	Reset Value	Description
31:15	RW	0x00000	Reserved1 Reserved Field:Yes
14	RW	0x1	wr_port_pagematch_en If set to 1, enables the Page Match feature. If enabled, once a requesting port is granted, the port is continued to be granted if the following immediate commands are to the same memory page (same bank and same row). See also related PCCFG.pagematch_limit register. Value After Reset:0x1 Programming Mode:Static
13	RW	0x0	wr_port_urgent_en If set to 1, enables the AXI urgent sideband signal (awurgent). When enabled and awurgent is asserted by the master, that port becomes the highest priority and co_gs_go2critical_wr signal to DDRC is asserted if enabled in PCCFG.go2critical_en register. Note that awurgent signal can be asserted anytime and as long as required which is independent of address handshaking (it is not associated with any particular command). Value After Reset:0x0 Programming Mode:Static
12	RW	0x1	wr_port_aging_en If set to 1, enables aging function for the write channel of the port. Value After Reset:0x1 Programming Mode:Static
11:10	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
9:0	RW	0x01f	wr_port_priority Determines the initial load value of write aging counters. These counters will be parallel loaded after reset, or after each grant to the corresponding port. The aging counters down-count every clock cycle where the port is requesting but not granted. The higher significant 5-bits of the write aging counter sets the initial priority of the write channel of a given port. Port's priority will increase as the higher significant 5-bits of the counter starts to decrease. When the aging counter becomes 0, the corresponding port channel will have the highest priority level. For multi-port configurations, the aging counters cannot be used to set port priorities when external dynamic priority inputs (awqos) are enabled (timeout is still applicable). For single port configurations, the aging counters are only used when they timeout (become 0) to force read-write direction switching. Note: The two LSBs of this register field are tied internally to 2'b00. Value After Reset:0x1f Programming Mode:Static

DDRCTL_PCTRL

Address: Operational Base + offset (0x20090)

DDRCTL_SBRCTL
Address: Operational Base + offset (0x200E0)

Bit	Attr	Reset Value	Description
31	RW	0x0	Reserved4 Reserved Field:Yes

Bit	Attr	Reset Value	Description
30:28	RW	0x1	scrub_burst_length_lp Scrub burst length in Low Power mode - Determines the number of back-to-back scrub read commands that can be issued together when the controller is in one of the HW controlled low power modes with Sideband ECC and Inline ECC. - During these modes, the period of the scrub burst becomes "scrub_burst_length_lp*scrub_interval" cycles. Valid values are (Sideband ECC): 1: 1 read, 2: 4 reads, 3: 16 reads, 4: 64 reads, 5: 256 reads, 6: 1024 reads. (Inline ECC): 1: 8 reads, 2: 16 reads, 3: 32 reads. To program a new value to this register field, first disable Scrubber by setting SBRCTL.scrub_en = 0. Program the new value.Enable Scrubber by setting SBRCTL.scrub_en = 1. Value After Reset:0x1 Programming Mode:Dynamic
27:26	RW	0x0	Reserved3 Reserved Field:Yes
25:24	RW	0x0	scrub_cmd_type This field determines the kind of traffic scrubber must generate. 00: Read - Only periodic reads will be generated 01: Write - Only back to back initialization writes will be generated. SBRCTL.scrub_interval must be programmed to 0. 10: Read Modify Write - only periodic RMWs will be generated.Periodic RMW transactions are currently supported only if Debug DFI Sideband Signals are enabled in the configuration. 11: reserved. Value After Reset:0x0 Programming Mode:Dynamic
23:21	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
20:8	RW	0x00ff	scrub_interval Scrub interval. (N x scrub_interval) number of clock cycles between two scrub read commands, where N is the granularity. If set to 0, scrub commands are issued back-to-back. This mode of operation (scrub_interval=0) can typically be used for scrubbing the full range of memory at once before or after SW controlled low power operations. After completing the full range of scrub while scrub_interval=0, scrub_done register is set and sbr_done_intr interrupt signal is asserted. This mode can't be used with Inline ECC: If MEMC_INLINE_ECC is 1 and scrub_interval is programme to 0, then RMW logic inside scrubber is disabled. New programmed value will take effect only after scrubber is disabled by programming scrub_en to 0. Unit: Multiples of 256 sbr_clk cycles in Sideband ECC configurations and 512 sbr_clk cycles in Inline ECC Configurations. Value After Reset:0xff Programming Mode:Dynamic
7	RW	0x0	Reserved1 Reserved Field:Yes
6:4	RW	0x1	scrub_burst_length_nm Scrub burst length in normal mode. - Determines the number of back-to-back scrub read commands that can be issued together when the controller is in normal operation in Inline ECC & Sideband ECC. - The period of the scrub burst becomes "scrub_burst_length_nm*scrub_interval" cycles. During normal operation mode of the controller with Sideband ECC (not in power-down or self refresh), scrub_burst_length_nm is ignored and only one scrub command is generated. Valid values are (Sideband ECC): 1: 1 read (Inline ECC): 1: 8 reads, 2: 16 reads, 3: 32 reads. In Sideband ECC, software must ensure that the scrub_burst_length_nm is programmed to the value of 1. Other values are not supported. To program a new value to this register field, first disable Scrubber by setting SBRCTL.scrub_en = 0. Program the new value.Enable Scrubber by setting SBRCTL.scrub_en = 1. Value After Reset:0x1 Programming Mode:Dynamic
3:2	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
1	RW	0x0	scrub_during_lowpower Continue scrubbing during low power. If set to 1, burst of scrubs will be issued in HW controlled low power modes. There are two such modes: automatically initiated by idleness or initiated by Hardware low power interface. If set to 0, the scrubber will not attempt to send commands while the DDRC is in HW controlled low power modes. In this case, the scrubber will remember the last address issued and will automatically continue from there when the DDRC exits the LP mode. Value After Reset:0x0 Programming Mode:Dynamic
0	RW	0x0	scrub_en Enable ECC scrubber. If set to 1, enables the scrubber to generate background read commands after the memories are initialized. If set to 0, disables the scrubber, resets the address generator to 0 and clears the scrubber status. This bit field must be accessed separately from the other bitfields in this register. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_SBRSTAT

Address: Operational Base + offset (0x200E4)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	Reserved0 Reserved Field:Yes
1	RO	0x0	scrub_done Scrubber done. Controller sets this bit to 1, after full range of addresses are scrubbed once while scrub_interval is set to 0. Cleared if scrub_en is set to 0 (scrubber disabled) or scrub_interval is set to a non-zero value for normal scrub operation. The interrupt signal, sbr_done_intr, is equivalent to this status bitfield. Value After Reset:0x0 Programming Mode:Dynamic
0	RO	0x0	scrub_busy Scrubber busy. Controller sets this bit to 1 when the scrubber logic has outstanding read commands being executed. Cleared when there are no active outstanding scrub reads in the system. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_SBRWDATA0

Address: Operational Base + offset (0x200E8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	scrub_pattern0 ECC Scrubber write data pattern for data bus[31:0] Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_SBRSTART0

Address: Operational Base + offset (0x200F0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sbr_address_start_mask_0 sbr_address_start_mask_0 holds the bits [31:0] of the starting address the ECC scrubber generates. The register must be programmed as explained in Address Configuration in ECC Scrub and Scrubber. The scrubber address registers are changed only when the scrubber is disabled (SBRCTL.scrub_en = 0) and there are no scrubber commands in progress (SBRSTAT.scrub_busy = 0). Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_SBRSTART1

Address: Operational Base + offset (0x200F4)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved0 Reserved Field:Yes
7:0	RW	0x00	sbr_address_start_mask_1 sbr_address_start_mask_1 holds bits [MEMC_HIF_ADDR_WIDTH_MAX-1:32] of the starting address the ECC scrubber generates.The register must be programmed as explained in Address Configuration in ECC Scrub and Scrubber. The scrubber address registers are changed only when the scrubber is disabled (SBRCTL.scrub_en = 0) and there are no scrubber commands in progress (SBRSTAT.scrub_busy = 0). Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_SBRRANGE0

Address: Operational Base + offset (0x200F8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sbr_address_range_mask_0 sbr_address_range_mask_0 holds the bits [31:0] of the scrubber address range mask. The scrubber address range mask limits the address range that the ECC scrubber can generate.The register must be programmed as explained in Address Configuration in ECC Scrub and Scrubber. The scrubber address registers are changed only when the scrubber is disabled (SBRCTL.scrub_en = 0) and there are no scrubber commands in progress (SBRSTAT.scrub_busy = 0). Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_SBRRANGE1

Address: Operational Base + offset (0x200FC)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
7:0	RW	0x00	sbr_address_range_mask_1 sbr_address_range_mask_1 holds the bits [MEMC_HIF_ADDR_WIDTH_MAX-1:32] of the scrubber address range mask. The scrubber address range mask limits the address range that the ECC scrubber can generate.The register must be programmed as explained in Address Configuration in ECC Scrub and Scrubber. The scrubber address registers are changed only when the scrubber is disabled (SBRCTL.scrub_en = 0) and there are no scrubber commands in progress (SBRSTAT.scrub_busy = 0). Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_PSTAT

Address: Operational Base + offset (0x20114)

Bit	Attr	Reset Value	Description
31:17	RW	0x0000	Reserved1 Reserved Field:Yes
16	RO	0x0	wr_port_busy_0 Indicates if there are outstanding writes for AXI/CHI port 0. Value After Reset:0x0 Programming Mode:Dynamic
15:1	RW	0x0000	Reserved0 Reserved Field:Yes
0	RO	0x0	rd_port_busy_0 Indicates if there are outstanding reads for AXI/CHI port 0. Value After Reset:0x0 Programming Mode:Dynamic

DDRCTL_ADDRMAP1

Address: Operational Base + offset (0x30004)

Bit	Attr	Reset Value	Description
31:6	RW	0x0000000	Reserved0 Reserved Field:Yes
5:0	RW	0x00	addrmap_cs_bit0 Selects the HIF address bit used as rank address bit 0. Valid Range: 0 to 33, and 63 Internal Base: 6 The selected HIF address bit is determined by adding the internal base to the value of this field. If unused, set to 63 and then rank address bit 0 is set to 0. Value After Reset:0x0 Programming Mode:Static

DDRCTL_ADDRMAP3

Address: Operational Base + offset (0x3000C)

Bit	Attr	Reset Value	Description
31:22	RW	0x000	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
21:16	RW	0x00	addrmap_bank_b2 Selects the HIF address bit used as bank address bit 2. Valid Range: 0 to 34, and 63 Internal Base: 5 The selected HIF address bit is determined by adding the internal base to the value of this field. If unused, set to 63 and then bank address bit 2 is set to 0. Value After Reset:0x0 Programming Mode:Static
15:14	RW	0x0	Reserved1 Reserved Field:Yes
13:8	RW	0x00	addrmap_bank_b1 Selects the HIF address bits used as bank address bit 1. Valid Range: 0 to 35, and 63 Internal Base: 4 The selected HIF address bit for each of the bank address bits is determined by adding the internal base to the value of this field. If unused, set to 63 and then bank address bit 1 is set to 0. Value After Reset:0x0 Programming Mode:Static
7:6	RW	0x0	Reserved0 Reserved Field:Yes
5:0	RW	0x00	addrmap_bank_b0 Selects the HIF address bits used as bank address bit 0. Valid Range: 0 to 36, and 63 Internal Base: 3 The selected HIF address bit for each of the bank address bits is determined by adding the internal base to the value of this field. Value After Reset:0x0 Programming Mode:Static

DDRCTL_ADDRMAP4

Address: Operational Base + offset (0x30010)

Bit	Attr	Reset Value	Description
31:14	RW	0x00000	Reserved1 Reserved Field:Yes
13:8	RW	0x00	addrmap_bg_b1 Selects the HIF address bits used as bank group address bit 1. Valid Range: 0 to 35, and 63 Internal Base: 4 The selected HIF address bit for each of the bank group address bits is determined by adding the internal base to the value of this field. If unused, set to 63 and then bank group address bit 1 is set to 0. Value After Reset:0x0 Programming Mode:Static
7:6	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
5:0	RW	0x00	addrmap_bg_b0 Selects the HIF address bits used as bank group address bit 0. Valid Range: 0 to 36, and 63 Internal Base: 3 The selected HIF address bit for each of the bank group address bits is determined by adding the internal base to the value of this field. If unused, set to 63 and then bank group address bit 0 is set to 0. Value After Reset:0x0 Programming Mode:Static

DDRCTL_ADDRMAP5

Address: Operational Base + offset (0x30014)

Bit	Attr	Reset Value	Description
31:29	RW	0x0	Reserved3 Reserved Field:Yes
28:24	RW	0x00	addrmap_col_b10 Selects the HIF address bit used as column address bit 10. Valid Range: 0 to 7, x, and 31. x indicates a valid value in the inline ECC configuration. Internal Base: 10 The selected HIF address bit is determined by adding the internal base to the value of this field. Note: In Inline ECC configuration (MEMC_INLINE_ECC=1) and ECC is enabled (ECCCFG0.ecc_mode>0), the highest 3 column address bits must map to the highest 3 valid HIF address bits. If column bit 10 is the highest column address bit, it must map to the highest valid HIF address bit. (x = the highest valid HIF address bit - internal base) If column bit 10 is the second highest column address bit, it must map to the second highest valid HIF address bit. (x = the highest valid HIF address bit - 1 - internal base) If column bit 10 is the third highest column address bit, it must map to the third highest valid HIF address bit. (x = the highest valid HIF address bit - 2 - internal base) If unused, set to 31 and then this column address bit is set to 0. Value After Reset:0x0 Programming Mode:Static
23:21	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
20:16	RW	0x00	addrmap_col_b9 Selects the HIF address bit used as column address bit 9. Valid Range: 0 to 7, x, and 31. x indicates a valid value in the inline ECC configuration. Internal Base: 9 The selected HIF address bit is determined by adding the internal base to the value of this field. Note: In Inline ECC configuration (MEMC_INLINE_ECC=1) and ECC is enabled (ECCCFG0.ecc_mode>0), the highest 3 column address bits must map to the highest 3 valid HIF address bits. If column bit 9 is the highest column address bit, it must map to the highest valid HIF address bit. (x = the highest valid HIF address bit - internal base) If column bit 9 is the second highest column address bit, it must map to the second highest valid HIF address bit. (x = the highest valid HIF address bit - 1 - internal base) If column bit 9 is the third highest column address bit, it must map to the third highest valid HIF address bit. (x = the highest valid HIF address bit - 2 - internal base) If unused, set to 31 and then this column address bit is set to 0. Value After Reset:0x0 Programming Mode:Static
15:13	RW	0x0	Reserved1 Reserved Field:Yes
12:8	RW	0x00	addrmap_col_b8 Selects the HIF address bit used as column address bit 8. Valid Range: 0 to 7, x, and 31. x indicates a valid value in the inline ECC configuration. Internal Base: 8 The selected HIF address bit is determined by adding the internal base to the value of this field. Note: In Inline ECC configuration (MEMC_INLINE_ECC=1) and ECC is enabled (ECCCFG0.ecc_mode>0), the highest 3 column address bits must map to the highest 3 valid HIF address bits. If column bit 8 is the second highest column address bit, it must map to the second highest valid HIF address bit. (x = the highest valid HIF address bit - 1 - internal base) If column bit 8 is the third highest column address bit, it must map to the third highest valid HIF address bit. (x = the highest valid HIF address bit - 2 - internal base) If unused, set to 31 and then this column address bit is set to 0. Value After Reset:0x0 Programming Mode:Static
7:5	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
4:0	RW	0x00	addrmap_col_b7 Selects the HIF address bit used as column address bit 7. Valid Range: 0 to 7, x, and 31. x indicates a valid value in the inline ECC configuration. Internal Base: 7 The selected HIF address bit is determined by adding the internal base to the value of this field. In Inline ECC configuration (MEMC_INLINE_ECC=1) and ECC is enabled (ECCCFG0.ecc_mode>0), the highest 3 column address bits must map to the highest 3 valid HIF address bits. If column bit 7 is the third highest column address bit, it must map to the third highest valid HIF address bit. (x = the highest valid HIF address bit - 2 - internal base) If unused, set to 31 and then this column address bit is set to 0. Value After Reset:0x0 Programming Mode:Static

31:29	RW	0x0	Reserved3 Reserved Field:Yes
28:24	RW	0x07	dfi_t_ctrl_delay Specifies the number of DFI clock cycles after an assertion or de-assertion of the DFI control signals that the control signals at the PHY-DRAM interface reflect the assertion or de-assertion. If the DRAM clock and the memory clock are not phase-aligned, this timing parameter must be rounded up to the next integer value. Note that if using RDIMM/LRDIMM, it is necessary to increment this parameter by RDIMM's/LRDIMM's extra cycle of latency in terms of DFI clock. Unit: DFI clock cycles. Value After Reset:0x7 Volatile:true Programming Mode:Quasi-dynamic Group 4
23	RW	0x0	Reserved2 Reserved Field:Yes
22:16	RW	0x02	dfi_t_rddata_en Time from the assertion of a read command on the DFI interface to the assertion of the dfi_rddata_en signal. Refer to PHY specification for correct value. This corresponds to the DFI parameter trddata_en. Note that, depending on the PHY, if using RDIMM/LRDIMM, it may be necessary to use the adjusted value of CL in the calculation of trddata_en. This is to compensate for the extra cycle(s) of latency through the RDIMM/LRDIMM. Unit: DRAM data clock cycles. Value After Reset:0x2 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
15:14	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
13:8	RW	0x00	dfi_tphy_wrdata Specifies the number of clock cycles between when dfi_wrdata_en is asserted to when the associated write data is driven on the dfi_wrdata signal. This corresponds to the DFI timing parameter tphy_wrdata. Refer to PHY specification for correct value. Note, max supported value is 8. Unit: DRAM data clock cycles. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 4
7:6	RW	0x0	Reserved0 Reserved Field:Yes
5:0	RW	0x02	dfi_tphy_wrlat Write latency Number of clocks from the write command to write data enable (dfi_wrdata_en). This corresponds to the DFI timing parameter tphy_wrlat. Refer to PHY specification for correct value.Note that, depending on the PHY, if using RDIMM/LRDIMM, it may be necessary to use the adjusted value of CL in the calculation of tphy_wrlat. This is to compensate for the extra cycle(s) of latency through the RDIMM/LRDIMM. For LPDDR4, dfi_tphy_wrlat>60 is not supported. Unit: DRAM data clock cycles. Value After Reset:0x2 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DFITMG1_FREQ1

Address: Operational Base + offset (0x100584)

Bit	Attr	Reset Value	Description
31:21	RW	0x000	Reserved2 Reserved Field:Yes
20:16	RW	0x00	dfi_t_wrdata_delay Specifies the number of DFI clock cycles between when the dfi_wrdata_en signal is asserted and when the corresponding write data transfer is completed on the DRAM bus. This corresponds to the DFI timing parameter twrdata_delay. For LPDDR5, this should be set to "twck_delay + BL/n_max - BL/n_min" instead of twrdata_delay. twck_delay specifies the time from dfi_wck_en deassertion to when WCK transfer completes on the DRAM bus and is defined by the PHY Refer to PHY specification for correct value. When TMGCFG.frequency_ratio is set to 0(1:2 Mode), divided the value by 2 and round it up to the next integer value. When TMGCFG.frequency_ratio is set to 1(1:4 Mode), divided the value by 4 and round it up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 4
15:13	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
12:8	RW	0x04	dfi_t_dram_clk_disable Specifies the number of DFI clock cycles from the assertion of the dfi_dram_clk_disable signal on the DFI until the clock to the DRAM memory devices, at the PHY-DRAM boundary, maintains a low value. If the DRAM clock and the memory clock are not phase aligned, this timing parameter must be rounded up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 4
7:5	RW	0x0	Reserved0 Reserved Field:Yes
4:0	RW	0x04	dfi_t_dram_clk_enable Specifies the number of DFI clock cycles from the de-assertion of the dfi_dram_clk_disable signal on the DFI until the first valid rising edge of the clock to the DRAM memory devices, at the PHY-DRAM boundary. If the DRAM clock and the memory clock are not phase aligned, this timing parameter must be rounded up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 4

Address: Operational Base + offset (0x100588)

Bit	Attr	Reset Value	Description
31:22	RW	0x000	Reserved2 Reserved Field:Yes
21:16	RW	0x00	dfi_twck_delay Number of DFI PHY clock cycles from dfi_wck_en is de-asserted to when the WCK transfer completes on th DRAM bus. Refer to PHY specification for correct value. Unit: DFI PHY clock cycles. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
15	RW	0x0	Reserved1 Reserved Field:Yes
14:8	RW	0x02	dfi_tphy_rdcslat Number of DFI PHY clock cycles between when a read command is sent on the DFI control interface and when the associated dfi_rddata_cs signal is asserted. This corresponds to the DFI timing parameter tphy_rdcslat. Refer to PHY specification for correct value. Unit: DRAM data clock cycles. Value After Reset:0x2 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4
7:6	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
5:0	RW	0x02	dfi_tphy_wrcslat Number of DFI PHY clock cycles between when a write command is sent on the DFI control interface and when the associated dfi_wrdata_cs signal is asserted. This corresponds to the DFI timing parameter tphy_wrcslat. Refer to PHY specification for correct value. Unit: DRAM data clock cycles. Value After Reset:0x2 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DFITMG4_FREQ1
Address: Operational Base + offset (0x100590)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	dfi_twck_en_rd WCK Enable Read Timing. Defines the timing from the CAS-WS_RD command to driving of the dfi_wck_en=ENABLED. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
23:16	RW	0x00	dfi_twck_en_wr WCK Enable Read Timing. Defines the timing from the CAS-WS_WR command to driving of the dfi_wck_en=ENABLED. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
15:8	RW	0x00	dfi_twck_en_fs WCK Enable Fast Sync Timing. Defines the timing from the CAS-WS_FS command to driving of the dfi_wck_en=ENABLED. Unit: WCK cycles Value After Reset:0x0 Programming Mode:Quasi-dynamic Group 1, Group 4
7:0	RW	0x00	dfi_twck_dis WCK Off Timing. Defines the timing from the last command opportunity to the deassertion of dfi_wck_en and dfi_wck_toggle_en assuming that no command is being sent. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4

DDRCTL_DFITMG5_FREQ1
Address: Operational Base + offset (0x100594)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	dfi_twck_fast_toggle Defines the number of clock cycles between the dfi_wck_signal being driven to TOGGLE to when the dfi_wck_signal is driven to FAST_TOGGLE. This timing is only applicable when the WCK transitions from the slow to fast toggle. Otherwise, this timing parameter must be set to 0x0. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
23:16	RW	0x00	dfi_twck_toggle WCK Toggle Enable Timing. Defines the timing from dfi_wck_en assertion to dfi_wck_toggle_en assertion. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
15:8	RW	0x00	dfi_twck_toggle_cs Defines the number of clock cycles between a read or write command to when the dfi_wck_cs signal must be stable. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
7:0	RW	0x00	dfi_twck_toggle_post Defines the number of clock cycles after a read or write command data burst completion during which the WCK must remain in the current toggle state. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4

DDRCTL_DFIUPDTMG1_FREQ1

Address: Operational Base + offset (0x1005AC)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	Reserved1 Reserved Field:Yes
23:16	RW	0x01	dfi_t_ctrlupd_interval_min_x1024 This is the minimum amount of time between DDRCTL initiated DFI update requests (which is executed whenever the DDRCTL is idle). Set this number higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the DDRCTL is idle. Minimum allowed value for this field is 1. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x1 Programming Mode:Static
15:8	RW	0x00	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
7:0	RW	0x01	dfi_t_ctrlupd_interval_max_x1024 This is the maximum amount of time between DDRCTL initiated DFI update requests. This timer resets with each update request; when the timer expires dfi_ctrlupd_req is sent and traffic is blocked until the dfi_ctrlupd_ackx is received. PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors. Updates are required to maintain calibration over PVT, but frequent updates may impact performance. Minimum allowed value for this field is 1. Note: Value programmed for DFIUPD1.dfi_t_ctrlupd_interval_max_x1024 must be greater than DFIUPD1.dfi_t_ctrlupd_interval_min_x1024. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x1 Programming Mode:Static

DDRCTL_RFSHSET1TMG0_FREQ1

Address: Operational Base + offset (0x100600)

Bit	Attr	Reset Value	Description
31	RW	0x0	t_refi_x1_sel Specifies whether RFSHSET1TMG0.t_refi_x1_x32 and RFSHSET1TMG0.refresh_to_x1_x32 register values are x1 or x32. 0 - x32 register values are used, 1 - x1 register values are used. This applies only when per-bank refresh is enabled (RFSHMOD0.per_bank_refresh=1); if per-bank refresh is not enabled, the x32 register values are used and this register field is ignored. This register field does not exist for configurations which do not support LPDDR4/5. For such configurations, the value of this register field can be assumed to be 0, so that RFSHSET1TMG0.t_refi_x1_x32 and RFSHSET1TMG0.refresh_to_x1_x32 are interpreted as x32 register fields Value After Reset:0x0 Programming Mode:Dynamic - Refresh Related
30:28	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
27:24	RW	0x2	refresh_margin Threshold value in number of DRAM clock cycles before the critical refresh or page timer expires. A critical refresh is to be issued before this threshold is reached. It is recommended that this not be changed from the default value, currently shown as 0x2. It must always be less than internally used t_refi/32. Note that internally used t_refi is equal to RFSHSET1TMG0.t_refi_x1_x32 * 32 if RFSHSET1TMG0.t_refi_x1_sel = 0. If RFSHSET1TMG0.t_refi_x1_sel = 1, internally used t_refi is equal to RFSHSET1TMG0.t_refi_x1_x32. Note that, internally used t_refi may be divided by four if derating or TCR is enabled. Unit: Multiples of 32 DRAM clock cycles. Value After Reset:0x2 Programming Mode:Dynamic - Refresh Related
23:22	RW	0x0	Reserved1 Reserved Field:Yes
21:16	RW	0x10	refresh_to_x1_x32 If the refresh timer has expired at least once (i.e. >tREFI period elapses, and there are postponed refreshes), then a speculative refresh may be performed. A speculative refresh is a refresh performed at a time when refresh would be useful. When there are no transactions pending in the CAM for a period of time determined by this RFSHSET1TMG0.refresh_to_x1_x32 and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed. Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTL. This is also used for non speculative refresh when LPDDR per-bank refresh (REFpb) or DDR5 same-bank refresh (REFsb) is enabled. The controller observes the period of time determined by this for each bank, and a priority of bank address is determined. For non-DDR5, this should be programmed to tREFI based value in controller's current refresh mode. For DDR5, this should be always programmed to tREFI1 based value even in FGR mode. The controller calculates this according to current refresh mode. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on RFSHSET1TMG0.t_refi_x1_sel. Value After Reset:0x10 Programming Mode:Dynamic - Refresh Related
15:12	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
11:0	RW	0x062	t_refi_x1_x32 Average time interval between refreshes per rank (Specification: 7.8us for DDR4, 3.9us for DDR5. See JEDEC specification for LPDDR4). set this register to RoundDown(tREFI/tCK) if RFSHSET1TMG0.t_refi_x1_sel = 0, divide the above result by 32 and round down. For LPDDR controller: if using all-bank refreshes (RFSHMOD0.per_bank_refresh = 0), use tREFIab in the above calculations if using per-bank refreshes (RFSHMOD0.per_bank_refresh = 1), use tREFIpb in the above calculations For DDR controller, tREFI value is different depending on FGR mode. In DDR4 mode, if using FGR 1x mode (RFSHMOD1.fgr_mode = 000), use tREFI1 in the above calculations In DDR4 mode, if using FGR 2x mode (RFSHMOD1.fgr_mode = 001), use tREFI2 in the above calculations In DDR4 mode, if using FGR 4x mode (RFSHMOD1.fgr_mode = 010), use tREFI4 in the above calculations In DDR5 mode, always use tREFI1 in the above calculations Note that: RFSHSET1TMG0.t_refi_x1_x32 must be greater than 0x1. if RFSHSET1TMG0.t_refi_x1_sel == 1, RFSHSET1TMG0.t_refi_x1_x32 must be greater than RFSHSET1TMG1.t_rfc_min if RFSHSET1TMG0.t_refi_x1_sel == 0, RFSHSET1TMG0.t_refi_x1_x32 * 32 must be greater than RFSHSET1TMG1.t_rfc_min In non-DDR4 or DDR4 Fixed 1x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0xFFE. In DDR4 Fixed 2x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0x7FF. In DDR4 Fixed 4x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0x3FF. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on RFSHSET1TMG0.t_refi_x1_sel. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x62 Programming Mode:Dynamic - Refresh Related

Bit	Attr	Reset Value	Description
31:15	RW	0x00000	Reserved0 Reserved Field:Yes
14:8	RW	0x00	rdwr_idle_gap When the preferred transaction store is empty for these many clock cycles, switch to the alternate transaction store if it is non-empty. The read transaction store (both high and low priority) is the default preferred transaction store and the write transaction store is the alternative store. When prefer write over read is set this is reversed. 0x0 is a legal value for this register. When set to 0x0, the transaction store switching will happen immediately when the switching conditions become true. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles. Value After Reset:0x0 Programming Mode:Static
7:0	RW	0x00	pageclose_timer This field works in conjunction with SCHED.pageclose. It only has meaning if SCHED.pageclose==1. If SCHED.pageclose==1 and pageclose_timer==0, then an auto-precharge may be scheduled for last read or write command in the CAM with a bank and page hit. Note, sometimes an explicit precharge is scheduled instead of the auto-precharge. See SCHED.pageclose for details of when this may happen. If SCHED.pageclose==1 and pageclose_timer>0, then an auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. Instead, a timer is started, with pageclose_timer as the initial value. There is a timer on a per bank basis. The timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to pageclose_timer value if the next read or write in the CAM to a bank is a page hit. Once the timer has reached zero, an explcit precharge will be attempted to be scheduled. Unit: DRAM clock cycles. Value After Reset:0x0 Programming Mode:Static

DDRCTL_PERFHPR1_FREQ1

Address: Operational Base + offset (0x100C80)

Bit	Attr	Reset Value	Description

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
15:8	RW	0x06	diff_rank_wr_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive writes to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_wrcsgap (see PHY databook for value of tphy_wrcsgap) If CRC feature is enabled, must be increased by 1. If write preamble is set to 2tCK(DDR4 only), must be increased by 1. Write preamble is always set to 2tCK for LPDDR4, refer to PHY databook to see if this is already factored into tphy_wrcsgap value or if it needs to be increased by 1. If write postamble is set to 1.5tCK(LPDDR4 only), must be increased by 1. ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during writes. For LPDDR4, with DQ ODT enabled, diff_rank_wr_gap must be a minimum of ODTLoff - ODTLon - BL/2 + 1 For other cases, diff_rank_wr_gap must be a minimum of ODTCFG.wr_odt_hold - BL/2 Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Note that, if using DDR4-LRDIMM, refer to TWRWR timing requirements in JEDEC DDR4 Data Buffer (DDR4DB01) Specification. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles. Value After Reset:0x6 Volatile:true Programming Mode:Quasi-dynamic Group 2

Bit	Attr	Reset Value	Description
7:0	RW	0x06	diff_rank_rd_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive reads to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_rdcsgap (see PHY databook for value of tphy_rdcsgap) ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during reads: Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Note that, if using DDR4-LRDIMM, refer to TRDRD timing requirements in JEDEC DDR4 Data Buffer (DDR4DB01) Specification. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles. 7:0	RW	0x0d	wr2rd_s Minimum time from write command to read command for different bank group. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. Applicable only in designs configured to support DDR SDRAM memories or LPDDR5 SDRAM memories. DDR4/DDR5 designs: CWL + PL + BL/2 + tWTR_S Minimum time from write command to read command for different bank group. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. Where: CWL = CAS write latency PL = Parity latency BL = burst length. This must match the value programmed in the BL bit of the mode register to the SDRAM tWTR_S = internal write to read command delay for different bank group. This comes directly from the SDRAM specification. WTR_S must be increased by one if DDR4 2tCK write preamble is used. LPDDR5 designs: WL + BL/n_min +RU(tWTR_S/tCK) Where: WL = Write Latency BL/n_min = Effective Burst Length tWTR_S = internal write to read command delay for different bank group. Unit: DRAM clock cycles. Value After Reset:0xd Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

Bit	Attr	Reset Value	Description
31:29	RW	0x0	Reserved3 Reserved Field:Yes
28:24	RW	0x07	dfi_t_ctrl_delay Specifies the number of DFI clock cycles after an assertion or de-assertion of the DFI control signals that the control signals at the PHY-DRAM interface reflect the assertion or de-assertion. If the DRAM clock and the memory clock are not phase-aligned, this timing parameter must be rounded up to the next integer value. Note that if using RDIMM/LRDIMM, it is necessary to increment this parameter by RDIMM's/LRDIMM's extra cycle of latency in terms of DFI clock. Unit: DFI clock cycles. Value After Reset:0x7 Volatile:true Programming Mode:Quasi-dynamic Group 4
23	RW	0x0	Reserved2 Reserved Field:Yes
22:16	RW	0x02	dfi_t_rddata_en Time from the assertion of a read command on the DFI interface to the assertion of the dfi_rddata_en signal. Refer to PHY specification for correct value. This corresponds to the DFI parameter trddata_en. Note that, depending on the PHY, if using RDIMM/LRDIMM, it may be necessary to use the adjusted value of CL in the calculation of trddata_en. This is to compensate for the extra cycle(s) of latency through the RDIMM/LRDIMM. Unit: DRAM data clock cycles. Value After Reset:0x2 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
15:14	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
13:8	RW	0x00	dfi_tphy_wrdata Specifies the number of clock cycles between when dfi_wrdata_en is asserted to when the associated write data is driven on the dfi_wrdata signal. This corresponds to the DFI timing parameter tphy_wrdata. Refer to PHY specification for correct value. Note, max supported value is 8. Unit: DRAM data clock cycles. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 4
7:6	RW	0x0	Reserved0 Reserved Field:Yes
5:0	RW	0x02	dfi_tphy_wrlat Write latency Number of clocks from the write command to write data enable (dfi_wrdata_en). This corresponds to the DFI timing parameter tphy_wrlat. Refer to PHY specification for correct value.Note that, depending on the PHY, if using RDIMM/LRDIMM, it may be necessary to use the adjusted value of CL in the calculation of tphy_wrlat. This is to compensate for the extra cycle(s) of latency through the RDIMM/LRDIMM. For LPDDR4, dfi_tphy_wrlat>60 is not supported. Unit: DRAM data clock cycles. Value After Reset:0x2 Volatile:true Programming Mode:Quasi-dynamic Group 2, Group 4

DDRCTL_DFITMG1_FREQ2

Address: Operational Base + offset (0x200584)

Bit	Attr	Reset Value	Description
31:21	RW	0x000	Reserved2 Reserved Field:Yes
20:16	RW	0x00	dfi_t_wrdata_delay Specifies the number of DFI clock cycles between when the dfi_wrdata_en signal is asserted and when the corresponding write data transfer is completed on the DRAM bus. This corresponds to the DFI timing parameter twrdata_delay. For LPDDR5, this should be set to "twck_delay + BL/n_max - BL/n_min" instead of twrdata_delay. twck_delay specifies the time from dfi_wck_en deassertion to when WCK transfer completes on the DRAM bus and is defined by the PHY Refer to PHY specification for correct value. When TMGCFG.frequency_ratio is set to 0(1:2 Mode), divided the value by 2 and round it up to the next integer value. When TMGCFG.frequency_ratio is set to 1(1:4 Mode), divided the value by 4 and round it up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 4
15:13	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
12:8	RW	0x04	dfi_t_dram_clk_disable Specifies the number of DFI clock cycles from the assertion of the dfi_dram_clk_disable signal on the DFI until the clock to the DRAM memory devices, at the PHY-DRAM boundary, maintains a low value. If the DRAM clock and the memory clock are not phase aligned, this timing parameter must be rounded up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 4
7:5	RW	0x0	Reserved0 Reserved Field:Yes
4:0	RW	0x04	dfi_t_dram_clk_enable Specifies the number of DFI clock cycles from the de-assertion of the dfi_dram_clk_disable signal on the DFI until the first valid rising edge of the clock to the DRAM memory devices, at the PHY-DRAM boundary. If the DRAM clock and the memory clock are not phase aligned, this timing parameter must be rounded up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 4

7:0	RW	0x00	dfi_twck_dis WCK Off Timing. Defines the timing from the last command opportunity to the deassertion of dfi_wck_en and dfi_wck_toggle_en assuming that no command is being sent. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4

DDRCTL_DFITMG5_FREQ2
Address: Operational Base + offset (0x200594)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	dfi_twck_fast_toggle Defines the number of clock cycles between the dfi_wck_signal being driven to TOGGLE to when the dfi_wck_signal is driven to FAST_TOGGLE. This timing is only applicable when the WCK transitions from the slow to fast toggle. Otherwise, this timing parameter must be set to 0x0. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
23:16	RW	0x00	dfi_twck_toggle WCK Toggle Enable Timing. Defines the timing from dfi_wck_en assertion to dfi_wck_toggle_en assertion. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
15:8	RW	0x00	dfi_twck_toggle_cs Defines the number of clock cycles between a read or write command to when the dfi_wck_cs signal must be stable. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
7:0	RW	0x00	dfi_twck_toggle_post Defines the number of clock cycles after a read or write command data burst completion during which the WCK must remain in the current toggle state. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4

DDRCTL_DFIUPDTMG1_FREQ2

Address: Operational Base + offset (0x2005AC)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	Reserved1 Reserved Field:Yes
23:16	RW	0x01	dfi_t_ctrlupd_interval_min_x1024 This is the minimum amount of time between DDRCTL initiated DFI update requests (which is executed whenever the DDRCTL is idle). Set this number higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the DDRCTL is idle. Minimum allowed value for this field is 1. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x1 Programming Mode:Static
15:8	RW	0x00	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
7:0	RW	0x01	dfi_t_ctrlupd_interval_max_x1024 This is the maximum amount of time between DDRCTL initiated DFI update requests. This timer resets with each update request; when the timer expires dfi_ctrlupd_req is sent and traffic is blocked until the dfi_ctrlupd_ackx is received. PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors. Updates are required to maintain calibration over PVT, but frequent updates may impact performance. Minimum allowed value for this field is 1. Note: Value programmed for DFIUPD1.dfi_t_ctrlupd_interval_max_x1024 must be greater than DFIUPD1.dfi_t_ctrlupd_interval_min_x1024. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x1 Programming Mode:Static

DDRCTL_RFSHSET1TMG0_FREQ2
Address: Operational Base + offset (0x200600)

Bit	Attr	Reset Value	Description
31	RW	0x0	t_refi_x1_sel Specifies whether RFSHSET1TMG0.t_refi_x1_x32 and RFSHSET1TMG0.refresh_to_x1_x32 register values are x1 or x32. 0 - x32 register values are used, 1 - x1 register values are used. This applies only when per-bank refresh is enabled (RFSHMOD0.per_bank_refresh=1); if per-bank refresh is not enabled, the x32 register values are used and this register field is ignored. This register field does not exist for configurations which do not support LPDDR4/5. For such configurations, the value of this register field can be assumed to be 0, so that RFSHSET1TMG0.t_refi_x1_x32 and RFSHSET1TMG0.refresh_to_x1_x32 are interpreted as x32 register fields Value After Reset:0x0 Programming Mode:Dynamic - Refresh Related
30:28	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
27:24	RW	0x2	refresh_margin Threshold value in number of DRAM clock cycles before the critical refresh or page timer expires. A critical refresh is to be issued before this threshold is reached. It is recommended that this not be changed from the default value, currently shown as 0x2. It must always be less than internally used t_refi/32. Note that internally used t_refi is equal to RFSHSET1TMG0.t_refi_x1_x32 * 32 if RFSHSET1TMG0.t_refi_x1_sel = 0. If RFSHSET1TMG0.t_refi_x1_sel = 1, internally used t_refi is equal to RFSHSET1TMG0.t_refi_x1_x32. Note that, internally used t_refi may be divided by four if derating or TCR is enabled. Unit: Multiples of 32 DRAM clock cycles. Value After Reset:0x2 Programming Mode:Dynamic - Refresh Related
23:22	RW	0x0	Reserved1 Reserved Field:Yes
21:16	RW	0x10	refresh_to_x1_x32 If the refresh timer has expired at least once (i.e. >tREFI period elapses, and there are postponed refreshes), then a speculative refresh may be performed. A speculative refresh is a refresh performed at a time when refresh would be useful. When there are no transactions pending in the CAM for a period of time determined by this RFSHSET1TMG0.refresh_to_x1_x32 and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed. Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTL. This is also used for non speculative refresh when LPDDR per-bank refresh (REFpb) or DDR5 same-bank refresh (REFsb) is enabled. The controller observes the period of time determined by this for each bank, and a priority of bank address is determined. For non-DDR5, this should be programmed to tREFI based value in controller's current refresh mode. For DDR5, this should be always programmed to tREFI1 based value even in FGR mode. The controller calculates this according to current refresh mode. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on RFSHSET1TMG0.t_refi_x1_sel. Value After Reset:0x10 Programming Mode:Dynamic - Refresh Related
15:12	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
11:0	RW	0x062	t_refi_x1_x32 Average time interval between refreshes per rank (Specification: 7.8us for DDR4, 3.9us for DDR5. See JEDEC specification for LPDDR4). set this register to RoundDown(tREFI/tCK) if RFSHSET1TMG0.t_refi_x1_sel = 0, divide the above result by 32 and round down. For LPDDR controller: if using all-bank refreshes (RFSHMOD0.per_bank_refresh = 0), use tREFIab in the above calculations if using per-bank refreshes (RFSHMOD0.per_bank_refresh = 1), use tREFIpb in the above calculations For DDR controller, tREFI value is different depending on FGR mode. In DDR4 mode, if using FGR 1x mode (RFSHMOD1.fgr_mode = 000), use tREFI1 in the above calculations In DDR4 mode, if using FGR 2x mode (RFSHMOD1.fgr_mode = 001), use tREFI2 in the above calculations In DDR4 mode, if using FGR 4x mode (RFSHMOD1.fgr_mode = 010), use tREFI4 in the above calculations In DDR5 mode, always use tREFI1 in the above calculations Note that: RFSHSET1TMG0.t_refi_x1_x32 must be greater than 0x1. if RFSHSET1TMG0.t_refi_x1_sel == 1, RFSHSET1TMG0.t_refi_x1_x32 must be greater than RFSHSET1TMG1.t_rfc_min if RFSHSET1TMG0.t_refi_x1_sel == 0, RFSHSET1TMG0.t_refi_x1_x32 * 32 must be greater than RFSHSET1TMG1.t_rfc_min In non-DDR4 or DDR4 Fixed 1x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0xFFE. In DDR4 Fixed 2x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0x7FF. In DDR4 Fixed 4x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0x3FF. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on RFSHSET1TMG0.t_refi_x1_sel. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x62 Programming Mode:Dynamic - Refresh Related

DDRCTL_RFSHSET1TMG1_FREQ2

Address: Operational Base + offset (0x200604)

Bit	Attr	Reset Value	Description
31:12	RW	0x00000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
11:0	RW	0x08c	t_rfc_min tRFC (min): Minimum time from refresh to refresh or activate. t_rfc_min must be set to RoundUp(tRFCmin/tCK). In LPDDR controller: if using all-bank refreshes, the tRFCmin value in the above equations is equal to tRFCab if using per-bank refreshes, the tRFCmin value in the above equations is equal to tRFCpb In DDR4/DDR5 mode, the tRFCmin value in the above equations is different depending on the refresh mode (fixed 1X,2X,4X) and the device density. The user must program the appropriate value from the spec based on the 'fgr_mode' and the device density that is used. Unit: DRAM clock cycles. Value After Reset:0x8c Programming Mode:Dynamic - Refresh Related

DDRCTL_RFSHSET1TMG2_FREQ2

DDRCTL_HWLPTMG0_FREQ2
Address: Operational Base + offset (0x200B80)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	Reserved1 Reserved Field:Yes
27:16	RW	0x000	hw_lp_idle_x32 Hardware idle period. The cactive_ddrc output is driven low if the DDRC command channel is idle for hw_lp_idle * 32 cycles if not in INIT or DPD/MPSM operating_mode. The DDRC command channel is considered idle when there are no HIF commands outstanding. The hardware idle function is disabled when hw_lp_idle_x32=0. hw_lp_idle_x32=1 is an illegal value when the controller is in 1:2 mode. hw_lp_idle_x32=1/2/3 are illegal values when the controller is in 1:4 mode. FOR PERFORMANCE ONLY. Unit: Multiples of 32 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x0 Volatile:true Programming Mode:Static
15:0	RW	0x0000	Reserved0 Reserved Field:Yes

DDRCTL_SCHEDTMG0_FREQ2
Address: Operational Base + offset (0x200C00)

Bit	Attr	Reset Value	Description
31:15	RW	0x00000	Reserved0 Reserved Field:Yes
14:8	RW	0x00	rdwr_idle_gap When the preferred transaction store is empty for these many clock cycles, switch to the alternate transaction store if it is non-empty. The read transaction store (both high and low priority) is the default preferred transaction store and the write transaction store is the alternative store. When prefer write over read is set this is reversed. 0x0 is a legal value for this register. When set to 0x0, the transaction store switching will happen immediately when the switching conditions become true. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles. Value After Reset:0x0 Programming Mode:Static
7:0	RW	0x00	pageclose_timer This field works in conjunction with SCHED.pageclose. It only has meaning if SCHED.pageclose==1. If SCHED.pageclose==1 and pageclose_timer==0, then an auto-precharge may be scheduled for last read or write command in the CAM with a bank and page hit. Note, sometimes an explicit precharge is scheduled instead of the auto-precharge. See SCHED.pageclose for details of when this may happen. If SCHED.pageclose==1 and pageclose_timer>0, then an auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. Instead, a timer is started, with pageclose_timer as the initial value. There is a timer on a per bank basis. The timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to pageclose_timer value if the next read or write in the CAM to a bank is a page hit. Once the timer has reached zero, an explcit precharge will be attempted to be scheduled. Unit: DRAM clock cycles. Value After Reset:0x0 Programming Mode:Static

DDRCTL_PERFHPR1_FREQ2

Address: Operational Base + offset (0x200C80)

Bit	Attr	Reset Value	Description
31:24	RW	0x0f	hpr_xact_run_length Number of transactions that are serviced once the HPR queue goes critical is the smaller of: (a) This number (b) Number of transactions available. Unit: Transaction. FOR PERFORMANCE ONLY. Value After Reset:0xf Volatile:true Programming Mode:Quasi-dynamic Group 3

Bit	Attr	Reset Value	Description
23:16	RW	0x00	Reserved0 Reserved Field:Yes
15:0	RW	0x0001	hpr_max_starve Number of DRAM clocks that the HPR queue can be starved before it goes critical. The minimum valid functional value for this register is 0x1. Programming it to 0x0 will disable the starvation functionality; during normal operation, this function must not be disabled as it will cause excessive latencies. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles. Value After Reset:0x1 Volatile:true Programming Mode:Quasi-dynamic Group 3

DDRCTL_PERFLPR1_FREQ2

Address: Operational Base + offset (0x200C84)

DDRCTL_RANKTMG0_FREQ2

Address: Operational Base + offset (0x200D04)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
15:8	RW	0x06	diff_rank_wr_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive writes to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_wrcsgap (see PHY databook for value of tphy_wrcsgap) If CRC feature is enabled, must be increased by 1. If write preamble is set to 2tCK(DDR4 only), must be increased by 1. Write preamble is always set to 2tCK for LPDDR4, refer to PHY databook to see if this is already factored into tphy_wrcsgap value or if it needs to be increased by 1. If write postamble is set to 1.5tCK(LPDDR4 only), must be increased by 1. ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during writes. For LPDDR4, with DQ ODT enabled, diff_rank_wr_gap must be a minimum of ODTLoff - ODTLon - BL/2 + 1 For other cases, diff_rank_wr_gap must be a minimum of ODTCFG.wr_odt_hold - BL/2 Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Note that, if using DDR4-LRDIMM, refer to TWRWR timing requirements in JEDEC DDR4 Data Buffer (DDR4DB01) Specification. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles. Value After Reset:0x6 Volatile:true Programming Mode:Quasi-dynamic Group 2

Bit	Attr	Reset Value	Description
7:0	RW	0x06	diff_rank_rd_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive reads to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_rdcsgap (see PHY databook for value of tphy_rdcsgap) ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during reads: Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Note that, if using DDR4-LRDIMM, refer to TRDRD timing requirements in JEDEC DDR4 Data Buffer (DDR4DB01) Specification. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles. Bit	Attr	Reset Value	Description
31:21	RW	0x000	Reserved2 Reserved Field:Yes
20:16	RW	0x00	dfi_t_wrdata_delay Specifies the number of DFI clock cycles between when the dfi_wrdata_en signal is asserted and when the corresponding write data transfer is completed on the DRAM bus. This corresponds to the DFI timing parameter twrdata_delay. For LPDDR5, this should be set to "twck_delay + BL/n_max - BL/n_min" instead of twrdata_delay. twck_delay specifies the time from dfi_wck_en deassertion to when WCK transfer completes on the DRAM bus and is defined by the PHY Refer to PHY specification for correct value. When TMGCFG.frequency_ratio is set to 0(1:2 Mode), divided the value by 2 and round it up to the next integer value. When TMGCFG.frequency_ratio is set to 1(1:4 Mode), divided the value by 4 and round it up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 4
15:13	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
12:8	RW	0x04	dfi_t_dram_clk_disable Specifies the number of DFI clock cycles from the assertion of the dfi_dram_clk_disable signal on the DFI until the clock to the DRAM memory devices, at the PHY-DRAM boundary, maintains a low value. If the DRAM clock and the memory clock are not phase aligned, this timing parameter must be rounded up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 4
7:5	RW	0x0	Reserved0 Reserved Field:Yes
4:0	RW	0x04	dfi_t_dram_clk_enable Specifies the number of DFI clock cycles from the de-assertion of the dfi_dram_clk_disable signal on the DFI until the first valid rising edge of the clock to the DRAM memory devices, at the PHY-DRAM boundary. If the DRAM clock and the memory clock are not phase aligned, this timing parameter must be rounded up to the next integer value. Unit: DFI clock cycles. Value After Reset:0x4 Volatile:true Programming Mode:Quasi-dynamic Group 4

7:0	RW	0x00	dfi_twck_dis WCK Off Timing. Defines the timing from the last command opportunity to the deassertion of dfi_wck_en and dfi_wck_toggle_en assuming that no command is being sent. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4

DDRCTL_DFITMG5_FREQ3
Address: Operational Base + offset (0x300594)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	dfi_twck_fast_toggle Defines the number of clock cycles between the dfi_wck_signal being driven to TOGGLE to when the dfi_wck_signal is driven to FAST_TOGGLE. This timing is only applicable when the WCK transitions from the slow to fast toggle. Otherwise, this timing parameter must be set to 0x0. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
23:16	RW	0x00	dfi_twck_toggle WCK Toggle Enable Timing. Defines the timing from dfi_wck_en assertion to dfi_wck_toggle_en assertion. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
15:8	RW	0x00	dfi_twck_toggle_cs Defines the number of clock cycles between a read or write command to when the dfi_wck_cs signal must be stable. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4
7:0	RW	0x00	dfi_twck_toggle_post Defines the number of clock cycles after a read or write command data burst completion during which the WCK must remain in the current toggle state. Unit: WCK cycles Value After Reset:0x0 Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 4

DDRCTL_DFIUPDTMG1_FREQ3

Address: Operational Base + offset (0x3005AC)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	Reserved1 Reserved Field:Yes
23:16	RW	0x01	dfi_t_ctrlupd_interval_min_x1024 This is the minimum amount of time between DDRCTL initiated DFI update requests (which is executed whenever the DDRCTL is idle). Set this number higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the DDRCTL is idle. Minimum allowed value for this field is 1. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x1 Programming Mode:Static
15:8	RW	0x00	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
7:0	RW	0x01	dfi_t_ctrlupd_interval_max_x1024 This is the maximum amount of time between DDRCTL initiated DFI update requests. This timer resets with each update request; when the timer expires dfi_ctrlupd_req is sent and traffic is blocked until the dfi_ctrlupd_ackx is received. PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors. Updates are required to maintain calibration over PVT, but frequent updates may impact performance. Minimum allowed value for this field is 1. Note: Value programmed for DFIUPD1.dfi_t_ctrlupd_interval_max_x1024 must be greater than DFIUPD1.dfi_t_ctrlupd_interval_min_x1024. Unit: Multiples of 1024 DFI clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x1 Programming Mode:Static

DDRCTL_RFSHSET1TMG0_FREQ3

Address: Operational Base + offset (0x300600)

Bit	Attr	Reset Value	Description
31	RW	0x0	t_refi_x1_sel Specifies whether RFSHSET1TMG0.t_refi_x1_x32 and RFSHSET1TMG0.refresh_to_x1_x32 register values are x1 or x32. 0 - x32 register values are used, 1 - x1 register values are used. This applies only when per-bank refresh is enabled (RFSHMOD0.per_bank_refresh=1); if per-bank refresh is not enabled, the x32 register values are used and this register field is ignored. This register field does not exist for configurations which do not support LPDDR4/5. For such configurations, the value of this register field can be assumed to be 0, so that RFSHSET1TMG0.t_refi_x1_x32 and RFSHSET1TMG0.refresh_to_x1_x32 are interpreted as x32 register fields Value After Reset:0x0 Programming Mode:Dynamic - Refresh Related
30:28	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
27:24	RW	0x2	refresh_margin Threshold value in number of DRAM clock cycles before the critical refresh or page timer expires. A critical refresh is to be issued before this threshold is reached. It is recommended that this not be changed from the default value, currently shown as 0x2. It must always be less than internally used t_refi/32. Note that internally used t_refi is equal to RFSHSET1TMG0.t_refi_x1_x32 * 32 if RFSHSET1TMG0.t_refi_x1_sel = 0. If RFSHSET1TMG0.t_refi_x1_sel = 1, internally used t_refi is equal to RFSHSET1TMG0.t_refi_x1_x32. Note that, internally used t_refi may be divided by four if derating or TCR is enabled. Unit: Multiples of 32 DRAM clock cycles. Value After Reset:0x2 Programming Mode:Dynamic - Refresh Related
23:22	RW	0x0	Reserved1 Reserved Field:Yes
21:16	RW	0x10	refresh_to_x1_x32 If the refresh timer has expired at least once (i.e. >tREFI period elapses, and there are postponed refreshes), then a speculative refresh may be performed. A speculative refresh is a refresh performed at a time when refresh would be useful. When there are no transactions pending in the CAM for a period of time determined by this RFSHSET1TMG0.refresh_to_x1_x32 and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed. Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTL. This is also used for non speculative refresh when LPDDR per-bank refresh (REFpb) or DDR5 same-bank refresh (REFsb) is enabled. The controller observes the period of time determined by this for each bank, and a priority of bank address is determined. For non-DDR5, this should be programmed to tREFI based value in controller's current refresh mode. For DDR5, this should be always programmed to tREFI1 based value even in FGR mode. The controller calculates this according to current refresh mode. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on RFSHSET1TMG0.t_refi_x1_sel. Value After Reset:0x10 Programming Mode:Dynamic - Refresh Related
15:12	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
11:0	RW	0x062	t_refi_x1_x32 Average time interval between refreshes per rank (Specification: 7.8us for DDR4, 3.9us for DDR5. See JEDEC specification for LPDDR4). set this register to RoundDown(tREFI/tCK) if RFSHSET1TMG0.t_refi_x1_sel = 0, divide the above result by 32 and round down. For LPDDR controller: if using all-bank refreshes (RFSHMOD0.per_bank_refresh = 0), use tREFIab in the above calculations if using per-bank refreshes (RFSHMOD0.per_bank_refresh = 1), use tREFIpb in the above calculations For DDR controller, tREFI value is different depending on FGR mode. In DDR4 mode, if using FGR 1x mode (RFSHMOD1.fgr_mode = 000), use tREFI1 in the above calculations In DDR4 mode, if using FGR 2x mode (RFSHMOD1.fgr_mode = 001), use tREFI2 in the above calculations In DDR4 mode, if using FGR 4x mode (RFSHMOD1.fgr_mode = 010), use tREFI4 in the above calculations In DDR5 mode, always use tREFI1 in the above calculations Note that: RFSHSET1TMG0.t_refi_x1_x32 must be greater than 0x1. if RFSHSET1TMG0.t_refi_x1_sel == 1, RFSHSET1TMG0.t_refi_x1_x32 must be greater than RFSHSET1TMG1.t_rfc_min if RFSHSET1TMG0.t_refi_x1_sel == 0, RFSHSET1TMG0.t_refi_x1_x32 * 32 must be greater than RFSHSET1TMG1.t_rfc_min In non-DDR4 or DDR4 Fixed 1x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0xFFE. In DDR4 Fixed 2x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0x7FF. In DDR4 Fixed 4x mode: RFSHSET1TMG0.t_refi_x1_x32 must be less than or equal to 0x3FF. Unit: DRAM clock cycles or multiples of 32 DRAM clock cycles, depending on RFSHSET1TMG0.t_refi_x1_sel. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x62 Programming Mode:Dynamic - Refresh Related

Bit	Attr	Reset Value	Description
31:15	RW	0x00000	Reserved0 Reserved Field:Yes
14:8	RW	0x00	rdwr_idle_gap When the preferred transaction store is empty for these many clock cycles, switch to the alternate transaction store if it is non-empty. The read transaction store (both high and low priority) is the default preferred transaction store and the write transaction store is the alternative store. When prefer write over read is set this is reversed. 0x0 is a legal value for this register. When set to 0x0, the transaction store switching will happen immediately when the switching conditions become true. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles. Value After Reset:0x0 Programming Mode:Static
7:0	RW	0x00	pageclose_timer This field works in conjunction with SCHED.pageclose. It only has meaning if SCHED.pageclose==1. If SCHED.pageclose==1 and pageclose_timer==0, then an auto-precharge may be scheduled for last read or write command in the CAM with a bank and page hit. Note, sometimes an explicit precharge is scheduled instead of the auto-precharge. See SCHED.pageclose for details of when this may happen. If SCHED.pageclose==1 and pageclose_timer>0, then an auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. Instead, a timer is started, with pageclose_timer as the initial value. There is a timer on a per bank basis. The timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to pageclose_timer value if the next read or write in the CAM to a bank is a page hit. Once the timer has reached zero, an explcit precharge will be attempted to be scheduled. Unit: DRAM clock cycles. Value After Reset:0x0 Programming Mode:Static

Address: Operational Base + offset (0x300C88)

Bit	Attr	Reset Value	Description
31:24	RW	0x0f	w_xact_run_length Number of transactions that are serviced once the WR queue goes critical is the smaller of: (a) This number (b) Number of transactions available. Unit: Transaction. FOR PERFORMANCE ONLY. Value After Reset:0xf Volatile:true Programming Mode:Quasi-dynamic Group 3

Bit	Attr	Reset Value	Description
23:16	RW	0x00	Reserved0 Reserved Field:Yes
15:0	RW	0x007f	w_max_starve Number of DRAM clocks that the WR queue can be starved before it goes critical. The minimum valid functional value for this register is 0x1. Programming it to 0x0 will disable the starvation functionality; during normal operation, this function must not be disabled as it will cause excessive latencies. FOR PERFORMANCE ONLY. Unit: DRAM clock cycles. Value After Reset:0x7f Volatile:true Programming Mode:Quasi-dynamic Group 3

DDRCTL_TMGCFG_FREQ3
Address: Operational Base + offset (0x300D00)

Bit	Attr	Reset Value	Description
31:10	RW	0x000000	Reserved1 Reserved Field:Yes
9:8	RW	0x0	dfi_freq_fsp This register value propergates to dfi_freq_fsp pin directly. Value After Reset:0x0 Programming Mode:Dynamic
7:1	RW	0x00	Reserved0 Reserved Field:Yes
0	RW	0x0	frequency_ratio Selects the Frequency Ratio For DDR4/DDR5/LPDDR4: 0: 1:2 Mode 1: 1:4 Mode For LPDDR5: 0: 1:1:2 Mode 1: 1:1:4 Mode Value After Reset:0x0 Programming Mode:Quasi-dynamic Group 2

DDRCTL_RANKTMG0_FREQ3
Address: Operational Base + offset (0x300D04)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
15:8	RW	0x06	diff_rank_wr_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive writes to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_wrcsgap (see PHY databook for value of tphy_wrcsgap) If CRC feature is enabled, must be increased by 1. If write preamble is set to 2tCK(DDR4 only), must be increased by 1. Write preamble is always set to 2tCK for LPDDR4, refer to PHY databook to see if this is already factored into tphy_wrcsgap value or if it needs to be increased by 1. If write postamble is set to 1.5tCK(LPDDR4 only), must be increased by 1. ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during writes. For LPDDR4, with DQ ODT enabled, diff_rank_wr_gap must be a minimum of ODTLoff - ODTLon - BL/2 + 1 For other cases, diff_rank_wr_gap must be a minimum of ODTCFG.wr_odt_hold - BL/2 Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Note that, if using DDR4-LRDIMM, refer to TWRWR timing requirements in JEDEC DDR4 Data Buffer (DDR4DB01) Specification. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles. Value After Reset:0x6 Volatile:true Programming Mode:Quasi-dynamic Group 2

Bit	Attr	Reset Value	Description
7:0	RW	0x06	diff_rank_rd_gap Only present for multi-rank configurations. Indicates the number of clocks of gap in data responses when performing consecutive reads to different ranks. This is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement. PHY requirement: tphy_rdcsgap (see PHY databook for value of tphy_rdcsgap) ODT requirement: The value programmed in this register takes care of the ODT switch off timing requirement when switching ranks during reads: Program this to the larger of PHY requirement or ODT requirement. After PHY has completed training the value programmed may need to be increased. Refer to relevant PHY documentation. Note that, if using DDR4-LRDIMM, refer to TRDRD timing requirements in JEDEC DDR4 Data Buffer (DDR4DB01) Specification. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles. Value After Reset:0x6 Volatile:true Programming Mode:Quasi-dynamic Group 2

DDRCTL_RANKTMG1_FREQ3

Address: Operational Base + offset (0x300D08)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	Reserved0 Reserved Field:Yes
15:8	RW	0x0f	rd2wr_dr Minimum time from read command to write command for different rank. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. The value must be larger than or equal to the value of DRAMSET1TMG2.rd2wr. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles Value After Reset:0xf Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

Bit	Attr	Reset Value	Description
7:0	RW	0x0f	wr2rd_dr Minimum time from write command to read command for different rank. Includes time for bus turnaround, recovery times, and all per-bank, per-rank, and global constraints. For LPDDR5, Please set to "JEDEC formula + tphy_wckcsgap + board delay" Please see PHY databook for the value of tphy_wckcsgap Unit: DRAM clock cycles Value After Reset:0xf Volatile:true Programming Mode:Quasi-dynamic Group 1, Group 2, Group 4

DDRCTL_PWRTMG_FREQ3

Address: Operational Base + offset (0x300D0C)

Bit	Attr	Reset Value	Description
31:26	RW	0x00	Reserved1 Reserved Field:Yes
25:16	RW	0x040	selfref_to_x32 After this many clocks of the DDRC command channel being idle the DDRCTL automatically puts the SDRAM into Self Refresh. The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled in the PWRCTL.selfref_en. FOR PERFORMANCE ONLY. Unit: Multiples of 32 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x40 Volatile:true Programming Mode:Quasi-dynamic Group 4
15:7	RW	0x000	Reserved0 Reserved Field:Yes
6:0	RW	0x10	powerdown_to_x32 After this many clocks of the DDRC command channel being idle the DDRCTL automatically puts the SDRAM into power-down. The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled in the PWRCTL.powerdown_en. FOR PERFORMANCE ONLY. Unit: Multiples of 32 DRAM clock cycles. Please refer to "Note 1" from "Notes on Timing Registers" at the start of "Register Descriptions" chapter for details on how to program this register field. Value After Reset:0x10 Volatile:true Programming Mode:Quasi-dynamic Group 4

2.4.3 Registers Summary For DDRPHY

Name	Offset	Size	Reset Value	Description
DDRPHY_GNR_CON0	0x0000	W	0x44005011	GENERAL Control Register 0
DDRPHY_CAL_CON0	0x0004	W	0x789606C0	CALIBRATION Control Register 0
DDRPHY_CAL_CON1	0x0008	W	0x20142001	CALIBRATION Control Register 1
DDRPHY_CAL_CON2	0x000C	W	0x42001300	CALIBRATION Control Register 2

Name	Offset	Size	Reset Value	Description
DDRPHY_CAL_CON3	0x0010	W	0xFC7F9000	CALIBRATION Control Register 3
DDRPHY_CAL_CON4	0x0014	W	0x0083806F	CALIBRATION Control Register 4
DDRPHY_LP_CON0	0x0018	W	0x000C4403	Low Power Control Register 0
DDRPHY_GATE_CON0	0x001C	W	0x0300F00F	GATE Control Register 0
DDRPHY_OFFSETR_CON0	0x0020	W	0x00000000	READ Code Control Register 0
DDRPHY_OFFSETW_CON0	0x0030	W	0x00000000	OFFSET WRITE Code Control Register 0

2.4.4 Detail Registers Description

DDRPHY_GNR_CON0

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:30	RW	0x1	ctrl_upd_time It controls when DLL is updated. Clock period information from Master DLL will be updated to Slave DLLs by DLL update. 2'b00: Update always. 2'b01: To update depending on "ctrl_flock". 2'b10: To update periodically with interval defined by ctrl_upd_interval. 2'b11: Don't update DLL.
29:28	RW	0x0	ctrl_upd_range It decides how many differences between the new lock value and the current lock value which is used in Slave-DLL is needed for updating lock value. upd_range_ext = 2'b00 (default) 2'b00: Update when difference is greater than 0 tFS. 2'b01: Update when difference is greater than 3 tFS. 2'b10: Update when difference is greater than 7 tFS. 2'b11: Update when difference is greater than 15 tFS. upd_range_ext = 2'b01 2'b00: Update when difference is greater than 5 tFS. 2'b01: Update when difference is greater than 9 tFS. 2'b10: Update when difference is greater than 11 tFS. 2'b11: Update when difference is greater than 13 tFS. upd_range_ext = 2'b10 2'b00: Update when difference is greater than 17 tFS. 2'b01: Update when difference is greater than 19 tFS. 2'b10: Update when difference is greater than 21 tFS. 2'b11: Update when difference is greater than 23 tFS. upd_range_ext = 2'b11 2'b00: Update when difference is greater than 25 tFS. 2'b01: Update when difference is greater than 27 tFS. 2'b10: Update when difference is greater than 29 tFS. 2'b11: Update when difference is greater than 31 tFS.
27	RW	0x0	ctrl_twpst Write postamble length control. Vendor specific option. 1'b0: 0.5tCK 1'b1: 1.5tCK
26	RW	0x1	ctrl_dfdqs DQS I/O Receiver mode setting. 1'b0: Single-ended DQS (io_dqs_se = 2'b11) 1'b1: Differential DQS (io_dqs_se =2'b00)
25:24	RW	0x0	ctrl_ddr_mode 2'b00: LPDDR4 2'b10: LPDDR5 Others: Reserved
23:21	RW	0x0	ctrl_fnc_fb FNC Feedback mode setting. 3'b000: FNC feedback disable 3'b010: External FNC feedback mode 3'b011: Internal FNC feedback mode Others: Reserved

Bit	Attr	Reset Value	Description
20	RW	0x0	dvfs_gate_upd_mode Gate information update mode for DVFS pause. 1'b0: Gate delay information will be restored to the initial training result whenever DVFS pause occurs. 1'b1: Gate delay information will not be restore to the initial training result if DVFS pause occurs without changing dvfs_mode and clock frequency in order to make DLL relock.
19	RW	0x0	wdqs_oen_mode Write DQS Drive state control mode. 1'b0: DQS will be driven except for the read duration. ds_io_pd should be set to 1. 1'b1: DQS will be driven only for write duration.
18	RW	0x0	write_se_dqs Single ended mode enable for write DQS. It can be enabled to reduce power consumption. 1'b0: Single ended mode is disabled for Write DQS. 1'b1: Single ended mode is enabled for Write DQS. Caution: write_se_ck should be enabled using write_se_dqs in LPDDR4.
17	RW	0x0	write_se_ck Single ended mode enable for CK. It can be enabled to reduce power consumption. 1'b0: Single ended mode is disabled for CK. 1'b1: Single ended mode is enabled for CK. Caution: write_se_dqs should be enabled using write_se_ck in LPDDR4. Caution: write_se_wck should be enabled using write_se_ck in LPDDR5.
16	RW	0x0	ctrl_pd_width PD (io_dqs_pd, io_dq_pd, io_dm_pd) signal width control. 1'b0: Same width with READ (io_pdqs_read, io_ndqs_read, io_dq_read, io_dm_read). 1'b1: Longer than READ.
15	RW	0x0	ctrl_twpre Write preamble length control. Refer to DRAM spec for write preamble definition. 1'b0: 2 tCK for higher speeds 1'b1: 1 tCK for lower speeds
14	RW	0x1	ctrl_otf_bl On-the-fly BL enable 1'b0: On-the-fly BL is disabled. 1'b1: On-the-fly BL is enabled.
13:8	RW	0x10	ctrl_bstlen Fixed Burst Length(BL). This field is ignored when ctrl_otf_bl is 1'b1. 6'h10: BL = 16 6'h20: BL = 32 Others: Reserved
7	RW	0x0	ctrl_ckdis Deprecated

Bit	Attr	Reset Value	Description
6	RW	0x0	ctrl_cmosrcv This field controls the input mode of I/O. 1'b0: Differential receiver mode for high speed operation (io_dqs_cmosrcv = 2'b00, io_dm_cmosrcv = 2'b00, io_dq_cmosrcv = 16'h0000). 1'b1: CMOS receiver mode for low speed operation (under 400MHz) (io_dqs_cmosrcv = 2'b11, io_dm_cmosrcv = 2'b11, io_dq_cmosrcv = 16'hffff).
5:0	RW	0x11	ctrl_rdlat_rank0 Read Latency(RL) for RANK0

DDRPHY_CAL_CON0
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:30	RW	0x1	cs_default Default dfi_wrdata_cs setting. This field will set the default value for internally generated dfi_wrdata_cs, which will be used when wr_per_rank_en is disabled.
29	RW	0x1	wr_per_rank_en Per-rank write DQ/DM DLL control enable. If this field is enabled, Write training should be done for both rank0 and rank1 and dfi_wrdata_cs should be properly controlled by the memory controller. If this field is disabled, dfi_wrdata_cs will be controlled internally by PHY, and it will be fixed to the default chip select, which is specified in cs_default. 1'b1: Write DQ DLL code will be controlled per rank. 1'b0: Write DQ DLL code will be fixed for rank-to-rank write.
28	RW	0x1	rd_per_rank_en Per-rank read DQS/DQ/DM DLL control enable. If this field is enabled, Read training should be done for both rank0 and rank1. 1'b1: Read DQS/DQ/DM DLL code will be controlled per rank. 1'b0: Read DQS/DQ/DM DLL code will be fixed for rank-to-rank read.
27	RW	0x1	gate_rdchk_en Gate training read check enable control signal. If this is enabled, PHY will check if the read data from DRAM caused by MPC-RD DQ Calibration from the memory controller is correct or not while finding the read DQS location during gate training. 1'b1: Read check is enabled during gate training. 1'b0: Read check is disabled during gate training.
26	RW	0x0	dvfs_wr_train_en DVFS write training enable. If enabled, write training initiation with dfi_lvl_periodic=0 will be interpreted as DVFS write training. During the initial training, dvfs_wr_train_en should be 0. 1'b1: DVFS write training enabled. Training logic will find tDQS2DQ variation. The start point is determined by dvfs_wr_start_adj. Training will finish when the valid data widow edge is found. 1'b0: DVFS write training disabled.

Bit	Attr	Reset Value	Description
25:24	RW	0x0	avg_window_size Average window size for DLL lock value average. 2'b00: Lock value will be sampled 32 times and averaged(Default). 2'b01: Lock value will be sampled 16 times and averaged. 2'b10: Lock value will be sampled 8 times and averaged. 2'b11: Lock value will be sampled 64 times and averaged.
23	RW	0x1	freq_offset_en Frequency offset calculation enable. When enabled, PHY calculates the required offset based on the frequency information to get more margins at the lower frequencies. It should be set to 1'b0 if DLL is off because the frequency compensation offset will be calculated using the current DLL lock value. Frequency offset will be applied to write DQ/DM and read DQS. 1'b1: Enable frequency offset calculation. 1'b0: Disable frequency offset calculation.
22	RW	0x0	cal_vtc_en VT compensation enable. DLL Delay is updated depending on the latest Master DLL lock value whenever "dfi_ctrlupd_req" or "dfi_phyupd_req" is issued if cal_vtc_en=1. It compensates On-chip VT variation. 1'b1: VT compensation enabled. 1'b0: VT compensation disabled.
21	RW	0x0	ca_swap_mode_dis CA swap disable for LPDDR4 HW CAL CBT mode
20	RW	0x1	wck_vtc_en VT compensation enable for WCK. DLL Delay is updated depending on the latest Master DLL lock value whenever "dfi_ctrlupd_req" or "dfi_phyupd_req" is issued if wck_vtc_en=1. It compensates On-chip VT variation. 1'b1: VT compensation enabled. 1'b0: VT compensation disabled. cal_vtc_en should be 1 for use wck_vtc_en = 1.
19	RW	0x0	Reserved0 Reserved
18	RW	0x1	rdtrn_dbi_cal_en DBI enable for LPDDR4/5 read training. 1'b0: DBI is not calibrated during read training. 1'b1: DBI is calibrated during read training.
17	RW	0x1	wrtrn_dbi_cal_en DBI enable for LPDDR4/5 write training. Set to 0 if Data Mask, Write DBI and Read DBI are all disabled at DRAM. Otherwise, it should be set to 1. 1'b0: DBI is not calibrated during write training. 1'b1: DBI is calibrated during write training.
16	RO	0x0	wrlvl_resp Response after Write Leveling is done.
15	RW	0x0	LP5_16bank_mode LP5 16bank mode 1'b1: 16bank mode 1'b0: 4bg/4bank mode 8 bank mode don't care about this field.

Bit	Attr	Reset Value	Description
14:13	RW	0x0	ctrl_upd_interval DLL update interval. DLL update is done periodically with interval defined by ctrl_upd_interval when ctrl_upd_time = 2'b10. 2'b00: 2us 2'b01: 4us 2'b10: 6us 2'b11: 8us
12:11	RW	0x0	lock_sample_condition Lock value sampling condition setting for lock value averaging. Applied when lock_averge_en = 1. 2'b00: Lock value will be sampled if ctrl_flock = 1. 2'b01: Lock value will be sampled if ctrl_clock = 1. 2'b10: Lock value will be sampled if ctrl_locked = 1.
10:9	RW	0x3	wrtrn_dqs_edge_en DQS edge enable for initial write training. This field can be changed to find the effect of duty cycle error on the initial write training result for debug purpose. For normal operation, use the default value (2'b11). 2'b11: DQ/DM captured at the rising and falling edge of DQS will be used for the initial write training (Default). 2'b01: DQ/DM captured only at the rising edge of DQS will be used for the initial write training. 2'b10: DQ/DM captured only at the falling edge of DQS will be used for the initial write training. 2'b00: Do not use.
8	RW	0x0	wrlvl_start Write Leveling start. It can be enabled when wrlvl_mode = 1. It should be disabled after write leveling response (wrlvl_resp) is asserted.
7:6	RW	0x3	rdlvl_dqs_edge_en DQS edge enable for initial read training. This field can be changed to find the effect of duty cycle error on the initial read training result for debug purpose. For normal operation, use the default value (2'b11). 2'b11: DQ/DM captured at the rising and falling edge of DQS will be used for the initial read training (Default). 2'b01: DQ/DM captured only at the rising edge of DQS will be used for the initial read training. 2'b10: DQ/DM captured only at the falling edge of DQS will be used for the initial read training. 2'b00: Do not use.
5	RW	0x0	wr_cal_mode If it is enabled, PHY will use "SDLL Code" which is calculated during Write training. If disabled, PHY will use "SDLL Code" which is calculated from Master DLL(T/4).
4	RW	0x0	lock_average_en Lock value average enable. If enabled, moving average will be applied to DLL lock value to remove lock value deviation due to power noise. 1'b0: DLL lock value will not be averaged. (Default) 1'b1: DLL lock value will be sampled and averaged. The number of lock value that will be averaged is defined in avg_window_size.

Bit	Attr	Reset Value	Description
3	RW	0x0	rd_cal_mode When rd_cal_mode=1, PHY will use "SDLL Code" which is calculated during Read training. If disabled, PHY will use "SDLL Code" which is calculated from Master DLL (T/4).
2	RW	0x0	ca_cal_mode CBT Mode Enable. For LPDDR4, if ca_cal_mode = 1 and cbt_vref_dqs_en[N] = 1, DQS/DQ/DM pad for Byte N will be set to driver mode. For LPDDR5, if ca_cal_mode = 1 and cbt_bit_dq_en[n] = 0, DQ pad for bit n will be set to driver mode.
1	RW	0x0	gate_cal_mode Gate training mode enable. If gate training is used, this value should be high during operation. 1'b1: PHY will apply gate cycle/offset result(GT_VWMC*_cs0/cs1 and GT_CYC*_cs0/cs1) from gate training to gate signal. 1'b0: PHY will apply ctrl_shiftc to gate signal.
0	RW	0x0	wrlvl_mode Write leveling mode enable. If write leveling is configured(wrlvl_mode = 1), DQ/DM pad will be set to receiver mode (io_dq_en=16'hFFFF, io_dm_en=2'b11) and DQS pad will be set to driver mode (io_pdqs_en=2'b00, io_ndqs_en=2'b00).

DDRPHY_CAL_CON1

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:28	RW	0x2	wrtrn_pass_adj This field controls how many times write should be operated well to determine if it goes into VWP(Valid Window Period) or not. For write training, PHY decides that DQ is in the valid window if data check passes *4 times consecutively. The valid range is 0x1~0xF. 4'h1: PHY decides that DQ is in the valid window if data check passes 4 time. 4'h2: PHY decides that DQ is in the valid window if data check passes 8 times consecutively. 4'h3: PHY decides that DQ is in the valid window if data check passes 12 times consecutively. . . 4'hE: PHY decides that DQ is in the valid window if data check passes 56 times consecutively. 4'hF: PHY decides that DQ is in the valid window if data check passes 60 times consecutively.
27	RW	0x0	dfi_error_en Dfi error enable
26:20	RW	0x01	rdlvl_incr_adj Initial training step size (default: 7'h1, fine step delay). It should be smaller than 7'b0F. This is valid only for write/read DQ calibration, gate training and write leveling. bit[26:25]=2'b00: The step value will be "rdlvl_incr_adj[4:0]". bit[26:25]=2'b01: The step value will be "T/4". bit[26:25]=2'b10: The step value will be "T/8". bit[26:25]=2'b11: The step value will be "T/64".

Bit	Attr	Reset Value	Description
19:16	RW	0x4	rdlvl_pass_adj This field controls how many times "Read" should be operated well to determine if it goes into VWP(Valid Window Period) or not. 4'h1: PHY decides that DQS is in the valid window if data check passes 2 time. 4'h2: PHY decides that DQS is in the valid window if data check passes 4 times consecutively. 4'h3: PHY decides that DQS is in the valid window if data check passes 6 times consecutively. 4'h4: PHY decides that DQS is in the valid window if data check passes 8 times consecutively. 4'h5: PHY decides that DQS is in the valid window if data check passes 10 times consecutively. 4'h6: PHY decides that DQS is in the valid window if data check passes 12 times consecutively. 4'h7: PHY decides that DQS is in the valid window if data check passes 14 times consecutively. Others: Do not use.
15:14	RW	0x0	ctrl_rpost_opt LPDDR5 read post-amble toggle option. Refer to read post-amble description in DRAM spec. 2'b00: Read post-amble = 0.5tWCK static. 2'b01: Read post-amble = 2.5tWCK static. 2'b10: Read post-amble = 4.5tWCK static.
13:7	RW	0x40	glvl_periodic_incr_adj Periodic (or short) gate training step size. It should be smaller than 7'h1F. Default value is 7'b1000000(T/4). bit[13:12]=2'b00: The step value will be "glvl_periodic_incr_adj[4:0]". bit[13:12]=2'b01: The step value will be "T/2". bit[13:12]=2'b10: The step value will be "T/4" (default). bit[13:12]=2'b11: The step value will be "T/8". bit[13:7]=7'h00: The step value will be "T/16".
6:0	RW	0x01	rdlvl_periodic_incr_adj Periodic (or short) training step size. It decides the step value of delay line to increase during periodic read and write training. It should be smaller than 7'b0F. Default value is 7'h40(T/32). bit[6:5]=2'b00: The step value will be "rdlvl_periodic_incr_adj[4:0]". bit[6:5]=2'b01: The step value will be "T/16". bit[6:5]=2'b10: The step value will be "T/32" (default). bit[6:5]=2'b11: The step value will be "T/64".

DDRPHY_CAL_CON2

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31	RW	0x0	ctrl_rpre_opt Read pre-amble toggle option. Refer to read pre-amble description in DRAM spec. For LPDDR4: 1'b1: Read pre-amble = 2nCK toggle. 1'b0: Read pre-amble = 2nCK static. For LPDDR5: 1'b1: Read pre-amble = 2tWCK static + 2tWCK toggle. 1'b0: Read pre-amble = 2tWCK static.
30	RW	0x1	ctrl_rodt_disable Read ODT(On-Die-Termination) disable signal. 1'b1: Read ODT disabled. Drive ctrl_read_p* to 0. If using LPDDR4, ctrl_read_p* will be always 0 by enabling this field. Io_pdqs_read, io_ndqs_read, io_dq_read, io_dm_read are low. 1'b0: Read ODT enabled. Drive ctrl_read_p* normally. Io_pdqs_read, io_ndqs_read, io_dq_read, io_dm_read are high only for read duration.
29	RW	0x0	ctrl_shgate This field controls the gate control signal. 1'b0: Gate signal length = "burst length / 2" + N (Apply when DQS Pull-Down is enabled. N is determined by ctrl_gateduradj). 1'b1: Gate signal length = "burst length / 2" ? 1 For LPDDR4, MR1 should be programmed so that read Pre-amble is 2nCK static and read Post-amble is 0.5tCK when shgate is 'h0.
28	RW	0x0	ctrl_gt_fine_disable Gate fine training enable for periodic gate training.
27:24	RW	0x2	ctrl_gateduradj It adjusts the duration cycle of "ctrl_gate" on a clock cycle base. MSB(bit3) controls direction: 1'b1: Subtract duration 1'b0: Add duration Bit[2:0] set duration value.
23:20	RW	0x0	ctrl_gateadj It adjusts the enable time of "ctrl_gate" on a clock cycle base. The reference point is at the end of RL. MSB(bit3) controls direction: 1'b1: Subtract delay 1'b0: Add delay Bit[2:0] set delay value. When gate training is enabled, it configures the start point of gate training. If gate training is not enabled, it will be used to manually control the position of ctrl_gate.
19:16	RW	0x0	ctrl_readduradj It adjusts the duration cycle of "ctrl_read" on a clock cycle base. "ctrl_read" is the read odt control signal within PHY. MSB(bit3) controls direction: 1'b1: Subtract delay 1'b0: Add delay Bit[2:0] set delay value. It determines the high duration of io_pdqs_read, io_ndqs_read, io_dq_read and io_dm_read if ctrl_rodt_disable is 0.

Bit	Attr	Reset Value	Description
15:12	RW	0x1	ctrl_readadj It adjusts the enable time of "ctrl_read" on a clock cycle base. The reference point is at the end of RL. MSB(bit3) controls direction: 1'b1: Subtract delay 1'b0: Add delay Bit[2:0] set delay. It determines the start cycle of high duration of io_pdqs_read, io_ndqs_read, io_dq_read and io_dm_read if ctrl_rodt_disable is 0.
11	RW	0x0	ctrl_readduradj_ext Default value is 0. This field is used for extend control range of ctrl_readduradj value. ctrl_readduradj_ext = 1'b0 (default) => Non Extended ctrl_readduradj_ext = 1'b1 => ctrl_readduradj[2:0] + 'h8
10	RW	0x0	ctrl_readadj_ext Default value is 0. This field is used for extend control range of ctrl_readadj value. ctrl_readadj_ext = 1'b0 (default) => Non Extended ctrl_readadj_ext = 1'b1 => ctrl_readadj[2:0] + 'h8
9:8	RW	0x3	ctrl_maskdur_adj Single-ended NDQS input glitch masking duration adjustment during read ODT enable timing. 2'b11: SE NDQS Glitch 3.5tCK Masking(default). 2'b10: SE NDQS Glitch 4.5tCK Masking. 2'b00: SE NDQS Glitch 5.5tCK Masking.
7	RW	0x0	ctrl_long_gate_train_mode Gate training mode by long gate(shgate = 0)
6:4	RW	0x0	glvl_start_adj Gate training start point adjustment. This field adjusts the initial code provided to the gate delay line at the beginning of periodic gate training. bit[6:4]=3'b000: The start point code is -T from the first DQS risinge edge. bit[6:4]=3'b001: The start point code is -7T/8 from the first DQS risinge edge. bit[6:4]=3'b010: The start point code is -6T/8 from the first DQS risinge edge. bit[6:4]=3'b011: The start point code is -5T/8 from the first DQS risinge edge. bit[6:4]=3'b100: The start point code is -4T/8 from the first DQS risinge edge. bit[6:4]=3'b101: The start point code is -3T/8 from the first DQS risinge edge. bit[6:4]=3'b110: The start point code is -2T/8 from the first DQS risinge edge. bit[6:4]=3'b111: The start point code is -T/8 from the first DQS risinge edge.

Bit	Attr	Reset Value	Description
3	RW	0x0	ctrl_gateduradj_ext Default value is 0. This field is used for extend control range of ctrl_gateduradj value. ctrl_gateduradj_ext = 1'b0 (default) => Non Extended ctrl_gateduradj_ext = 1'b1 => ctrl_gateduradj[2:0] + 'h8
2	RW	0x0	ctrl_gateadj_ext Default value is 0. This field is used for extend control range of ctrl_gateadj value. ctrl_gateadj_ext = 1'b0 (default) => Non Extended ctrl_gateadj_ext = 1'b1 => ctrl_gateadj[2:0] + 'h8
1:0	RW	0x0	ctrl_read_width The default is 1'b0. We strongly recommend that it should have one more idle cycle between read and write because the variation of data arrival time during read can be greater than 1 cycle. If it is 1'b1, the package and board should be carefully optimized with a short length and it should be used at the low frequency. Please refer to. 1'b0: Termination on (io_pdqs_read, io_ndqs_read, io_dq_read, io_dm_read are driven high) period is (BL/2+1.5) cycle (Default). 1'b1: Termination on period (io_pdqs_read, io_ndqs_read, io_dq_read, io_dm_read are driven high is (BL/2+1) cycle(Not recommended).

Bit	Attr	Reset Value	Description
31:30	RW	0x0	Reserved0 Reserved
29	RW	0x0	resync_handshake_mode This field controls SW DLL update policy. 1'b1: SW DLL update by handshaking between ctrl_resync and resync_done_flag*. 1'b0: SW DLL update by ctrl_resync enable and disable.
28	RW	0x0	upd_mode This field controls "PHY Update" mode. 1'b1: MC-Initiated update mode. dfi_phyupd_req is not asserted by PHY. 1'b0: PHY-Initiated update mode. dfi_phyupd_req will be asserted by PHY.
27	RO	0x0	resync_done_flag_cs This field can identify resync is applied for CtrlPHY. 1'b1: Resync is applied. 1'b0: Resync is not applied.
26	RO	0x0	resync_done_flag_ds1 This field can identify resync is applied for DataPHY1. 1'b1: Resync is applied. 1'b0: Resync is not applied.
25	RO	0x0	resync_done_flag_ds0 This field can identify resync is applied for DataPHY0. 1'b1: Resync is applied. 1'b0: Resync is not applied.

Bit	Attr	Reset Value	Description
24	RW	0x0	ctrl_resync Active RISIG-EDGE signal. User should set this signal LOW after setting HIGH for normal operation. When this bit transits from LOW to HIGH, pointers of FIFO within PHY and all of the DLL information (Read/Write/CA/CS DLL) is updated. If PHY is set to PHY-initiated updated mode, dfi_phyupd_req/dfi_phyupd_ack handshake should occur after ctrl_resync transits from LOW to HIGH. If PHY is set to MC-initiated update mode, FIFO reset and DLL update will progress without a handshake after ctrl_resync transits from LOW to HIGH. In general, this bit should be set only during initialization and refresh cycles. Refer to "7.9 DLL Code Update" to use ctrl_resync. NOTE: Invalid command that are not listed in JEDEC command truth table could be interpreted as Read command and it will lead to FIFO/gate signal corruption. For example, vendor specific TMRS is reported to be causing this issue. Please toggle ctrl_resync after sending TMRS so that FIFO and Gate signal can be restored.
23:10	RW	0x0000	Reserved2 Reserved
9:0	RW	0x000	ctrl_offsetd DLL offset control for CA. It can be controlled to adjust delay of CA bus during Command Bus Training. If this field is fixed, this should not be changed during normal operation. This value is valid only after dfi_ctrlupd_req becomes HIGH and LOW. The right-shifted value is limited by the quarter of the maximum delay in master delay line. offset amount for CA: ctrl_offsetd[9] = 1 : (tFS: fine step delay) CA deskew delay - ctrl_offsetd[8:0] x tFS ctrl_offsetd[9] = 0 : CA deskew delay + ctrl_offsetd[8:0] x tFS

Bit	Attr	Reset Value	Description
31:24	RW	0x55	rdtrn_inv_pattern_ds0 This fields specifies the lower byte invert. The expected read data pattern is defined with this field for read training or gate training with gate_rdchk_en enabled. The value should be the same as DRAM MR15 setting(Lower-Byte Invert Register for DQ Calibration).
23:16	RW	0x55	rdtrn_inv_pattern_ds1 This fields specifies the upper byte invert. The expected read data pattern is defined with this field for read training or gate training with gate_rdchk_en enabled. The value should be the same as DRAM MR20 setting(Upper-Byte Invert Register for DQ Calibration).

Bit	Attr	Reset Value	Description
15:8	RW	0x5a	rdtrn_rddata_pattern0 This fields specifies the DQ/DMI pattern. The expected read data pattern is defined with this field for read training or gate training with gate_rdchk_en enabled. The value should be the same as DRAM MR32 setting(DQ Calibration Pattern "A").
7:0	RW	0x3c	rdtrn_rddata_pattern1 This fields specifies the DQ/DMI pattern. The expected read data pattern is defined with this field for read training or gate training with gate_rdchk_en enabled. The value should be the same as DRAM MR40 setting(DQ Calibration Pattern "B").

DDRPHY_MDLL_CON0

Address: Operational Base + offset (0x00B0)

Bit	Attr	Reset Value	Description
31:24	RW	0x20	ctrl_start_point Initial DLL lock start point. This is the number of delay cells and is the start point where "DLL" start tracing to be locked. Initial delay time is calculated by multiplying the unit delay of delay cell and this value.
23	RW	0x0	clkm_cg_en_sw S/W master DLL clock gating enable for debug purpose. It should be low for normal operation. Its function is the same as ctrl_clkm_cg_en. If ctrl_clkm_cg_en or clkm_cg_en_sw is high, master DLL clock gating is enabled. 1'b0: PHY master DLL clock gating is disabled. 1'b1: PHY master DLL clock gating is enabled.
22:19	RW	0x0	Reserved0 Should be zero
18:8	RW	0x001	ctrl_force This field is used instead of ctrl_lock_value[9:0], which represents one DRAM clock period information found by the DLL only when ctrl_dll_on is LOW, i.e. If the DLL is off, this field is used to generate 270 degrees clock and shift DQS by 90 degrees.
7	RW	0x0	ctrl_half_gtlich_mask_ignore 1'b1: Glitch masking ignore using ctrl_half on DVFS. 1'b0: Glitch masking using ctrl_half on DVFS.
6	RW	0x1	ctrl_start This field is used to start DLL locking. 1'b1: Master DLL locking is enabled. 1'b0: Master DLL reset.
5	RW	0x1	ctrl_dll_on HIGH active start signal to turn on the DLL. This signal should be kept HIGH for normal operation. If this signal becomes LOW, DLL is turned off. This bit should be kept set before ctrl_start is set to turn on the DLL.

Bit	Attr	Reset Value	Description
4:1	RW	0xf	ctrl_ref This field determines the period of time when ctrl_locked is cleared. It is used to make ctrl_locked insensitive to clock jitter. 4'b0000: Don't use. 4'b0001: Ctrl_flock is de-asserted during 16 clock cycles, ctrl_locked is deasserted. 4'b0010: Ctrl_flock is de-asserted during 24 clock cycles, ctrl_locked is deasserted. ... 4'b1110: Ctrl_flock is de-asserted during 120 clock cycles, ctrl_locked is deasserted. 4'b1111: Once ctrl_locked and dfi_init_complete are asserted, those won't be deasserted until rst_n is asserted.
0	RW	0x0	ctrl_half This field controls low speed mode for Master DLL. If this bit is high, DLL can lock at low frequencies (266MHz <= DFI PHY clock frequency < 533MHz).

DDRPHY_MDLL_CON1

Address: Operational Base + offset (0x00B4)

Bit	Attr	Reset Value	Description
31:21	RO	0x001	ctrl_lock_value_init The reference lock_value for VT compensation, which has been read during the initial training. It is updated when dfi_lvl_periodic = 0 and dfi_rdlvl_gate_en/dfi_rdlvl_wr_en/dfi_rdlvl_en changes from 1'b0 to 1'b1.
20	RO	0x0	ctrl_clock Coarse lock information. According to clock jitter, ctrl_clock can be de-asserted.
19	RO	0x0	ctrl_flock Fine lock information. According to clock jitter, ctrl_flock can be de-asserted.
18	RO	0x0	ctrl_locked DLL stable lock information. This field is set after ctrl_flock is set. This field is cleared when ctrl_flock is de-asserted for some period of time specified by ctrl_ref value. This field is required for stable lock status check.
17	RW	0x0	lock_value_init_override Initial lock_value override mode. 1'b1: Ctrl_lock_value_init in read/write mode. If this field is enabled, ctrl_lock_value_init will be written to the PHY internal register. 1'b0: Ctrl_lock_value in read only mode. If this field is disabled, internal initial lock value will be read out.
16:11	RW	0x00	Reserved0 Reserved
10:0	RO	0x100	ctrl_lock_value Locked delay line encoding value. Ctrl_lock_value[10:3]: Number of delay cells for coarse lock. Ctrl_lock_value[2:0]: Control value for fine lock. From ctrl_lock_value[10:0], tFS(fine step delay) can be calculated. tFS = tCK/ctrl_lock_value[10:0], fine step delay.

DDRPHY_DVFS_CON

Address: Operational Base + offset (0x00B8)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	dvfs_mode DVFS mode select. This field controls which DVFS register sets will be used after frequency change. 2'b00: Normal mode 2'b01: DVFS0 mode 2'b10: DVFS1 mode
29:14	RW	0x0000	Reserved0 Reserved
13	RW	0x1	per_dvfs_train_disable Per DVFS Training register control disable. 1'b0: SW_RD*, SW_WR*, PRBS_* register value will be applied to internal training code registers when frequency change occurs. 1'b1: PRBS, read and write training register will not be changed when frequency change occurs.
12	RW	0x0	dvfs_fsbst_en Vref fast boost mode enable during DVFS pause duration. Enable to reduce SOC Vref settling time when SOC Vref level should be changed during DVFS pause. 1'b1: SOC Vref FSBST is enabled. PHY will guarantee that io_zq_ds_vref_fsbst is driven 2'b11 for at least 125ns and then stay at 2'b00 for at least 125ns during frequency change duration via dfi_init_start and dfi_init_complete handshake. 1'b0: Io_zq_ds_vref_fsbst will be determined by zq_ds0_vref_fsbst and zq_ds1_vref_fsbst.
11:0	RW	0x640	freq_train DFI PHY clock frequency for the initial training(read/write/gate training/write leveling/CBT). It is used as a reference for VT compensation and frequency offset compensation. Initial training should be done only at the highest frequency. For example, if the highest frequency is 1600MHz, freq_train should be set to 'd1600. This field should not change during the normal operation.

DDRPHY_DVFS0_CON0

Address: Operational Base + offset (0x00BC)

Bit	Attr	Reset Value	Description
31:20	RW	0x640	dvfs0_freq DFI PHY clock frequency for DVFS0 mode. This field must be properly set to increase data eye margin.
19:14	RW	0x20	dvfs0_rdlat_rank0 This field will be used instead of ctrl_rdlat_rank0 during DVFS0 mode.
13	RW	0x0	dvfs0_twpre Write preamble length for DVFS0 mode. It will be used instead of ctrl_twpre in DVFS0 mode. 1'b0: 2 tCK for higher speeds. 1'b1: 1 tCK for lower speeds.
12	RW	0x0	dvfs0_rpre_opt Read pre-amble toggle option for DVFS0 mode. It will be used instead of ctrl_rpre_opt in DVFS0 mode. 1'b1: Read pre-amble = 2nCK toggle. 1'b0: Read pre-amble = 2nCK static.
11	RW	0x1	dvfs0_wr_per_rank_en Per rank Write DQ/DM DLL control enable in DVFS0 mode. It will be used instead of wr_per_rank_en in DVFS0 mode.

Bit	Attr	Reset Value	Description
10	RW	0x1	dvfs0_rd_per_rank_en Per rank Read DQS/DQ/DM DLL control enable in DVFS0 mode. It will be used instead of rd_per_rank_en in DVFS0 mode.
9	RW	0x0	dvfs0_freq_offset_en Frequency offset calculation enable in DVFS0 mode. It should be set to 1'b0 if DLL is off because the frequency compensation offset will be calculated using the current DLL lock value.
8	RW	0x0	dvfs0_auto_dqs_clean Enable Auto-DQS-Clean mode in DVFS0 mode.
7	RW	0x0	dvfs0_glitch_removal_en This field is used for postamble glitch removal enable during Auto-DQS-Clean mode in DVFS0 mode. 1'b0: Glitch removal disable. 1'b1: Glitch removal enable.
6:5	RW	0x0	dvfs0_rpost_opt Read post-amble toggle option for DVFS0 mode. It will be used instead of ctrl_rpost_opt in DVFS0 mode. 2'b00: Read pre-amble = 0.5tWCK static. 2'b01: Read pre-amble = 2.5tWCK static. 2'b10: Read pre-amble = 4.5tWCK static.
4	RW	0x0	dvfs0_cbt_en LPDDR5 CBT mode enable for DVFS0 mode
3	RW	0x0	dvfs0_link_ecc_mode LP5 link ecc mode for dvfs0 mode 1'b1: ON 1'b0: OFF
2	RW	0x1	dvfs0_rdtrn_dbi_cal_en DBI enable for LPDDR4 read training in DVFS0. 1'b0: DBI is not calibrated during read training. 1'b1: DBI is calibrated during read training.
1	RW	0x1	dvfs0_wrtrn_dbi_cal_en DBI enable for LPDDR4 write training in DVFS0. Set to 0 if Data Mask, Write DBI and Read DBI are all disabled at DRAM. Otherwise, it should be set to 1. 1'b0: DBI is not calibrated during write training. 1'b1: DBI is calibrated during write training.
0	RW	0x0	dvfs0_LP5_16bank_mode LP5 16bank mode 1'b1: 16bank mode 1'b0: 4bg/4bank mode 8 bank mode don't care about this field.

10:0	RO	0x000	wr_vwmr0 Right code value in write valid window margin for Data Slice0. It shows the information for the bit with minimum center code between DQ[7:0] and DM[0].

DDRPHY_CAL_CON5

Address: Operational Base + offset (0x0160)

Bit	Attr	Reset Value	Description
31:11	RW	0x000000	Reserved0 Reserved
10	RW	0x0	binary_en This feature is TBD.

Bit	Attr	Reset Value	Description
9:2	RW	0x00	wrtrn_cyc_th Write training cycle threshold. This is the minimum amount of delay line offset to determine cycle based delay on DQ/DM. For example, the first write training is completed with cycle = 1 and offset = 10 and wrtrn_cyc_th = 15. Because offset < wrtrn_cyc_th, PHY determines that cycle based delay should be reverted to 0, instead of 1. For the second write training cycle will be fixed to 0 and write training will progress increasing delay line code only. This is to guarantee the non-linearity cause by cycle delay not affect training result.
1	RW	0x0	wrtrn_cyc_en Write training cycle delay enable. if enabled, cycle based latency will be used along with DQ/DM delay line. (cycle delay = 0.5/1.0/1.5tCK) Enable this field for LPDDR4. It will reduce the VT calculation error caused by lock value variation as DQ/DM offset is reduced. Disable for other DRAM types.
0	RW	0x0	wrtrn_cyc_mode Cycle based write training mode. 1'b0: Cycle code for left edge and right edge are matched. This improves accuracy in training result but with limited training range (1GHz or over). 1'b1: Cycle code for left edge and right edge are not matched. Use for low frequencies (500MHz~1GHz).

DDRPHY_DVFS_UPD_CON0

Address: Operational Base + offset (0x0164)

Bit	Attr	Reset Value	Description
31:22	RW	0x000	Reserved0 Reserved
21:16	RW	0x3f	dvfs_mcupd_req_cycle For debug purpose. For mc-initiated update mode. It controls the number of cycle during which cs_dvfsupd FSM stays at ST_DVFS_C_VTC state.

Address: Operational Base + offset (0x0730)

Bit	Attr	Reset Value	Description
31	RO	0x0	locked_release ctrl_locked release indicator for normal mode 1. It will be detected locked release after finished relock.
30	RO	0x0	harmonic_err Harmonic lock error indicator for normal mode. Valid only when the core voltage is not changed.
29:20	RO	0x001	relock_value DLL Re-lock value for normal mode. If mdll_monitor_en is high, it will be updated to ctrl_lock_value after DLL relocking that occurs during the frequency change with normal mode (dvfs_mode = 'h0).
19:10	RO	0x3ff	lock_value_min Minimum lock value for normal mode. If mdll_monitor_en is high, it shows the minimum ctrl_lock_value during the normal operation with normal mode (dvfs_mode = 'h0), except for the frequency change duration.

Bit	Attr	Reset Value	Description
9:0	RO	0x001	lock_value_max Maximum lock value for normal mode. If mdll_monitor_en is high, it shows the maximum ctrl_lock_value during the normal operation with normal mode (dvfs_mode = 'h0), except for the frequency change duration.

Bit	Attr	Reset Value	Description
25:16	RW	0x000	gtcc_offsetc1 Gate center control offset amount for DDR. If this field is fixed, this should not be changed during operation. This value is valid only after ctrl_vtc_en is high and ctrl_vtc_en is high and dfi_ctrlupd_req becomes HIGH and LOW. It is used to give offset to gate training result (T/2 from DQS rising edge by default) for debug purpose. gtcc_offsetc [9] = 1 : (tFS: fine step delay) Total GATE delay amount - gtcc_offsetc [8:0] x tFS gtcc_offsetc [9] = 0 : Total GATE delay amount + gtcc_offsetc [8:0] x tFS
15:10	RW	0x00	Reserved1 Reserved
9:0	RW	0x000	gtcc_offsetc0 Gate offset control offset amount for DDR. If this field is fixed, this should not be changed during operation. This value is valid only after ctrl_vtc_en is high and dfi_ctrlupd_req becomes HIGH and LOW. It is used to give offset to gate training result (T/2 from DQS rising edge by default) for debug purpose. gtcc_offsetc [9] = 1 : (tFS: fine step delay) Total GATE delay amount - gtcc_offsetc [8:0] x tFS gtcc_offsetc [9] = 0 : Total GATE delay amount + gtcc_offsetc [8:0] x tFS

DDRPHY_RANK1_CON0

Address: Operational Base + offset (0x0A1C)

Bit	Attr	Reset Value	Description
31:19	RW	0x0000	Reserved0 Reserved
18	RW	0x0	per_rank_rl_enable Enable signal to support assymmetric rank RL. If this field is enabled, RL of rank1(*_rdlat_rank1) should be set.
17:12	RW	0x20	dvfs1_rdlat_rank1 This field will be used instead of ctrl_rdlat_rank1 during DVFS1 mode.
11:6	RW	0x20	dvfs0_rdlat_rank1 This field will be used instead of ctrl_rdlat_rank1 during DVFS0 mode.
5:0	RW	0x20	ctrl_rdlat_rank1 Read latency(RL) for RANK1

DDRPHY_SCHD_CON0

Address: Operational Base + offset (0x0A20)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved1 Reserved
7	RW	0x0	schd_fsm_clear Phy scheduler FSM reset. Please use set and clear for FSM reset
6	RW	0x1	sw_cmd_start If this bit is disabled, the scheduler command will not be generated. When the sw_cmd_start is enabled, the commands in FIFO that you already requested will be generated by the timing parameter.

Bit	Attr	Reset Value	Description
5	RW	0x0	phy_mstr_cnt_en_APB Enable dfi_phymstr counter. dfi_phymstr_req will be disabled 64 DFI cycles, when dfi_phymstr_ack is not asserted.
4	RW	0x0	dvfs_train_force DVFS training force start control for debug purpose. DVFS training will start when this register changes from 0 to 1 even when there is no frequency change handshake.
3	RW	0x0	periodic_train_force Periodic training force can control for debugging pupose and SW initiated training. Periodic training will be initiated one time when this register changes from 0 to 1. HW Periodic training should be disabled by periodic_en = 0, before periodic training is initiated by this register. Please follow procedure below For debug purpose using HW periodic training. PHY initial training --> HW periodic training enable --> HW periodic training disable --> schd_fsm_clear set and clear --> SW periodic training enable --> SW periodic training disable. Also if this field used by SW periodic training, do not use the mix up both HW periodic training and SW periodic training for normal operation.
2	RW	0x0	phy_mstr_bypass Master interface bypass control. If phy_mstr_bypass = 1, the handshake of DFI PHY master mode is skipped when periodic/dvfs training is excuted.
1	RW	0x0	scheduler_cg_en_disable Scheduler clock gating disable.
0	RW	0x0	scheduler_sw_mode SW sheduler mode enable

Bit	Attr	Reset Value	Description
31	RW	0x0	Reserved0 Reserved
30:28	RW	0x6	ext_dfi_address_p6 Internal dfi_address bit position for external dfi_address[6] This field specifies a connection between the SOC CA[6] and a bit of DRAM CA[6:0]. When this field set to 3'd0, CA[6] connection in package will be swapped in the following way. SOC CA[6] - DRAM CA[0] The memory controller must swap dfi_address_pN[6:0] and drive it to PHY in order to cancel out the swapped CA connection in the package. For PHY training interface, PHY will generate and swap dfi_address_pN[6:0] according to this field.
27	RW	0x0	Reserved1 Reserved
26:24	RW	0x5	ext_dfi_address_p5 Internal dfi_address bit position for external dfi_address[5] This field specifies a connection between the SOC CA[5] and a bit of DRAM CA[6:0]. When this field set to 3'd0, CA[5] connection in package will be swapped in the following way. SOC CA[5] - DRAM CA[0] The memory controller must swap dfi_address_pN[6:0] and drive it to PHY in order to cancel out the swapped CA connection in the package. For PHY training interface, PHY will generate and swap dfi_address_pN[6:0] according to this field.

DDRPHY_PHYUPD_PARA_CON0

Address: Operational Base + offset (0x0E40)

Bit	Attr	Reset Value	Description
31:13	RW	0x00000	Reserved0 Reserved
12	RW	0x1	ctrl_upd_req_timeout_en For debug purpose. If ctrl_upd_req_timeout_en = 1 and dfi_phyupd_ack is not asserted to corresponding dfi_phyupd_req assertion, dfi_phyupd_req will be deasserted after tphyupd_resp is expired.

Bit	Attr	Reset Value	Description
11:9	RW	0x0	Reserved1 Reserved
8:0	RW	0x03f	ctrl_tphyupd_resp ctrl_tphyupd_resp parameter in term of DFI clock cycle Please should use default value during normal operation. But If write leveing need to enable during LPDDR5 WCK free running mode, Please control this register under 300ns as per memory controller specification.

DDRPHY_DVFS0_PHYUPD_PARA_CON0

Address: Operational Base + offset (0x0E44)

Bit	Attr	Reset Value	Description
31:13	RW	0x00000	Reserved0 Reserved
12	RW	0x1	dvfs0_upd_req_timeout_en For debug purpose. If dvfs0_upd_req_timeout_en = 1 and dfi_phyupd_ack is not asserted to corresponding dfi_phyupd_req assertion, dfi_phyupd_req will be deasserted after tphyupd_resp is expired.
11:9	RW	0x0	Reserved1 Reserved
8:0	RW	0x03f	dvfs0_tphyupd_resp dvfs0_tphyupd_resp parameter in term of DFI clock cycle. Please should use default value during normal operation. But If write leveing need to enable during LPDDR5 WCK free running mode on DVFS0, Please control this reigister under 300ns as per memory controller specification.

DDRPHY_DVFS1_PHYUPD_PARA_CON0

Address: Operational Base + offset (0x0E48)

Bit	Attr	Reset Value	Description
31:13	RW	0x00000	Reserved0 Reserved
12	RW	0x1	dvfs1_upd_req_timeout_en For debug purpose. If dvfs1_upd_req_timeout_en = 1 and dfi_phyupd_ack is not asserted to corresponding dfi_phyupd_req assertion, dfi_phyupd_req will be deasserted after tphyupd_resp is expired.
11:9	RW	0x0	Reserved1 Reserved
8:0	RW	0x03f	dvfs1_tphyupd_resp dvfs1_tphyupd_resp parameter in term of DFI clock cycle. Please should use default value during normal operation. But If write leveing need to enable during LPDDR5 WCK free running mode on DVFS1, Please control this register under 300ns as per memory controller specification.

2.5 Interface Description

DDR IOs from DDRPHY are listed as following table.

Table 2-1 DDR Channel 0 IO description

Pad Name	Description
DDR_CH0_CK_A	Positive differential clock
DDR_CH0_CKB_A	Negative differential clock
DDR_CH0_RESET_A	When asserted LOW, this signal resets the die.
DDR_CH0_LP4/4X_CKE0/LP5_CS0_A	Active-high clock enable signal for rank0 of

	LPDDR4/4X and acts as chip select signal for rank0 of LPDDR5.
DDR_CH0_LP4/4X_CKE1/LP5_CS1_A	Active-high clock enable signal for rank1 of LPDDR4/4X and acts as chip select signal for rank1 of LPDDR5.
DDR_CH0_LP4/4X_CS0_A	Chip select signal for rank0. Only used for LPDDR4/4X.
DDR_CH0_LP4/4X_CS1_A	Chip select signal for rank1. Only used for LPDDR4/4X.
DDR_CH0_Ai_A(i=0~6)	Command and address signals
DDR_CH0_DQS0P_A	Positive DQS for DQ[7:0]
DDR_CH0_DQS0N_A	Negative DQS for DQ[7:0]
DDR_CH0_DQS1P_A	Positive DQS for DQ[15:8]
DDR_CH0_DQS1N_A	Negative DQS for DQ[15:8]
DDR_CH0_WCK0P_A	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[7:0].
DDR_CH0_WCK0N_A	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[7:0].
DDR_CH0_WCK1P_A	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[15:8].
DDR_CH0_WCK1N_A	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[15:8].
DDR_CH0_DM0_A	This signal achieves multiple function such as Data Mask (DM), Data Bus Inversion (DBI), and Parity at read with ECC operation by setting the Mode Register and it is a bi-directional signal and each byte of data has a DMI signal. This signal correspondes to DQ[7:0].
DDR_CH0_DM1_A	This signal correspondes to DQ[15:8].
DDR_CH0_DQi_A(i=0~15)	Bidirectional data bus
DDR_CH0_ZQ_A	Used to calibrate the output drive strength and the termination resistance as calibration reference.

Table 2-2 DDR Channel 1 IO description

Pad Name	Description
DDR_CH0_CK_B	Positive differential clock
DDR_CH0_CKB_B	Negative differential clock
DDR_CH0_RESET_B	When asserted LOW, this signal resets the die.
DDR_CH0_LP4/4X_CKE0/LP5_CS0_B	Active-high clock enable signal for rank0 of LPDDR4/4X and acts as chip select signal for rank0 of LPDDR5.
DDR_CH0_LP4/4X_CKE1/LP5_CS1_B	Active-high clock enable signal for rank1 of LPDDR4/4X and acts as chip select signal for rank1 of LPDDR5.
DDR_CH0_LP4/4X_CS0_B	Chip select signal for rank0. Only used for LPDDR4/4X.
DDR_CH0_LP4/4X_CS1_B	Chip select signal for rank1. Only used for LPDDR4/4X.
DDR_CH0_Ai_B(i=0~6)	Command and address signals
DDR_CH0_DQS0P_B	Positive DQS for DQ[7:0]
DDR_CH0_DQS0N_B	Negative DQS for DQ[7:0]
DDR_CH0_DQS1P_B	Positive DQS for DQ[15:8]
DDR_CH0_DQS1N_B	Negative DQS for DQ[15:8]

Pad Name	Description
DDR_CH0_WCK0P_B	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[7:0].
DDR_CH0_WCK0N_B	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[7:0].
DDR_CH0_WCK1P_B	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[15:8].
DDR_CH0_WCK1N_B	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[15:8].
DDR_CH0_DM0_B	This signal achieves multiple function such as Data Mask (DM), Data Bus Inversion (DBI), and Parity at read with ECC operation by setting the Mode Register and it is a bi-directional signal and each byte of data has a DMI signal. This signal correspondes to DQ[7:0].
DDR_CH0_DM1_B	This signal correspondes to DQ[15:8].
DDR_CH0_DQi_B(i=0~15)	Bidirectional data bus
DDR_CH0_ZQ_B	Used to calibrate the output drive strength and the termination resistance as calibration reference.

Table 2-3 DDR Channel 2 IO description

Pad Name	Description
DDR_CH1_CK_C	Positive differential clock
DDR_CH1_CKB_C	Negative differential clock
DDR_CH1_RESET_C	When asserted LOW, this signal resets the die.
DDR_CH1_LP4/4X_CKE0/LP5_CS0_C	Active-high clock enable signal for rank0 of LPDDR4/4X and acts as chip select signal for rank0 of LPDDR5.
DDR_CH1_LP4/4X_CKE1/LP5_CS1_C	Active-high clock enable signal for rank1 of LPDDR4/4X and acts as chip select signal for rank1 of LPDDR5.
DDR_CH1_LP4/4X_CS0_C	Chip select signal for rank0. Only used for LPDDR4/4X.
DDR_CH1_LP4/4X_CS1_C	Chip select signal for rank1. Only used for LPDDR4/4X.
DDR_CH1_Ai_C(i=0~6)	Command and address signals
DDR_CH1_DQS0P_C	Positive DQS for DQ[7:0]
DDR_CH1_DQS0N_C	Negative DQS for DQ[7:0]
DDR_CH1_DQS1P_C	Positive DQS for DQ[15:8]
DDR_CH1_DQS1N_C	Negative DQS for DQ[15:8]
DDR_CH1_WCK0P_C	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[7:0].
DDR_CH1_WCK0N_C	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[7:0].
DDR_CH1_WCK1P_C	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[15:8].
DDR_CH1_WCK1N_C	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[15:8].
DDR_CH1_DM0_C	This signal achieves multiple function such as Data

	Mask (DM), Data Bus Inversion (DBI), and Parity at read with ECC operation by setting the Mode Register and it is a bi-directional signal and each byte of data has a DMI signal. This signal correspondes to DQ[7:0].
DDR_CH1_DM1_C	This signal correspondes to DQ[15:8].
DDR_CH1_DQi_C(i=0~15)	Bidirectional data bus
DDR_CH1_ZQ_C	Used to calibrate the output drive strength and the termination resistance as calibration reference.

Table 2-4 DDR Channel 3 IO description

Pad Name	Description
DDR_CH1_CK_D	Positive differential clock
DDR_CH1_CKB_D	Negative differential clock
DDR_CH1_RESET_D	When asserted LOW, this signal resets the die.
DDR_CH1_LP4/4X_CKE0/LP5_CS0_D	Active-high clock enable signal for rank0 of LPDDR4/4X and acts as chip select signal for rank0 of LPDDR5.
DDR_CH1_LP4/4X_CKE1/LP5_CS1_D	Active-high clock enable signal for rank1 of LPDDR4/4X and acts as chip select signal for rank1 of LPDDR5.
DDR_CH1_LP4/4X_CS0_D	Chip select signal for rank0. Only used for LPDDR4/4X.
DDR_CH1_LP4/4X_CS1_D	Chip select signal for rank1. Only used for LPDDR4/4X.
DDR_CH1_Ai_D(i=0~6)	Command and address signals
DDR_CH1_DQS0P_D	Positive DQS for DQ[7:0]
DDR_CH1_DQS0N_D	Negative DQS for DQ[7:0]
DDR_CH1_DQS1P_D	Positive DQS for DQ[15:8]
DDR_CH1_DQS1N_D	Negative DQS for DQ[15:8]
DDR_CH1_WCK0P_D	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[7:0].
DDR_CH1_WCK0N_D	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[7:0].
DDR_CH1_WCK1P_D	Positive differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[15:8].
DDR_CH1_WCK1N_D	Negative differential clock used for WRITE data capture and READ data output for LPDDR5. It correspondes to DQ[15:8].
DDR_CH1_DM0_D	This signal achieves multiple function such as Data Mask (DM), Data Bus Inversion (DBI), and Parity at read with ECC operation by setting the Mode Register and it is a bi-directional signal and each byte of data has a DMI signal. This signal correspondes to DQ[7:0].
DDR_CH1_DM1_D	This signal correspondes to DQ[15:8].
DDR_CH1_DQi_D(i=0~15)	Bidirectional data bus
DDR_CH1_ZQ_D	Used to calibrate the output drive strength and the termination resistance as calibration reference.

2.6 Application Notes

2.6.1 4-channel Interleaving LPDDR4/4X Initialization

Following steps are for 4-channel interleaving LPDDR4/4X initialization.

1. Power up DDRPHY core supply (DDR_CH0_VDD and DDR_CH1_VDD), power up CKE power (DDR_CH0_VDDQ_CKE and DDR_CH1_VDDQ_CKE) and then power up IO supply

(DDR_CH0_VDDQ_CK, DDR_CH0_VDDQ, DDR_CH1_VDDQ_CK and DDR_CH1_VDDQ).
2. Keep DDRPLL (D0APLL, D1APLL, D2APLL and D3APLL) at default configuration to output 24MHz frequency. Configure DDRPLL (D0BPLL, D1BPLL, D2BPLL and D3BPLL) to lock at target operation frequency. Now defaultly the input clk_phy2x of DDRPHY is 24MHz. Make sure that PCLK frequency of DDRPHY is not higher than clk_dfi which is generated from clk_phy2x.
3. De-assert PRESETn of DDRPHY and present of DDRCTL.
4. De-assert RESETn of DDRPHY. Wait for at least 10 cycles of clk_phy2x.
5. Set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR01_GRF to 1'b1, set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR23_GRF to 1'b1 to enable DDRPHY2XCLKGATE_ENABLE of each DDRPHY. Wait for at least 10 cycles of clk_phy2x.
6. De-assert div_rst_n of DDRPHY. Wait for at least 10 cycles of clk_phy2x.
7. Assert sbr_resetn, core_ddrc_rstn and aresetn_0 of DDRCTL.
8. De-assert rst_n of DDRPHY. Make sure that rst_n is released at 24MHz low frequency.
9. Set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR01_GRF to 1'b0, set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR23_GRF to 1'b0 to disable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
10. Assert div_rst_n of DDRPHY.
11. Set DDRPHY registers to select memory type and clock mode.
- DDRPHY_GNR_CON0.ctrl_ddr_mode='h0
- DDRPHY_CLKMODE_CON.ctrl_phy_mode='h1
- DDRPHY_CLKMODE_CON.ctrl_phy_clk_2x='h1

12. De-assert div_rst_n of DDRPHY.
13. Excutes step 5 again to enable the output clk_dfi of DDRPHY. Clk_dfi is used as the source clock of DDRCTL. It is connected to the core_ddrc_core_clk, aclk_0, sbr_clk and bsm_clk of DDRCTL.
14. Set DDRCTL registers.
15. De-assert sbr_resetn, core_ddrc_rstn and aresetn_0 of DDRCTL.
16. Disable auto-refreshes, self-refresh, powerdown and assertion of dfi_dram_clk_disable by setting DDRCTL_RFSHCTL0.dis_auto_refresh = 1, DDRCTL_PWRCTL.powerdown_en = 0 and DDRCTL_PWRCTL.selfref_en = 0, DDRCTL_PWRTL.en_dfi_dram_clk_disable = 0.
17. Set DDRCTL_SWCTL.sw_done to 1'b0.
18. Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b0.
19. Set DDRCTL_SWCTL.sw_done to 1'b1.
20. Set DDRCTL_PCTRL.port_en to 1'b1 to enable AXI port of DDRCTL.
21. Begin to set DDRPHY registers. Such as read latency, write latency and burst length and so on.
22. Apply DDRPHY IO settings before ZQ calibration.
23. Start DFI initialization
- Set DDRPHY_MDLL_CON0.ctrl_dll_on=1'b0
- DDRCTL should assert dfi_init_start from low to high
- DDRCTL should wait dfi_init_complete change from low to high

24. Set DDRCTL_SWCTL.sw_done to 1'b0. Set DDRCTL_DFIMISC.dfi_init_start to 1'b0 and DDRCTL_DFIMISC.dfi_init_complete_en to 1'b1. Set DDRCTL_SWCTL.sw_done to 1'b1.
25. Wait for DDRCTL to move to normal operating mode by monitoring DDRCTL_STAT.operating_mode register.
26. DDRPHY vref related registers settings without vref training.
27. DDRPHY ODT related registers settings.
28. Start DDRPHY ZQ calibration.
- Enable DDRPHY_ZQ_CON0.zq_clk_div_en
- Enable DDRPHY_ZQ_CON0.zq_manual_str
- Wait until DDRPHY_ZQ_CON1.zq_done is enabled
- Disable DDRPHY_ZQ_CON0.zq_manual_str
- Disable DDRPHY_ZQ_CON0.zq_clk_div_en

29. Frequency change to the target operation speed. Using frequency change protocol via MC-PHY handshake.
- Set DDRCTL_SWCTL.sw_done to 1'b0.
- Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b0.

- Set DDRCTL_DFIMISC.dfi_init_start to 1'b1. Set DDRCTL_SWCTL.sw_done to 1'b1.
- Poll DDRCTL_DFISTAT.dfi_init_complete=1'b0.
- Programming DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR01_GRF to 1'b0, programming DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR23_GRF to 1'b0 to disable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
- Assert div_rst_n of DDRPHY.
- Change clk_phy2x frequency of DDRPHY by setting DDR0CRU_CLKSEL_CON00[0], DDR1CRU_CLKSEL_CON00[0], DDR2CRU_CLKSEL_CON00[0] and DDR3CRU_CLKSEL_CON00[0] to 1'b1 to select D0BPLL, D1BPLL, D2BPLL and D3BPLL output clock as DDRPHY driving clock.
- De-assert div_rst_n of DDRPHY.
- Set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR01_GRF to 1'b1, set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR23_GRF to 1'b1 to enable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
- Set DDRCTL_SWCTL.sw_done to 1'b0. Set DDRCTL_DFIMISC.dfi_init_start to 1'b0. Set DDRCTL_SWCTL.sw_done to 1'b1.
- Poll DDRCTL_DFISTAT.dfi_init_complete=1'b1.
- Set DDRCTL_SWCTL.sw_done to 1'b0.
- Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b1 to indicate to the controller that the DDRPHY has finished frequency change.
- Set DDRCTL_SWCTL.sw_done to 1'b1.

30. Turn DDRPHY master DLL by setting DDRPHY_MDLL_CON0.ctrl_dll_on=1'b1.
31. Start DDRPHY master DLL locking by enable DDRPHY_MDLL_CON0.ctrl_start
    - Set DDRPHY_MDLL_CON0.ctrl_start to 1'b0.
    - Set DDRPHY_MDLL_CON0.ctrl_start to 1'b1.
    - Wait until DDRPHY_MDLL_CON1.ctrl_locked=1'b1.
32. DDRPHY SFR settings. Set DDRPHY_LP_CON0.ctrl_scheduler_en to 1'b1 and other registers if necessary.
33. Start DDRPHY initial training. Please refer to the following section for LPDDR4/4X training procedure.
34. DDRPHY SFR settings that should be set after training such as following registers and so on.
    - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw to 1'b0.
    - Set DDRPHY_CAL_CON0.cal_vtc_en to 1'b1.
    - Set DDRPHY_CAL_CON5.wrtrn_cycle_mode=0 during normal operation.

2.6.2 4-channel Interleaving LPDDR5 Initialization

Following steps are for 4-channel interleaving LPDDR5 initialization.

1. Power up DDRPHY core supply (DDR_CH0_VDD and DDR_CH1_VDD), power up CKE power (DDR_CH0_VDDQ_CKE and DDR_CH1_VDDQ_CKE) and then power up IO supply (DDR_CH0_VDDQ_CK, DDR_CH0_VDDQ, DDR_CH1_VDDQ_CK and DDR_CH1_VDDQ).
2. Keep DDRPLL (D0APLL, D1APLL, D2APLL and D3APLL) at default configuration to output 24MHz frequency. Configure DDRPLL (D0BPLL, D1BPLL, D2BPLL and D3BPLL) to lock at target operation frequency. Now defaultly the input clk_phy2x of DDRPHY is 24MHz. Make sure that PCLK frequency of DDRPHY is not higher than clk_dfi which is generated from clk_phy2x.
3. De-assert PRESETn of DDRPHY and present of DDRCTL.
4. De-assert RESETn of DDRPHY. Wait for at least 10 cycles of clk_phy2x.
5. Set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR01_GRF to 1'b1, set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR23_GRF to 1'b1 to enable DDRPHY2XCLKGATE_ENABLE of each DDRPHY. Wait for at least 10 cycles of clk_phy2x.
6. De-assert div_rst_n of DDRPHY. Wait for at least 10 cycles of clk_phy2x.
7. Assert sbr_resetn, core_ddrc_rstn and aresetn_0 of DDRCTL.
8. De-assert rst_n of DDRPHY. Make sure that rst_n is released at 24MHz low frequency.
9. Set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR01_GRF to 1'b0, set DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR23_GRF to 1'b0 to disable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
10. Assert div_rst_n of DDRPHY.
11. Set DDRPHY registers to select memory type and clock mode. Following configuration

are for 1:1:4 mode (CLK_DFI: CK: WCK).
- DDRPHY_GNR_CON0.ctrl_ddr_mode='h2
- DDRPHY_CLKMODE_CON.ctrl_phy_mode='h4
- DDRPHY_CLKMODE_CON.ctrl_phy_clk_2x='h1

If CLK_DFI: CK: WCK is 1:1:2, following configuration should be followed.
- DDRPHY_GNR_CON0.ctrl_ddr_mode='h2
- DDRPHY_CLKMODE_CON.ctrl_phy_mode='h2
- DDRPHY_CLKMODE_CON.ctrl_phy_clk_2x='h1

12. De-assert div_rst_n of DDRPHY.
13. Excutes step 5 again to enable the output clk_dfi of DDRPHY. Clk_dfi is used as the source clock of DDRCTL. It is connected to the core_ddrc_core_clk, aclk_0, sbr_clk and bsm_clk of DDRCTL.
14. Set DDRCTL registers.
15. De-assert sbr_resetn, core_ddrc_rstn and aresetn_0 of DDRCTL.
16. Disable auto-refreshes, self-refresh, powerdown and assertion of dfi_dram_clk_disable by setting DDRCTL_RFSHCTL0.dis_auto_refresh = 1, DDRCTL_PWRCTL.powerdown_en = 0 and DDRCTL_PWRCTL.selfref_en = 0, DDRCTL_PWRTL.en_dfi_dram_clk_disable = 0.
17. Set DDRCTL_SWCTL.sw_done to 1'b0.
18. Set DDRCTL_DFIMISC.dfi_init_complete_en to 1'b0.
19. Set DDRCTL_SWCTL.sw_done to 1'b1.
20. Set DDRCTL_PCTRL.port_en to 1'b1 to enable AXI port of DDRCTL.
21. Begin to set DDRPHY registers. Such as read latency, write latency and burst length and so on.
22. Apply DDRPHY IO settings before ZQ calibration.
23. DDRPHY DLL lock value force and update for low frequency initialization under 100MHz.
    - Set DDRPHY_MDLL_CON0.ctrl_force=11'h2ef.
    - Set DDRPHY_MDLL_CON0.ctrl_dll_on=1'b0.
24. Start DFI initialization
    - DDRCTL should assert dfi_init_start from low to high
    - DDRCTL should wait dfi_init_complete change from low to high
    - Enable and then disable DDRPHY_OFFSETD_CON0.ctrl_resync 10 cycles after de-asserting ctrl_dll_on.
25. Set DDRCTL_SWCTL.sw_done to 1'b0. Set DDRCTL_DFIMISC.dfi_init_start to 1'b0 and DDRCTL_DFIMISC.dfi_init_complete_en to 1'b1. Set DDRCTL_SWCTL.sw_done to 1'b1.
26. Delay an appropriate period of time according to the DDRCTL_INITTMG1.dram_rstn_x1024 to issue power down exit asynchronously by programming following registers.
    - Set DDR_GRF_CHA_CON2[17:0] and DDR_GRF_CHB_CON2[17:0] of DDR01_GRF to 8'hff, set DDR_GRF_CHA_CON2[17:0] and DDR_GRF_CHB_CON2[17:0] of DDR23_GRF to 8'hff to toggle LPDDR5 chip select signal(CS).
    - Set DDR_GRF_CHA_CON2[17:0] and DDR_GRF_CHB_CON2[17:0] of DDR01_GRF to 8'h00, set DDR_GRF_CHA_CON2[17:0] and DDR_GRF_CHB_CON2[17:0] of DDR23_GRF to 8'h00.
27. Start memory initialization by DDRCTL by sending MRW command.
28. Wait for DDRCTL to move to normal operating mode by monitoring DDRCTL_STAT.operating_mode register.
29. DDRPHY vref related registers settings without vref training.
30. DDRPHY ODT related registers settings.
31. Start DDRPHY ZQ calibration.
    - Enable DDRPHY_ZQ_CON0.zq_clk_div_en
    - Enable DDRPHY_ZQ_CON0.zq_manual_str
    - Wait until DDRPHY_ZQ_CON1.zq_done is enabled
    - Disable DDRPHY_ZQ_CON0.zq_manual_str
    - Disable DDRPHY_ZQ_CON0.zq_clk_div_en
32. Frequency change to the target operation speed. Using frequency change protocol via MC-PHY hangshake.
    - Set DDRCTL_SWCTL.sw_done to 1'b0.

- Set DDRCTL_DFIMISC.dfi_init_complete_en to 1’b0.
- Set DDRCTL_DFIMISC.dfi_init_start to 1’b1. Set DDRCTL_SWCTL.sw_done to 1’b1.
- Poll DDRCTL_DFISTAT.dfi_init_complete=1’b0.
- Programming DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR01_GRF to 1’b0, programming DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR23_GRF to 1’b0 to disable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
- Assert div_rst_n of DDRPHY.
- Change clk_phy2x frequency of DDRPHY by setting DDR0CRU_CLKSEL_CON00[0], DDR1CRU_CLKSEL_CON00[0], DDR2CRU_CLKSEL_CON00[0] and DDR3CRU_CLKSEL_CON00[0] to 1’b1 to select D0BPLL, D1BPLL, D2BPLL and D3BPLL output clock as DDRPHY driving clock.
- De-assert div_rst_n of DDRPHY.
- Programming DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR01_GRF to 1’b1, programming DDR_GRF_PHY_CON0[3] and DDR_GRF_PHY_CON1[3] of DDR23_GRF to 1’b1 to enable DDRPHY2XCLKGATE_ENABLE of each DDRPHY.
- Set DDRCTL_SWCTL.sw_done to 1’b0. Set DDRCTL_DFIMISC.dfi_init_start to 1’b0. Set DDRCTL_SWCTL.sw_done to 1’b1.
- Poll DDRCTL_DFISTAT.dfi_init_complete=1’b1.
- Set DDRCTL_SWCTL.sw_done to 1’b0.
- Set DDRCTL_DFIMISC.dfi_init_complete_en to 1’b1 to indicate to the controller that the DDRPHY has finished frequency change.
- Set DDRCTL_SWCTL.sw_done to 1’b1.

33. Turn DDRPHY master DLL by setting DDRPHY_MDLL_CON0.ctrl_dll_on=1’b1.
34. Start DDRPHY master DLL locking by enable DDRPHY_MDLL_CON0.ctrl_start
    - Set DDRPHY_MDLL_CON0.ctrl_start to 1’b0.
    - Set DDRPHY_MDLL_CON0.ctrl_start to 1’b1.
    - Wait until DDRPHY_MDLL_CON1.ctrl_locked=1’b1.
35. DDRPHY SFR settings.
    - Set DDRPHY_LP_CON0.wck_enable=1’b1.
    - Set DDRPHY_LP_CON0.ctrl_scheduler_en=1’b1.
    - Set DDRPHY_LP_CON0.ctrl_dqs_drv_off=1’b1 if write link ECC is disabled.
    - Set DDRPHY_GNR_CON0.wdqs_oen_mode=1’b1.
36. Set DDRPHY wck_adj, rwck_adj, wckdur_adj, rwckdur_adj properly. Set gate/read settings properly.
37. Start DDRPHY initial training. Please refer to the following section for LPDDR5 training procedure.
38. Please set WCK_MODE_APB before memory normal operation.

If WCK always on mode is enabled, set DDRPHY_WCK2CKSYNC_CON0.WCK_MODE_APB=2’b1 and DDRPHY_SCHD_CMD_CON0.CAS_EN_APB=1’b0. If WCK always on mode is disabled, set DDRPHY_WCK2CKSYNC_CON0.WCK_MODE_APB=2’b0 and DDRPHY_SCHD_CMD_CON0.CAS_EN_APB=1’b1.

2.6.3 LPDDR4/4X Training Procedure

Please apply the following steps before memory initialization if training are required. Controller should not assert dfi_ctrlupd_req during training.

- Settings before training
    - Set DDRPHY_OFFSETD_CON0.upd_mode=1’b0 for PHY-initiated update mode.
    - Write current frequency to DDRPHY_DVFS_CON.freq_train
    - Initial Vref setting.
    - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw=1’b1 to freeze DLL lock value during training for stability.
- Command bus training
- Apply one of the following DQS cleaning options.
    - Auto DQS clean mode
    - IO RCV Single-Ended mode
- Read DQ training
- Write DQ training

- Save the training result to read and save training registers for PHY power in/off scenario.
- Initial training at lower frequency if necessary.
- The PHY should start the periodic training to compensate DRAM voltage/temperature variation followed by periodic training guide.

2.6.4 LPDDR4/4X Command Bus Training

DDRPHY supports 2 command bus training modes for LPDDR4/4X. That is SW command bus training mode and HW command bus training mode.
Following steps are for SW command bus training mode.

- Change to low frequency (under 200MHz).
- Set DDRPHY_LP_CON0.ds_io_pd=1’b0.
- Apply DQS offset.
  - DDRPHY_CAL_CON3.wrlvl_sw_mode=1’b1.
  - DDRPHY_WR_LVL_CON0.ctrl_wrlvl*_code=ck_offset (ck_offset=91ps/tFS, tFS: finedelay).
  - Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
  - Disable DDRPHY_OFFSETD_CON0.ctrl_resync.
  - DDRPHY_CAL_CON3.wrlvl_sw_mode=1’b0.
- Controller should configure memory (LPDDR4/4X) in comman bus training mode. Issue MRW-1 command followed by MRW-2 command to set MR13 OP[0]=1’b1 (command bus training mode enabled).
- After tMRD, configure DDRPHY in command bus training mode.
  - Set DDRPHY_CAL_CON0.ca_cal_mode=1’b1.
  - Set DDRPHY_CBT_CON0.cbt_vref_dqs_en=1’b1.
  - After tDQSCKE, set DDRPHY_CBT_CON3.cbt cke=2’b0.
- After tCKELCK, change CK frequency to the highest operating frequency.
- Configure CA Vref setting.
  - Set DDRPHY_CBT_CON0.cbt_ca_vref=CA Vref setting value(MR12 OP[6: 0]).
  - Set DDRPHY_CAL_CON3.wr_sw_mode=1’b1.
  - Set DDRPHY_WR_LVL_CON2.ctrl_dqs_shift=1’b1.
  - After tCAENT(20ns), set DDRPHY_CBT_CON0.cbt_vref_dq_en=1’b1 to drive CA vref setting value on DQ.
  - Wait until DDRPHY_CBT_CON5.cbt_tDSTRAIN+ DDRPHY_CBT_CON5.cbt_tDHTRAIN+6 DFI clock cycle.
  - Set DDRPHY_CBT_CON0.cbt_vref_dq_ en=1’b0.
  - Set DDRPHY_WR_LVL CON2.ctrl dqs shift=1’b0.
  - Set DDRPHY_CAL_CON3.wr_sw_mode=1’b0.
  - Wait for tVREF_LONG(250ns max).
  - Set DDRPHY_CBT_CON0.cbt_sw_mode=1’b1.
- Run command bus training (CA training/CS fine training) as followings.
  Following are function definition.

```
APB_READ(REG_NAME.field_name)

```

If two ranks are used, CS1DeSkewCode should be applied by training result of CS0 (CS0DeSkewCode).

- Exit command bus training.
  - Set DDRPHY_CBT_CON3.cbt_cke= 2'b11
  - Wait for tCKEHDQS.
  - Set DDRPHY_CBT_CON0.cbt_vref_dqs_en=1'b0.
  - Set DDRPHY_CAL_CON0.ca_cal_mode=1'b0.
  - Set DDRPHY_CBT_CON0.cbt_sw_mode=1'b0.
  - After tFC(20ns), memory controller should configure memory(LPDDR4/4X)in normal mode.

Following steps are for HW command bus training mode.

- Change to the low frequency (under 200MHz)
- Set DDRPHY_LP_CON0.ds_io_pd=1'b0.
- Set DDRPHY_CAL_CON0.ca_swap_mode_dis=1'b1.
- Apply DQS offset

  - DDRPHY_CAL_CON3.wrlvl_sw_mode=1’b1
  - DDRPHY_WR_LVL_CON0.ctrl_wrlvl*_code =ck_offset(ck_offset=91ps/tFS, tFS: finedelay).
  - Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
  - Disable DDRPHY_OFFSETD_CON0.ctrl_ resync.
  - DDRPHY_CAL_CON3.wrlvl_sw_mode=1’b0.
- Controller should configure memory(LPDDR4/4X)in command bus training mode. Controller should issue MRW-1 command followed by MRW-2 command to set MR13 OP[0]=1’b1(command bus training mode enabled).
- After tMRD, configure DDRPHY in command bus training mode.
  - Enable DDRPHY_CAL CON0.ca_cal_mode.
  - Set DDRPHY_CBT_CON0.cbt_vref_dqs_en as 2’b01.
  - After tDQSCKE, set DDRPHY_CBT_CON2.cbt_cke as 2’b00.
- After tCKELCK, change CK frequency to the highest operating frequency.
- Configure CA Vref setting
  - Set CA Vref setting value(MR12 OP[6:0]) in DDRPHY_CBT_CON0.cbt_ca_vref.
  - Enable DDRPHY_CAL_CON3.wr_sw_mode.
  - Set DDRPHY_WR_LVL_CON2.ctrl_dqs_shift=1’b1.
  - After tCAENT(20ns), set DDRPHY_CBT_CON0.cbt_vref_dq_en as 2’b01 to drive CA vref setting value on DQ.
  - Wait until DDRPHY_CBT_CON5.cbt_tDSTRAIN+ DDRPHY_CBT_CON5.cbt_tDHTRAIN+6 DFI clock cycle.
  - Set DDRPHY_CBT_CON0.cbt_vref_dq_en as 2’b00.
  - Set DDRPHY_WR_LVL_CON2.ctrl_dqs_shift=1’b0.
  - Disable DDRPHY_CAL_CON3.wr_sw_mode.
  - Wait for tVREF_LONG(250ns max).
- Start CS/CA calibration.
  - Apply CK/CS offset.
    Enable DDRPHY_CBT_CON0.cbt_sw_mode.
    Set DDRPHY_CA_DESKEW_CON4.CKDeSkewCode=ck_offset(ck_offset=91ps/tFS, tFS: finedelay).
    Set DDRPHY_CA_DESKEW_CON5.CS0DeSkewCode=ck_offset(ck_offset=91ps/tFS, tFS: finedelay).
    Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
    Disable DDRPHY_OFFSETD_CON0.ctrl_resync.
    Disable DDRPHY_CBT_CON0.cbt_sw_mode.
  - Enable DDRPHY_LP_CON0.scheduler_HW_clock_gating_disable.
  - Enable DDRPHY_LP_CON0.ctrl_scheduler_en.
  - Enable DDRPHY_CBT_CON0.cbt_cs_coarse_dis.
  - Enable DDRPHY_CBT_CON3.cbt_hw_cal_start.
  - Wait until DDRPHY_CBT_CAL_STAT0.cbt_hw_cal_done.
  - Disbale DDRPHY_LP_CON0.ctrl_scheduler_en.
  - Disable DDRPHY_LP_CON0.scheduler_HW_clock_gating_disable.
- Exit command bus training.
  - Set DDRPHY_CBT_CON2.cbt_cke as 2’b11.
  - Wait for tCKEHDQS.
  - Set DDRPHY_CBT_CON0.cbt_vref_dqs_en as 2’b00.
  - Set DDRPHY_CAL_CON0.ca_cal_mode to 1’b0.
  - Disable DDRPHY_CBT_CON3.cbt_hw_cal_start.
  - After tFC(20ns), memory controller should configure memory (LPDDR4/4X) in normal mode.

2.6.5 LPDDR4/4X DQS Clean Procedure

1. Auto DQS clean mode

The goal of auto DQS clean mode is to get valid read DQS without the gate training. Auto DQS clean mode can be used if VSSQ termination is enabled.

- Set DDRPHY_TESTIRCV_CON0.dqs0_testircv=4’h3, DDRPHY_TESTIRCV_CON0.dqs1_testircv=4’h3.

- Set DDRPHY_CAL_CON0.gate_cal_mode=1’b0.
- Enable DDRPHY_CAL_CON3.auto_dqs_clean.
- Set DDRPHY_CAL_CON2.ctrl_rodt_disable=1’b0.

2. DQS Clean Using IO RCV Single-Ended(SE) mode on VSSQ Termination(Mandatory under 2133Mbps)

The goal of DQS clean using IO RCV SE mode is to get valid read DQS without the gate training and auto dqs clean on VSSQ termination on. It is allowed under 2133Mbps and IO RCV SE mode and RCV ODT should be enabled.

2.6.6 LPDDR4/4X Read DQ Calibration

Read DQ calibration adjusts DQS and DQ delay to compensate the skew introduced by the package, board and on-chip to maximize the setup and hold timing margin.

- Configure DDRPHY training pattern registers in DDRPHY_CAL_RD_PATTERN_CON0.
  - Set rdtrn_inv_pattern_ds0=0xee, rdtrn_inv_pattern_ds1=0xee, rdtrn_rddata_pattern0=0x55 and rdtrn_rddata_pattern1=0x55.
  - Configure DDRPHY_OP_CODE_RDC registers for MR32, MR40, MR20 and MR15 such that the training pattern output from DRAM is the same as the training pattern defined above.
  - Configure MR32, MR40, MR25 and MR15 for read training pattern. OP_CODE_PATA=0x55(=rdtrn_rddata_pattern0), OP_CODE_PATB =0x55(=rdtrn_rddata_pattern1), OP_CODE_INVA=0xee(=rdtrn_inv_pattern_ds0), OP_CODE_INVB=0xee(=rdtrn_inv_pattern_ds1).
  - Rdtrn_inv_pattern should be the same per BYTE.
  - Based on the DDRPHY_OP_CODE* values, DDRPHY will send MRW for MR31, MR32, MR3 and MR34 to DRAM at the beginning of Read training.
- Configure DDRPHY in read training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_rdtrn_en=1’b1.
  - Set SCHD_TRAIN_CON0.phy_rdtrn_rank_en properly. For example, if phy_rdtrn_rank_en is set to 2’b11, per-rank read training will start from rank-0 to rank-1 sequentially. Any rank can be enabled for read training. For example, it is possible to set phy_rdtrn_rank_en= 2’b10.

Caution: For Read DQ's setup/hold margin maximization, read DQ delay should bigger than read DOS delay.

Caution: Pattern configuration is an example. Training pattern can be changed by user selection.

2.6.7 LPDDR4/4X Write DQ Calibration Initiated by DDRPHY

Write DQ calibration adjusts for the delays introduced by the memory (tDQS2DQ), package, board and on-chip that impact the write cycle.

Normal Initial Training Setting (533MHz or more)

- If data mask and DBI are all disabled at DRAM, set DDRPHY_CAL_CON0.wrtrn_dbi_cal_en=1’b0. Otherwise, set to 1’b1.
- If current frequency is equal or greater than 1066MHz
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_en=1 and DDRPHY_CAL_CON5.wrtm_cyc_mode=0 (High frequency cycle based training mode).
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_th=0x1f.
- If current frequency is less than 1066MHz and equal to or greater than 533MHz, set DDRPHY_CAL_CON5.wrtrn_cyc_en=1 and DDRPHY_CAL_CON5.wrtm_cyc_mode=1 (Low frequency cycle based training mode).
- Increase DDRPHY_CAL_CON4.num_repeat to make the initial training result stable.
- Set DDRPHY_CAL_CON4.wrtrn_multi_pattern to 1, to use more patterns during the initial training. Additional patterns should be defined in DDRPHY_CAL_WR_PATTERN2_CON0~4, DDRPHY_CAL_WR_PATTERN3_CON0~4, DDRPHY_CAL_WR_PATTERN4_CON0~4.
- DDRPHY_CAL_CON5.wrtm_cyc_mode should be 0 during normal operation.

Low Frequency Initial Training Setting (under 533MHz)-

- Set DDRPHY_CAL_CON0.dvfs_wr_train_en=0x1.
- Set DDRPHY_CAL_CON4.dvfs_wr_start_adj=0x0.
- Set DDRPHY_CAL_CON5.wrtm_cyc_en=0.
- After low frequency write training is done, apply the following setting.
  - Store the current lockvalue/4 value.
  - Store write training results from DDRPHY_WR_DESKEWC_CS*_CON*, DDRPHY_DM_DESKEWC_CS*_CON*.
  - Write (stored write training result values+lockvalue*2/4 value) to the following registers.
    - Enable DDRPHY_CAL_CON0.wr_cal_mode.
    - Enable DDRPHY_CAL_CON3.wr_sw_mode.
    - DDRPHY_SW_WR_DESKEWC_CS*_CON, DDRPHY_SW_DM_DESKEWC_CS*_CON*.
    - Disable DDRPHY_CAL_CON3.wr_sw_mode.
    - Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
    - Disable DDRPHY_OFFSETD_CON0.ctrf_resync.
- Restore DVFS write training related setting for successful DVFS write training or other initial write training.
  - Set DDRPHY_CAL_CON4.dvfs_wr_slart_adj=0xf.
  - Set DDRPHY_CAL_CON0.dvfs_wr_train_en=0.

Common Setting for Write Training

- Set write training paltem
  - DQ pattern in DDRPHY_CAL_WR_PATTERN1_CON0~ DDRPHY_CAL_WR_PATTERN1_CON3.
- Set wrtrn_rddata_adj_w0_bst1_8 for BL1~BL2 pattern.
- Set wrtrn_rddata_adj_w1_bst1_8 for BL3~BL4 pattern.
- Set wrtm_rddata_adj_w2_bst1_8 for BL5~BL6 pattern.
- Set wrtrn_rddata_adj_w3_bst1_8 for BL7~BL8 pattern.
- Set wrtm_rddata_adj_w0_bst9_16 for BL9~BL10 pattern.
- Set wrtrn_rddata_adj_w1_bst9_16 for BL11~BL12 pattern.
- Set wrtm_rddata_adj_w2_bst9_16 for BL13-BL14 pattern.
- Set wrtrn_rddata_adj_w3_bst9_16 for BL15~BL16 pattern.
- Set write DM pattern in CAL_WR_PATTERN1_CON4.
- Set wrtrn_rddata_dm_adj_w0_bst1_8 for BL1~BL2 pattern.
- Set wrtrn_rddata_dm_adj_w1_bst1_8 for BL3~BL4 pattern.
- Set wrtrn_rddata_dm_adj_w2_bst1_8 for BL5~BL6 pattern.
- Set wrtrn_rddata_dm_adj_w3_bst1_8 for BL7~BL8 pattern.
- Set wrtrn_rddata_dm_adj_w0_bst9_16 for BL9~BL10 pattern.
- Set wrtrn_rddata_dm_adj_w1_bst9_16 for BL11~BL12 pattern.
- Set wrtrn_rddata_dm_adj_w2_bst9_16 for BL13~BL14 pattern.
- Set wrtrn_rddata_dm_adj_w3_bst9_16 for BL15~BL16 pattern.
- Configure DDRPHY in write training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_wrtrn_en=1.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_wrtrn_rank_en properly.
  - For example, if phy_wrtrn_rank_en is set to 0x3, per-rank write training will start from rank0 to rank1 sequentially.

2.6.8 LPDDR4/4X Periodic Training

Periodic training using PHY master interface

Periodic write training compensates write center shift and gate shift caused by VT variation in memory. Initial training should be completed before periodic training. During periodic training, DDRPHY uses the PHY master interface and generates MPC commands without the memory controller. When DDRPHY request PHY master mode, the controller should place the DRAM in self refresh and assert dfi_phymstr_ack. Periodic write training will be excuted in sequence.

- The common parameter is same as initial training.
- Enable periodic gate training properly (refer to SFR description)
  - Set DDRPHY_SCHD_TRAIN_CON0.periodic_gttrn_en and if use DVFS, set

DDRPHY_DVFS0_TRAIN_CON0.dvfs0_periodic gttrn_en and
DDRPHY_DVFS1_TRAIN_CON0.dvfs1_periodic_gttrn_en.

- Enable periodic write training properly. Mandatory up to 2133Mbps.
  - Set DDRPHY_SCHD_TRAIN_CON0.periodic_wrtrn_en and if use DVFS, set DDRPHY_DVFS0_TRAIN_CON0.dvfs0_periodic_wrtrn_en and DDRPHY_DVFS1_TRAIN_CON0.dvfs1_periodic_wrtrn_en.
- Set DDRPHY_SCHD_TRAIN_CON1.periodic_time.
  - Interval of periodic training = periodic_time*tCK_osc (oscillator dock).
- Set DDRPHY_SCHD_TRAIN_CON1.periodic_en =1 and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_periodic_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_periodic_en properly.
- Set DDRPHY_SCHD_TRAIN_CON1.periodic en = 0 for disable periodic training and if use DVFS, set
  DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_periodic_en and
  DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_periodic_en properly.

DVFS training using PHY master interface

DVFS training compensates write center shift and gate shift caused by VT variation in memory. Initial write/gate training should be completed before DVFS training. During DVFS training, DDRPHY uses the PHY master interface and generates MPC commands without the memory controller. When DDRPHY request PHY master mode, the controller should place the DRAM in self refresh and assert dfi_phymstr_ack. DVFS training will be executed in sequence.

- The common parameter is same as initial training.
- Enable DVFS gate training properly
  - Set DDRPHY_SCHD_TRAIN_CON0.dvfs_gttrn_en and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_dvfs_gttrn_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_dvfs_gttrn_en.
- Enable DVFS write training properly.
  Set DDRPHY_SCHD_TRAIN_CON0.dvfs_wrtrn_en and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_dvfs_wrtrn_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_dvfs_wrtrn_en.
- Set DDRPHY_CAL_CON0.dvfs_wr_train_en=1(DVFS mode).

2.6.9 LPDDR5 Training Procedure

- Settings before training.
  - Set DDRPHY_OFFSETD_CON0.upd_mode=0 for PHY-initiated update mode.
  - Write the current frequency to DDRPHY_DVFS_CON.freq_train.
  - Initial Vref setting.
  - Set DDRPHY_MDLL_CON1.clkm_cg_en_sw=1 to freeze DLL lock value during training for stability.

Before DRAM interface training, training setting should be configured properly.

- LP5 SW CBT (command bus training)
- Auto DQS clean
- Read Calibration
- Write DQ Calibration

To set DDRPHY training under 1600Mbps at MODE4/3, under 1067Mbps at MODE2, DDRPHY training need WCK2CK sync always on mode and DDRPHY_WCK2CKSYNC_CON0.ctrl_WCK_MODE_APB=1. So please follow the DDRPHY training procedure below.

Set MR18 OP[4]=0(always on disable), CAS_EN=1, WCK_MODE=0 ==> CBT/WCK2CK leveling(if needed) ==> set MR18 OP[4]=1(always on), CAS_EN=0,WCK_MODE=1 ==> Send CAS command to memory ==> set dfi_wck_en always 1 ==> DDRPHY training except CBT, WCK2CK leveling (if needed) ==> User choice for WCK2CK sync operation (if use wck2ck sync always on, please keep it or if not, set MR18 OP[4]=0(always on disable), CAS_EN=1,WCK_MODE=0 ==>Do normal transactions.

After training setting is done, apply the following sequence.

- Configure common parameter training properly.

  - Set DDRPHY_SCHD_TIME_CON0.phy_t_rddata_en='d6.
  - Set DDRPHY_SCHD_TIME_CON0.WL to match it with DRAM WL setting.
  - Set DDRPHY_SCHD_TIME_CON1.tCCD=0x8(LPDDR5).
  - Set DDRPHY_SCHD_TIME_CON1.tWTR=0x1f.
  - If WCK always on disable, set DDRPHY_WCK2CKSYNC_CON0.ctrl_WCK_MODE_APB=0x0 and DDRPHY_SCHD_CMD_CON0.CAS_EN_APB=0x1.
  - If WCK always on, set WCK2CKSYNC_CON0.ctrl_WCK_MODE_APB=0x1 and SCHD_CMD_CON0.CAS_EN_APB=0x0.
  - WCK should be driven by memory controller at WCK always on mode.
- Set MR operand code same as setting on memory.
  - For LPDDR5, DDRPHY_LP5_MR_OP.
- Enable DDRPHY training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_train_en=0x1.
- Wait until SCHD_TRAIN_CON0.phy_train_done=0x1.
- Disable DDRPHY training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_train_en=0x0.
- Setting after training.
  - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw=0 to enable DLL locking.
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_mode=0 during normal operation.
  - Set DDRPHY_CAL_CON0.cal_vtc_en=1 to compensate voltage, temperature variation on calibration results.
  - Set DDRPHY_CAL_CON0.dvfs_wr_train_en=1 initial write training (Write training with dfi_lvl_periodic=0) will be interpreted as DVFS write training afterwards.
- Update DDRPHY DLL
  - Enable DDRPHY_OFFSETD_CON0.ctrl_resync.
  - Disable DDRPHY_OFFSETD_CON0.ctrl_resync.
- The DDRPHY should start the periodic training to compensate DRAM voltage/temperature variation followed by periodic training guide.
  - Write periodic training.

2.6.10 LPDDR5 Command Bus Training

LPDDR5 only supports SW command bus training mode. LPDDR5 SW command bus training supports CA bit de-skewing function. The overall sequence is CA left edge searching-CA right edge searching-Calculation center code of CA. Because LPDDR5 CA is DDR (CA is captured at CK rising edge and falling edge), the edge should be searched with changing CBT-PH mode. **Setting before Training**

- Before CBT training start, check if MR13 OP[6]=1 for CBT mode2.
- Set DDRPHY_SCHD_CMD_CON0.RANK_SEL=cs.
- Set DDRPHY_CBT_CON2.cbt_dqdm_sel=0x80.
- Set DDRPHY_CBT_CON0.cbt_sw_mode=0x1.
- Set DDRPHY_CBT_CON2.cbt_tWCK2DQ7 satisfying memory timing parameter tWCK2DQ7H.
- Set DDRPHY_CBT_CON2.cbt_tDSTRAIN_LP5 satisfying memory timing parameter tDStrain.

CA Left Edge Searching with CBT-PH[7]=1'b0

- Entering CBT Mode
  - Configure the memory entering CBT mode.
    - Set DDRPHY_SCHD_CON0.scheduler_sw_mode=0x1.
    - Set DDRPHY_CAL_CON0.ca_cal_mode=0x1.
    - Set DDRPHY_CBT_CON0.cbt_vref_dqs_en=0x1.
    - Set DDRPHY_WCK2CKSYNC_CON0.wck_out_enable=0x1.
    - Set DDRPHY_SCHD_CMD_CON2.MA_CODE=0x10.
    - Set DDRPHY_SCHD_CMD_CON2.OP_CODE=0x10.
    - Toggle DDRPHY_SCHD_DIRECT_CMD3.CMD_MWR_req.
  - Configure the PHY entering CBT mode.
    - Set DDRPHY_CBT_CON0.cbt_vref_dq_en=0x1.

- ◆ Set DDRPHY_CBT_CON2.cbt_start=0x1.
- ◆ Wait for tDQ7HWCK+tDQ72DQ (255ns).
- ◆ Set DDRPHY_CBT_CON2.cbt_wck_en=0x1.
- ◆ Toggle DDRPHY_CBT_CON2.cbt_vref_set_en.
- ◆ Set DDRPHY_CBT_CON2.cbt_dq_rcv_en=0x1.
- ◆ Set DDRPHY_CBT_CON3.cbt_en=0x1.
- ◆ Toggle DDRPHY_OFFSETD_CON0.ctrl_resync.

- Searching CA Left edge as followings.

Calculation of CA Center Code

- MODE2
  - CA_VWMR_TMP[k]=Lock_value – CA_VWMR[k](k=0,1,2…6)
  - If CA_VWML[k]>=CA_VWMR_TMP[k], CA_VWMC[k]=(CA_VWML[k]-CA_VWMR_TMP[k])/2+Lock_value/2
  - Else, CA_VWMC[k]=Lock_value/2-((CA_VWMR_TMP[k]-CA_VWML[k])/2)
- MODE4
  - CA_VWMR_TMP[k]=2*Lock_value-CA_VWMR[k](k=0,1,2…6).
  - If CA_VWML[k]>=CA_VWMR_TMP[k], CA_VWMC[k]=(CA_VWML[k]-CA_VWMR_TMP[k])/2+Lock_value.
  - Else, CA_VWMC[k]=Lock_value-((CA_VWMR_TMP[k]-CA_VWML[k])/2).
- Update CA center code on
  - Write DDRPHY_CA_DESKEW_CON0~2.CAkDeSkewCode as CA_VWMC[k].
  - Set DDRPHY_CBT_CON3.cbt_en=0x1.
  - Toggle DDRPHY_OFFSETD_CON0.ctrl_resync.
  - Set DDRPHY_CBT_CON0.cbt_sw_mode=0x0.

2.6.11 LPDDR5 DQS Clean Procedure

Auto DQS Clean (Mandatory above 3200Mbps)

The goal of auto DQS clean mode is to get valid read DQS without the gate training. Auto DQS clean mode can be used if VSSQ termination is enabled.

- Set DDRPHY_TESTIRCV_CON0.dqs0_testircv=0x3, DDRPHY_TESTIRCV_CON0.dqs1_testircv=0x3.
- Set DDRPHY_CAL_CON0.gate_cal_mode=0x0.
- Enable DDRPHY_CAL_CON3.auto_dqs_clean.
- Set DDRPHY_CAL_CON2.ctrl_rodt_disable=0x0.

If auto DQS clean mode is enabled, RL should be minimum RL of below table or more. The memory post_amble duration should be 4.5tWCK static and preamble duration should be 2tWCK static, 2tWCK toggle or 4tWCK static.

Table 2-5 Minimum Read Latency for LPDDR5 Auto DQS Clean Enable

PHY mode	0	1	2	3	4
Memory Type	LPDDR4/4X		LPDDR5		
Min Read Latency w/Auto DQS Enable	28CK	24CK	14CK (28 WCK)	9CK (36 WCK)	9CK (36 WCK)

DQS Clean Using IO RCV Single-Ended (SE) Mode on VSSQ Termination (Mandatory under 3200Mbps)

The goal of DQS clean using IO RCV SE mode is to get valid read DQS without the gate training and auto dqs clean on VSSQ termination ON. It is allowed under 3200Mbps and IO RCV SE MODE and RCV ODT should be enabled.

2.6.12 LPDDR5 Read DQ Calibration

Read Calibration adjusts DQS and DQ delay to compensate the skew introduced by the package, board and on-chip to maximize the setup and hold timing margin.

- Configure PHY training pattern registers in CAL_RD_PATTERN_CON0
  - Set rdtrn_inv_pattern_ds0=0xee, rdtrn_inv_pattern_ds1=0xee, rdtrn_rddata_pattern0=0x55 and rdtrn_rddata_pattern1=0x55.
  - Configure DDRPHY_OP_CODE_RDC registers for MR31, MR32, MR33 and MR34 such that the training pattern output from DRAM is the same as the training pattern defined above.
  - Configure MR31, MR32, MR33 and MR34 for read training pattern.
    - OP_CODE_PATA=0x55(rdtrn_rddata_pattern0), OP_CODE_PATB=0x55(rdtrn_rddata_pattern1), OP_CODE_INVA=0xee(rdtrn_inv_pattern_ds0), OP_CODE_INVB=0xee(rdtrn_inv_pattern_ds1).

- Rdtrn_inv_pattern should be the same per BYTE.
- Based on the OP_CODE_* values, PHY will send MRW for MR31, MR32, MR33 and MR34 to DRAM at the beginning of read training.

- Configure DDRPHY and memory in link ECC mode, if link ECC is enabled.
  - Configure memory in link ECC mode.
    - Issue MR3 command to set DBI-WR enabled and DBI-RD disabled.
    - Issue MR22 command to enable link ECC mode.
  - Configure DDRPHY in link ECC mode.
    - Set DDRPHY_CAL_CON0.rdtrn_dbi_cal_en =0x1.
    - Set DDRPHY_CAL CON3.ctrl_link_ecc_mode=0x1.
- Configure DDRPHY in read training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_rdtrn_en=1
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_rdtrn_rank_en properly.
    - For example, if phy_rdtrn_rank_en is set to 2’b11, per-rank read training will start from rank0 to rank1 sequentially.
    - Any rank can be enabled for read training. For example, it is possible to set phy_rdtrn_rank_en=2’b10.

2.6.13 LPDDR5 Write DQ Calibration

Normal Initial Training Setting (533MHz or More)

- If data mask and DBI are all disabled at DRAM, set DDRPHY_CAL_CON0.wrtrn_dbi_cal_en=0. Otherwise set to 1.
- Configure DDRPHY and memory in link ECC mode if link ECC is enabled.
  - Configure memory in link ECC mode.
    - Issue MR3 command to set DBI-WR enabled and DBI-RD disabled.
    - Issue MR22 command to enable link ECC mode.
  - Configure DDRPHY in link ECC mode.
    Set DDRPHY_CAL_CON0.wrtrn_dbi_cal_en=0x1.
    Set DDRPHY_CAL_CON3.ctrl_link_ecc_mode=0x1.
- If current frequency is equal to or greater than 1066MHz
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_en=1 and DDRPHY_CAL_CON5.wrtrn_cyc_mode=0(High frequency cycle based training mode).
  - Set DDRPHY_CAL_CON5.wrtrn_cyc_th=31(LPDDR5).
  - If PRBS write training is to be enabled after write training is done
    - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw=1
    - Read DDRPHY_MDLL_CON1.ctrl_lock_value
    - Set DDRPHY_CAL_CON5.wrtrn_cyc_th=ctrl_lock_value/4
    - Set DDRPHY_MDLL_CON0.clkm_cg_en_sw=0
- If current frequency is less than 1066MHz and equal to or greater than 533MHz, set DDRPHY_CAL_CON5.wrtrn_cyc_en=1 and DDRPHY_CAL_CON5.wrtrn_cyc_mode=1(Low frequency cycle based training mode).
- Increase DDRPHY_CAL_CON4.num_repeat to make the initial training result stable.
- Set DDRPHY_CAL_CON4.wrtrn_multi_pattern to 1 to use more patterns during the initial training. Additional patterns should be defined in DDRPHY_CAL_WR_PATTERN2_CON0~4, DDRPHY_CAL_WR_PATTERN3_CON0~4, DDRPHY_CAL_WR_PATTERN4_CON0~4.
- DDRPHY_CAL_CON5.wrtrn_cyc_mode should be 0 during normal operation.

Low Frequency Initial Training Setting (under 533MHz)

- Set DDRPHY_CAL_CON0.dvfs_wr_train_en=0x1.
- Set DDRPHY_CAL_CON4.dvfs_wr_start_adj=0x0.
- Set DDRPHY_CAL_CON5.wrtrn_cyc_en=0.
- After low frequency write training is done, apply the following setting.
  - Store the current lockvalue/4 value.
  - Store write training results from DDRPHY_WR_DESKEWC_CS*_CON*, DDRPHY_DM_DESKEWC_CS*_CON*, DDRPHY_ECC_DESKEWC_CS*_CON*.
  - Write (stored write training result values + lockvalue/4) to the following register.
    - Enable DDRPHY_CAL_CON0.wr_cal_mode.
    - Enable DDRPHY_CAL_CON3.wr_sw_mode.

- DDRPHY_SW_WR_DESKEWC_CS*_CON, DDRPHY_SW_DM_DESKEWC_CS*_CON*, DDRPHY_SW_ECC_DESKEWC_CS*_CON*.
- Disable DDRPHY_CAL_CON3.wr_sw_mode.
- Restore DVFS write training related setting for successful DVFS write training or other initial write training.
  - Set DDRPHY_CAL_CON4.dvfs_wr_start_adj=0xf.
  - Set DDRPHY_CAL_CON0.dvfs_wr_train_en=0.

Common Setting for Write Training

- Set write training paltem
  - DQ pattern in DDRPHY_CAL_WR_PATTERN1_CON0~ DDRPHY_CAL_WR_PATTERN1_CON3.
- Set wrtrn_rddata_adj_w0_bst1_8 for BL1~BL2 pattern.
- Set wrtrn_rddata_adj_w1_bst1_8 for BL3~BL4 pattern.
- Set wrtm_rddata_adj_w2_bst1_8 for BL5~BL6 pattern.
- Set wrtrn_rddata_adj_w3_bst1_8 for BL7~BL8 pattern.
- Set wrtm_rddata_adj_w0_bst9_16 for BL9~BL10 pattern.
- Set wrtrn_rddata_adj_w1_bst9_16 for BL11~BL12 pattern.
- Set wrtm_rddata_adj_w2_bst9_16 for BL13-BL14 pattern.
- Set wrtrn_rddata_adj_w3_bst9_16 for BL15~BL16 pattern.
- Set write DM pattern in DDRPHY_CAL_WR_PATTERN1_CON4.
- Set wrtrn_rddata_dm_adj_w0_bst1_8 for BL1~BL2 pattern.
- Set wrtrn_rddata_dm_adj_w1_bst1_8 for BL3~BL4 pattern.
- Set wrtrn_rddata_dm_adj_w2_bst1_8 for BL5~BL6 pattern.
- Set wrtrn_rddata_dm_adj_w3_bst1_8 for BL7~BL8 pattern.
- Set wrtrn_rddata_dm_adj_w0_bst9_16 for BL9~BL10 pattern.
- Set wrtrn_rddata_dm_adj_w1_bst9_16 for BL11~BL12 pattern.
- Set wrtrn_rddata_dm_adj_w2_bst9_16 for BL13~BL14 pattern.
- Set wrtrn_rddata_dm_adj_w3_bst9_16 for BL15~BL16 pattern.
- Configure DDRPHY in write training mode.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_wrtrn_en=1.
  - Set DDRPHY_SCHD_TRAIN_CON0.phy_wrtrn_rank_en properly.
  - For example, if phy_wrtrn_rank_en is set to 0x3, per-rank write training will start from rank0 to rank1 sequentially.

2.6.14 LPDDR5 Periodic Training

Periodic training compensates write center shift and gate shift caused by VT variation in memory. Initial write/gate training should be completed before periodic training. During periodic training, DDRPHY uses the PHY master interface and generates RDC/WFF/RFF/MPC commands without the memory controller. When DDRPHY request PHY master mode, the controller should place the DRAM in self refresh and assert dfi_phymstr_ack. Periodic training will be excuted in sequence.

- The common parameter is same as initial training.
- Enable periodic write training properly (refer to SFR description)
  - Set DDRPHY_SCHD_TRAIN_CON0.periodic_wrtrn_en and if use DVFS, set DDRPHY_DVFS0_TRAIN_CON0.dvfs0_periodic_wrtrn_en and DDRPHY_DVFS1_TRAIN_CON0.dvfs1_periodic_wrtrn_en.
- Set DDRPHY_SCHD_TRAIN_CON1.periodic_time.
  - Interval of periodic training = periodic_time*tCK_osc (oscillator clock).
- Set DDRPHY_SCHD_TRAIN_CON1/ DDRPHY_DVFS*_SCHD_TIME_CON3.periodic_en =1 and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_periodic_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_periodic_en properly.

2.6.15 LPDDR5 DVFS Training

DVFS training compensates write center shift and gate shift caused by VT variation in memory. Initial write/gate training should be completed before DVFS training. During DVFS training, DDRPHY uses the PHY master interface and generates RDC/WFF/RFF/MPC commands without the memory controller. When DDRPHY request PHY master mode, the controller should place the DRAM in self refresh and assert dfi_phymstr_ack. DVFS training will be executed in sequence.

- The common parameter is same as initial training.
- Enable DVFS write training properly.
  - Set DDRPHY_SCHD_TRAIN_CON0.dvfs_wrtrn_en and if use DVFS, set DDRPHY_DVFS0_SCHD_TIME_CON3.dvfs0_dvfs_wrtrn_en and DDRPHY_DVFS1_SCHD_TIME_CON3.dvfs1_dvfs_wrtrn_en.
- Set DDRPHY_CAL_CON0.dvfs_wr_train_en=1(DVFS mode).

Chapter 3 Mobile Storage Host Controller

3.1 Overview

The Mobile Storage Host Controller is designed to support Secure Digital memory (SD-max version 3.01) with 1 bits or 4 bits data width, Multimedia Card(MMC-max version 4.51) with 1 bits or 4 bits or 8 bits data width.
The Host Controller is instantiated for SDMMC, SDIO. The interface difference between these instances is shown in “Interface Description”.
The Host Controller supports following features:

- Bus Interface Features:
  - Support AMBA AHB interface for master and slave
  - Supports internal DMA interface(IDMAC)
    - Supports 16/32-bit data transfers
    - Single engine used for Transmit and Receive, which are mutually exclusive
    - Dual-buffer and chained descriptor linked list
    - Each descriptor can transfer up to 4KB of data in chained mode and 8KB of data in dual-buffer mode
    - Programmable burst size for optimal host bus utilization
  - Support combined single FIFO for both transmit and receive operations
  - Support FIFO size of 256x32
  - Support FIFO over-run and under-run prevention by stopping card clock
- Card Interface Features:
  - Support Secure Digital memory protocol commands
  - Support Secure Digital I/O protocol commands
  - Support Multimedia Card protocol commands
  - Support Command Completion Signal and interrupts to host
  - Support CRC generation and error detection
  - Support programmable baud rate
  - Support power management and power switch
  - Support card detection
  - Support write protection
  - Support hardware reset
  - Support SDIO interrupts in 1-bit and 4-bit modes
  - Support 4-bit mode in SDIO3.0
  - Support SDIO suspend and resume operation
  - Support SDIO read wait
  - Support block size of 1 to 65,535 bytes
  - Support 1-bit, 4-bit modes
- Clock Interface Features:
  - Support 0/90/180/270-degree phase shift operation for sample clock (cclk_in_sample) and drive clock(cclk_in_drv) relative to function clock(cclk_in) respectively
  - Support phase tuning using delay line for sample clock(cclk_in_sample) and drive clock(cclk_in_drv) relative to function clock (cclk_in) respectively. The max number of delay element number is 256

3.2 Block Diagram

The Host Controller consists of the following main functional blocks.

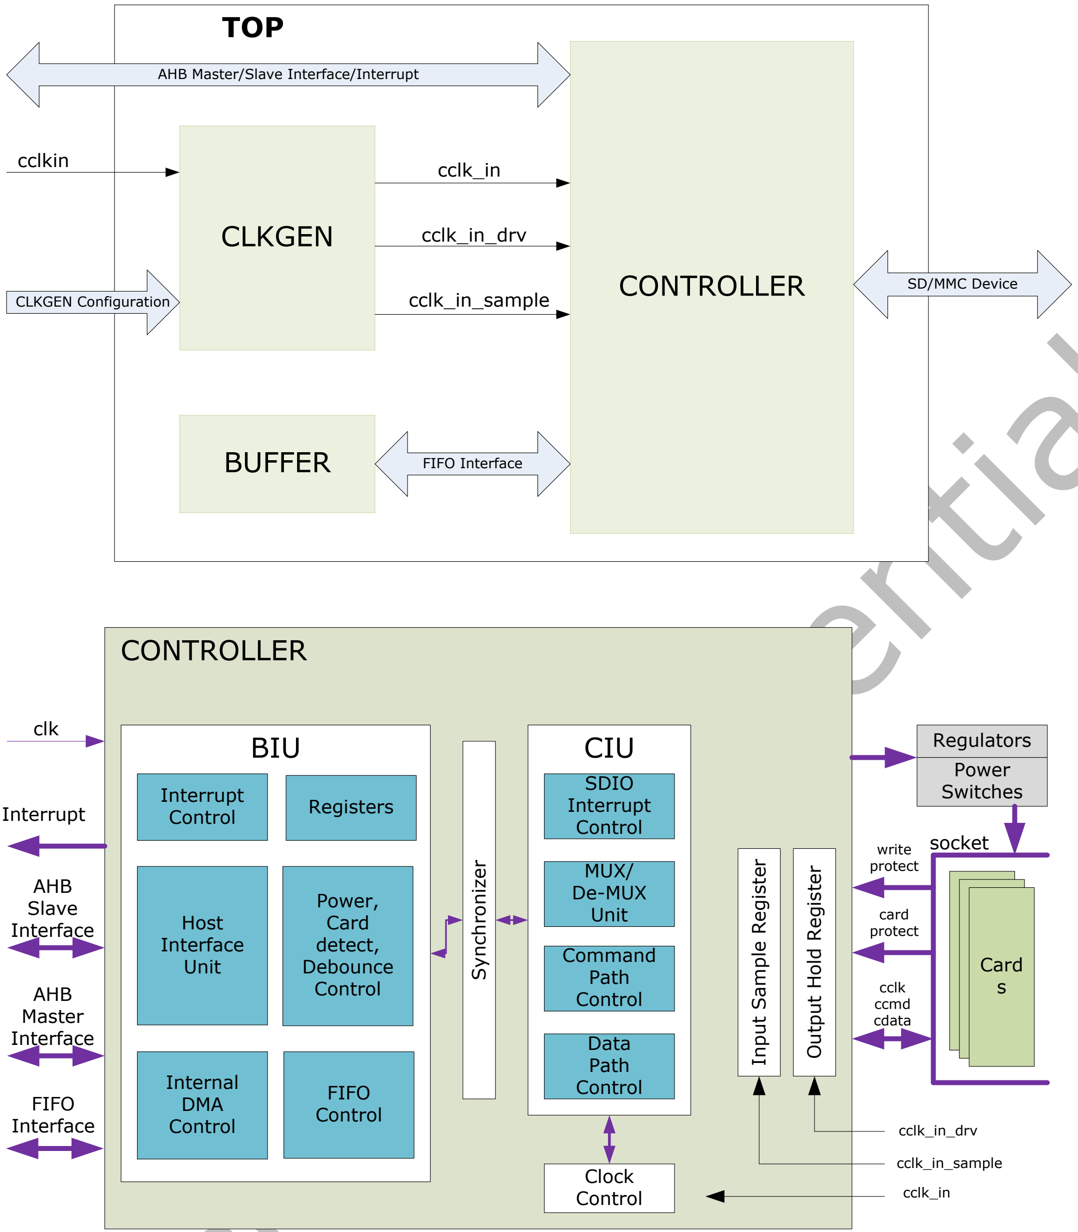

Fig. 3-1 Mobile Storage Host Control Block Diagram

- Clock Generate Unit (CLKGEN): Generates card interface clock cclk_in/ cclk_sample/cclk_drv based on cclkin and configuration information.
  - cclkin: original clock
  - cclk_in: functional clock
  - cclk_sample: sample clock
  - cclk_drv: driver clock
- Asynchronous dual-port memory (BUFFER): Use a two-clock synchronous read and synchronous write dual-port RAM. One of the ports is connected to the host clock, and the other port is connected to the card clock.
- Bus Interface Unit (BIU): Provides AMBA AHB interfaces for register and data read/write.
- Card Interface Unit (CIU): Takes care of the SD/MMC protocols and provides clock management.

3.3 Function Description

3.3.1 Bus Interface Unit

The Bus Interface Unit provides the following functions:

- Host interface
- Interrupt control
- Register access
- External FIFO access

- Power control and card detection

3.3.1.1 Host Interface Unit

The Host Interface Unit is an AHB slave interface, which provides the interface between the SD/MMC card and the host bus.

3.3.1.2 Register Unit

The register unit is part of the bus interface unit; it provides read and write access to the registers.
All registers reside in the Bus Interface Unit clock domain. When a command is sent to a card by setting the start_bit, which is bit[31] of the SDMMC_CMD register, all relevant registers needed for the CIU operation are transferred to the CIU block. During this time, the registers that are transferred from the BIU to the CIU should not be written. The software should wait for the hardware to clear the start bit before writing to these registers again. The register unit has a hardware locking feature to prevent illegal writes to registers. The lock is necessary in order to avoid metastability violations, both because the host and card clock domains are different and to prevent illegal software operations.
Once a command start is issued by setting the start_bit of the SDMMC_CMD register, the following registers cannot be reprogrammed until the command is accepted by the card interface unit:

- SDMMC_CMD – Command
- SDMMC_CMDARG – Command Argument
- SDMMC_BYTCNT – Byte Count
- SDMMC_BLKSIZ – Block Size
- SDMMC_CLKDIV – Clock Divider
- SDMMC_CLKENA – Clock Enable
- SDMMC_CLKSRC – Clock Source
- SDMMC_TMOUT – Timeout
- SDMMC_CTYPE – Card Type

The hardware resets the start_bit once the CIU accepts the command. If a host write to any of these registers is attempted during this locked time, then the write is ignored and the hardware lock error bit is set in the raw interrupt status register. Additionally, if the interrupt is enabled and not masked for a hardware lock error, then an interrupt is sent to the host.
When the Card Interface Unit is in an idle state, it typically takes the following number of clocks for the command handshake, where clk is the BIU clock and cclk_in is the CIU clock:
3 (clk) + 3 (cclk_in)
Once a command is accepted, you can send another command to the CIU-which has a one-deep command queue-under the following conditions:

- If the previous command was not a data transfer command, the new command is sent to the SD/MMC card once the previous command completes.
- If the previous command is a data transfer command and if wait_prvdata_complete (bit[13]) of the SDMMC_CMD register is set for the new command, the new command is sent to the SD/MMC card only when the data transfer completes.
- If the wait_prvdata_complete is 0, then the new command is sent to the SD/MMC card as soon as the previous command is sent. Typically, you should use this only to stop or abort a previous data transfer or query the card status in the middle of a data transfer.

3.3.1.3 Interrupt Controller Unit

The interrupt controller unit generates an interrupt that depends on the controller raw interrupt status, the interrupt-mask register, and the global interrupt-enable register bit. Once an interrupt condition is detected, it sets the corresponding interrupt bit in the raw interrupt status register SDMMC_RINTSTS. The raw interrupt status bit stays on until the software clears the bit by writing a 1 to the interrupt bit; a 0 leaves the bit untouched.
The interrupt port is an active-high, level-sensitive interrupt. The interrupt port is active only when any bit in the raw interrupt status register is active, the corresponding interrupt mask bit is 1, and the global interrupt enable bit is 1. The interrupt port is registered in order to avoid any combinational glitches.
The int_enable is reset to 0 on power-on, and the interrupt mask bits are set to 32’h0, which masks all the interrupts.
Notes:

Before enabling the interrupt, it is always recommended that you write 32'hffff_ffff to the raw interrupt status register in order to clear any pending unserviced interrupts. When clearing interrupts during normal operation, ensure that you clear only the interrupt bits that you serviced.
The SDIO Interrupts, Receive FIFO Data Request (RXDR), and Transmit FIFO Data Request (TXDR) are set by level-sensitive interrupt sources. Therefore, the interrupt source should be first cleared before you can clear the interrupt bit of the Raw Interrupt register. For example, on seeing the Receive FIFO Data Request (RXDR) interrupt, the FIFO should be emptied so that the "FIFO count greater than the RX-Watermark" condition, which triggers the interrupt, becomes inactive. The rest of the interrupts are triggered by a single clock-pulse-width source.

Table 3-1 Bits in Interrupt Status Register

Bits	Interrupt	Description
24	sdio_interrupt	Interrupt from SDIO card. In MMC-Ver3.3-only mode, these bits are always 0.
16	Card no-busy	If card exit busy status, the interrupt happened.
15	End Bit Error (read) / Write no CRC (EBE)	Error in end-bit during read operation, or no data CRC received during write operation. For MMC CMD19, there may be no CRC status returned by the card. Hence, EBE is set for CMD19. The application should not treat this as an error.
14	Auto Command Done (ACD)	Stop/abort commands automatically sent by card unit and not initiated by host; similar to Command Done (CD) interrupt. Recommendation: Software typically need not enable this for non CE-ATA accesses; Data Transfer Over (DTO) interrupt that comes after this interrupt determines whether data transfer has correctly competed.
13	Start Bit Error (SBE)	Error in data start bit when data is read from a card. In 4-bit mode, if DAT[0] line indicates start bit-that is, 0-and any of the other data bits do not have start bit, then this error is set. Busy Complete Interrupt when data is written to the card. This interrupt is generated after completion of busy driven by the card after the last data block is written into the card.
12	Hardware Locked write Error (HLE)	During hardware-lock period, write attempted to one of locked registers. When software sets the start_cmd bit in the SDMMC_CMD register, the Host Controller tries to load the command. If the command buffer is already filled with a command, this error is raised. The software then has to reload the command.
11	FIFO Underrun/ Overrun Error (FRUN)	Host tried to push data when FIFO was full, or host tried to read data when FIFO was empty. Typically this should not happen, except due to error in software. Card unit never pushes data into FIFO when FIFO is full, and pop data when FIFO is empty. If IDMAC is enabled, FIFO under-run/over-run can occur due to a programming error on MSIZE and watermark values in SDMMC_FIFOTH register.
10	Data Starvation by Host Timeout (HTO)	To avoid data loss, card clock out is stopped if FIFO is empty when writing to card, or FIFO is full when reading from card. Whenever card clock is stopped to avoid data loss, data-starvation timeout counter is started with data-timeout value. This interrupt is set if host does not fill data into FIFO during write to card, or does not read from FIFO during read from card before timeout period.

Bits	Interrupt	Description
		Even after timeout, card clock stays in stopped state, with CIU state machines waiting. It is responsibility of host to push or pop data into FIFO upon interrupt, which automatically restarts cclk_out and card state machines. Even if host wants to send stop/abort command, it still needs to ensure it has to push or pop FIFO so that clock starts in order for stop/abort command to send on command signal along with data that is sent or received on data line.
9	Data Read Timeout (DRTO)	In Normal functioning mode: Data read timeout (DRTO) Data timeout occurred. Data Transfer Over (DTO) also set if data timeout occurs. In Boot Mode: Boot Data Start (BDS) When set, indicates that Host Controller has started to receive boot data from the card. A write to this register with a value of 1 clears this interrupt.
8	Response Timeout (RTO)	In normal functioning mode: Response timeout (RTO) Response timeout occurred. Command Done (CD) also set if response timeout occurs. If command involves data transfer and when response times out, no data transfer is attempted by Host Controller. In Boot Mode: Boot Ack Received (BAR) When expect_boot_ack is set, on reception of a boot acknowledge pattern—0-1-0—this interrupt is asserted. A write to this register with a value of 1 clears this interrupt.
7	Data CRC Error (DCRC)	Received Data CRC does not match with locally-generated CRC in CIU. Can also occur if the Write CRC status is incorrectly sampled by the Host.
6	Response CRC Error (RCRC)	Response CRC does not match with locally-generated CRC in CIU.
5	Receive FIFO Data Request (RXDR)	Interrupt set during read operation from card when FIFO level is greater than Receive-Threshold level. Recommendation: In DMA modes, this interrupt should not be enabled. In non-DMA mode: pop RX_WMark + 1 data from FIFO.

4	Transmit FIFO Data Request (TXDR)	Interrupt set during write operation to card when FIFO level reaches less than or equal to Transmit-Threshold level.
		Recommendation:
		In DMA modes, this interrupt should not be enabled.
		In non-DMA mode:
		if (pending_bytes > (FIFO_DEPTH - TX_WMark))
		        push (FIFO_DEPTH - TX_WMark) data into FIFO
		else
		        push pending_bytes data into FIFO

3	Data Transfer Over (DTO)	Indicates Data transfer completed. Though on detection of errors-Start Bit Error, Data CRC error, and so on, DTO may or may not be set; the application must issue CMD12, which ensures that DTO is set. Recommendation:

Bits	Interrupt	Description
		In non-DMA mode, when data is read from card, on seeing interrupt, host should read any pending data from FIFO. In DMA mode, DMA controllers guarantee FIFO is flushed before interrupt. DTO bit is set at the end of the last data block, even if the device asserts MMC busy after the last data block.
2	Command Done(CD)	Command sent to card and got response from card, even if Response Error or CRC error occurs.
1	Response Error (RE)	Error in received response set if one of following occurs: ● Transmission bit != 0 ● Command index mismatch ● End-bit != 1
0	Card-Detect (CDT)	When one or more cards inserted or removed, this interrupt occurs. Software should read card-detect register to determine current card status. Recommendation: After power-on and before enabling interrupts, software should read card detect register and store it in memory. When interrupt occurs, it should read card detect register and compare it with value stored in memory to determine which card(s) were removed/inserted. Before exiting ISR, software should update memory with new card-detect value.

3.3.1.4 FIFO Controller Unit

The FIFO controller interfaces the external FIFO to the host interface and the card controller unit. When FIFO overrun and under-run conditions occur, the card clock stops in order to avoid data loss.
The FIFO uses a two-clock synchronous read and synchronous write dual-port RAM. One of the ports is connected to the host clock(clk), and the second port is connected to the card clock(cclk_in).

Notes: The FIFO controller does not support simultaneous read/write access from the same port. For debugging purposes, the software may try to write into the FIFO and read back the data; results are indeterminate, since the design does not support read/write access from the same port.

3.3.1.5 Card Detection Unit

The register unit has registers that control the power. Power to each card can be selectively turned on or off.
The card detection unit looks for any changes in the card-detect signals for card insertion or card removal. It filters out the debounce associated with mechanical insertion or removal, and generates one interrupt to the host. You can program the debounce filter value.

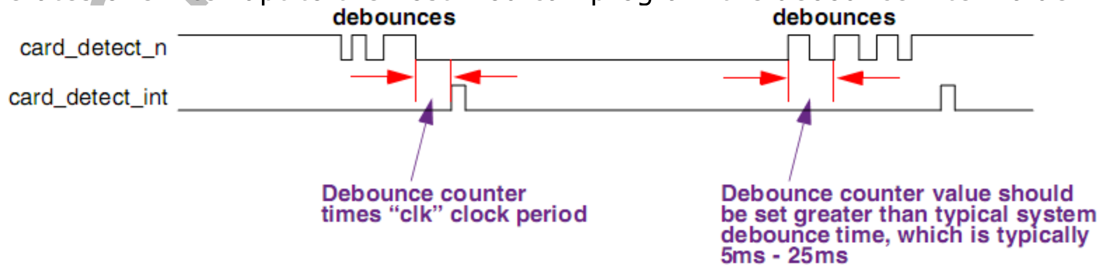

Fig. 3-2 SD/MMC Card-Detect Signal

3.3.2 Card Interface Unit

The Card Interface Unit (CIU) interfaces with the Bus Interface Unit (BIU) and the external devices. The host writes command parameters to the BIU control registers, and these parameters are then passed to the CIU. Depending on control register values, the CIU generates SD/MMC command and data traffic on a selected card bus according to SD/MMC protocol. The Host Controller accordingly controls the command and data path.
The following software restrictions should be met for proper CIU operation:

- Only one data transfer command can be issued at a time.
- During an open-ended card write operation, if the card clock is stopped because the FIFO is empty, the software must first fill the data into the FIFO and start the card clock. It can then issue only a stop/abort command to the card.
- When issuing card reset commands (CMD0, CMD15 or CMD52_reset) while a card data transfer is in progress, the software must set the stop_abort_cmd bit in the SDMMC_CMD register so that the Host Controller can stop the data transfer after issuing the card reset command.
- When the data end bit error is set in the SDMMC_RINTSTS register, the Host Controller does not guarantee SDIO interrupts. The software should ignore the SDIO interrupts and issue the stop/abort command to the card, so that the card stops sending the read data.
- If the card clock is stopped because the FIFO is full during a card read, the software should read at least two FIFO locations to start the card clock.

The CIU block consists of the following primary functional blocks:

- Command path
- Data path
- SDIO interrupt control
- Clock control
- Error detection

3.3.2.1 Command Path

The command path performs the following functions:

- Loads clock parameters
- Loads card command parameters
- Sends commands to card bus (ccmd_out line)
- Receives responses from card bus (ccmd_in line)
- Sends responses to BIU
- Drives the P-bit on command line

A new command is issued to the Host Controller by programming the BIU registers and setting the start_cmd bit in the SDMMC_CMD register. The BIU asserts start_cmd, which indicates that a new command is issued to the SD/MMC device. The command path loads this new command (command, command argument, timeout) and sends acknowledge to the BIU by asserting cmd_taken.

Once the new command is loaded, the command path state machine sends a command to the device bus-including the internally generated CRC7-and receives a response, if any. The state machine then sends the received response and signals to the BIU that the command is done, and then waits for eight clocks before loading a new command.

Load Command Parameters

One of the following commands or responses is loaded in the command path:

- New command from BIU – When start_cmd is asserted, then the start_cmd bit is set in the SDMMC_CMD register.
- Internally generated auto-stop command – When the data path ends, the stop command request is loaded.
- IRQ response with RCA 0x000 – When the command path is waiting for an IRQ response from the MMC card and a “send irq response” request is signaled by the BIU, then the send_irq_response bit is set in the SDMMC_CTRL register.

Loading a new command from the BIU in the command path depends on the following SDMMC_CMD register bit settings:

- update_clock_registers_only – If this bit is set in the SDMMC_CMD register, the command path updates only the clock enable, clock divider, and clock source registers. If this bit is not set, the command path loads the command, command argument, and timeout registers; it then starts processing the new command.
- wait_prvdata_complete – If this bit is set, the command path loads the new command under one of the following conditions:
  - Immediately, if the data path is free (that is, there is no data transfer in progress), or if an open-ended data transfer is in progress (byte_count = 0).
  - After completion of the current data transfer, if a predefined data transfer is in progress.

Send Command and Receive Response
Once a new command is loaded in the command path, update_clock_registers_only bit is unset – the command path state machine sends out a command on the device bus; the command path state machine is illustrated in following figure.

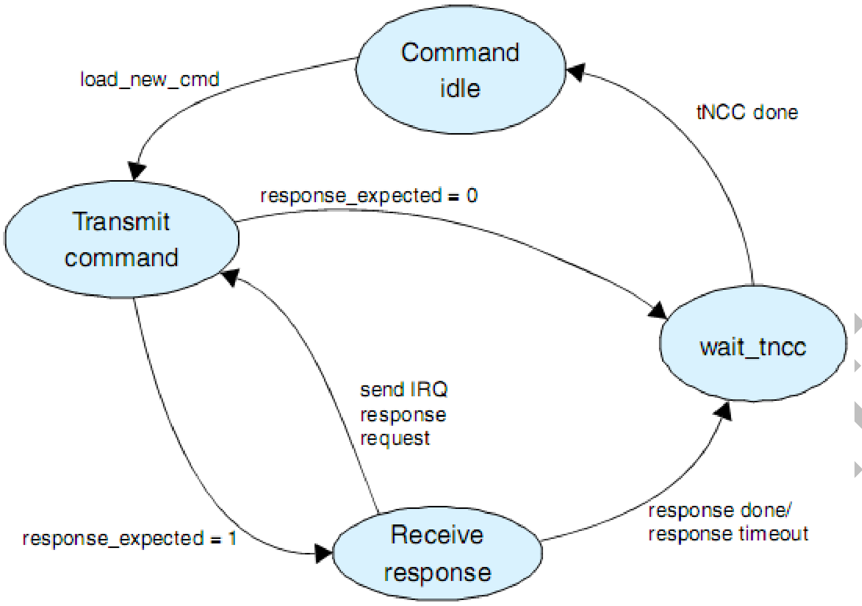

Fig. 3-3 Host Controller Command Path State Machine

The command path state machine performs the following functions, according to SDMMC_CMD register bit values:

- send_initialization – Initialization sequence of 80 clocks is sent before sending the command.
- response_expected – Response is expected for the command. After the command is sent out, the command path state machine receives a 48-bit or 136-bit response and sends it to the BIU. If the start bit of the card response is not received within the number of clocks programmed in the timeout register, then the response timeout and command done bit is set in the Raw Interrupt Status register as a signal to the BIU. If the response-expected bit is not set, the command path sends out a command and signals a response done to the BIU; that is, the command done bit is set in the Raw Interrupt Status register.
- response_length – If this bit is set, a 136-bit response is received; if it is not set, a 48-bit response is received.
- check_response_crc – If this bit is set, the command path compares CRC7 received in the response with the internally-generated CRC7. If the two do not match, the response CRC error is signaled to the BIU; that is, the response CRC error bit is set in the Raw Interrupt Status register SDMMC_RINTSTS.

Send Response to BIU
If the response_expected bit is set in the SDMMC_CMD register, the received response is sent to the BIU. The Response0 register is updated for a short response, and the Response3, Response2, Response1, and Response0 registers are updated on a long response, after which the Command Done bit is set. If the response is for an auto_stop command sent by the CIU, the response is saved in the Response1 register, after which the Auto Command Done bit is set.
Additionally, the command path checks for the following:

- Transmission bit = 0
- Command index matches command index of the sent command
- End bit = 1 in received card response

The command index is not checked for a 136-bit response or if the check_response_crc bit is unset. For a 136-bit response and reserved CRC 48-bit responses, the command index is reserved-that is, 111111.
Polling Command Completion Signal
The device generates the Command Completion Signal in order to notify the host controller

of the normal command completion or command termination.

Command Completion Signal Detection and Interrupt to Host Processor

If the ccs_expected bit is set in the SDMMC_CMD register, the Command Completion Signal (CCS) from the device is indicated by setting the Data Transfer Over (DTO) bit in the SDMMC_RINTSTS register. The Host Controller generates a Data Transfer Over (DTO) interrupt if this interrupt is not masked.

Command Completion Signal Timeout

If the command expects a CCS from the device—if the ccs_expected bit is set in the SDMMC_CMD register—the command state machine waits for the CCS and remains in a wait_CCSS state. If the device fails to send out the CCS, the host software should implement a timeout mechanism to free the command and data path. The host controller does not implement a hardware timer; it is the responsibility of the host software to maintain a software timer.

In the event of a CCS timeout, the host should issue a CCSD by setting the send_ccsd bit in the CTRL register. The host controller command state machine sends the CCSD to the device and exits to an idle state. After sending the CCSD, the host should also send a CMD12 to the device in order to abort the outstanding command.

Send Command Completion Signal Disable

If the send_ccsd bit is set in the SDMMC_CTRL register, the host sends a Command Completion Signal Disable (CCSD) pattern on the CMD line. The host can send the CCSD while waiting for the CCS or after a CCS timeout happens.

After sending the CCSD pattern, the host sets the Command Done (CD) bit in SDMMC_RINTSTS and also generates an interrupt to the host if the Command Done interrupt is not masked.

3.3.2.2 Data Path

The data path block pops the data FIFO and transmits data on cdata_out during a write data transfer, or it receives data on cdata_in and pushes it into the FIFO during a read data transfer. The data path loads new data parameters—that is, data expected, read/write data transfer, stream/block transfer, block size, byte count, card type, timeout registers—whenever a data transfer command is not in progress.

If the data_expected bit is set in the SDMMC_CMD register, the new command is a data transfer command and the data path starts one of the following:

- Transmit data if the read/write bit = 1
- Data receive if read/write bit = 0

Data Transmit

The data transmit state machine, illustrated in following figure, starts data transmission two clocks after a response for the data write command is received; this occurs even if the command path detects a response error or response CRC error. If a response is not received from the card because of a response timeout, data is not transmitted. Depending upon the value of the transfer_mode bit in the SDMMC_CMD register, the data transmit state machine puts data on the card data bus in a stream or in block(s).

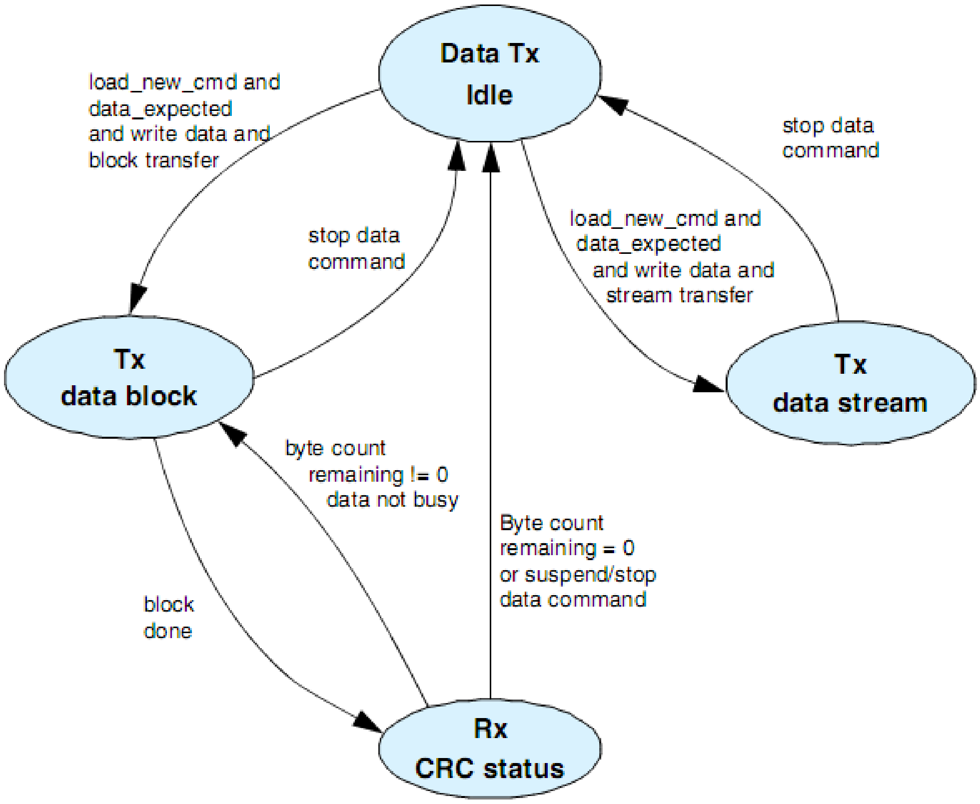

Fig. 3-4 Host Controller Data Transmit State Machine

Stream Data Transmit

If the transfer_mode bit in the SDMMC_CMD register is set to 1, it is a stream-write data transfer. The data path pops the FIFO from the BIU and transmits in a stream to the card data bus. If the FIFO becomes empty, the card clock is stopped and restarted once data is available in the FIFO.

If the byte_count register is programmed to 0, it is an open-ended stream-write data transfer. During this data transfer, the data path continuously transmits data in a stream until the host software issues a stop command. A stream data transfer is terminated when the end bit of the stop command and end bit of the data match over two clocks.

If the byte_count register is programmed with a non-zero value and the send_auto_stop bit is set in the SDMMC_CMD register, the stop command is internally generated and loaded in the command path when the end bit of the stop command occurs after the last byte of the stream write transfer matches.

This data transfer can also terminate if the host issues a stop command before all the data bytes are transferred to the card bus.

Single Block Data

If the transfer_mode bit in the SDMMC_CMD register is set to 0 and the byte_count register value is equal to the value of the block_size register, a single-block write-data transfer occurs. The data transmit state machine sends data in a single block, where the number of bytes equals the block size, including the internally-generated CRC16.

If the SDMMC_CTYPE register bit for the selected card – indicated by the card_num value in the SDMMC_CMD register – is set for a 1-bit, 4-bit, or 8-bit data transfer, the data is transmitted on 1, 4, or 8 data lines, respectively, and CRC16 is separately generated and transmitted for 1, 4, or 8 data lines, respectively.

After a single data block is transmitted, the data transmit state machine receives the CRC status from the card and signals a data transfer to the BIU; this happens when the data-transfer-over bit is set in the SDMMC_RINTSTS register.

If a negative CRC status is received from the card, the data path signals a data CRC error to the BIU by setting the data CRC error bit in the SDMMC_RINTSTS register.

Additionally, if the start bit of the CRC status is not received by two clocks after the end of the data block, a CRC status start bit error is signaled to the BIU by setting the write-no-CRC bit in the SDMMC_RINTSTS register.

Multiple Block Data
A multiple-block write-data transfer occurs if the transfer_mode bit in the SDMMC_CMD register is set to 0 and the value in the byte_count register is not equal to the value of the block_size register. The data transmit state machine sends data in blocks, where the number of bytes in a block equals the block size, including the internally-generated CRC16.
If the SDMMC_CTYPE register bit for the selected card – indicated by the card_num value in the SDMMC_CMD register – is set to 1-bit, 4-bit, or 8-bit data transfer, the data is transmitted on 1, 4, or 8 data lines, respectively, and CRC16 is separately generated and transmitted on 1, 4, or 8 data lines, respectively.
After one data block is transmitted, the data transmit state machine receives the CRC status from the card. If the remaining byte_count becomes 0, the data path signals to the BIU that the data transfer is done; this happens when the data-transfer-over bit is set in the SDMMC_RINTSTS register.
If the remaining data bytes are greater than 0, the data path state machine starts to transmit another data block.
If a negative CRC status is received from the card, the data path signals a data CRC error to the BIU by setting the data CRC error bit in the SDMMC_RINTSTS register, and continues further data transmission until all the bytes are transmitted.
Additionally, if the CRC status start bit is not received by two clocks after the end of a data block, a CRC status start bit error is signaled to the BIU by setting the write-no-CRC bit in the SDMMC_RINTSTS register; further data transfer is terminated.
If the send_auto_stop bit is set in the SDMMC_CMD register, the stop command is internally generated during the transfer of the last data block, where no extra bytes are transferred to the card. The end bit of the stop command may not exactly match the end bit of the CRC status in the last data block.
If the block size is less than 4, 16, or 32 for card data widths of 1 bit, 4 bits, or 8 bits, respectively, the data transmit state machine terminates the data transfer when all the data is transferred, at which time the internally generated stop command is loaded in the command path.
If the byte_count is 0 – the block size must be greater than 0 – it is an open-ended block transfer. The data transmit state machine for this type of data transfer continues the block-write data transfer until the host software issues a stop or abort command.
Data Receive
The data-receive state machine, illustrated in following figure, receives data two clock cycles after the end bit of a data read command, even if the command path detects a response error or response CRC error. If a response is not received from the card because a response timeout occurs, the BIU does not receive a signal that the data transfer is complete; this happens if the command sent by the Host Controller is an illegal operation for the card, which keeps the card from starting a read data transfer.
If data is not received before the data timeout, the data path signals a data timeout to the BIU and an end to the data transfer done. Based on the value of the transfer_mode bit in the SDMMC_CMD register, the data-receive state machine gets data from the card data bus in a stream or block(s).

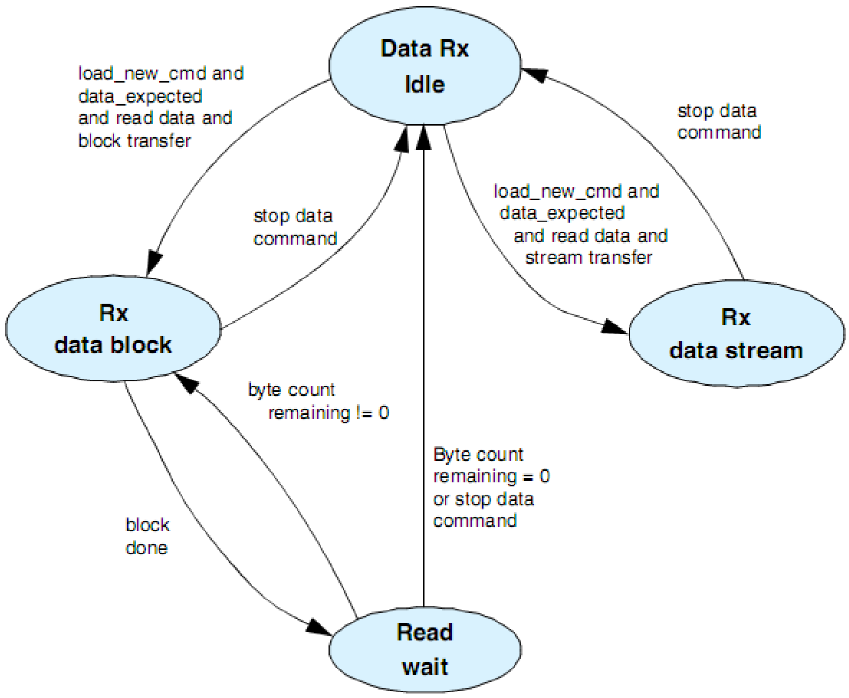

Fig. 3-5 Host Controller Data Receive State Machine

Stream Data Read

A stream-read data transfer occurs if the transfer_mode bit in the SDMMC_CMD register equals 1, at which time the data path receives data from the card and pushes it to the FIFO. If the FIFO becomes full, the card clock stops and restarts once the FIFO is no longer full.
An open-ended stream-read data transfer occurs if the byte_count register equals 0. During this type of data transfer, the data path continuously receives data in a stream until the host software issues a stop command. A stream data transfer terminates two clock cycles after the end bit of the stop command.
If the byte_count register contains a non-zero value and the send_auto_stop bit is set in the SDMMC_CMD register, a stop command is internally generated and loaded into the command path, where the end bit of the stop command occurs after the last byte of the stream data transfer is received. This data transfer can terminate if the host issues a stop or abort command before all the data bytes are received from the card.

Single-Block Data Read

A single-block read-data transfer occurs if the transfer_mode bit in the SDMMC_CMD register is set to 0 and the value of the byte_count register is equal to the value of the block_size register. When a start bit is received before the data times out, data bytes equal to the block size and CRC16 are received and checked with the internally-generated CRC16.
If the SDMMC_CTYPE register bit for the selected card – indicated by the card_num value in the SDMMC_CMD register – is set to a 1-bit, 4-bit, or 8-bit data transfer, data is received from 1, 4, or 8 data lines, respectively, and CRC16 is separately generated and checked for 1, 4, or 8 data lines, respectively. If there is a CRC16 mismatch, the data path signals a data CRC error to the BIU. If the received end bit is not 1, the BIU receives an end-bit error.

Multiple-Block Data Read

If the transfer_mode bit in the SDMMC_CMD register is set to 0 and the value of the byte_count register is not equal to the value of the block_size register, it is a multiple-block read-data transfer. The data-receive state machine receives data in blocks, where the number of bytes in a block is equal to the block size, including the internally-generated CRC16.
If the SDMMC_CTYPE register bit for the selected card – indicated by the card_num value in the SDMMC_CMD register – is set to a 1-bit, 4-bit, or 8-bit data transfer, data is received from 1, 4, or 8 data lines, respectively, and CRC16 is separately generated and checked for 1, 4, or 8 data lines, respectively.
After a data block is received, if the remaining byte_count becomes 0, the data path signals a data transfer to the BIU.

If the remaining data bytes are greater than 0, the data path state machine causes another data block to be received. If CRC16 of a received data block does not match the internally-generated CRC16, a data CRC error to the BIU and data reception continue further data transmission until all bytes are transmitted.
Additionally, if the end of a received data block is not 1, data on the data path signals terminate the bit error to the CIU and the data-receive state machine terminates data reception, waits for data timeout, and signals to the BIU that the data transfer is complete.
If the send_auto_stop bit is set in the SDMMC_CMD register, the stop command is internally generated when the last data block is transferred, where no extra bytes are transferred from the card; the end bit of the stop command may not exactly match the end bit of the last data block.
If the requested block size for data transfers to cards is less than 4, 16, or 32 bytes for 1-bit, 4-bit, or 8-bit data transfer modes, respectively, the data-transmit state machine terminates the data transfer when all data is transferred, at which point the internally-generated stop command is loaded in the command path. Data received from the card after that are then ignored by the data path.
If the byte_count is 0—the block size must be greater than 0—it is an open-ended block transfer. For this type of data transfer, the data-receive state machine continues the block-read data transfer until the host software issues a stop or abort command.

Auto-Stop

The Host Controller internally generates a stop command and is loaded in the command path when the send_auto_stop bit is set in the SDMMC_CMD register.
The software should set the send_auto_stop bit according to details listed in following table.

Table 3-2 Auto-Stop Generation

Card type	Transfer type	Byte Count	send_auto_stop bit set	Comments
MMC	Stream read	0	No	Open-ended stream
MMC	Stream read	>0	Yes	Auto-stop after all bytes transfer
MMC	Stream write	0	No	Open-ended stream
MMC	Stream write	>0	Yes	Auto-stop after all bytes transfer
MMC	Single-block read	>0	No	Byte count =0 is illegal
MMC	Single-block write	>0	No	Byte count =0 is illegal
MMC	Multiple-block read	0	No	Open-ended multiple block
MMC	Multiple-block read	>0	Yes①	Pre-defined multiple block
MMC	Multiple-block write	0	No	Open-ended multiple block
MMC	Multiple-block write	>0	Yes①	Pre-defined multiple block
SDMEM	Single-block read	>0	No	Byte count =0 is illegal
SDMEM	Single-block write	>0	No	Byte count =0 illegal
SDMEM	Multiple-block read	0	No	Open-ended multiple block
SDMEM	Multiple-block read	>0	Yes	Auto-stop after all bytes transfer
SDMEM	Multiple-block write	0	No	Open-ended multiple block
SDMEM	Multiple-block write	>0	Yes	Auto-stop after all bytes transfer
SDIO	Single-block read	>0	No	Byte count =0 is illegal
SDIO	Single-block write	>0	No	Byte count =0 illegal
SDIO	Multiple-block read	0	No	Open-ended multiple block
SDIO	Multiple-block read	>0	No	Pre-defined multiple block
SDIO	Multiple-block write	0	No	Open-ended multiple block
SDIO	Multiple-block	>0	No	Pre-defined multiple block

Card type	Transfer type	Byte Count	send_auto_stop bit set	Comments
	write			

*①:The condition under which the transfer mode is set to block transfer and byte_count is equal to block size is treated as a single-block data transfer command for both MMC and SD cards. If byte_count = n*block_size (n = 2, 3, …), the condition is treated as a predefined multiple-block data transfer command. In the case of an MMC card, the host software can perform a predefined data transfer in two ways: 1) Issue the CMD23 command before issuing CMD18/CMD25 commands to the card – in this case, issue MD18/CMD25 commands without setting the send_auto_stop bit. 2) Issue CMD18/CMD25 commands without issuing CMD23 command to the card, with the send_auto_stop bit set. In this case, the multiple-block data transfer is terminated by an internally-generated auto-stop command after the programmed byte count.*

The following list conditions for the auto-stop command.

- Stream read for MMC card with byte count greater than 0 – The Host Controller generates an internal stop command and loads it into the command path so that the end bit of the stop command is sent out when the last byte of data is read from the card and no extra data byte is received. If the byte count is less than 6 (48 bits), a few extra data bytes are received from the card before the end bit of the stop command is sent.
- Stream write for MMC card with byte count greater than 0 - The Host Controller generates an internal stop command and loads it into the command path so that the end bit of the stop command is sent when the last byte of data is transmitted on the card bus and no extra data byte is transmitted. If the byte count is less than 6 (48 bits), the data path transmits the data last in order to meet the above condition.
- Multiple-block read memory for SD card with byte count greater than 0 – If the block size is less than 4 (single-bit data bus), 16 (4-bit data bus), or 32 (8-bit data bus), the auto-stop command is loaded in the command path after all the bytes are read. Otherwise, the top command is loaded in the command path so that the end bit of the stop command is sent after the last data block is received.
- Multiple-block write memory for SD card with byte count greater than 0 – If the block size is less than 3 (single-bit data bus), 12 (4-bit data bus), or 24 (8-bit data bus), the auto-stop command is loaded in the command path after all data blocks are transmitted. Otherwise, the stop command is loaded in the command path so that the end bit of the stop command is sent after the end bit of the CRC status is received.
- Precaution for host software during auto-stop – Whenever an auto-stop command is issued, the host software should not issue a new command to the SD/MMC device until the auto-stop is sent by the Host Controller and the data transfer is complete. If the host issues a new command during a data transfer with the auto-stop in progress, an auto-stop command may be sent after the new command is sent and its response is received; this can delay sending the stop command, which transfers extra data bytes. For a stream write, extra data bytes are erroneous data that can corrupt the card data. If the host wants to terminate the data transfer before the data transfer is complete, it can issue a stop or abort command, in which case the Host Controller does not generate an auto-stop command.

3.3.2.3 Non-Data Transfer Commands that Use Data Path

Some non-data transfer commands (non-read/write commands) also use the data path. Following table lists the commands and register programming requirements for them.

Table 3-3 Non-data Transfer Commands and Requirements

Base Address [12:8]	CMD 27	CMD 30	CMD 42	ACMD 13	ACMD 22	ACMD 51
SDMMC_CMD register programming						
cmd_index	6'h1B	6'h1E	6'h2A	6'h0D	6'h16	6'h33
response_expect	1	1	1	1	1	1
rResponse_length	0	0	0	0	0	0
check_response_crc	1	1	1	1	1	1
data_expected	1	1	1	1	1	1
read/write	1	0	1	0	0	0
transfer_mode	0	0	0	0	0	0
send_auto_stop	0	0	0	0	0	0

Base Address [12:8]	CMD 27	CMD 30	CMD 42	ACMD 13	ACMD 22	ACMD 51
wait_prevdata_complete	0	0	0	0	0	0
stop_abort_cmd	0	0	0	0	0	0
Command Argument register programming						
	stuff bits	32-bit write protect data address	stuff bits	stuff bits	stuff bits	stuff bits
Block Size register programming						
	16	4	Num_bytes①	64	4	8
Byte Count register programming						
	16	4	Num_bytes①	64	4	8

①: Num_bytes = No. of bytes specified as per the lock card data structure (Refer to the SD specification and the MMC specification)

3.3.2.4 SDIO Interrupt Control

Interrupts for SD cards are reported to the BIU by asserting an interrupt signal for two clock cycles. SDIO cards signal an interrupt by asserting cdata_in low during the interrupt period; an interrupt period for the selected card is determined by the interrupt control state machine. An interrupt period is always valid for non-active or non-selected cards, and 1-bit data mode for the selected card. An interrupt period for a wide-bus active or selected card is valid for the following conditions:

- Card is idle
- Non-data transfer command in progress
- Third clock after end bit of data block between two data blocks
- From two clocks after end bit of last data until end bit of next data transfer command

Bear in mind that, in the following situations, the controller does not sample the SDIO interrupt of the selected card when the card data width is 4 bits. Since the SDIO interrupt is level-triggered, it is sampled in a further interrupt period and the host does not lose any SDIO interrupt from the card.

- Read/Write Resume – The CIU treats the resume command as a normal data transfer command. SDIO interrupts during the resume command are handled similarly to other data commands. According to the SDIO specification, for the normal data command the interrupt period ends after the command end bit of the data command; for the resume command, it ends after the response end bit. In the case of the resume command, the Controller stops the interrupt sampling period after the resume command end bit, instead of stopping after the response end bit of the resume command.
- Suspend during read transfer – If the read data transfer is suspended by the host, the host sets the abort_read_data bit in the controller to reset the data state machine. In the CIU, the SDIO interrupts are handled such that the interrupt sampling starts after the abort_read_data bit is set by the host. In this case the controller does not sample SDIO interrupts between the period from response of the suspend command to setting the abort_read_data bit, and starts sampling after setting the abort_read_data bit.

3.3.2.5 Clock Control

The clock control block provides different clock frequencies required for SD/MMC cards. The cclk_in signal is the source clock (cclk_in >= card max operating frequency) for clock divider of the clock control block. This source clock (cclk_in) is used to generate different card clock frequencies (cclk_out). The card clock can have different clock frequencies, since the card can be a low-speed card or a full-speed card. The Host Controller provides one clock signal (cclk_out).

The clock frequency of a card depends on the following clock control registers:

- Clock Divider register – Internal clock dividers are used to generate different clock frequencies required for card. The division factor for each clock divider can be programmed by writing to the Clock Divider register. A value of 0 represents a clock-divider bypass, a value of 1 represents a divide by 2.

- Clock Control register – cclk_out can be enabled or disabled for each card under the following conditions:
  - clk_enable – cclk_out for a card is enabled if the clk_enable bit for a card in the Clock Control register is programmed (set to 1) or disabled (set to 0).
  - Low-power mode – Low-power mode of a card can be enabled by setting the low-power mode bit of the Clock Control register to 1. If low-power mode is enabled to save card power, the cclk_out is disabled when the card is idle for at least 8 card clock cycles. It is enabled when a new command is loaded and the command path goes to a non-idle state.

Additionally, cclk_out is disabled when an internal FIFO is full – card read (no more data can be received from card) – or when the FIFO is empty – card write (no data is available for transmission). This helps to avoid FIFO overrun and underrun conditions. It is used by the command and data path to qualify cclk_in for driving outputs and sampling inputs at the programmed clock frequency for the selected card, according to the Clock Divider and Clock Source register values.
Under the following conditions, the card clock is stopped or disabled, along with the active clk_en, for the selected card:

- Clock can be disabled by writing to Clock Enable register (clk_en bit = 1).
- If low-power mode is selected and card is idle, or not selected for 8 clocks.
- FIFO is full and data path cannot accept more data from the card and data transfer is incomplete –to avoid FIFO overrun.
- FIFO is empty and data path cannot transmit more data to the card and data transfer is incomplete – to avoid FIFO underrun.

3.3.2.6 Error Detection

- Response
  - Response timeout – Response expected with response start bit is not received within programmed number of clocks in timeout register.
  - Response CRC error – Response is expected and check response CRC requested; response CRC7 does not match with the internally-generated CRC7.
  - Response error – Response transmission bit is not 0, command index does not match with the command index of the send command, or response end bit is not 1.
- Data transmit
  - No CRC status – During a write data transfer, if the CRC status start bit is not received two clocks after the end bit of the data block is sent out, the data path does the following:
    - Signals no CRC status error to the BIU
    - Terminates further data transfer
    - Signals data transfer done to the BIU
  - Negative CRC – If the CRC status received after the write data block is negative (that is, not 010), a data CRC error is signaled to the BIU and further data transfer is continued.
  - Data starvation due to empty FIFO – If the FIFO becomes empty during a write data transmission, or if the card clock is stopped and the FIFO remains empty for data timeout clocks, then a data-starvation error is signaled to the BIU and the data path continues to wait for data in the FIFO.
- Data receive
  - Data timeout – During a read-data transfer, if the data start bit is not received before the number of clocks that were programmed in the timeout register, the data path does the following:
    - Signals data-timeout error to the BIU
    - Terminates further data transfer
    - Signals data transfer done to BIU
  - Data start bit error – During a 4-bit or 8-bit read-data transfer, if the all-bit data line does not have a start bit, the data path signals a data start bit error to the BIU and waits for a data timeout, after which it signals that the data transfer is done.
  - Data CRC error – During a read-data-block transfer, if the CRC16 received does not match with the internally generated CRC16, the data path signals a data CRC error

to the BIU and continues further data transfer.
- Data end-bit error – During a read-data transfer, if the end bit of the received data is not 1, the data path signals an end-bit error to the BIU, terminates further data transfer, and signals to the BIU that the data transfer is done.
- Data starvation due to FIFO full – During a read data transmission and when the FIFO becomes full, the card clock is stopped. If the FIFO remains full for data timeout clocks, a data starvation error is signaled to the BIU (Data Starvation by Host Timeout bit is set in SDMMC_RINTSTS register) and the data path continues to wait for the FIFO to start to empty.

3.3.3 Internal Direct Memory Access Controller (IDMAC)

The Internal Direct Memory Access Controller (IDMAC) has a Control and Status Register (CSR) and a single Transmit/Receive engine, which transfers data from host memory to the device port and vice versa. The controller utilizes a descriptor to efficiently move data from source to destination with minimal Host CPU intervention. You can program the controller to interrupt the Host CPU in situations such as data Transmit and Receive transfer completion from the card, as well as other normal or error conditions.
The IDMAC and the Host driver communicate through a single data structure. CSR addresses 0x80 to 0x98 are reserved for host programming.
The IDMAC transfers the data received from the card to the Data Buffer in the Host memory, and it transfers Transmit data from the Data Buffer in the Host memory to the FIFO. Descriptors that reside in the Host memory act as pointers to these buffers.
A data buffer resides in physical memory space of the Host and consists of complete data or partial data. Buffers contain only data, while buffer status is maintained in the descriptor. Data chaining refers to data that spans multiple data buffers. However, a single descriptor cannot span multiple data.
A single descriptor is used for both reception and transmission. The base address of the list is written into Descriptor List Base Address Register (SDMMC_DBADDR @0x88). A descriptor list is forward linked. The Last Descriptor can point back to the first entry in order to create a ring structure. The descriptor list resides in the physical memory address space of the Host. Each descriptor can point to a maximum of two data buffers.

3.3.3.1 IDMAC CSR Access

When an IDMAC is introduced, an additional CSR space resides in the IDMAC that controls the IDMAC functionality. The host accesses the new CSR space in addition to the existing control register set in the BIU. The IDMAC CSR primarily contains descriptor information. For a write operation to the CSR, the respective CSR logic of the IDMAC and BIU decodes the address before accepting. For a read operation from the CSR, the appropriate CSR read path is enabled.
You can enable or disable the IDMAC operation by programming bit[25] in the SDMMC_CTRL register of the BIU. This allows the data transfer by accessing the slave interface on the AMBA bus if the IDMAC is present but disabled. When IDMAC is enabled, the FIFO cannot be accessed through the slave interface.

3.3.3.2 Descriptors

- Descriptor structures

The IDMAC uses these types of descriptor structures:
- Dual-Buffer Structure – The distance between two descriptors is determined by the Skip Length value programmed in the Descriptor Skip Length (DSL) field of the Bus Mode Register (SDMMC_BMOD @0x80).

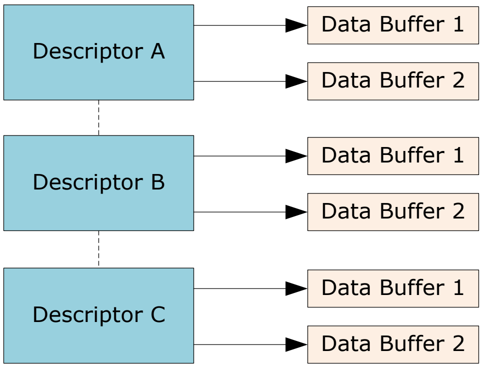

Fig. 3-6 Dual-Buffer Descriptor Structure

- Chain Structure – Each descriptor points to a unique buffer and the next descriptor.

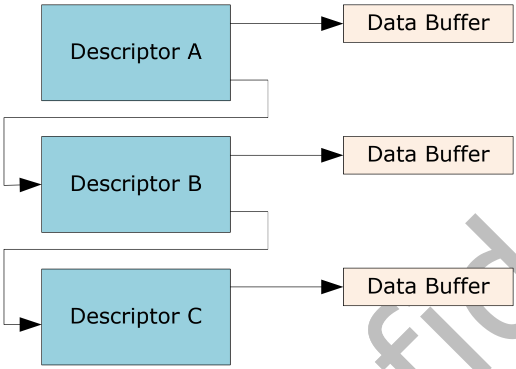

Fig. 3-7 Chain Descriptor Structure

- Descriptor formats

Following figure illustrates the internal formats of a descriptor. The descriptor addresses must be aligned to the bus width used for 32-bit AHB data buses. Each descriptor contains 16 bytes of control and status information. DES0 is a notation used to denote the [31:0] bits, DES1 to denote [63:32] bits, DES2 to denote [95:64] bits, DES3 to denote [127:96] bits.

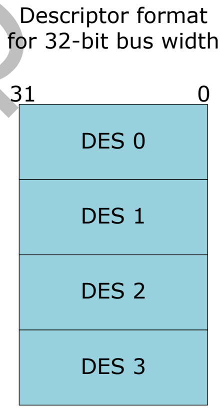

Fig. 3-8 Descriptor Formats for 32-bit AHB Address Bus Width

- The DES0 element in the IDMAC contains control and status information.

Table 3-4 Bits in IDMAC DES0 Element

Bit	Name	Description
31	OWN	When set, this bit indicates that the descriptor is owned by the IDMAC. When this bit is reset, it indicates that the descriptor is owned by the Host. The IDMAC clears this bit when it completes the data transfer.
30	Card Error Summary (CES)	These error bits indicate the status of the transaction to or from the card. These bits are also present in SDMMC_RINTSTS Indicates the logical OR of the following bits:

Bit	Name	Description
		• EBE: End Bit Error • RTO: Response Time out • RCRC: Response CRC • SBE: Start Bit Error • DRTO: Data Read Timeout • DCRC: Data CRC for Receive • RE: Response Error
29:6	Reserved	-
5	End of Ring (ER)	When set, this bit indicates that the descriptor list reached its final descriptor. The IDMAC returns to the base address of the list, creating a Descriptor Ring. This is meaningful for only a dual-buffer descriptor structure.
4	Second Address Chained (CH)	When set, this bit indicates that the second address in the descriptor is the Next Descriptor address rather than the second buffer address. When this bit is set, BS2 (DES1[25:13]) should be all zeros.
3	First Descriptor (FS)	When set, this bit indicates that this descriptor contains the first buffer of the data. If the size of the first buffer is 0, next Descriptor contains the beginning of the data.
2	Last Descriptor (LD)	This bit is associated with the last block of a DMA transfer. When set, the bit indicates that the buffers pointed to by this descriptor are the last buffers of the data. After this descriptor is completed, the remaining byte count is 0. In other words, after the descriptor with the LD bit set is completed, the remaining byte count should be 0.
1	Disable Interrupt on Completion (DIC)	When set, this bit will prevent the setting of the TI/RI bit of the IDMAC Status Register (IDSTS) for the data that ends in the buffer pointed to by this descriptor.
0	Reserved	-

- The DES1 element contains the buffer size.

Table 3-5 Bits in IDMAC DES1 Element

Bit	Name	Description
31:26	Reserved	-
25:13	Buffer 2 Size (BS2)	These bits indicate the second data buffer byte size. The buffer size must be a multiple of 2, 4, or 8, depending upon the bus widths—16, 32, and 64 respectively. In the case where the buffer size is not a multiple of 2, 4, or 8, the resulting behavior is undefined. If this field is 0, the DMA ignores this buffer and proceeds to the next buffer in case of a dual-buffer structure. This field is not valid for chain structure; that is, if DES0[4] is set.
12:0	Buffer 1 Size (BS1)	Indicates the data buffer byte size, which must be a multiple of 2, 4, or 8 bytes, depending upon the bus widths—16, 32, and 64, respectively. In the case where the buffer size is not a multiple of 2, 4, or 8, the resulting behavior is undefined. This field should not be zero. Note: If there is only one buffer to be programmed, you need to use only the Buffer 1, and not Buffer 2.

- The DES2 element contains the address pointer to the data buffer.

Table 3-6 Bits in IDMAC DES2 Element

Bit	Name	Description
31:26	Reserved	
25:13	Buffer 2 Size (BS2)	These bits indicate the second data buffer byte size. The buffer size must be a multiple of 2, 4, or 8, depending upon the bus

Bit	Name	Description
		widths—16, 32, and 64 respectively. In the case where the buffer size is not a multiple of 2, 4, or 8, the resulting behavior is undefined. If this field is 0, the DMA ignores this buffer and proceeds to the next buffer in case of a dual-buffer structure. This field is not valid for chain structure; that is, if DES0[4] is set.
12:0	Buffer 1 Size (BS1)	Indicates the data buffer byte size, which must be a multiple of 2, 4, or 8 bytes, depending upon the bus widths—16, 32, and 64, respectively. In the case where the buffer size is not a multiple of 2, 4, or 8, the resulting behavior is undefined. This field should not be zero. Note: If there is only one buffer to be programmed, you need to use only the Buffer 1, and not Buffer 2.

- The DES3 element contains the address pointer to the next descriptor if the present descriptor is not the last descriptor in a chained descriptor structure or the second buffer address for a dual-buffer structure.

Table 3-7 Bits in IDMAC DES3 Element

Bit	Name	Description
31:0	Buffer Address Pointer 2/ Next Descriptor Address (BAP2)	These bits indicate the physical address of the second buffer when the dual-buffer structure is used. If the Second Address Chained (DES0[4]) bit is set, then this address contains the pointer to the physical memory where the Next Descriptor is present. If this is not the last descriptor, then the Next Descriptor address pointer must be bus-width aligned.

3.3.3.3 Initialization

IDMAC initialization occurs as follows:

1) Write to IDMAC Bus Mode Register—SDMMC_BMOD to set Host bus access parameters.
2) Write to IDMAC Interrupt Enable Register—SDMMC_IDINTEN to mask unnecessary interrupt causes.
3) The software driver creates either the Transmit or the Receive descriptor list. Then it writes to IDMAC Descriptor List Base Address Register (SDMMC_DBADDR), providing the IDMAC with the starting address of the list.
4) The IDMAC engine attempts to acquire descriptors from the descriptor lists.

- Host Bus Burst Access

The IDMAC attempts to execute fixed-length burst transfers on the AHB Master interface if configured using the FB bit of the IDMAC Bus Mode register. The maximum burst length is indicated and limited by the PBL field. The descriptors are always accessed in the maximum possible burst-size for the 16-bytes to be read— 16*8/bus-width.

The IDMAC initiates a data transfer only when sufficient space to accommodate the configured burst is available in the FIFO or the number of bytes to the end of data, when less than the configured burst-length.

The IDMAC indicates the start address and the number of transfers required to the AHB Master Interface. When the AHB Interface is configured for fixed-length bursts, then it transfers data using the best combination of INCR4/8/16 and SINGLE transactions. Otherwise, in no fixed-length bursts, it transfers data using INCR (undefined length) and SINGLE transactions.

- Host Data Buffer Alignment

The Transmit and Receive data buffers in host memory must be aligned, depending on the data width.

- Buffer Size Calculations

The driver knows the amount of data to transmit or receive. For transmitting to the card, the IDMAC transfers the exact number of bytes to the FIFO, indicated by the buffer size field of DES1.

If a descriptor is not marked as last-LS bit of DES0-then the corresponding buffer(s) of the descriptor are full, and the amount of valid data in a buffer is accurately indicated by its buffer size field. If a descriptor is marked as last, then the buffer cannot be full, as indicated by the buffer size in DES1. The driver is aware of the number of locations that are valid in this case.

- Transmission

IDMAC transmission occurs as follows:

1) The Host sets up the elements (DES0-DES3) for transmission and sets the OWN bit (DES0[31]). The Host also prepares the data buffer.
2) The Host programs the write data command in the SDMMC_CMD register in BIU.
3) The Host will also program the required transmit threshold level (TX_WMark field in SDMMC_FIFOTH register).
4) The IDMAC determines that a write data transfer needs to be done as a consequence of step 2.
5) The IDMAC engine fetches the descriptor and checks the OWN bit. If the OWN bit is not set, it means that the host owns the descriptor. In this case the IDMAC enters suspend state and asserts the Descriptor Unable interrupt in the SDMMC_IDSTS register. In such a case, the host needs to release the IDMAC by writing any value to the poll demand register.
6) It will then wait for Command Done (CD) bit and no errors from BIU which indicates that a transfer can be done.
7) The IDMAC engine will now wait for a DMA interface request from BIU. This request will be generated based on the programmed transmit threshold value. For the last bytes of data which can’t be accessed using a burst, SINGLE transfers are performed on AHB Master Interface.
8) The IDMAC fetches the Transmit data from the data buffer in the Host memory and transfers to the FIFO for transmission to card.
9) When data spans across multiple descriptors, the IDMAC will fetch the next descriptor and continue with its operation with the next descriptor. The Last Descriptor bit in the descriptor indicates whether the data spans multiple descriptors or not.
10) When data transmission is complete, status information is updated in SDMMC_IDSTS register by setting Transmit Interrupt, if enabled. Also, the OWN bit is cleared by the IDMAC by performing a write transaction to DES0.

- Reception

IDMAC reception occurs as follows:

1) The Host sets up the element (DES0-DES3) for reception, sets the OWN (DES0[31]).
2) The Host programs the read data command in the SDMMC_CMD register in BIU.
3) The Host will program the required receive threshold level (RX_WMark field in FIFOTH register).
4) The IDMAC determines that a read data transfer needs to be done as a consequence of step 2.
5) The IDMAC engine fetches the descriptor and checks the OWN bit. If the OWN bit is not set, it means that the host owns the descriptor. In this case the DMA enters suspend state and asserts the Descriptor Unable interrupt in the SDMMC_IDSTS register. In such a case, the host needs to release the IDMAC by writing any value to the poll demand register.
6) It will then wait for Command Done (CD) bit and no errors from BIU which indicates that a transfer can be done.
7) The IDMAC engine will now wait for a DMA interface request from BIU. This request will be generated based on the programmed receive threshold value. For the last bytes of data which can’t be accessed using a burst, SINGLE transfers are performed on AHB.
8) The IDMAC fetches the data from the FIFO and transfer to Host memory.
9) When data spans across multiple descriptors, the IDMAC will fetch the next descriptor and continue with its operation with the next descriptor. The Last Descriptor bit in the descriptor indicates whether the data spans multiple descriptors or not.
10) When data reception is complete, status information is updated in SDMMC_IDSTS register by setting Receive Interrupt, if enabled. Also, the OWN bit is cleared by the IDMAC by performing a write transaction to DES0.

- Interrupts

Interrupts can be generated as a result of various events. SDMMC_IDSTS register contains all the bits that might cause an interrupt. SDMMC_IDINTEN register contains an Enable bit for each of the events that can cause an interrupt.
There are two groups of summary interrupts-Normal and Abnormal-as outlined in SDMMC_IDSTS register. Interrupts are cleared by writing a 1 to the corresponding bit position. When all the enabled interrupts within a group are cleared, the corresponding summary bit is cleared. When both the summary bits are cleared, the interrupt signal dmac_intr_o is de-asserted.
Interrupts are not queued and if the interrupt event occurs before the driver has responded to it, no additional interrupts are generated. For example, Receive Interrupt—SDMMC_IDSTS[1] indicates that one or more data was transferred to the Host buffer.
An interrupt is generated only once for simultaneous, multiple events. The driver must scan SDMMC_IDSTS register for the interrupt cause.

3.3.4 Variable Delay/Clock Generation Unit

Variable delay mechanism for the cclk_in_drv is useful in order to meet a range of hold-time requirements across modes. Variable delay mechanism for the cclk_in_sample is mandatory and is required to achieve the correct sampling point for data.
The Clock Generation Unit (CLKGEN) includes Phase Shift Unit and Delay Line Unit.
The Phase Shift Unit can shift cclk_in_sample/cclk_in_drv by 0/90/180/270-degree relative to cclk_in. The Delay Line Unit can shift cclk_in_sample/cclk_in_drv step by step in the unit of delay element. The delay value range is 25ps~56ps for every delay element; the max delay element number is 256.
The architecture is as follows.

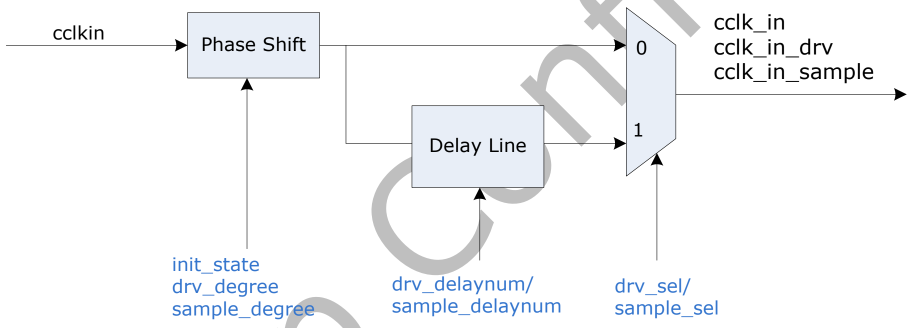

Fig. 3-9 Clock Generation Unit

3.4 Register Description

3.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
SDMMC_CTRL	0x0000	W	0x00000000	Control register
SDMMC_PWREN	0x0004	W	0x00000000	Power enable register
SDMMC_CLKDIV	0x0008	W	0x00000000	Clock divider register
SDMMC_CLKSRC	0x000c	W	0x00000000	SD clock source register
SDMMC_CLKENA	0x0010	W	0x00000000	Clock enable register
SDMMC_TMOUT	0x0014	W	0xFFFFFF40	Timeout register
SDMMC_CTYPE	0x0018	W	0x00000000	Card type register
SDMMC_BLKSIZ	0x001c	W	0x00000200	Block size register
SDMMC_BYTCNT	0x0020	W	0x00000200	Byte count register

SDMMC_RDYINT_GEN	0x0120	W	0x00FF0000	Card ready interrupt generation control register
SDMMC_FIFO_BASE	0x0200	W	0x00000000	FIFO base address register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

3.4.2 Detail Register Description

SDMMC_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RW	0x0	use_internal_dmac Present only for the Internal DMAC configuration; else, it is reserved. 1'b0: The host performs data transfers through the slave interface 1'b1: Internal DMAC used for data transfer
24:12	RO	0x0000	reserved
11	RW	0x0	ceata_device_interrupt_status 1'b0: Interrupts not enabled in CE-ATA device 1'b1: Interrupts are enabled in CE-ATA device Software should appropriately write to this bit after power-on reset or any other reset to CE-ATA device. After reset, usually CE-ATA device interrupt is disabled. If the host enables CE-ATA device interrupt, then software should set this bit.

Bit	Attr	Reset Value	Description
10	RW	0x0	send_auto_stop_ccsd 1'b0: Clear bit if Host Controller does not reset the bit 1'b1: Send internally generated STOP after sending CCSD to CE-ATA device NOTE: Always set send_auto_stop_ccsd and send_ccsd bits together send_auto_stop_ccsd should not be set independent of send_ccsd. When set, the Host Controller automatically sends internally-generated STOP command (CMD12) to CE-ATA device. After sending internally-generated STOP command, Auto Command Done (ACD) bit in SDMMC_RINTSTS is set and generates interrupt to host if Auto Command Done interrupt is not masked. After sending the CCSD, the Host Controller automatically clears send_auto_stop_ccsd bit.
9	RW	0x0	send_ccsd 1'b0: Clear bit if Host Controller does not reset the bit 1'b1: Send Command Completion Signal Disable (CCSD) to CE-ATA device When set, the Host Controller sends CCSD to CE-ATA device. Software sets this bit only if current command is expecting CCS (that is, RW_BLK) and interrupts are enabled in CE-ATA device. Once the CCSD pattern is sent to device, the Host Controller automatically clears send_ccsd bit. It also sets Command Done (CD) bit in SDMMC_RINTSTS register and generates interrupt to host if Command Done interrupt is not masked. NOTE: Once send_ccsd bit is set, it takes two card clock cycles to drive the CCSD on the CMD line. Due to this, during the boundary conditions it may happen that CCSD is sent to the CE-ATA device, even if the device signalled CCS.
8	RW	0x0	abort_read_data 1'b0: No change 1'b1: After suspend command is issued during read-transfer, software polls card to find when suspend happened. Once suspend occurs, software sets bit to reset data state-machine, which is waiting for next block of data. Bit automatically clears once data state machine resets to idle. Used in SDIO card suspend sequence.
7	RW	0x0	send_irq_response 1'b0: No change 1'b1: Send auto IRQ response Bit automatically clears once response is sent. To wait for MMC card interrupts, software issues CMD40, and the Host Controller waits for interrupt response from MMC card. In meantime, if software wants the Controller to exit waiting for interrupt state, it can set this bit, at which time the Host Controller command state-machine sends CMD40 response on bus and returns to idle state.
6	RW	0x0	read_wait 1'b0: Clear read wait 1'b1: Assert read wait For sending read-wait to SDIO cards.

Bit	Attr	Reset Value	Description
5	RW	0x0	dma_enable 1'b0: Disable DMA transfer mode 1'b1: Enable DMA transfer mode Even when DMA mode is enabled, host can still push/pop data into or from FIFO; this should not happen during the normal operation. If there is simultaneous FIFO access from host/DMA, the data coherency is lost. Also, there is no arbitration inside the controller to prioritize simultaneous host/DMA access.
4	RW	0x0	int_enable Global interrupt enable/disable bit. 1'b0: Disable interrupts 1'b1: Enable interrupts The int port is 1 only when this bit is 1 and one or more unmasked interrupts are set.
3	RO	0x0	reserved
2	WO	0x0	dma_reset 1'b0: No change 1'b1: Reset internal DMA interface control logic To reset DMA interface, firmware should set bit to 1. This bit is auto-cleared after two AHB clocks.
1	WO	0x0	fifo_reset 1'b0: No change 1'b1: Reset to data FIFO to reset FIFO pointers To reset FIFO, firmware should set bit to 1. This bit is auto-cleared after completion of reset operation.
0	WO	0x0	controller_reset 1'b0: No change 1'b1: Reset Host Controller To reset Host Controller, firmware should set bit to 1. This bit is auto-cleared after two AHB and two cclk_in clock cycles. This resets: a. BIU/CIU interface b. CIU and state machines c. abort_read_data, send_irq_response, and read_wait bits of SDMMC_CTRL register d. start_cmd bit of SDMMC_CMD register Does not affect any registers or DMA interface, or FIFO or controller interrupts.

SDMMC_PWREN

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	power_enable Power on/off switch for the card. Once power is turned on, firmware should wait for regulator/switch ramp-up time before trying to initialize card. 1'b0: Power off 1'b1: Power on Bit values output to card_power_en port.

SDMMC_CLKDIV

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:0	RW	0x00	clk_divider0 Clock divider-0 value. Clock division is 2*n. For example, value of 0 means divide by 2*0 = 0 (no division, bypass), value of 1 means divide by 2*1 = 2, and so on. The recommended value is 0 or 1.

SDMMC_CLKSRC

Address: Operational Base + offset (0x000c)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x0	clk_source Clock divider source. 2'b00: Clock divider 0 The cclk_out is always from clock divider 0, and this register is not implemented.

SDMMC_CLKENA

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	cclk_low_power Low-power control for SD card clock and MMC card clock supported. 1'b0: Non-low-power mode 1'b1: Low-power mode Stop clock when card in IDLE (should be normally set to only MMC and SD memory cards; for SDIO cards, if interrupts must be detected, clock should not be stopped).
15:1	RO	0x0000	reserved
0	RW	0x0	cclk_enable Clock-enable control for SD card clock and MMC card clock supported. 1'b0: Clock disabled 1'b1: Clock enabled

SDMMC_TMOUT

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:8	RW	0xffffff	data_timeout Value for card data read timeout; same value also used for data starvation by host timeout. Value is in number of card output clock. Note: The software timer should be used if the timeout value is in the order of 100 ms. In this case, read data timeout interrupt needs to be disabled.
7:0	RW	0x40	response_timeout Response timeout value. Value is in number of card output clock cclk_out.

SDMMC_CTYPE

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
16	RW	0x0	card_width_8 Indicates if card is 8-bit. 1'b0: Non 8-bit mode 1'b1: 8-bit mode
15:1	RO	0x0000	reserved
0	RW	0x0	card_width Indicates if card is 1-bit or 4-bit. 1'b0: 1-bit mode 1'b1: 4-bit mode

SDMMC_BLKSIZ

Address: Operational Base + offset (0x001c)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0200	block_size Block size

SDMMC_BYTCNT

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000200	byte_count Number of bytes to be transferred; should be integer multiple of block size for block transfers. For undefined number of byte transfers, byte count should be set to 0. When byte count is set to 0, it is responsibility of host to explicitly send stop/abort command to terminate data transfer.

SDMMC_INTMASK

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RW	0x0	sdio_int_mask 1'b0: SDIO interrupt not masked 1'b1: SDIO interrupt masked
23:17	RO	0x00	reserved
16	RW	0x0	data_nobusy_int_mask 1'b0: Data no busy interrupt not masked 1'b1: Data no busy interrupt masked

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	int_mask Bits used to mask unwanted interrupts. Value of 0 masks interrupt; value of 1 enables interrupt. bit 15: End-bit error (read)/Write no CRC (EBE) bit 14: Auto command done (ACD) bit 13: Start-bit error (SBE) bit 12: Hardware locked write error (HLE) bit 11: FIFO underrun/overrun error (FRUN) bit 10: Data starvation-by-host timeout (HTO) /Volt_switch_int bit 9: Data read timeout (DRTO) bit 8: Response timeout (RTO) bit 7: Data CRC error (DCRC) bit 6: Response CRC error (RCRC) bit 5: Receive FIFO data request (RXDR) bit 4: Transmit FIFO data request (TXDR) bit 3: Data transfer over (DTO) bit 2: Command done (CD) bit 1: Response error (RE) bit 0: Card detect (CD)

SDMMC_CMDARG
Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	cmd_arg Value indicates command argument to be passed to card.

SDMMC_CMD
Address: Operational Base + offset (0x002c)

Bit	Attr	Reset Value	Description
31	RW	0x0	start_cmd Start command. Once command is taken by CIU, bit is cleared. When bit is set, host should not attempt to write to any command registers. If write is attempted, hardware lock error is set in raw interrupt register. Once command is sent and response is received from SD/MMC cards, Command Done bit is set in raw interrupt register.
30	RO	0x0	reserved
29	RW	0x1	use_hold_reg Use hold register. 1'b0: CMD and DATA sent to card bypassing hold register 1'b1: CMD and DATA sent to card through the hold register
28	RW	0x0	volt_switch Voltage switch bit. 1'b0: No voltage switching 1'b1: Voltage switching enabled; must be set for CMD11 only.
27	RW	0x0	boot_mode Boot mode selection. 1'b0: Mandatory boot operation 1'b1: Alternate boot operation
26	RW	0x0	disable_boot Disable boot. When software sets this bit along with start_cmd, CIU terminates the boot operation. Do not set disable_boot and enable_boot together.

Bit	Attr	Reset Value	Description
25	RW	0x0	expect_boot_ack Expect boot acknowledge. When software sets this bit along with enable_boot, CIU expects a boot acknowledge start pattern of 0-1-0 from the selected card.
24	RW	0x0	enable_boot Enable boot. This bit should be set only for mandatory boot mode. When Software sets this bit along with start_cmd, CIU starts the boot sequence for the corresponding card by asserting the CMD line low. Do not set disable_boot and enable_boot together.
23	RW	0x0	ccs_expected 1'b0: Interrupts are not enabled in CE-ATA device or command does not expect CCS from device 1'b1: Interrupts are enabled in CE-ATA device and RW_BLK command expects command completion signal from CE-ATA device If the command expects command completion signal (CCS) from the CE-ATA device, the software should set this control bit. The Host Controller sets data transfer over (DTO) bit in SDMMC_RINTSTS register and generates interrupt to host if data transfer over interrupt is not masked.
22	RW	0x0	read_ceata_device 1'b0: Host is not performing read access towards CE-ATA device 1'b1: Host is performing read access towards CE-ATA device Software should set this bit to indicate that CE-ATA device is being accessed for read transfer. This bit is used to disable read data timeout indication while performing CE-ATA read transfers. Maximum value of I/O transmission delay can be no less than 10 seconds. The Host Controller should not indicate read data timeout while waiting for data from CE-ATA device.
21	RW	0x0	update_clock_regs_only 1'b0: Normal command sequence 1'b1: Do not send commands, just update clock register value into card clock domain. Following register values transferred into card clock domain: SDMMC_CLKDIV, SDMMC_CLRSRC, SDMMC_CLKENA. Changes card clocks (change frequency, truncate off or on, and set low-frequency mode); provided in order to change clock frequency or stop clock without having to send command to cards. During normal command sequence, when update_clock_regs_only = 0, following control registers are transferred from BIU to CIU: SDMMC_CMD, SDMMC_CMDARG, SDMMC_TMOUT, SDMMC_CTYPE, SDMMC_BLKSIZ, SDMMC_BYTCNT. CIU uses new register values for new command sequence to card. When bit is set, there are no Command Done interrupts because no command is sent to SD_MMC_CEATA cards.
20:16	RO	0x00	reserved

Bit	Attr	Reset Value	Description
15	RW	0x0	send_initialization 1'b0: Do not send initialization sequence (80 clocks of 1) before sending this command 1'b1: Send initialization sequence before sending this command After power on, 80 clocks must be sent to card for initialization before sending any commands to card. Bit should be set while sending first command to card so that controller will initialize clocks before sending command to card. This bit should not be set for either of the boot modes (alternate or mandatory).
14	RW	0x0	stop_abort_cmd 1'b0: Neither stop nor abort command to stop current data transfer in progress. If abort is sent to function-number currently selected or not in data-transfer mode, then bit should be set to 0. 1'b1: Stop or abort command intended to stop current data transfer in progress. When open-ended or predefined data transfer is in progress, and host issues stop or abort command to stop data transfer, bit should be set so that command/data state-machines of CIU can return correctly to idle state. This is also applicable for Boot mode transfers. To Abort boot mode, this bit should be set along with SDMMC_CMD[26]=disable_boot.
13	RW	0x0	wait_prvdata_complete 1'b0: Send command at once, even if previous data transfer has not completed 1'b1: Wait for previous data transfer completion before sending command The wait_prvdata_complete=0 option typically used to query status of card during data transfer or to stop current data transfer; card_number should be same as in previous command.
12	RW	0x0	send_auto_stop 1'b0: No stop command sent at end of data transfer 1'b1: Send stop command at end of data transfer When set, the Host Controller sends stop command to card at end of data transfer. a. When send_auto_stop bit should be set, since some data transfers do not need explicit stop commands b. Open-ended transfers that software should explicitly send to stop command Additionally, when "resume" is sent to resume-suspended memory access of SD-Combo card, bit should be set correctly if suspended data transfer needs send_auto_stop. Don't care if no data expected from card.
11	RW	0x0	transfer_mode 1'b0: Block data transfer command 1'b1: Stream data transfer command Don't care if no data expected.
10	RW	0x0	wr 1'b0: Read from card 1'b1: Write to card Don't care if no data expected from card.
9	RW	0x0	data_expected 1'b0: No data transfer expected (read/write) 1'b1: Data transfer expected (read/write)

Bit	Attr	Reset Value	Description
8	RW	0x0	check_response_crc 1'b0: Do not check response CRC 1'b1: Check response CRC Some of command responses do not return valid CRC bits. Software should disable CRC checks for those commands in order to disable CRC checking by controller.
7	RW	0x0	response_length 1'b0: Short response expected from card 1'b1: Long response expected from card
6	RW	0x0	response_expect 1'b0: No response expected from card 1'b1: Response expected from card
5:0	RW	0x00	cmd_index Command index

SDMMC_RESP0
Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	response0 Bit[31:0] of response

SDMMC_RESP1
Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	response1 Register represents bit[63:32] of long response. When CIU sends auto-stop command, then response is saved in register. Response for previous command sent by host is still preserved in response 0 register. Additional auto-stop issued only for data transfer commands, and response type is always "short" for them.

SDMMC_RESP2
Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	response2 Bit[95:64] of long response.

SDMMC_RESP3
Address: Operational Base + offset (0x003c)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	response3 Bit[127:96] of long response.

SDMMC_MINTSTS
Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RO	0x0	sdio_interrupt SDIO interrupt status when sdio_int_mask is set.
23:17	RO	0x00	reserved
16	RW	0x0	data_nobusy_int_status Data no busy interrupt status when data_nobusy_int_mask is set

Bit	Attr	Reset Value	Description
15:0	RO	0x0000	int_status Interrupt enabled only if corresponding bit in interrupt mask register is set. bit 15: End-bit error (read)/Write no CRC (EBE) bit 14: Auto command done (ACD) bit 13: Start-bit error (SBE) bit 12: Hardware locked write error (HLE) bit 11: FIFO underrun/overrun error (FRUN) bit 10: Data starvation-by-host timeout (HTO) /Volt_switch_int bit 9: Data read timeout (DRTO) bit 8: Response timeout (RTO) bit 7: Data CRC error (DCRC) bit 6: Response CRC error (RCRC) bit 5: Receive FIFO data request (RXDR) bit 4: Transmit FIFO data request (TXDR) bit 3: Data transfer over (DTO) bit 2: Command done (CD) bit 1: Response error (RE) bit 0: Card detect (CD)

SDMMC_RINTSTS
Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	WO	0x0	sdio_interrupt Raw SDIO interrupt status. Write value of 1 clears this bit, and value of 0 leaves bit intact.
23:17	RO	0x00	reserved
16	WO	0x0	data_nobusy_int_status Raw data no busy interrupt status. Write value of 1 clears this bit, and value of 0 leaves bit intact.
15:0	WO	0x0000	int_status Raw interrupt status. Writes to bits clear status bit. Write value of 1 clears status bit, and value of 0 leaves bit intact. bit 15: End-bit error (read)/Write no CRC (EBE) bit 14: Auto command done (ACD) bit 13: Start-bit error (SBE) bit 12: Hardware locked write error (HLE) bit 11: FIFO underrun/overrun error (FRUN) bit 10: Data starvation-by-host timeout (HTO) /Volt_switch_int bit 9: Data read timeout (DRTO) bit 8: Response timeout (RTO) bit 7: Data CRC error (DCRC) bit 6: Response CRC error (RCRC) bit 5: Receive FIFO data request (RXDR) bit 4: Transmit FIFO data request (TXDR) bit 3: Data transfer over (DTO) bit 2: Command done (CD) bit 1: Response error (RE) bit 0: Card detect (CD)

SDMMC_STATUS
Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31	RO	0x0	dma_req DMA request signal state
30	RO	0x0	dma_ack DMA acknowledge signal state
29:17	RO	0x0000	fifo_count Number of filled locations in FIFO
16:11	RO	0x00	response_index Index of previous response, including any auto-stop sent by core.
10	RO	0x0	data_state_mc_busy Data transmit or receive state-machine is busy.
9	RO	0x0	data_busy Inverted version of raw selected card_data[0]. 1'b0: Card data not busy 1'b1: Card data busy
8	RO	0x1	data_3_status Raw selected card_data[3]; checks whether card is present. 1'b0: Card not present 1'b1: Card present
7:4	RO	0x0	command_fsm_states Command FSM states: 4'h0: Idle 4'h1: Send init sequence 4'h2: Tx cmd start bit 4'h3: Tx cmd tx bit 4'h4: Tx cmd index + arg 4'h5: Tx cmd crc7 4'h6: Tx cmd end bit 4'h7: Tx resp start bit 4'h8: Rx resp IRQ response 4'h9: Rx resp tx bit 4'ha: Rx resp cmd idx 4'hb: Rx resp data 4'hc: Rx resp crc7 4'hd: Rx resp end bit 4'he: Cmd path wait NCC 4'hf: Wait; CMD-to-response turnaround The command FSM state is represented using 19 bits. The SDMMC_STATUS register[7:4] has 4 bits to represent the command FSM states. Using these 4 bits, only 16 states can be represented. Thus three states cannot be represented in the SDMMC_STATUS[7:4] register. The three states that are not represented in the SDMMC_STATUS register[7:4] are: Bit 16: Wait for CCS Bit 17: Send CCSD Bit 18: Boot Mode Due to this, while command FSM is in "Wait for CCS state" or "Send CCSD" or "Boot Mode", the SDMMC_STATUS register indicates status as 0 for the bit field [7:4].
3	RO	0x0	fifo_full FIFO is full status
2	RO	0x1	fifo_empty FIFO is empty status

Bit	Attr	Reset Value	Description
1	RO	0x1	fifo_tx_watermark FIFO reached Transmit watermark level; not qualified with data transfer.
0	RO	0x0	fifo_rx_watermark FIFO reached Receive watermark level; not qualified with data transfer.

SDMMC_FIFOTH

Address: Operational Base + offset (0x004c)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:28	RW	0x0	dma_mutiple_transaction_size Burst size of multiple transaction; should be programmed same as DMA controller multiple-transaction-size SRC/DEST_MSIZE. 3'b000: 1 transfers 3'b001: 4 transfers 3'b010: 8 transfers 3'b011: 16 transfers 3'b100: 32 transfers 3'b101: 64 transfers 3'b110: 128 transfers 3'b111: 256 transfers The unit for transfer is 32bits.
27:16	RW	0x0ff	rx_wmark FIFO threshold watermark level when receiving data to card. When FIFO data count reaches greater than this number, DMA/FIFO request is raised. During end of packet, request is generated regardless of threshold programming in order to complete any remaining data. In non-DMA mode, when receiver FIFO threshold (RXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, interrupt is not generated if threshold programming is larger than any remaining data. It is responsibility of host to read remaining bytes on seeing Data Transfer Done interrupt. In DMA mode, at end of packet, even if remaining bytes are less than threshold, DMA request does single transfers to flush out any remaining bytes before Data Transfer Done interrupt is set. 12 bits-1 bit less than FIFO-count of status register, which is 13 bits. Limitation: rx_wmark <= FIFO_DEPTH-2 Recommended: (FIFO_DEPTH/2) - 1; (means greater than (FIFO_DEPTH/2) - 1) NOTE: In DMA mode during CCS time-out, the DMA does not generate the request at the end of packet, even if remaining bytes are less than threshold. In this case, there will be some data left in the FIFO. It is the responsibility of the application to reset the FIFO after the CCS timeout.
15:12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
11:0	RW	0x000	tx_wmark FIFO threshold watermark level when transmitting data to card. When FIFO data count is less than or equal to this number, DMA/FIFO request is raised. If Interrupt is enabled, then interrupt occurs. During end of packet, request or interrupt is generated, regardless of threshold programming. In non-DMA mode, when transmit FIFO threshold (TXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, on last interrupt, host is responsible for filling FIFO with only required remaining bytes (not before FIFO is full or after CIU completes data transfers, because FIFO may not be empty). In DMA mode, at end of packet, if last transfer is less than burst size, DMA controller does single cycles until required bytes are transferred. 12 bits -1 bit less than FIFO-count of status register, which is 13 bits. Limitation: tx_wmark >= 1; Recommended: FIFO_DEPTH/2; (means less than or equal to FIFO_DEPTH/2)

SDMMC_CDETECT

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x1	card_detect_n Value on card_detect_n input port. 1'b0: Represents presence of card 1'b1: Represents absence of card

SDMMC_WRTPRT

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	write_protect Value on card_write_prt input port. 1 represents write protection.

SDMMC_TCBCNT

Address: Operational Base + offset (0x005c)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	trans_card_byte_count Number of bytes transferred by CIU unit to card.

SDMMC_TBBCNT

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	trans_fifo_byte_count Number of bytes transferred between host/DMA memory and BIU FIFO.

SDMMC_DEBNCE

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23:0	RW	0xffffff	debounce_count Number of host clock used by debounce filter logic; typical debounce time is 5-25 ms.

SDMMC_USRID

Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	usrid User identification register

SDMMC_VERID

Address: Operational Base + offset (0x006c)

Bit	Attr	Reset Value	Description
31:0	RO	0x5342270a	verid Version identification register

SDMMC_HCON

Address: Operational Base + offset (0x0070)

SDMMC_UHSREG

Address: Operational Base + offset (0x0074)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	ddr_reg DDR mode. These bits indicate DDR mode of operation to the core for the data transfer. 1'b0: Non-DDR mode 1'b1: DDR mode
15:0	RO	0x0000	reserved

SDMMC_RSTN

Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x1	card_reset Hardware reset. 1'b0: Active mode 1'b1: Reset These bits cause the cards to enter pre-idle state, which requires them to be re-initialized.

SDMMC_BMOD

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
10:8	RO	0x0	pbl Programmable burst length. These bits indicate the maximum number of beats to be performed in one IDMAC transaction. The IDMAC will always attempt to burst as specified in PBL each time it starts a Burst transfer on the host bus. The permissible values are 1, 4, 8, 16, 32, 64, 128 and 256. This value is the mirror of MSIZE of SDMMC_FIFOTH register. In order to change this value, write the required value to SDMMC_FIFOTH register. This is an encode value as follows. 3'b000: 1 transfers 3'b001: 4 transfers 3'b010: 8 transfers 3'b011: 16 transfers 3'b100: 32 transfers 3'b101: 64 transfers 3'b110: 128 transfers 3'b111: 256 transfers Transfer unit is 32 bits. PBL is a read-only value and is applicable only for data access; it does not apply to descriptor accesses.
7	RW	0x0	de IDMAC enable. When set, the IDMAC is enabled.
6:2	RW	0x00	dsl Descriptor skip length. Specifies the number of word to skip between two unchained descriptors. This is applicable only for dual buffer structure.
1	RW	0x0	fb Fixed burst. Controls whether the AHB Master interface performs fixed burst transfers or not. When set, the AHB will use only SINGLE, INCR4, INCR8 or INCR16 during start of normal burst transfers. When reset, the AHB will use SINGLE and INCR burst transfer operations.
0	RW	0x0	swr Software reset. When set, the DMA Controller resets all its internal registers. It is automatically cleared after 1 clock cycle.

SDMMC_PLDMND

Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	pd Poll demand. If the OWN bit of a descriptor is not set, the FSM goes to the suspend state. The host needs to write any value into this register for the IDMAC FSM to resume normal descriptor fetch operation.

SDMMC_DBADDR

Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sbl Start of descriptor list. Contains the base address of the first descriptor. The LSB bits[1:0] are ignored and taken as all-zero by the IDMAC internally. Hence these LSB bits are read-only.

SDMMC_IDSTS

Address: Operational Base + offset (0x008c)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:13	RO	0x0	fsm DMAC FSM present state. 4'h0: DMA_IDLE 4'h1: DMA_SUSPEND 4'h2: DESC_RD 4'h3: DESC_CHK 4'h4: DMA_RD_REQ_WAI 4'h5: DMA_WR_REQ_WAI 4'h6: DMA_RD 4'h7: DMA_WR 4'h8: DESC_CLOSE Others: Reserved
12:10	RO	0x0	eb Error bits. Indicates the type of error that caused a bus error. Valid only with fatal bus. 3'h1: Host abort received during transmission 3'h2: Host abort received during reception Others: Reserved
9	RW	0x0	ais Abnormal interrupt summary. Logical OR of the following: SDMMC_IDSTS[2] fatal bus interrupt SDMMC_IDSTS[4] du bit interrupt Only unmasked bits affect this bit. This is a sticky bit and must be cleared each time a corresponding bit that causes ais to be set is cleared. Writing a 1 clears this bit.
8	RW	0x0	nis Normal interrupt summary. Logical OR of the following: SDMMC_IDSTS[0] transmit interrupt SDMMC_IDSTS[1] receive interrupt Only unmasked bits affect this bit. This is a sticky bit and must be cleared each time a corresponding bit that causes nis to be set is cleared. Writing a 1 clears this bit.
7:6	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5	RW	0x0	ces Card error summary. Indicates the status of the transaction to/from the card; also present in SDMMC_RINTSTS. Indicates the logical OR of the following bits: EBE: End Bit Error RTO: Response Timeout/Boot Ack Timeout RCRC: Response CRC SBE: Start Bit Error DRTO: Data Read Timeout/BDS timeout DCRC: Data CRC for Receive RE: Response Error Writing a 1 clears this bit. The abort condition of the IDMAC depends on the setting of this CES bit. If the CES bit is enabled, then the IDMAC aborts on a "response error"; however, it will not abort if the CES bit is cleared.
4	RW	0x0	dui Descriptor unavailable interrupt. This bit is set when the descriptor is unavailable due to OWN bit = 0 (DES0[31] =0). Writing a 1 clears this bit.
3	RO	0x0	reserved
2	RW	0x0	fbe Fatal bus error interrupt. Indicates that a bus error occurred (SDMMC_IDSTS[12:10]). When this bit is set, the DMA disables all its bus accesses. Writing a 1 clears this bit.
1	RW	0x0	ri Receive interrupt. Indicates the completion of data reception for a descriptor. Writing a 1 clears this bit.
0	RW	0x0	ti Transmit interrupt. Indicates that data transmission is finished for a descriptor. Writing 1 clears this bit.

SDMMC_IDINTEN

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9	RW	0x0	ai Abnormal interrupt summary enable. When set, an abnormal interrupt is enabled. This bit enables the following bits: SDMMC_IDINTEN[2] fatal bus error interrupt SDMMC_IDINTEN[4] du interrupt
8	RW	0x0	ni Normal interrupt summary enable. When set, a normal interrupt is enabled. When reset, a normal interrupt is disabled. This bit enables the following bits: SDMMC_IDINTEN[0] transmit interrupt SDMMC_IDINTEN[1] receive interrupt
7:6	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5	RW	0x0	ces Card error summary interrupt enable. When set, it enables the card interrupt summary.
4	RW	0x0	du Descriptor unavailable interrupt. When set along with abnormal interrupt summary enable, the du interrupt is enabled.
3	RO	0x0	reserved
2	RW	0x0	fbe Fatal bus error enable. When set with abnormal interrupt summary enable, the fatal bus error interrupt is enabled. When reset, fatal bus error enable interrupt is disabled.
1	RW	0x0	ri Receive interrupt enable. When set with normal interrupt summary enable, receive interrupt is enabled. When reset, receive interrupt is disabled.
0	RW	0x0	ti Transmit interrupt enable. When set with normal interrupt summary enable, transmit interrupt is enabled. When reset, transmit interrupt is disabled.

SDMMC_DSCADDR

Address: Operational Base + offset (0x0094)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hda Host descriptor address pointer. This register points to the start address of the current descriptor read by the IDMAC. Cleared on reset. Pointer updated by IDMAC during operation.

SDMMC_BUFADDR

Address: Operational Base + offset (0x0098)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	hba Host buffer address pointer. This register points to the current data buffer address being accessed by the IDMAC. Cleared on Reset. Pointer updated by IDMAC during operation.

SDMMC_CARDTHRCTL

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	card_rd_thres Card read threshold size
15:2	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	busy_clr_int_en Busy clear interrupt. 1'b0: Busy clear interrupt disabled 1'b1: Busy clear interrupt enabled Note: The application can disable this feature if it does not want to wait for a busy clear interrupt. For example, in a multi-card scenario, the application can switch to the other card without waiting for a busy to be completed. In such cases, the application can use the polling method to determine the status of busy. By default this feature is disabled and backward-compatible to the legacy drivers where polling is used.
0	RW	0x0	card_rd_thres_en Card read threshold enable. 1'b0: Card read threshold disabled 1'b1: Card read threshold enabled. The host initiates read transfer only if zcard_rd_thres amount of space is available in receive FIFO.

SDMMC_BACKEND_POWER

Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	back_end_power Back end power. 1'b0: Off; Reset 1'b1: Back-end power supplied to card application

SDMMC_EMMCDDR_REG

Address: Operational Base + offset (0x010c)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	half_start_bit Control for start bit detection mechanism inside Host Controller based on duration of start bit. For eMMC 4.5, start bit can be: 1'b0: Full cycle (half_start_bit=0) 1'b1: Less than one full cycle (half_start_bit=1) Set half_start_bit=1 for eMMC 4.5 and above; set to 0 for SD applications.

SDMMC_RDYINT_GEN

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RO	0x0	rdyint_cnt_finish Counter finish indication. When high, it indicates that the rdyint counter is finished.
23:16	RO	0xff	rdyint_cnt_status Couner status, reflect internal counter value.
15:9	RO	0x00	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	rdyint_gen_working Working indication for rdyint generator. When high, Host Controller start to count and generate one rdyint trigger. After the rdyint trigger is generated, this bit will be set to 0 by Host Controller. So software should set it to 1 before detecting next interrupt.
7:0	RW	0x00	rdyint_gen_maxval Max counter value to detect cdata_in0 high value for generating rdyint, based on internal clock frequency.

SDMMC_FIFO_BASE

Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	fifo_base_addr FIFO base address

3.5 Interface Description

3.6 Application Notes

3.6.1 Software/Hardware Restriction

Before issuing a new data transfer command, the software should ensure that the card is not busy due to any previous data transfer command. Before changing the card clock frequency, the software must ensure that there are no data or command transfers in progress.

To avoid glitches in the card clock outputs, the software should use the following steps when changing the card clock frequency:

1) Before disable the clocks, ensure that the card is not busy due to any previous data command. To determine this, check for 0 in bit9 of SDMMC_STATUS register.
2) Update the Clock Enable register to disable clock. To ensure completion of any previous command before this update, send a command to the CIU to update the clock registers by setting:
   - start_cmd bit
   - "update clock registers only" bits
   - "wait_previous data complete" bit

   Wait for the CIU to take the command by polling for 0 on the start_cmd bit.
3) Set the start_cmd bit to update the Clock Divider and/or Clock Source register, and send a command to the CIU in order to update the clock registers; wait for the CIU to take the command.
4) Set start_cmd to update the Clock Enable register in order to enable the required clocks and send a command to the CIU to update the clock registers; wait for the CIU to take the command.

In non-DMA mode, while reading from a card, the Data Transfer Over (SDMMC_RINTSTS[3]) interrupt occurs as soon as the data transfer from the card is over. There still could be some data left in the FIFO, and the RX_WMark interrupt may or may not occur, depending on the remaining bytes in the FIFO. Software should read any remaining bytes upon seeing the Data Transfer Over (DTO) interrupt. While using the external DMA interface for reading from a card, the DTO interrupt occurs only after all the data is flushed to memory by the DMA interface unit.

While writing to a card in external DMA mode, if an undefined-length transfer is selected by setting the Byte Count Register to 0, the DMA logic will likely request more data than it will send to the card, since it has no way of knowing at which point the software will stop the transfer. The DMA request stops as soon as the DTO is set by the CIU.

If the software issues a controller_reset command by setting control register bit[0] to 1, all the CIU state machines are reset; the FIFO is not cleared. The DMA sends all remaining bytes to the host. In addition to a card-reset, if a FIFO reset is also issued, then:

- Any pending DMA transfer on the bus completes correctly
- DMA data read is ignored
- Write data is unknown(x)

Additionally, if dma_reset is also issued, any pending DMA transfer is abruptly terminated. When the DMA is used, the DMA controller channel should also be reset and reprogrammed. If any of the previous data commands do not properly terminate, then the software should issue the FIFO reset in order to remove any residual data, if any, in the FIFO. After asserting the FIFO reset, you should wait until this bit is cleared.

One data-transfer requirement between the FIFO and host is that the number of transfers should be a multiple of the FIFO data width (32bits). For example, you want to write only 15 bytes to an SD/MMC card (SDMMC_BYTCNT), the host should write 16 bytes to the FIFO or program the DMA to do 16-byte transfers. The software can still program the Byte Count register to only 15, at which point only 15 bytes will be transferred to the card. Similarly, when 15 bytes are read from a card, the host should still read all 16 bytes from the FIFO.

It is recommended that you not change the FIFO threshold register in the middle of data transfers.

3.6.2 Programming Sequence

3.6.2.1 Initialization

Following figure illustrates the initialization flow.

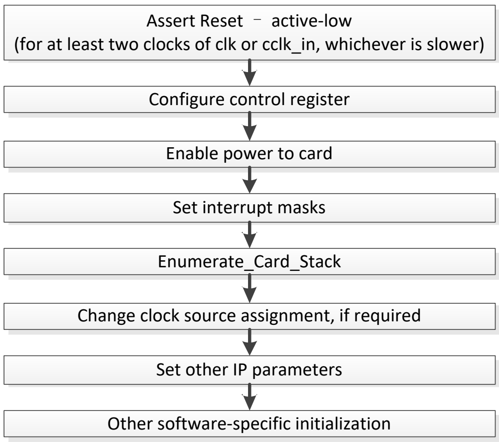

Fig. 3-10 Host Controller Initialization Sequence

Once the power and clocks are stable, reset_n should be asserted(active-low) for at least two cycles of clk or cclk_in, whichever is slower. The reset initializes the registers, ports, FIFO-pointers, DMA interface controls, and state-machines in the design. After power-on reset, the software should do the following:

1) Configure control register – For MMC mode, enable the open-drain pullup by setting enable_OD_pullup(bit24) in the SDMMC_CTRL register.
2) Enable power to cards – Before enabling the power, confirm that the voltage setting to the voltage regulators is correct. Enable power to the connected cards by setting the corresponding bit to 1 in the Power Enable register. Wait for the power ramp-up time.
3) Set masks for interrupts by clearing appropriate bits in the Interrupt Mask register. Set the global int_enable bit of the SDMMC_CTRL register. It is recommended that you write 0xffff_ffff to the Raw Interrupt register in order to clear any pending interrupts before setting the int_enable bit.
4) Enumerate card stack – Each card is enumerated according to card type; for details, refer to “Enumerated Card Stack”. For enumeration, you should restrict the clock frequency to 400KHz.
5) Changing clock source assignment – set the card frequency using the clock-divider and clock-source registers; for details, refer to “Clock Programming”. MMC cards operate at a maximum of 20MHz (at maximum of 52MHz in high-speed mode). SD mode operates at a maximum of 25MHz (at maximum of 50MHz in high-speed mode).
6) Set other parameters, which normally do not need to be changed with every command, with a typical value such as timeout values in cclk_out according to SD/MMC specifications.

- ResponseTimeOut = 0x64
- DataTimeOut = highest of one of the following:
- (10*((TAAC*Fop)+(100*NSAC))
- Host FIFO read/write latency from FIFO empty/full
- Set the debounce value to 25ms(default:0x0fffff) in host clock cycle units in the SDMMC_DEBNCE register.
- FIFO threshold value in bytes in the SDMMC_FIFOTH register.

3.6.2.2 Enumerated Card Stack

The card stack does the following:

- Enumerates all connected cards
- Sets the RCA for the connected cards
- Reads card-specific information
- Stores card-specific information locally

Enumeration depends on the operating mode of the SD/MMC card; the card type is first

identified and the appropriate card enumeration routine is called.
1) Check if the card is connected.
2) Clear the card type register to set the card width as a single bit. For the given card number, clear the corresponding bits in the card_type register. Clear the register bit for a 1-bit, 4-bit bus width. For example, for card number=1, clear bit 0 and bit 16 of the card_type register.
3) Set clock frequency to FOD=400KHz, maximum – Program clock divider0 (bits 0-7 in the SDMMC_CLKDIV register) value to one-half of the cclk_in frequency divided by 400KHz. For example, if cclk_in is 20MHz, then the value is 20, 000/(2*400)=25.
4) Identify the card type; that is, SD, MMC, or SDIO.
   a. Send CMD5 first. If a response is received, then the card is SDIO
   b. If not, send CMD8 with the following Argument
      Bit[31:12] = 20'h0 //reserved bits
      Bit[11:8] = 4'b0001 //VHS value
      Bit[7:0] = 8'b10101010 //Preferred Check Pattern by SD2.0
   c. If Response is received the card supports High Capacity SD2.0 then send ACMD41 with the following Argument
      Bit[31] = 1'b0; //Reserved bits
      Bit[30] = 1'b1; //High Capacity Status
      Bit[29:24] = 6'h0; //Reserved bits
      Bit[23:0] = Supported Voltage Range
   d. If Response is received for ACMD41 then the card is SD. Otherwise the card is MMC.
   e. If response is not received for initial CMD8 then card does not support High Capacity SD2.0, then issue CMD0 followed by ACMD41 with the following Argument
      Bit[31] = 1'b0; //Reserved bits
      Bit[30] = 1'b0; //High Capacity Status
      Bit[29:24] = 6'h0; //Reserved bits
      Bit[23:0] = Supported Voltage Range
5) Enumerate the card according to the card type.
6) Use a clock source with a frequency = Fod (that is, 400KHz) and use the following enumeration command sequence:
- SD card – Send CMD0, CMD8, ACMD41, CMD2, CMD3.
- MMC – Send CMD0, CMD1, CMD2, CMD3.

3.6.2.3 Clock Programming

The Host Controller supports one clock source. The clock to an individual card can be enabled or disabled. Registers that support this are:
- SDMMC_CLKDIV – Programs individual clock source frequency. SDMMC_CLKDIV limited to 0 or 1 is recommended.
- SDMMC_CLKSRC – Assign clock source for each card.
- SDMMC_CLKENA – Enables or disables clock for individual card and enables low-power mode, which automatically stops the clock to a card when the card is idle for more than 8 clocks.

The Host Controller loads each of these registers only when the start_cmd bit and the update_clk_regs_only bit in the SDMMC_CMD register are set. When a command is successfully loaded, the Host Controller clears this bit, unless the Host Controller already has another command in the queue, at which point it gives an HLE(Hardware Locked Error). Software should look for the start_cmd and the update_clk_regs_only bits, and should also set the wait_prvdata_complete bit to ensure that clock parameters do not change during data transfer. Note that even though start_cmd is set for updating clock registers, the Host Controller does not raise a command_done signal upon command completion.
The following shows how to program these registers:
1) Confirm that no card is engaged in any transaction; if there is a transaction, wait until it finishes.
2) Stop all clocks by writing 0 to the SDMMC_CLKENA register. Set the start_cmd, Update_clk_regs_only, and wait_prvdata_complete bits in the SDMMC_CMD register. Wait until start_cmd is cleared or an HLE is set; in case of an HLE, repeat the command.
3) Program the SDMMC_CLKDIV and SDMMC_CLKSRC registers, as required. Set the

start_cmd, Update_clk_regs_only, and wait_prvdata_complete bits in the SDMMC_CMD register. Wait until start_cmd is cleared or an HLE is set; in case of an HLE, repeat the command.

4) Re-enable all clocks by programming the SDMMC_CLKENA register. Set the start_cmd, update_clk_regs_only, and wait_prvdata_complete bits in the SDMMC_CMD register. Wait until start_cmd is cleared or an HLE is set; in case of an HLE, repeat the command.

3.6.2.4 No-Data Command With or Without Response Sequence

To send any non-data command, the software needs to program the SDMMC_CMD register @0x2C and the SDMMC_CMDARG register @0x28 with appropriate parameters. Using these two registers, the Host Controller forms the command and sends it to the command bus. The Host Controller reflects the errors in the command response through the error bits of the SDMMC_RINTSTS register.
When a response is received – either erroneous or valid – the Host Controller sets the command_done bit in the SDMMC_RINTSTS register. A short response is copied in Response Register0, while along response is copied to all four response registers @0x30, 0x34, 0x38, and 0x3C. The Response3 register bit 31 represents the MSB, and the Response0 register bit 0 represents the LSB of a long response.
For basic commands or non-data commands, follow these steps:

1) Program the Command register @0x28 with the appropriate command argument parameter.
2) Program the Command register @0x2C with the settings in following table.

Table 3-11 Command Settings for No-Data Command

Parameter	Value	Description
Default		
start_cmd	1	-
use_hold_reg	1	Choose value based on speed mode being used;ref to “use_hold_reg” on SDMMC_CMD register
update_clk_regs_only	0	No clock parameters update command
data_expected	0	No data command
card number	0	Actual card number(one controller only connect one card, the num is No. 0)
cmd_index	command-index	-
send_initialization	0	Can be 1, but only for card reset commands, such as CMD0
stop_abort_cmd	0	Can be 1 for commands to stop data transfer, such as CMD12
response_length	0	Can be 1 for R2(long) response
response_expect	1	Can be 0 for commands with no response; for example, CMD0, CMD4, CMD15, and so on
User-selectable		
wait_prvdata_complete	1	Before sending command on command line, host should wait for completion of any data command in process, if any (recommended to always set this bit, unless the current command is to query status

Parameter	Value	Description
		or stop data transfer when transfer is in progress)
check_response_crc	1	If host should crosscheck CRC of response received

3) Wait for command acceptance by host. The following happens when the command is loaded into the Host Controller:
- Host Controller accepts the command for execution and clears the start_cmd bit in the SDMMC_CMD register, unless one command is in process, at which point the Host Controller can load and keep the second command in the buffer.
- If the Host Controller is unable to load the command – that is, a command is already in progress, a second command is in the buffer, and a third command is attempted – then it generates an HLE (hardware-locked error).

4) Check if there is an HLE.
5) Wait for command execution to complete. After receiving either a response from a card or response timeout, the Host Controller sets the command_done bit in the SDMMC_RINTSTS register. Software can either poll for this bit or respond to a generated interrupt.
6) Check if response_timeout error, response_CRC error, or response error is set. This can be done either by responding to an interrupt raised by these errors or by polling bits 1, 6, and 8 from the SDMMC_RINTSTS register @0x44. If no response error is received, then the response is valid. If required, the software can copy the response from the response registers @0x30-0x3C.

Software should not modify clock parameters while a command is being executed.

3.6.2.5 Data Transfer Commands

Data transfer commands transfer data between the memory card and the Host Controller. To send a data command, the Host Controller needs a command argument, total data size, and block size. Software can receive or send data through the FIFO.
Before a data transfer command, software should confirm that the card is not busy and is in a transfer state, which can be done using the CMD13 and CMD7 commands, respectively.
For the data transfer commands, it is important that the same bus width that is programmed in the card should be set in the card type register @0x18.
The Host Controller generates an interrupt for different conditions during data transfer, which are reflected in the SDMMC_RINTSTS register @0x44 as:

1) Data_Transfer_Over (bit 3) – When data transfer is over or terminated. If there is a response timeout error, then the Host Controller does not attempt any data transfer and the "Data Transfer Over" bit is never set.
2) Transmit_FIFO_Data_request (bit 4) – FIFO threshold for transmitting data was reached; software is expected to write data, if available, in FIFO.
3) Receive_FIFO_Data_request (bit 5) – FIFO threshold for receiving data was reached; software is expected to read data from FIFO.
4) Data starvation by Host timeout (bit 10) – FIFO is empty during transmission or is full during reception. Unless software writes data for empty condition or reads data for full condition, the Host Controller cannot continue with data transfer. The clock to the card has been stopped.
5) Data read timeout error (bit 9) – Card has not sent data within the timeout period.
6) Data CRC error (bit 7) – CRC error occurred during data reception.
7) Start bit error (bit 13) – Start bit was not received during data reception.
8) End bit error (bit 15) – End bit was not received during data reception or for a write operation; a CRC error is indicated by the card.

Conditions 6), 7), and 8) indicate that the received data may have errors. If there was a response timeout, then no data transfer occurred.

3.6.2.6 Single-Block or Multiple-Block Read

Steps involved in a single-block or multiple-block read are:

1) Write the data size in bytes in the SDMMC_BYTCNT register @0x20.
2) Write the block size in bytes in the SDMMC_BLKSIZ register @0x1C. The Host Controller expects data from the card in blocks of size SDMMC_BLKSIZ each.

3) Program the SDMMC_CMDARG register @0x28 with the data address of the beginning of a data read.
4) Program the Command register with the parameters listed in following table. For SD and MMC cards, use CMD17 for a single-block read and CMD18 for a multiple-block read. For SDIO cards, use CMD53 for both single-block and multiple-block transfers.

Table 3-12 Command Setting for Single or Multiple-Block Read

Parameter	Value	Description
Default		
start_cmd	1	-
use_hold_reg	1	Choose value based on speed mode being used;ref to “use_hold_reg” on SDMMC_CMD register
update_clk_regs_only	0	No clock parameters update command
card number	0	Actual card number(one controller only connect one card, the num is No.0)
send_initialization	0	Can be 1, but only for card reset commands, such as CMD0
stop_abort_cmd	0	Can be 1 for commands to stop data transfer, such as CMD12
send_auto_stop	0/1	-
transfer_mode	0	Block transfer
read_write	0	Read from card
data_expected	1	Data command
response_length	0	Can be 1 for R2(long) response
response_expect	1	Can be 0 for commands with no response; for example, CMD0, CMD4, CMD15, and so on
User-selectable		
cmd_index	command-index	-
wait_prvdata_complete	1	0: Sends command immediately 1: Sends command after previous data transfer ends
check_response_crc	1	0: Host Controller should not check response CRC 1: Host Controller should check response CRC

After writing to the SDMMC_CMD register, the Host Controller starts executing the command; when the command is sent to the bus, the command_done interrupt is generated.

- Software should look for data error interrupts; that is, bits 7, 9, 13, and 15 of the SDMMC_RINTSTS register. If required, software can terminate the data transfer by sending a STOP command.
- Software should look for Receive_FIFO_Data_request and/or data starvation by host timeout conditions. In both cases, the software should read data from the FIFO and make space in the FIFO for receiving more data.
- When a Data_Transfer_Over interrupt is received, the software should read the remaining data from the FIFO.

3.6.2.7 Single-Block or Multiple-Block Write

Steps involved in a single-block or multiple-block write are:

1) Write the data size in bytes in the SDMMC_BYTCNT register @0x20.
2) Write the block size in bytes in the SDMMC_BLKSIZ register @0x1C; the Host Controller sends data in blocks of size SDMMC_BLKSIZ each.
3) Program SDMMC_CMDARG register @0x28 with the data address to which data should be written.
4) Write data in the FIFO; it is usually best to start filling data the full depth of the FIFO.
5) Program the Command register with the parameters listed in following table.

Table 3-13 Command Settings for Single or Multiple-Block Write

Parameter	Value	Description
Default		
start_cmd	1	-
use_hold_reg	1	Choose value based on speed mode being used;ref to “use_hold_reg” on SDMMC_CMD register
update_clk_regs_only	0	No clock parameters update command
card number	0	Actual card number(one controller only connect one card, the num is No. 0)
send_initialization	0	Can be 1, but only for card reset commands, such as CMD0
stop_abort_cmd	0	Can be 1 for commands to stop data transfer, such as CMD12
send_auto_stop	0/1	-
transfer_mode	0	Block transfer
read_write	1	Write to card
data_expected	1	Data command
response_length	0	Can be 1 for R2(long) response
response_expect	1	Can be 0 for commands with no response; for example, CMD0, CMD4, CMD15, and so on
User-selectable		
cmd_index	command-index	-
wait_prvdata_complete	1	0: Sends command immediately 1: Sends command after previous data transfer ends
check_response_crc	1	0: Host Controller should not check response CRC 1: Host Controller should check response CRC

After writing to the SDMMC_CMD register, Host Controller starts executing a command; when the command is sent to the bus, a command_done interrupt is generated.

- Software should look for data error interrupts; that is, for bits 7, 9, and 15 of the SDMMC_RINTSTS register. If required, software can terminate the data transfer by sending the STOP command.
- Software should look for Transmit_FIFO_Data_Request and/or timeout conditions from data starvation by the host. In both cases, the software should write data into the FIFO.
- When a Data_Transfer_Over interrupt is received, the data command is over. For an

open-ended block transfer, if the byte count is 0, the software must send the STOP command. If the byte count is not 0, then upon completion of a transfer of a given number of bytes, the Host Controller should send the STOP command, if necessary. Completion of the AUTO-STOP command is reflected by the Auto_command_done interrupt – bit 14 of the SDMMC_RINTSTS register. A response to AUTO_STOP is stored in SDMMC_RESP1 @0x34.

3.6.2.8 Stream Read

A stream read is like the block read mentioned in “Single-Block or Multiple-Block Read”, except for the following bits in the Command register:

transfer_mode = 1; //Stream transfer
cmd_index = CMD20;

A stream transfer is allowed for only a single-bit bus width.

3.6.2.9 Stream Write

A stream write is exactly like the block write mentioned in “Single-Block or Multiple-Block Write”, except for the following bits in the Command register:

transfer_mode = 1;//Stream transfer
cmd_index = CMD11;

In a stream transfer, if the byte count is 0, then the software must send the STOP command. If the byte count is not 0, then when a given number of bytes completes a transfer, the Host Controller sends the STOP command. Completion of this AUTO_STOP command is reflected by the Auto_command_done interrupt. A response to an AUTO_STOP is stored in the SDMMC_RESP1 register@0x34.
A stream transfer is allowed for only a single-bit bus width.

3.6.2.10 Sending Stop or Abort in Middle of Transfer

The STOP command can terminate a data transfer between a memory card and the Controller, while the ABORT command can terminate an I/O data transfer for only the SDIO_IOONLY and SDIO_COMBO cards.

- Send STOP command – Can be sent on the command line while a data transfer is in progress; this command can be sent at any time during a data transfer.

You can also use an additional setting for this command in order to set the Command register bits (5-0) to CMD12 and set bit 14 (stop_abort_cmd) to 1. If stop_abort_cmd is not set to 1, the Controller does not know that the user stopped a data transfer. Reset bit 13 of the Command register (wait_prvdata_complete) to 0 in order to make the Controller send the command at once, even though there is a data transfer in progress.

- Send ABORT command – Can be used with only an SDIO_IOONLY or SDIO_COMBO card. To abort the function that is transferring data, program the function number in ASx bits (CCCR register of card, address 0x06, bits (0-2) using CMD52.

3.6.2.11 Read_Wait Sequence

Read_wait is used with only the SDIO card and can temporarily stall the data transfer—either from function or memory—and allow the host to send commands to any function within the SDIO device. The host can stall this transfer for as long as required. The Host Controller provides the facility to signal this stall transfer to the card. The steps for doing this are:

1) Check if the card supports the read_wait facility; read SRW (bit 2) of the CCCR register @0x08. If this bit is 1, then all functions in the card support the read_wait facility. Use CMD52 to read this bit.
2) If the card supports the read_wait signal, then assert it by setting the read_wait (bit 6) in the SDMMC_CTRL register @0x00.
3) Clear the read_wait bit in the SDMMC_CTRL register.

3.6.2.12 Controller/DMA/FIFO Reset Usage

- Controller reset – Resets the controller by setting the controller_reset bit (bit 0) in the SDMMC_CTRL register; this resets the CIU and state machines, and also resets the BIU-to-CIU interface. Since this reset bit is self-clearing, after issuing the reset, wait until this bit is cleared.
- FIFO reset - Resets the FIFO by setting the fifo_reset bit (bit 1) in the SDMMC_CTRL register; this resets the FIFO pointers and counters of the FIFO. Since this reset bit is

self-clearing, after issuing the reset, wait until this bit is cleared.
In external DMA transfer mode, even when the FIFO pointers are reset, if there is a DMA transfer in progress, it could push or pop data to or from the FIFO; the DMA itself completes correctly. In order to clear the FIFO, the software should issue an additional FIFO reset and clear any FIFO under-run or overrun errors in the SDMMC_RAWINTS register caused by the DMA transfers after the FIFO was reset.

3.6.2.13 Card Read Threshold

When an application needs to perform a Single or Multiple Block Read command, the application must program the SDMMC_CARDTHRCTL register with the appropriate Card Read Threshold size (CardRdThreshold) and set the Card Read Threshold Enable (CardRdThrEnable) bit to 1'b1. This additional programming ensures that the Host controller sends a Read Command only if there is space equal to the Card Read Threshold available in the Rx FIFO. This in turn ensures that the card clock is not stopped in the middle a block of data being transmitted from the card. The Card Read Threshold can be set to the block size of the transfer, which guarantees that there is a minimum of one block size of space in the RxFIFO before the controller enables the card clock. The Card Read Threshold is required when the Round Trip Delay is greater than 0.5cclk_in period.

3.6.2.14 Error Handling

The Host Controller implements error checking; errors are reflected in the SDMMC_RAWINTS register@0x44 and can be communicated to the software through an interrupt, or the software can poll for these bits. Upon power-on, interrupts are disabled (int_enable in the SDMMC_CTRL register is 0), and all the interrupts are masked (bits 0-31 of the SDMMC_INTMASK register; default is 0).
Error handling:

- Response and data timeout errors – For response timeout, software can retry the command. For data timeout, the Host Controller has not received the data start bit – either for the first block or the intermediate block – within the timeout period, so software can either retry the whole data transfer again or retry from a specified block onwards. By reading the contents of the SDMMC_TCBCNT later, the software can decide how many bytes remain to be copied.
- Response errors – Set when an error is received during response reception. In this case, the response that copied in the response registers is invalid. Software can retry the command.
- Data errors – Set when error in data reception are observed; for example, data CRC, start bit not found, end bit not found, and so on. These errors could be set for any block-first block, intermediate block, or last block. On receipt of an error, the software can issue a STOP or ABORT command and retry the command for either whole data or partial data.
- Hardware locked error – Set when the Host Controller cannot load a command issued by software. When software sets the start_cmd bit in the SDMMC_CMD register, the Host Controller tries to load the command. If the command buffer is already filled with a command, this error is raised. The software then has to reload the command.
- FIFO under-run/overrun error – If the FIFO is full and software tries to write data in the FIFO, then an overrun error is set. Conversely, if the FIFO is empty and the software tries to read data from the FIFO, an under-run error is set. Before reading or writing data in the FIFO, the software should read the fifo_empty or fifo_full bits in the Status register.
- Data starvation by host timeout – Raised when the Host Controller is waiting for software intervention to transfer the data to or from the FIFO, but the software does not transfer within the stipulated timeout period. Under this condition and when a read transfer is in process, the software should read data from the FIFO and create space for further data reception. When a transmit operation is in process, the software should fill data in the FIFO in order to start transferring data to the card.
- CRC Error on Command – If a CRC error is detected for a command, the CE-ATA device does not send a response, and a response timeout is expected from the Host Controller. The ATA layer is notified that an MMC transport layer error occurred.

Notes: During a multiple-block data transfer, if a negative CRC status is received from the device, the data *path signals a data CRC error to the BIU by setting the data CRC error bit in the SDMMC_RINTSTS register. It then continues further data transmission until all the bytes are transmitted.*

3.6.3 Voltage Switching

The Host Controller supports SD 3.0 Ultra High Speed (UHS-1) and is capable of voltage switching in SD-mode, which can be applied to SD High-Capacity (SDHC) and SD Extended Capacity (SDXC) cards. UHS-1 supports only 4-bit mode.
However, whether the IO voltage of 1.8v supported or not is depended on the SoC design.
SD 3.0 UHS-1 supports the following transfer speed modes for UHS-50 and/or UHS-104 cards:

- DS – default-speed up to 25MHz, 3.3V signaling
- HS – high-speed up to 50MHz, 3.3V signaling
- SDR12 – SDR up to SDR 25MHz, 1.8V signaling
- SDR25 – SDR up to 50MHz, 1.8V signaling
- SDR50 – SDR up to 100MHz, 1.8V signaling
- DDR50 – DDR up to 50MHz, 1.8V signaling

Voltage selection can be done in only SD mode. The first CMD0 selects the bus mode-either SD mode or SPI mode. The card must be in SD mode in order for 1.8V signaling mode to apply, during which time the card cannot be switched to SPI mode or 3.3V signaling without a power cycle.
If the System BIOS in an embedded system already knows that it is connected to an SD 3.0 card, then the driver programs the Controller to initiate ACMD41. The software knows from the response of ACMD41 whether or not the card supports voltage switching to 1.8V.

- If bit 32 of ACMD41 response is 1'b1: card supports voltage switching and next command-CMD11-invokes voltage switching sequence. After CMD11 is started, the software must program the IO voltage selection register based on the soc architecture.
- If bit 32 of ACMD41 response is 1'b0: card does not support voltage switching and CMD11 should not be started.

If the card and host controller accept voltage switching, then they support UHS-1 modes of data transfer. After the voltage switch to 1.8V, SDR12 is the default speed.
Since the UHS-1 can be used in only 4-bit mode, the software must start ACMD6 and change the card data width to 4-bit mode; ACMD6 is driven in any of the UHS-1 speeds. If the host wants to select the DDR mode of data transfer, then the software must program the SDMMC_DDR_REG register in the CSR space with the appropriate card number.
To choose from any of the SDR or DDR modes, appropriate values should be programmed in the SDMMC_CLKDIV register.

3.6.3.1 Voltage Switch Operation

The Voltage Switch operation must be performed in SD mode only.

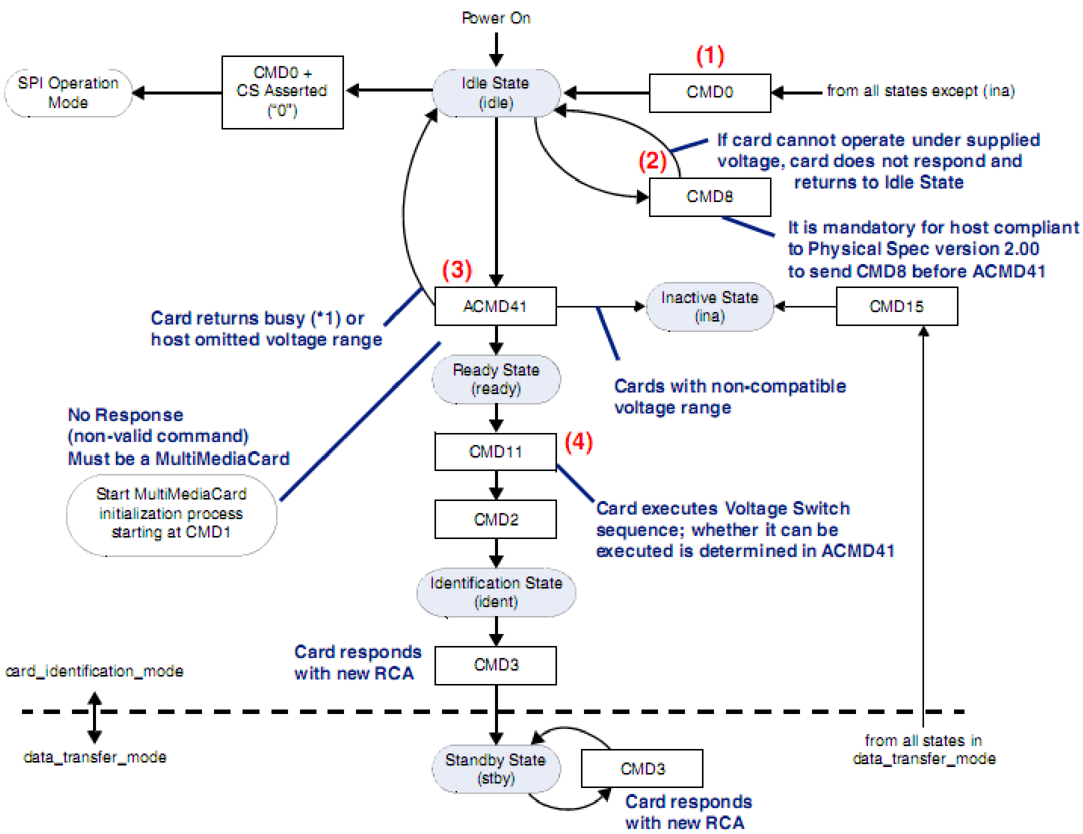

Fig. 3-11 Voltage Switching Command Flow Diagram

The following outlines the steps for the voltage switch programming sequence

1) Software Driver starts CMD0, which selects the bus mode as SD.
2) After the bus is in SD card mode, CMD8 is started in order to verify if the card is compatible with the SD Memory Card Specification, Version 2. 00. CMD8 determines if the card is capable of working within the host supply voltage specified in the VHS (19:16) field of the CMD; the card supports the current host voltage if a response to CMD8 is received.
3) ACMD 41 is started. The response to this command informs the software if the card supports voltage switching; bits 38, 36, and 32 are checked by the card argument of ACMD41; refer to following figure.

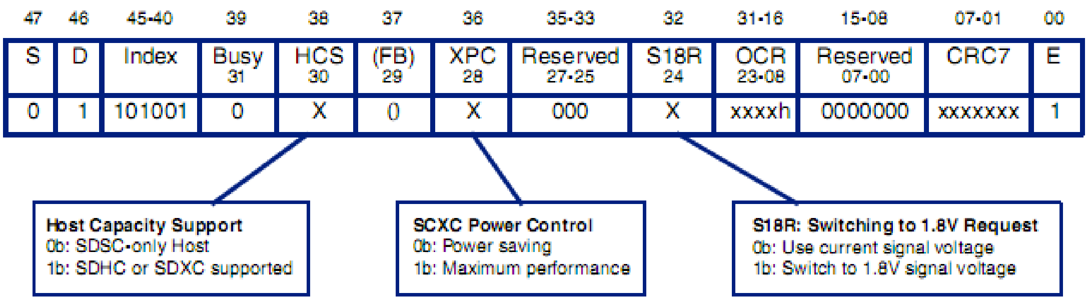

Fig. 3-12 ACMD41 Argument

- Bit 30 informs the card if host supports SDHC/SDXC or not; this bit should be set to 1'b1.
- Bit 28 can be either 1 or 0.
- Bit 24 should be set to 1'b1, indicating that the host is capable of voltage switching; refer to following figure.

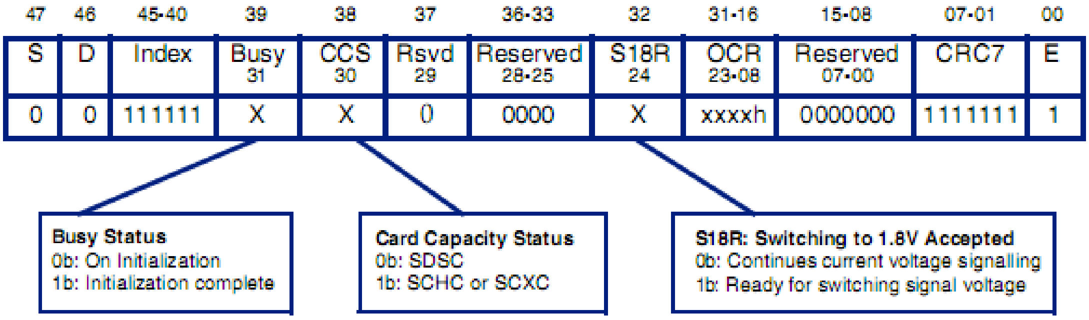

Fig. 3-13 ACMD41 Response(R3)

- Bit 30 – If set to 1'b1, card supports SDHC/SDXC; if set to 1'b0, card supports only SDSC
- Bit 24 – If set to 1'b1, card supports voltage switching and is ready for the switch
- Bit 31 – If set to 1'b1, initialization is over; if set to 1'b0, means initialization in process

4) If the card supports voltage switching, then the software must perform the steps discussed for either the "Voltage Switch Normal Scenario" or the "Voltage Switch Error Scenario".

3.6.3.2 Voltage Switch Normal Scenario

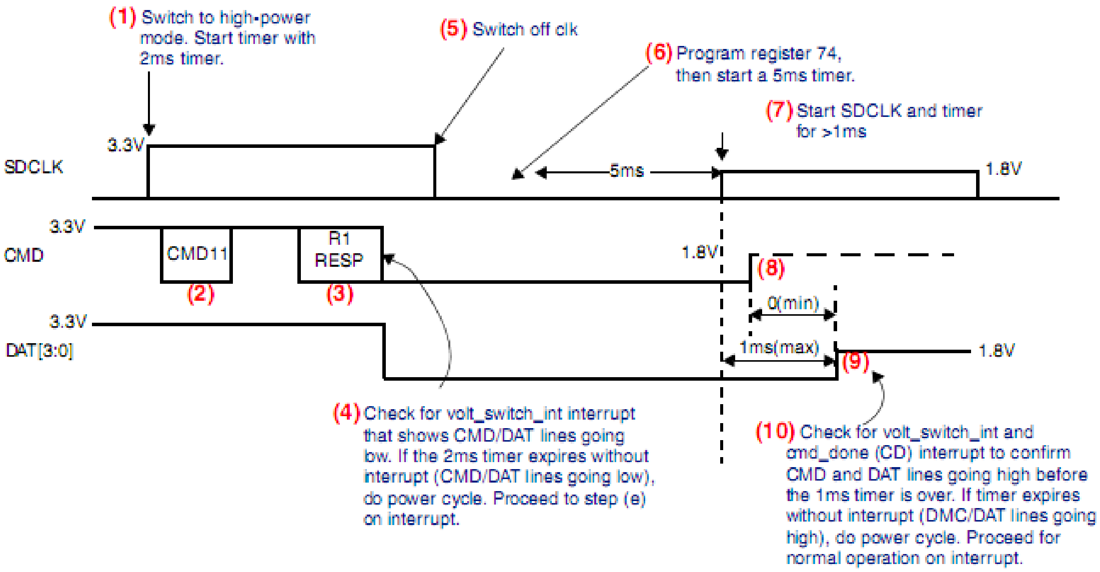

Fig. 3-14 Voltage Switch Normal Scenario

1) The host programs SDMMC_CLKENA—cclk_low_power register—with zero (0) for the corresponding card, which makes the host controller move to high-power mode. The application should start a timer with a recommended value of 2ms; this value of 2 ms is determined as below: Total cycles required for CMD11 = 48 cycles
   Total cycles required for RESP R1 = 48 cycles
   Maximum clock delay between MCD11 end to start of RESP1 = 60 cycles
   Total = 48+48 + 60 = 160
   Minimum frequency during enumeration is 100 KHz; that is, 10us
   Total time = 160 * 10us = 1600us = 1. 6ms ~ 2ms
2) The host issues CMD11 to start the voltage switch sequence. Set bit 28 to 1'b1 in CMD when setting CMD11; for more information on setting bits, refer to "Boot Operation".
3) The card returns R1 response; the host controller does not generate cmd_done interrupt on receiving R1 response.
4) The card drives CMD and DAT [3:0] to low immediately after the response. The host controller generates interrupt (VOLT_SWITCH_INT) once the CMD or DAT [3:0] line goes low. The application should wait for this interrupt. If the 2ms timer expires without an interrupt (CMD/DAT lines going low), do a power cycle.

Note: Before doing a power cycle, switch off the card clock by programming SDMMC_CLKENA register

Proceed to step (5) on getting an interrupt (VOLT_SWITCH_INT).

Note: This interrupt must be cleared once this interrupt is received. Additionally, this interrupt should not be

masked during the voltage switch sequence.
If the timer expires without interrupt (CMD/DAT lines going low), perform a power cycle. Proceed to step (5) on interrupt.
1) Program the SDMMC_CLKENA register, with 0 for the corresponding card; the host stops supplying SDCLK.
2) Program Voltage register to the required values for the corresponding card. The application should start a timer > 5ms.
3) After the 5ms timer expires, the host voltage regulator is stable. Program SDMMC_CLKENA register, with 1 for the corresponding card; the host starts providing SDCLK at 1. 8V; this can be at zero time after Voltage register has been programmed. When the SDMMC_CLKENA register is programmed, the application should start another timer > 1ms.
4) By detecting SDCLK, the card drives CMD to high at 1. 8V for at least one clock and then stops driving (tri-state); CMD is triggered by the rising edge of SDCLK (SDR timing).
5) If switching to 1. 8V signaling is completed successfully, the card drives DAT [3:0] to high at 1. 8V for at least one clock and then stops driving (tri-state); DAT [3:0] is triggered by the rising edge of SDCLK (SDR timing). DAT[3:0] must be high within 1ms from the start of SDCLK.
6) The host controller generates a voltage switch interrupt (VOLT_SWITCH_INT) and a command done (CD) interrupt once the CMD and DAT[3:0] lines go high. The application should wait for this interrupt to confirm CMD and DAT lines going high before the 1ms timer is done.

If the timer expires without the voltage switch interrupt (VOLT_SWITCH_INT), a power cycle should be performed. Program the SDMMC_CLKENA register to stop the clock for the corresponding card number. Wait for the cmd_done (CD) interrupt. Proceed for normal operation on interrupt. After the sequence is completed, the host and the card start communication in SDR12 timing.

3.6.3.3 Voltage Switch Error Scenario

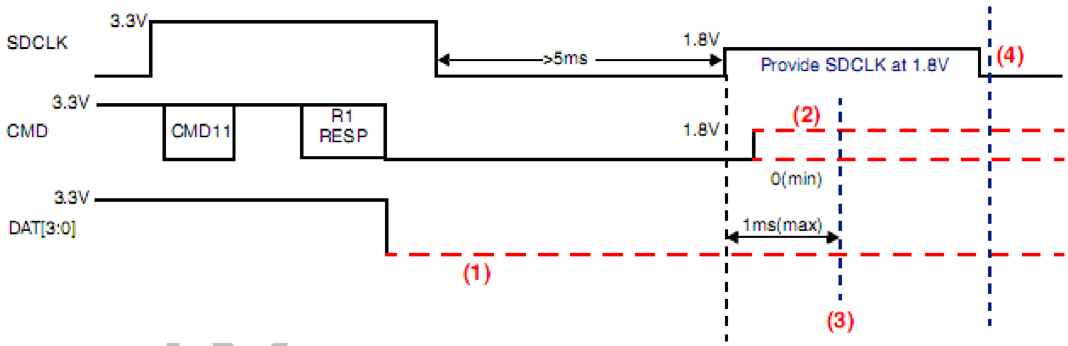

Fig. 3-15 Voltage Switch Error Scenario

1) If the interrupt (VOLT_SWITCH_INT) does not come, then the 2 ms timer should time out and a power cycle should be initiated.

Note: Before performing a power cycle, switch off the card clock by programming SDMMC_CLKENA register; no cmd_done (CD) interrupt is generated.

Additionally, if the card detects a voltage error at any point in between steps (5) and (7) in the card keeps driving DAT[3:0] to low until card power off.
2) CMD can be low or tri-state.
3) The host controller generates a voltage switch interrupt once the CMD and DAT[3:0] lines go high. The application should check for an interrupt to confirm CMD and DAT lines going high before the 1 ms timer is done.

If the 1 ms timer expires without interrupt (VOLT_SWITCH_INT) and cmd_done (CD), a power cycle should be performed. Program the SDMMC_CLKENA register to stop SDCLK of the corresponding card. Wait for the cmd_done interrupt. Proceed for normal operation on interrupt.
4) If DAT[3:0] is low, the host drives SDCLK to low and then stops supplying the card power.

Note: The card checks voltages of its own regulator output and host signals to ensure they are less than 2. 5V. Errors are indicated by (1) and (2).

- If voltage switching is accepted by the card, the default speed is SDR12.
- Command Done is given:
  - If voltage switching is properly done, CMD and DAT line goes high.
  - If switching is not complete, the 1ms timer expires, and the card clock is switched off.

Note: No other CMD should be driven before the voltage switching operation is completed and Command Done is received.

- The application should use CMD6 to check and select the particular function; the function appropriate-speed should be selected.

After the function switches, the application should program the correct value in the CLKDIV register, depending on the function chosen. Additionally, if Function 0x4 of the Access mode is chosen—that is, DDR50, then the application should also program 1'b1 in DDR_REG for the card number that has been selected for DDR50 mode.

3.6.4 DDR Operation

3.6.4.1 4-bit DDR Programming Sequence

DDR programming should be done only after the voltage switch operation has completed. The following outlines the steps for the DDR programming sequence:

1) Once the voltage switch operation is complete, the user must program voltage selection register to the required values for the corresponding card.
- To start a card to work in DDR mode, the application must program a bit of the newly defined SDMMC_UHSREG[16] register with a value of 1'b1.
- The bit that the user programs depends on which card is to be accessed in DDR mode.
2) To move back to SDR mode, a power cycle should be run on the card—putting the card in SDR12 mode—and only then should SDMMC_UHSREG[16]be set back to 1'b0 for the appropriate card.

3.6.4.2 8-bit DDR Programming Sequence

The following outlines the steps for the 8-bit DDR programming sequence:

1) The cclk_in signal should be twice the speed of the required cclk_out. Thus, if the cclk_out signal is required to be 50 MHz, the cclk_in signal should be 100 MHz.
2) The SDMMC_CLKDIV register should always be programmed with a value higher than zero (0); that is, a clock divider should always be used for 8-bit DDR mode.
3) The application must program the SDMMC_UHSREG[16] register (ddr_reg bits) by assigning it with a value of 1 for the bit corresponding to the card number; this causes the selected card to start working in DDR mode.
4) Depending on the card number, the SDMMC_CTYPE [16] bits should be set in order to make the host work in the 8-bit mode.

3.6.4.3 eMMC4.5 DDR START Bit

The eMMC4.5 changes the START bit definition in the following manner:

1) Receiver samples the START bit on the rising edge.
2) On the next rising edge after sampling the START bit, the receiver must sample the data.
3) Removes requirement of the START bit and END bit to be high for one full cycle.

Notes: The Host Controller does not support a START bit duration higher than one clock cycle. START bit durations of one or less than one clock cycle are supported and can be defined at the time of startup by programming the EMMC_DDR_REG register.

3.6.4.4 Reset Command/Moving From DDR50 to SDR12

To reset the mode of operation from DDR50 to SDR12, the following sequence of operations has to be done by the application:

1) Issue CMD0.
2) When CMD0 is received, the card changes from DDR50 to SDR12.
3) Program the SDMMC_CLKDIV register with an appropriate value.
4) Set ddr_reg to 0.

Note: The Voltage register should not be programmed to 0 while switching from DDR50 to SDR12, since the card is still operating in 1.8V mode after receiving CMD0.

3.6.5 H/W Reset Operation

When the RST_n signal goes low, the card enters a pre-idle state from any state other than the inactive state.

The following outlines the steps for the H/W reset programming sequence:
1) Program CMD12 to end any transfer in process.
2) Wait for DTO, even if no response is sent back by the card.
3) Set the following resets:
- DMA reset–SDMMC_CTRL [2] bit
- FIFO reset–SDMMC_CTRL [1] bit

Note: The above steps are required only if a transfer is in process.

4) Program the SDMMC_RSTN register with a value of 0; this can be done at any time when the card is connected to the controller. This programming asserts the RST_n signal and resets the card.
5) Wait for minimum of 1 μs or cclk_in period, whichever is greater
6) After a minimum of 1 μs, the application should program a value of 0 into the SDMMC_RSTN register. This de-asserts the RST_n signal and takes the card out of reset.
7) The application can program a new CMD only after a minimum of 200 μs after the de-assertion of the RST_n signal, as per the MMC 4.41 standard.

Note: For backward compatibility, the RST_n signal is temporarily disabled in the card by default. The host may need to set the signal as either permanently enabled or permanently disabled before it uses the card.

3.6.6 FBE Scenarios

An FBE occurs due to an AHB error response on the AHB bus. This is a system error, so the software driver should not perform any further programming to the Host. The only recovery mechanism from such scenarios is to do one of the following:
- Issue a hard reset by asserting the reset_n signal
- Do a program controller reset by writing to the SDMMC_CTRL[0] bit

3.6.6.1 FIFO Overflow and Underflow

During normal data transfer conditions, FIFO overflow and underflow will not occur. However if there is a programming error, then FIFO overflow/underflow can result. For example, consider the following scenarios.
- For transmit: PBL=4, Tx watermark = 1. For the above programming values, if the FIFO has only one location empty, it issues a dma_req to IDMAC FSM. Due to PBL value=4, the IDMAC FSM performs 4 pushes into the FIFO. This will result in a FIFO overflow interrupt.
- For receive: PBL=4, Rx watermark = 1. For the above programming values, if the FIFO has only one location filled, it issues a dma_req to IDMAC FSM. Due to PBL value=4, the IDMAC FSM performs 4 pops to the FIFO. This will result in a FIFO underflow interrupt.

The driver should ensure that the number of bytes to be transferred as indicated in the descriptor should be a multiple of 4bytes with respect to H_DATA_WIDTH=32. For example, if the SDMMC_BYTCNT=13, the number of bytes indicated in the descriptor should be 16 for H_DATA_WIDTH=32.

3.6.6.2 Programming of PBL and Watermark Levels

The DMAC performs data transfers depending on the programmed PBL and threshold values.

Table 3-14 PBL and Watermark Levels

PBL (Number of transfers)	Tx/Rx Watermark Value
1	Greater than or equal to 1
4	Greater than or equal to 4
8	Greater than or equal to 8
16	Greater than or equal to 16
32	Greater than or equal to 32
64	Greater than or equal to 64
128	Greater than or equal to 128
256	Greater than or equal to 256

3.6.7 Variable Delay Usage

The delay time of every element is in the range of 36ps~68ps, varying with different voltage and temperature.

The control signals for variable delay element usage are shown as follows.

3.6.7.1 SDMMC Variable Delay Usage

Table 3-15 Configuration for SDMMC Variable Delay Usage

Signal Name	Source	Default	Description
init_state	CRU_SDMMC_CON0[0]	0	Enable initialization for clock source. 1’b0: Disable 1’b1: Enable When init_state=1, the host clocks including drive clock and sample clock are inactive.
drv_degree[1:0]	CRU_SDMMC_CON0[2:1]	2	Phase selection for drive clock. 2’h0: 0-degree 2’h1: 90-degree 2’h2: 180-degree 2’h3: 270-degree It can be modified when init_state=1 and should be stable when init_state=0.
drv_delaynum[7:0]	CRU_SDMMC_CON0[10:3]	0	Delay element number configuration for drive clock. It can be modified when init_state=1 and should be stable when init_state=0.
drv_sel	CRU_SDMMC_CON0[11]	0	Selection for drive clock: 1’b0: Select clock delayed by phase shift 1’b1: Select clock delayed by phase shift and delay line It can be modified when init_state=1 and should be stable when init_state=0.
sample_degree[1:0]	CRU_SDMMC_CON1[2:1]	0	Phase selection for sample clock. 2’h0: 0-degree 2’h1: 90-degree 2’h2: 180-degree 2’h3: 270-degree It can be modified when init_state=1 and should be stable when init_state=0.
sample_delaynum[7:0]	CRU_SDMMC_CON1[10:3]	0	Delay element number configuration for sample clock. It can be modified when init_state=1 and should be stable when init_state=0.
sample_sel	CRU_SDMMC_CON1[11]	0	Selection for sample clock: 1’b0: Select clock delayed by phase shift 1’b1: Select clock delayed by phase shift and delay line It can be modified when init_state=1 and should be stable when init_state=0.

3.6.7.2 SDIO Variable Delay Usage

Table 3-16 Configuration for SDIO Variable Delay Usage

Signal Name	Source	Default	Description
init_state	CRU_SDIO_CON0[0]	0	Enable initialization for clock

Signal Name	Source	Default	Description
			source. 1'b0: Disable 1'b1: Enable When init_state=1, the host clocks including drive clock and sample clock are inactive.
drv_degree[1:0]	CRU_SDIO_CON0[2:1]	2	Phase selection for drive clock. 2'h0: 0-degree 2'h1: 90-degree 2'h2: 180-degree 2'h3: 270-degree It can be modified when init_state=1 and should be stable when init_state=0.
drv_delaynum [7:0]	CRU_SDIO_CON0[10:3]	0	Delay element number configuration for drive clock. It can be modified when init_state=1 and should be stable when init_state=0.
drv_sel	CRU_SDIO_CON0[11]	0	Selection for drive clock: 1'b0: Select clock delayed by phase shift 1'b1: Select clock delayed by phase shift and delay line It can be modified when init_state=1 and should be stable when init_state=0.
sample_degree [1:0]	CRU_SDIO_CON1[2:1]	0	Phase selection for sample clock. 2'h0: 0-degree 2'h1: 90-degree 2'h2: 180-degree 2'h3: 270-degree It can be modified when init_state=1 and should be stable when init_state=0.
sample_delaynum[7:0]	CRU_SDIO_CON1[10:3]	0	Delay element number configuration for sample clock. It can be modified when init_state=1 and should be stable when init_state=0.
sample_sel	CRU_SDIO_CON1[11]	0	Selection for sample clock: 1'b0: Select clock delayed by phase shift 1'b1: Select clock delayed by phase shift and delay line It can be modified when init_state=1 and should be stable when init_state=0.

The following outlines the steps for clock generation sequence:

1) Assert init_state to soft reset the CLKGEN.
2) Configure drv_degree/sample_degree.
3) If fine adjustment required, delay line can be used by configuring drv_delaynum/sample_delaynum and drv_sel/sample_sel.
4) Dis-assert init_state to start CLKGEN.

3.6.8 Variable Delay Tuning

Tuning is defined by SD and MMC cards to determine the correct sampling point required for

the host, especially for the speed modes SDR104 and HS200 where the output delays from the cards can be up to 2 UI. Tuning is required for other speed modes-such as DDR50-even though the output delay from the card is less than one cycle.
Command for tuning is different for different cards.

- SD Memory Card:
  - CMD19 – SD card for SDR50 and SDR104 speed modes. Tuning data is defined by card specifications.
  - CMD6 – SD card for speed modes not supporting CMD19. Tuning data is the 64byte SD status.
- Multimedia Card:
  - CMD21 – MMC card for HS200 speed mode. Tuning data is defined by card specifications.
  - CMD8 – MMC card for speed modes not supporting CMD21. Tuning data is 512 byte ExtCSD data.

The following is the procedure for variable delay tuning:

1) Set a phase shift of 0-degree on cclk_in_sample.
2) Send the Tuning command to the card; the card in turn sends an R1 response on the CMD line and tuning data on the DAT line.
3) If the host sees any of the errors—start bit error, data crc error, end bit error, data read time-out, response CRC error, response error—then the sampling point is incorrect.
4) Send CMD12 to bring the host controller state machines to idle.
   - The card may treat CMD12 as an invalid command because the card has successfully sent the tuning data, and it cannot send a response.
   - The host controller may generate a response time-out interrupt that must be cleared by software.
5) Repeat steps 2) to 4) by increasing the phase shift value or delay element number on cclk_in_sample until the correct sampling point is received such that the host does not see any of the errors.
6) Mark this phase shift value as the starting point of the sampling window.
7) Repeat steps 2 to 4 by increasing the phase shift value or delay element number on cclk_in_sample until the host sees the errors starting to come again or the phase shift value reaches 360-degree.
8) Mark the last successful phase shift value as the ending point of the sampling window.

A window is established where the tuning block is matched. For example, for a scenario where the tuning block is received correctly for a phase shift window of 90-degree and 180-degree, then an appropriate sampling point is established as 135-degree. Once a sampling point is established, no errors should be visible in the tuning block.

3.6.9 Card Detection Method

There are many methods for SDMMC/SDIO device detection.

- Method1: Using SDMMC_CDETECT register, which is value on card_detect_n input port. 0 represents presence of card. This method is available only for SDMMC/SDIO.
- Method2: Using card detection unit in Host Controller, outputting host interrupt. The card detection unit looks for any changes in the card-detect signals for card insertion or card removal. It filters out the debounces associated with mechanical insertion or removal, and generates one interrupt to the host. You can program the debounce filter value in SDMMC_DEBNCE [23:0]. Following figure illustrates the timing for card-detect signals. This method is available only for SDMMC/SDIO.

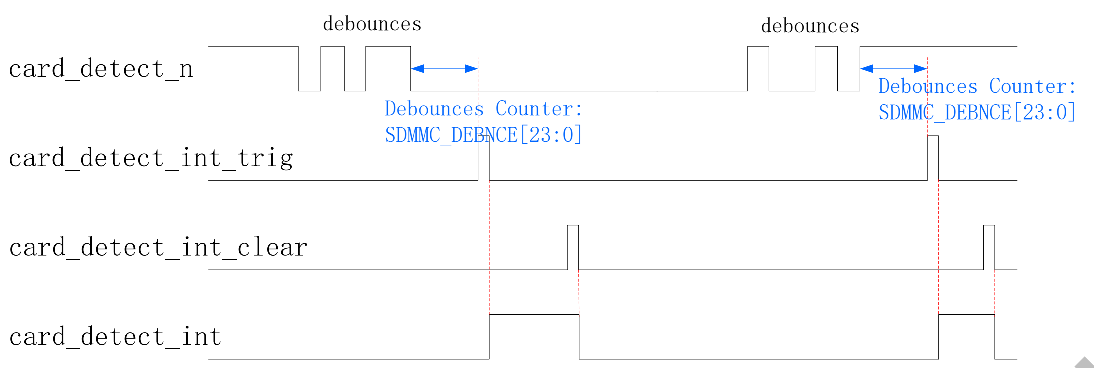

Fig. 3-16 Card Detection Method 2

- Method3: Using general card detection unit, outputting detect_dual_edge_int connecting to IRQ[308]. Similar to Method2, except that the debounce time is configurable by PMU1_GRF_SD_DETECT_CNT; and the insertion/removal detection interrupt can be enabled or cleared respectively.

The detailed register information is:

Table 3-17 Register for SDMMC Card Detection Method 3

Signal Name	Source	Default	Description
sd_detectn_rise_edge_irq_en	PMU1_GRF_SD_DETECT_CON[0]	0	Enable SDMMC detect pin rising edge interrupt. 1'b0: Disable 1'b1: Enable
sd_detect_fall_edge_detect_en	PMU1_GRF_SD_DETECT_CON[1]	0	Enable SDMMC detect pin falling edge interrupt. 1'b0: Disable 1'b1: Enable
sd_detect_rising_edge_dectect_status	PMU1_GRF_SD_DETECT_STS[0]	0	SDMMC detect pin rising edge status. 1'b0: Inactive 1'b1: Active
sd_detect_fall_edge_detect_status	PMU1_GRF_SD_DETECT_STS[1]	0	SDMMC detect pin falling edge status. 1'b0: Inactive 1'b1: Active
sd_detect_rising_edge_dectect_clr	PMU1_GRF_SD_DETECT_CLR[0]	0	Enable clear for SDMMC detect pin rising edge interrupt. 1'b0: Disable 1'b1: Enable
sd_detect_fall_edge_detect_clr	PMU1_GRF_SD_DETECT_CLR[1]	0	Enable clear for SDMMC detect pin falling edge interrupt. 1'b0: Disable 1'b1: Enable

3.6.10 SDMMC IOMUX With JTAG

The GPIO4d2/GPIO4d3 for sdmmc_cdata2/sdmmc_cdata3 is shared with jtag_tck/jtag_tms. The condition of usage for SDMMC or JTAG usage is as follows.

- If SYS_GRF_SOC_CON6[14] is equal to 1 and SD/MMC card is not detected within detection time(defined in SYS_GRF_SOC_CON11, in the unit of XIN24M clock), the GPIOs are used for JTAG.
- Otherwise, the GPIOs' usage is defined by IOMUX configuration.

Chapter 4 eMMC Host Controller

4.1 Overview

The eMMC Host Controller is highly programmable, and provides high performance with AXI as the bus interface for data transfer (master interface) and AHB as its slave interface.
It supports following features:

- Supports SD-HCI Host version 4 mode or less
  - Supports same SD-HCI register set for eMMC transfers
  - Supports Command Queuing Engine (CQE) and compliant with eMMC CQ HCI
  - Supports the following data transfer types: CPU, SDMA, AMDM2, ADMA3
- Supports eMMC protocols including eMMC 5.1
  - Supports Auto-tuning
  - Supports 4-bit/8-bit interface
  - Supports legacy, High Speed SDR, High Speed DDR, HS200, and HS400 speed modes
  - Supports boot operation and alternative boot operation
- AHB Slave Interface:
  - Supports 32-bit data width and address width
- AXI Master Interface:
  - Supports 32-bit address width and 64-bit data width
- Phase adjustment:
  - Supports phase auto adjustment for transmit clock, sample clock and data strobe, command output.

4.2 Block Diagram

The Host Controller consists of the following main functional blocks.

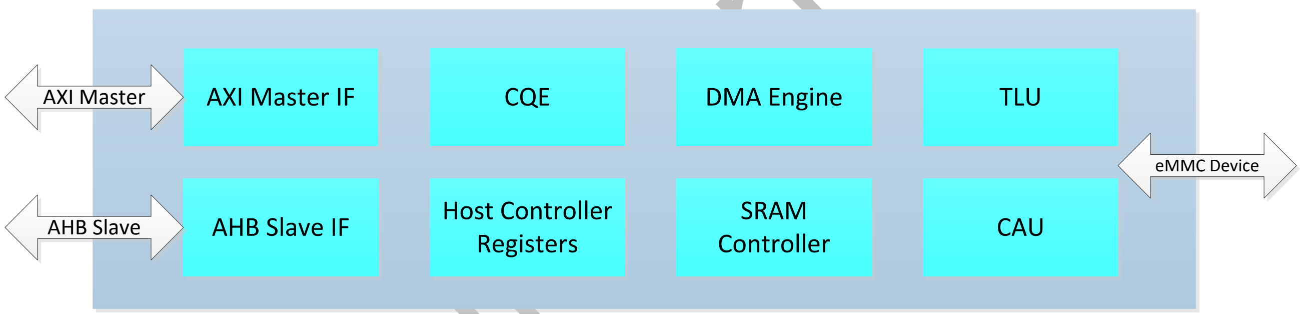

Fig. 4-1 EMMC Host Control Block Diagram

4.3 Function Description

4.3.1 The AXI Master Bus Interface Unit

This Master Bus Interface Unit implements the logic to transfer data on the AMBA Extensible Interface Bus (AXI) bus. The AXI interface transfers data to and from the system memory through the AXI master bus interface, respectively.

4.3.2 The AHB Slave Bus Interface Unit

The AHB slave bus interface module implements the logic to primarily access the host registers by using an external AMBA high-performance (AHB) bus.

4.3.3 Host Controller Registers

The host controller register unit comprises of the standard SD host controller registers as specified in the SD Specifications Part A2 SD Host Controller Standard Specification Version 4.20a. It also includes Command Queuing registers compliance to JEDEC eMMC 5.1 HCI specification.

4.3.4 DMA Engine

The DMA Engine unit handles data transfer between the host and system memory.

- Support SDMA/ADMA2/ADMA3 modes
- Fetch the descriptor and data
- The same DMA engine is used to interleave data transfer and descriptor fetch. This enables new task descriptor fetches (for CMD44 and CMD45) while DMA is moving data during task execution (for CMD46 and CMD47).

- The AXI transaction ID 0 is used for moving data and AXI transaction ID 1 is used to fetch task descriptors.
- Pre-fetch data for back-to-back eMMC write commands
- Write back the received data packets to the system memory

4.3.5 SRAM Controller

The SRAM controller interfaces the packet buffer of the host and the transaction controller units. The SRAM is a single clock single-port RAM synchronous to the core base clock. The width is 64-bit, the depth is 288-location.

4.3.6 Command Queuing Engine

This module implements command queuing and includes the following:

- Task scheduler with the ability to prioritize execution of tasks
- Control logic for descriptor fetch
- Control and sequence task submission and execution
- Status polling
- Timers and counter dedicated for CQE operation
- Interrupt coalescing logic

4.3.7 Transfer Level Unit

The TLU manages the command/response and data flow for communication with memory cards.

4.3.8 Clock Adjustment Unit

The clock adjustment unit (CAU) will detect the clock period and get the delay precision, adjust the clock phase base on the dedicate delay element. Also, you can program the register to set the delay precision. The flowing signals supports adjustment: transmit clock, sample clock and data strobe, command output.

4.4 Register Description

4.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
EMMC_SDMASA	0x0000	W	0x00000000	SDMA System Address Register
EMMC_BLOCKSIZE	0x0004	HW	0x00000000	Block Size Register
EMMC_BLOCKCOUNT	0x0006	HW	0x00000000	Block Count Register
EMMC_ARGUMENT	0x0008	W	0x00000000	Argument Register
EMMC_XFER_MODE	0x000C	HW	0x00000000	Transfer Mode Register
EMMC_CMD	0x000E	HW	0x00000000	Command Register
EMMC_RESP01	0x0010	W	0x00000000	Response Register 0/1
EMMC_RESP23	0x0014	W	0x00000000	Response Register 2/3
EMMC_RESP45	0x0018	W	0x00000000	Response Register 4/5
EMMC_RESP67	0x001C	W	0x00000000	Response Register 6/7
EMMC_BUF_DATA	0x0020	W	0x00000000	Buffer Data Port Register
EMMC_PSTATE	0x0024	W	0x19FF0000	Present State Register
EMMC_HOST_CTRL1	0x0028	B	0x00000000	Host Control 1 Register
EMMC_PWR_CTRL	0x0029	B	0x00000000	Power Control Register
EMMC_BGAP_CTRL	0x002A	B	0x00000000	Block Gap Control Register
EMMC_CLK_CTRL	0x002C	HW	0x00000000	Clock Control Register
EMMC_TOUT_CTRL	0x002E	B	0x00000000	Timeout Control Register
EMMC_SW_RST	0x002F	B	0x00000000	Software Reset Register
EMMC_NORMAL_INT_STAT	0x0030	HW	0x00000000	Normal Interrupt Status Register
EMMC_ERROR_INT_STAT	0x0032	HW	0x00000000	Error Interrupt Status Register
EMMC_NORMAL_INT_STAT_EN	0x0034	HW	0x00000000	Normal Interrupt Status Enable Register
EMMC_ERROR_INT_STAT_EN	0x0036	HW	0x00000000	Error Interrupt Status Enable Register
EMMC_NORMAL_INT_SIGNAL_EN	0x0038	HW	0x00000000	Normal Interrupt Signal Enable Register

Name	Offset	Size	Reset Value	Description
EMMC_ERROR_INT_SIGNAL_EN	0x003A	HW	0x00000000	Error Interrupt Signal Enable Register
EMMC_AUTO_CMD_STAT	0x003C	HW	0x00000000	Auto CMD Error Status Register
EMMC_HOST_CTRL2	0x003E	HW	0x00000000	Host Control 2 Register
EMMC_CAPABILITIES1	0x0040	W	0x40EDC880	Capabilities Register 1
EMMC_CAPABILITIES2	0x0044	W	0x000A2077	Capabilities Register 2
EMMC_FORCE_AUTO_CMD_STAT	0x0050	HW	0x00000000	Force Event Register for Auto CMD Error Status Register
EMMC_FORC_ERR_INT_STAT	0x0052	HW	0x00000000	Force Event Register for Error Interrupt Status Register
EMMC_ADMA_ERR_STAT	0x0054	B	0x00000000	ADMA Error Status Register

4.4.2 Detail Register Description

EMMC_SDMASA

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	BLOCKCNT_SDMASA 32-bit Block Count (SDMA System Address). 1. SDMA System Address (Host Version 4 Enable = 0): This register contains the system memory address for an SDMA transfer in the 32-bit addressing mode. When the Host Controller stops an SDMA transfer, this register points to the system address of the next contiguous data position. It can be accessed only if no transaction is executing. Reading this register during data transfers may return an invalid value. 2. 32-bit Block Count (Host Version 4 Enable = 1): From the Host Controller Version 4.10 specification, this register is redefined as 32-bit Block Count. The Host Controller decrements the block count of this register for every block transfer and the data transfer stops when the count reaches zero. This register must be accessed when no transaction is executing. Reading this register during data transfers may return invalid value. Values: 32'hFFFFFFFF: 1 Block ...... 32'h00000002: 2 Blocks 32'h00000001: 1 Block 32'h00000000: Stop Count Note: a. For Host Version 4 Enable = 0, the Host driver does not program the system address in this register while operating in ADMA mode. The system address must be programmed in the ADMA System Address register. b. For Host Version 4 Enable = 0, the Host driver programs a non-zero 32-bit block count value in this register when Auto CMD23 is enabled for non-DMA and ADMA modes. Auto CMD23 cannot be used with SDMA. c. This register must be programmed with a non-zero value for data transfer if the 32-bit Block count register is used instead of the 16-bit Block count register.

EMMC_BLOCKSIZE

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
15	RO	0x0	reserved
14:12	RW	0x0	SDMA_BUF_BDARY SDMA Buffer Boundary. These bits specify the size of contiguous buffer in system memory. The SDMA transfer waits at every boundary specified by these fields and the Host Controller generates the DMA interrupt to request the Host Driver to update the SDMA System Address register. Values: 3'h0: 4K bytes SDMA Buffer Boundary 3'h1: 8K bytes SDMA Buffer Boundary 3'h2: 16K bytes SDMA Buffer Boundary 3'h3: 32K bytes SDMA Buffer Boundary 3'h4: 64K bytes SDMA Buffer Boundary 3'h5: 128K bytes SDMA Buffer Boundary 3'h6: 256K bytes SDMA Buffer Boundary 3'h7: 512K bytes SDMA Buffer Boundary

Bit	Attr	Reset Value	Description
11:0	RW	0x000	XFER_BLOCK_SIZE Transfer Block Size. These bits specify the block size of data transfers. In case of memory, it is set to 512 bytes. It can be accessed only if no transaction is executing. Read operations during transfers may return an invalid value, and write operations are ignored. Values: 12'h1: 1 byte 12'h2: 2 bytes 12'h3: 3 bytes ...... 12'h1FF: 511 byte 12'h200: 512 bytes ...... 12'h800: 2048 bytes Note: This register must be programmed with a non-zero value for data transfer.

EMMC_BLOCKCOUNT

Address: Operational Base + offset (0x0006)

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	BLOCK_CNT 16-bit Block Count. If the Host Version 4 Enable bit is set 0 or the 16-bit Block Count register is set to non-zero, the 16-bit Block Count register is selected. If the Host Version 4 Enable bit is set 1 and the 16-bit Block Count register is set to zero, the 32-bit Block Count register is selected. Values: 16'h0: Stop Count 16'h1: 1 Block 16'h2: 2 Blocks ...... 16'hFFFF: 65535 Blocks Note: For Host Version 4 Enable = 0, this register must be set to 0 before programming the 32-bit block count register when Auto CMD23 is enabled for non-DMA and ADMA modes.

EMMC_ARGUMENT

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ARGUMENT Command Argument. These bits specify the SD/eMMC command argument that is specified in bits 39-8 of the Command format.

EMMC_XFER_MODE

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
15:9	RO	0x00	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	RESP_INT_DISABLE Response Interrupt Disable. The Host Controller supports response check function to avoid overhead of response error check by the Host driver. Response types of only R1 and R5 can be checked by the Controller. If Host Driver checks the response error, set this bit to 0 and wait for Command Complete Interrupt and then check the response register. If the Host Controller checks the response error, set this bit to 1 and set the Response Error Check Enable bit to 1. The Command Complete Interrupt is disabled by this bit regardless of the Command Complete Signal Enable. Note: During tuning (when the Execute Tuning bit in the Host Control2 register is set), the Command Complete Interrupt is not generated irrespective of the Response Interrupt Disable setting. Values: 1'b0: Response Interrupt is enabled 1'b1: Response Interrupt is disabled
7	RW	0x0	RESP_ERR_CHK_ENABLE Response Error Check Enable. The Host Controller supports response check function to avoid overhead of response error check by Host driver. Response types of only R1 and R5 can be checked by the Controller. If the Host Controller checks the response error, set this bit to 1 and set Response Interrupt Disable to 1. If an error is detected, the Response Error interrupt is generated in the Error Interrupt Status register. Note: a. Response error check must not be enabled for any response type other than R1 and R5. b. Response check must not be enabled for the tuning command. Values: 1'b0: Response Error Check is disabled 1'b1: Response Error Check is enabled
6	RW	0x0	RESP_TYPE Response Type R1/R5. This bit selects either R1 or R5 as a response type when the Response Error Check is selected. Values: 1'b0: R1 1'b1: R5
5	RW	0x0	MULTI_BLK_SEL Multi/Single Block Select. This bit is set when issuing multiple-block transfer commands using the DAT line. If this bit is set to 0, it is not necessary to set the Block Count register. Values: 1'b0: Single Block 1'b1: Multiple Block

Bit	Attr	Reset Value	Description
4	RW	0x0	DATA_XFER_DIR Data Transfer Direction Select. This bit defines the direction of DAT line data transfers. This bit is set to 1 by the Host Driver to transfer data from the SD/eMMC card to the Host Controller and it is set to 0 for all other commands. Values: 1'b0: Write (Host to Card) 1'b1: Read (Card to Host)
3:2	RW	0x0	AUTO_CMD_ENABLE Auto Command Enable. This field determines use of Auto Command functions. Values: 2'h0: Auto Command Disabled 2'h1: Auto CMD12 Enable 2'h2: Auto CMD23 Enable 2'h3: Auto CMD Auto Select
1	RW	0x0	BLOCK_COUNT_ENABLE Block Count Enable. This bit is used to enable the Block Count register, which is relevant for multiple block transfers. If this bit is set to 0, the Block Count register is disabled, which is useful in executing an infinite transfer. The Host Driver must set this bit to 0 when ADMA is used. Values: 1'b0: Disable 1'b1: Enable
0	RW	0x0	DMA_ENABLE DMA Enable. This bit enables the DMA functionality. If this bit is set to 1, a DMA operation begins when the Host Driver writes to the Command register. You can select one of the DMA modes by using DMA Select in the Host Control 1 register. Values: 1'b0: No data transfer or Non-DMA data transfer 1'b1: DMA Data transfer

EMMC_CMD

Address: Operational Base + offset (0x000E)

Bit	Attr	Reset Value	Description
15:14	RO	0x0	reserved
13:8	RW	0x00	CMD_INDEX Command Index. These bits are set to the command number that is specified in bits 45-40 of the command format.

Bit	Attr	Reset Value	Description
7:6	RW	0x0	CMD_TYPE Command Type. These bits indicate the command type. Note: While issuing Abort CMD using CMD12/CMD52 or reset CMD using CMD0/CMD52, CMD_TYPE field shall be set to 0x3. Values: 2'h0: Normal 2'h1: Suspend 2'h2: Resume 2'h3: Abort
5	RW	0x0	DATA_PRESENT_SEL Data Present Select. This bit is set to 1 to indicate that data is present and that the data is transferred using the DAT line. This bit is set to 0 in the following instances: a. Command using the CMD line b. Command with no data transfer but using busy signal on the DAT[0] line c. Resume Command Values: 1'b0: No Data Present 1'b1: Data Present
4	RW	0x0	CMD_IDX_CHK_ENABLE Command Index Check Enable. This bit enables the Host Controller to check the index field in the response to verify if it has the same value as the command index. If the value is not the same, it is reported as a Command Index error. Note: a. Index check enable must be set to 0 for the command with no response, R2 response, R3 response and R4 response. b. For the tuning command, this bit must always be set to enable the index check. Values: 1'b0: Disable 1'b1: Enable
3	RW	0x0	CMD_CRC_CHK_ENABLE Command CRC Check Enable. This bit enables the Host Controller to check the CRC field in the response. If an error is detected, it is reported as a Command CRC error. Note: a. CRC check enable must be set to 0 for the command with no response, R3 response, and R4 response. b. For the tuning command, this bit must always be set to 1 to enable the CRC check. Values: 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
2	RW	0x0	SUB_CMD_FLAG Sub Command Flag. This bit distinguishes between a main command and a sub command. Values: 1'b0: Main Command 1'b1: Sub Command
1:0	RW	0x0	RESP_TYPE_SELECT Response Type Select. This bit indicates the type of response expected from the card. Values: 2'h0: No Response 2'h1: Response length 136 2'h2: Response length 48 2'h3: Response length 48, check Busy after response.

EMMC_RESP01

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RESP01 Command Response. These bits reflect 39-8 bits of SD/eMMC Response Field. Note: For Auto CMD, the 32-bit response (bits 39-8 of the Response Field) is updated in the RESP67 register.

EMMC_RESP23

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RESP23 Command Response. These bits reflect 71-40 bits of the SD/eMMC Response Field.

EMMC_RESP45

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	RESP45 Command Response. These bits reflect 103-72 bits of the Response Field.

EMMC_RESP67

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	RESP67 Command Response These bits reflect bits 135-104 of SD/EMMC Response Field. For Auto CMD, this register also reflects the 32-bit response (bits 39-8 of the Response Field).

EMMC_BUF_DATA

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	BUF_DATA Buffer Data. These bits enable access to the Host Controller packet buffer.

EMMC_PSTATE

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RO	0x1	SUB_CMD_STAT Sub Command Status. This bit is used to distinguish between a main command and a sub command status. Values: 1'b0: Main Command Status 1'b1: Sub Command Status
27	RO	0x1	CMD_ISSUE_ERR Command Not Issued by Error. This bit is set if a command cannot be issued after setting the command register due to an error except the Auto CMD12 error. Values: 1'b0: No error for issuing a command 1'b1: Command cannot be issued
26:25	RO	0x0	reserved
24	RO	0x1	CMD_LINE_LVL Command-Line Signal Level. This bit is used to check the CMD line level to recover from errors and for debugging.
23:20	RO	0xf	DAT_3_0 DAT[3:0] Line Signal Level. This bit is used to check the DAT line level to recover from errors and for debugging.
19	RO	0x1	WR_PROTECT_SW_LVL Write Protect Switch Pin Level. This bit is supported only for memory and combo cards. Values: 1'b0: Write protected 1'b1: Write enabled
18	RO	0x1	CARD_DETECT_PIN_LEVEL Card Detect Pin Level. Values: 1'b0: No card present 1'b1: Card Present
17	RO	0x1	CARD_STABLE Card Stable. This bit indicates the stability of the Card Detect Pin Level. A card is not detected if this bit is set to 1 and the value of the CARD_INSERTED bit is 0. Values: 1'b0: Reset or Debouncing 1'b1: No Card or Inserted
16	RO	0x1	CARD_INSERTED Card Inserted. This bit indicates whether a card has been inserted. The Host Controller debounces this signal so that Host Driver need not wait for it to stabilize. Values: 1'b0: Reset, Debouncing, or No card 1'b1: Card Inserted
15:12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
11	RO	0x0	BUF_RD_ENABLE Buffer Read Enable. This bit is used for non-DMA transfers. This bit is set if valid data exists in the Host buffer. Values: 1'b0: Read disable 1'b1: Read enable
10	RO	0x0	BUF_WR_ENABLE Buffer Write Enable. This bit is used for non-DMA transfers. This bit is set if space is available for writing data. Values: 1'b0: Write disable 1'b1: Write enable
9	RW	0x0	RD_XFER_ACTIVE Read Transfer Active. This bit indicates whether a read transfer is active for SD/eMMC mode. Values: 1'b0: No valid data 1'b1: Transferring data
8	RO	0x0	WR_XFER_ACTIVE Write Transfer Active. This status indicates whether a write transfer is active for SD/eMMC mode. Values: 1'b0: No valid data 1'b1: Transferring data
7:4	RO	0x0	DAT_7_4 DAT[7:4] Line Signal Level. This bit is used to check the DAT line level to recover from errors and for debugging.
3	RO	0x0	RE_TUNE_REQ Re-Tuning Request. Host Controller does not generate retuning request. The software must maintain the Retuning timer.
2	RO	0x0	DAT_LINE_ACTIVE DAT Line Active (SD/eMMC Mode only). This bit indicates whether one of the DAT lines on the SD/eMMC bus is in use. In the case of read transactions, this bit indicates whether a read transfer is executing on the SD/eMMC bus. In the case of write transactions, this bit indicates whether a write transfer is executing on the SD/eMMC bus. For a command with busy, this status indicates whether the command executing busy is executing on an SD/eMMC bus. Values: 1'b0: DAT Line Inactive 1'b1: DAT Line Active

Bit	Attr	Reset Value	Description
1	RO	0x0	CMD_INHIBIT_DAT Command Inhibit (DAT). This bit is applicable for SD/eMMC mode and is generated if either DAT line active or Read transfer active is set to 1. If this bit is set to 0, it indicates that the Host Controller can issue subsequent SD/eMMC commands. Values: 1'b0: Can issue command which used DAT line 1'b1: Cannot issue command which used DAT line
0	RO	0x0	CMD_INHIBIT Command Inhibit (CMD). If this bit is set to 0, it indicates that the CMD line is not in use and the Host controller can issue an SD/eMMC command using the CMD line. This bit is set when the command register is written. This bit is cleared when the command response is received. This bit is not cleared by the response of auto CMD12/23 but cleared by the response of read/write command. Values: 1'b0: Host Controller is ready to issue a command 1'b1: Host Controller is not ready to issue a command

EMMC_HOST_CTRL1

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
7	RW	0x0	CARD_DETECT_SIG_SEL Card Detect Signal Selection. This bit selects a source for card detection. When the source for the card detection is switched, the interrupt must be disabled during the switching period. Values: 1'b0: Card Detect Signal is selected (for normal use) 1'b1: Card Detect Test Level is selected (for test purpose)
6	RW	0x0	CARD_DETECT_TEST_LVL Card Detect Test Level. This bit is enabled while the Card Detect Signal Selection is set to 1 and it indicates whether a card inserted or not. Values: 1'b0: No Card 1'b1: Card Inserted
5	RW	0x0	EXT_DAT_XFER Extended Data Transfer Width. This bit controls 8-bit bus width mode of embedded device. Values: 1'b0: Bus Width is selected by the Data Transfer Width 1'b1: 8-bit Bus Width

Bit	Attr	Reset Value	Description
4:3	RW	0x0	DMA_SEL DMA Select. This field is used to select the DMA type. When Host Version 4 Enable is 1 in Host Control 2 register: 2'h0: SDMA is selected 2'h1: Reserved 2'h2: ADMA2 is selected 2'h3: ADMA2 or ADMA3 is selected When Host Version 4 Enable is 0 in Host Control 2 register: 2'h0: SDMA is selected 2'h1: Reserved 2'h2: 32-bit Address ADMA2 is selected 2'h3: Reserved Values: 2'h0: SDMA is selected 2'h1: Reserved 2'h2: ADMA2 is selected 2'h3: ADMA2 or ADMA3 is selected
2	RW	0x0	HIGH_SPEED_EN High Speed Enable. In SD/eMMC mode, this bit is used to determine the selection of pre-set value for High Speed mode. Before setting this bit, the Host Driver checks the High Speed Support in the Capabilities register. Values: 1'b0: Normal Speed mode 1'b1: High Speed mode
1	RW	0x0	DAT_XFER_WIDTH Data Transfer Width. For SD/eMMC mode, this bit selects the data transfer width of the Host Controller. The Host Driver sets it to match the data width of the SD/eMMC card. Values: 1'b0: 1-bit mode 1'b1: 4-bit mode
0	RO	0x0	reserved

EMMC_PWR_CTRL

Address: Operational Base + offset (0x0029)

Bit	Attr	Reset Value	Description
7:1	RO	0x00	reserved
0	RW	0x0	SD_BUS_PWR If this bit is cleared, the Host Controller stops the SD Clock by clearing the SD_CLK_IN bit in the EMMC_CLK_CTRL register. Values: 1'b0: Power off 1'b1: Power on

EMMC_BGAP_CTRL

Address: Operational Base + offset (0x002A)

Bit	Attr	Reset Value	Description
7:4	RO	0x0	reserved

Bit	Attr	Reset Value	Description
3	RW	0x0	INT_AT_BGAP Interrupt At Block Gap. This bit is valid only in the 4-bit mode of an SDIO card and is used to select a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer.
2	RW	0x0	RD_WAIT_CTRL Read Wait Control. This bit is used to enable the read wait protocol to stop read data using DAT[2] line if the card supports read wait. Otherwise, the Host Controller has to stop the card clock to hold the read data. Values: 1'b0: Disable Read Wait Control 1'b1: Enable Read Wait Control
1	RW	0x0	CONTINUE_REQ Continue Request. This bit is used to restart the transaction, which was stopped using the Stop At Block Gap Request. The Host Controller automatically clears this bit when the transaction restarts. If stop at block gap request is set to 1, any write to this bit is ignored. Values: 1'b0: No Affect 1'b1: Restart
0	RW	0x0	STOP_BG_REQ Stop At Block Gap Request. This bit is used to stop executing read and write transactions at the next block gap for non-DMA, SDMA, and ADMA transfers. Values: 1'b0: Transfer 1'b1: Stop

EMMC_CLK_CTRL

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
15:8	RW	0x00	FREQ_SEL SDCLK Frequency Select. These bits specify the lower 8 bits of 10-bit SDCLK Frequency Select control. These bits are used to select the frequency of the SDCLK signal. These bits depend on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, these bits are set by the Host Driver. If Preset Value Enable = 1, these bits are automatically set to a value specified in one of the Preset Value register. 1. 10-bit Divided Clock Mode: 10'h000: Base clock (10MHz - 255 MHz) 10'h001: 1/2 Divided Clock 10'h002: 1/4 Divided Clock ...... 10'h3ff: 1/2046 Divided clock 2. Programmable Clock Mode: 10'h000: Base clock * M 10'h001: Base clock * M /2 10'h002: Base clock * M /3 ...... 10'h3ff: Base clock * M /1024

Bit	Attr	Reset Value	Description
7:6	RW	0x0	UPPER_FREQ_SEL These bits specify the upper 2 bits of 10-bit SDCLK Frequency Select control.
5	RW	0x0	CLK_GEN_SELECT Clock Generator Select. This bit is used to select the clock generator mode in SDCLK Frequency Select. If Preset Value Enable = 0, this bit is set by the Host Driver. If Preset Value Enable = 1, this bit is automatically set to a value specified in one of the Preset Value registers. Values: 1'b0: Divided Clock Mode 1'b1: Programmable Clock Mode
4:3	RO	0x0	reserved
2	RW	0x0	SD_CLK_EN SD/eMMC Clock Enable. This bit stops the SDCLK when set to 0. The SDCLK Frequency Select bit can be changed when this bit is set to 0. Values: 1'b0: Disable providing SDCLK 1'b1: Enable providing SDCLK
1	RO	0x0	INTERNAL_CLK_STABLE Internal Clock Stable. Values: 1'b0: Not Ready 1'b1: Ready
0	RW	0x0	INTERNAL_CLK_EN Internal Clock Enable. This bit is set to 0 when the Host Driver is not using the Host Controller. The Host Controller must stop its internal clock to enter a very low power state. However, registers can still be read and written to. Note: If this bit is not used to control the internal clock (base clock and master clock), it is recommended to set this bit to 1. Values: 1'b0: Stop 1'b1: Oscillate

EMMC_TOUT_CTRL

Address: Operational Base + offset (0x002E)

Bit	Attr	Reset Value	Description
7:4	RO	0x0	reserved

Bit	Attr	Reset Value	Description
3:0	RW	0x0	TOUT_CNT Data Timeout Counter Value. This value determines the interval by which DAT line timeouts are detected. Timeout clock frequency will be generated by dividing the base clock TMCLK by this value. When setting this register, prevent inadvertent timeout events by clearing the Data Timeout Error Status Enable (in the Error Interrupt Status Enable register). Values: 4'h0: TMCLK * 2^13 4'h1: TMCLK * 2^14 ...... 4'he: TMCLK * 2^27 4'hf: Reserved

EMMC_SW_RST

Address: Operational Base + offset (0x002F)

Bit	Attr	Reset Value	Description
7:3	RO	0x00	reserved
2	RW	0x0	SW_RST_DAT Software Reset For DAT line. This bit is used in SD/eMMC mode and it resets only a part of the data circuit and the DMA circuit is also reset. The following registers and bits are cleared by this bit: a. Buffer Data Port register: Buffer is cleared and initialized. b. Present state register: Buffer Read Enable Buffer Write Enable Read Transfer Active Write Transfer Active DAT Line Active Command Inhibit (DAT) c. Block Gap Control register: Continue Request Stop At Block Gap Request d. Normal Interrupt status register: Buffer Read Ready Buffer Write Ready DMA Interrupt Block Gap Event Transfer Complete Values: 1'b0: Work 1'b1: Reset

Bit	Attr	Reset Value	Description
1	RW	0x0	SW_RST_CMD Software Reset For CMD line. This bit resets only a part of the command circuit to be able to issue a command. This reset is effective only for a command issuing circuit (including response error statuses related to Command Inhibit (CMD) control) and does not affect the data transfer circuit. Host Controller can continue data transfer even after this reset is executed while handling subcommand-response errors. The following registers and bits are cleared by this bit: a. Present State register - Command Inhibit (CMD) bit b. Normal Interrupt Status register - Command Complete bit c. Error Interrupt Status - Response error statuses related to Command Inhibit (CMD) bit Values: 1'b0: Work 1'b1: Reset
0	RW	0x0	SW_RST_ALL Software Reset For All. This reset affects the entire Host Controller except for the card detection circuit. During its initialization, the Host Driver sets this bit to 1 to reset the Host Controller. All registers are reset except the capabilities register. If this bit is set to 1, the Host Driver must issue reset command and reinitialize the card. Values: 1'b0: Work 1'b1: Reset

EMMC_NORMAL_INT_STAT

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
15	RO	0x0	ERROR_INT_STAT Error Interrupt. If any of the bits in the Error Interrupt Status register are set, then this bit is set. Values: 1'b0: No Error 1'b1: Error
14	RC/W1C	0x0	CQE_EVENT Command Queuing Event. This status is set if Command Queuing/Crypto related event has occurred in eMMC/SD mode. Read CQHCI's CQIS/CRNQIS register for more details. Values: 1'b0: No Event 1'b1: Command Queuing Event is detected Writes to this bit clear it. Value of 1 clears bit and 0 leaves bit intact.
13	RO	0x0	FX_EVENT FX Event. This status is set when R[14] of response register is set to 1 and Response Type R1/R5 is set to 0 in Transfer Mode register. This interrupt is used with response check function. Values: 1'b0: No Event 1'b1: FX Event is detected

Bit	Attr	Reset Value	Description
12	RO	0x0	RE_TUNE_EVENT Re-tuning Event. This bit is set if the Re-Tuning Request changes from 0 to 1. Re-Tuning request is not supported.
11:9	RO	0x0	reserved
8	RO	0x0	CARD_INTERRUPT Card Interrupt. This bit reflects the synchronized value of DAT[1] Interrupt Input for SD Mode. Values: 1'b0: No Card Interrupt 1'b1: Generate Card Interrupt
7	RC/W1C	0x0	CARD_REMOVAL Card Removal. This bit is set if the Card Inserted in the Present State register changes from 1 to 0. Values: 1'b0: Card state stable or Debouncing 1'b1: Card Removed Writes to this bit clear it. Value of 1 clears bit and 0 leaves bit intact.
6	RC/W1C	0x0	CARD_INSERTION Card Insertion. This bit is set if the Card Inserted in the Present State register changes from 0 to 1. Values: 1'b0: Card state stable or Debouncing 1'b1: Card Inserted Writes to this bit clear it. Value of 1 clears bit and 0 leaves bit intact.
5	RC/W1C	0x0	BUF_RD_READY Buffer Read Ready. This bit is set if the Buffer Read Enable changes from 0 to 1. Values: 1'b0: Not ready to read buffer 1'b1: Ready to read buffer Writes to this bit clear it. Value of 1 clears bit and 0 leaves bit intact.
4	RC/W1C	0x0	BUF_WR_READY Buffer Write Ready. This bit is set if the Buffer Write Enable changes from 0 to 1. Values: 1'b0: Not ready to write buffer 1'b1: Ready to write buffer Writes to this bit clear it. Value of 1 clears bit and 0 leaves bit intact.

Bit	Attr	Reset Value	Description
3	RC/W1C	0x0	DMA_INTERRUPT DMA Interrupt. This bit is set if the Host Controller detects the SDMA Buffer Boundary during transfer. In case of ADMA, by setting the Int field in the descriptor table, the Host controller generates this interrupt. This interrupt is not generated after a Transfer Complete. Values: 1'b0: No DMA Interrupt 1'b1: DMA Interrupt is generated Writes to this bit clear it. Value of 1 clears bit and 0 leaves bit intact.
2	RC/W1C	0x0	BGAP_EVENT Block Gap Event. This bit is set when both read/write transaction is stopped at block gap due to a Stop at Block Gap Request. Values: 1'b0: No Block Gap Event 1'b1: Transaction stopped at block gap Writes to this bit clear it. Value of 1 clears bit and 0 leaves bit intact.
1	RC/W1C	0x0	XFER_COMPLETE Transfer Complete. This bit is set when a read/write transfer and a command with status busy is completed. Values: 1'b0: Not complete 1'b1: Command execution is completed Writes to this bit clear it. Value of 1 clears bit and 0 leaves bit intact.
0	RC/W1C	0x0	CMD_COMPLETE Command Complete. In an SD/eMMC Mode, this bit is set when the end bit of a response except for Auto CMD12 and Auto CMD23. This interrupt is not generated when the Response Interrupt Disable in Transfer Mode Register is set to 1. Values: 1'b0: No Command Complete 1'b1: Command Complete Writes to this bit clear it. Value of 1 clears bit and 0 leaves bit intact.

EMMC_ERROR_INT_STAT

Address: Operational Base + offset (0x0032)

Bit	Attr	Reset Value	Description
15:13	RO	0x0	reserved
12	RC/W1C	0x0	BOOT_ACK_ERR Boot Acknowledgement Error. This bit is set when there is a timeout for boot acknowledgement or when detecting boot acknowledgement status having a value other than 3'b010. This is applicable only when boot acknowledgement is expected in eMMC mode. Values: 1'b0: No Error 1'b1: Error

Bit	Attr	Reset Value	Description
11	RC/W1C	0x0	RESP_ERR Response Error Host Controller Version 4.00 supports response error check function to avoid overhead of response error check by Host Driver during DMA execution. If Response Error Check Enable is set to 1 in the Transfer Mode register, Host Controller Checks R1 or R5 response. If an error is detected in a response, this bit is set to 1. Values: 1'b0: No Error 1'b1: Error
10	RC/W1C	0x0	TUNING_ERR Tuning Error. This bit is set when an unrecoverable error is detected in a tuning circuit except during the tuning procedure (occurrence of an error during tuning procedure is indicated by Sampling Clock Select in the Host Control 2 register). By detecting Tuning Error, Host Driver needs to abort a command executing and perform tuning. To reset tuning circuit, Sampling Clock Select is set to 0 before executing tuning procedure. The Tuning Error is higher priority than the other error interrupts generated during data transfer. By detecting Tuning Error, the Host Driver must discard data transferred by a current read/write command and retry data transfer after the Host Controller retrieved from the tuning circuit error. Values: 1'b0: No Error 1'b1: Error
9	RC/W1C	0x0	ADMA_ERR ADMA Error. This bit is set when the Host Controller detects error during ADMA-based data transfer. The error could be due to following reasons: a. Error response received from System bus b. ADMA3,ADMA2 Descriptors invalid c. CQE Task or Transfer descriptors invalid When the error occurs, the state of the ADMA is saved in the ADMA Error Status register. In eMMC CQE mode: The Host Controller generates this Interrupt when it detects an invalid descriptor data at the Fetch Descriptor state. ADMA Error State in the ADMA Error Status indicates that an error has occurred in Fetch Descriptor state. The Host Driver may find that Valid bit is not set at the error descriptor. Values: 1'b0: No Error 1'b1: Error

Bit	Attr	Reset Value	Description
8	RC/W1C	0x0	AUTO_CMD_ERR Auto CMD Error. This error status is used by Auto CMD12 and Auto CMD23 in SD/eMMC mode. This bit is set when detecting that any of the bits D00 to D05 in Auto CMD Error Status register has changed from 0 to 1. D07 is effective in case of Auto CMD12. Auto CMD Error Status register is valid while this bit is set to 1 and may be cleared by clearing of this bit. Values: 1'b0: No Error 1'b0: Error
7	RO	0x0	reserved
6	RC/W1C	0x0	DATA_END_BIT_ERR Data End Bit Error. This error occurs in SD/eMMC mode either when detecting 0 at the end bit position of read data that uses the DAT line or at the end bit position of the CRC status. Values: 1'b0: No Error 1'b1: Error
5	RC/W1C	0x0	DATA_CRC_ERR Data CRC Error. This error occurs in SD/eMMC mode when detecting CRC error when transferring read data which uses the DAT line, when detecting the Write CRC status having a value of other than 010 or when write CRC status timeout. Values: 1'b0: No Error 1'b1: Error
4	RC/W1C	0x0	DATA_TOUT_ERR Data Timeout Error. This bit is set in SD/eMMC mode when detecting one of the following timeout conditions: a. Busy timeout for R1b, R5b type b. Busy timeout after Write CRC status c. Write CRC Status timeout d. Read Data timeout Values: 1'b0: No Error 1'b1: Time out
3	RC/W1C	0x0	CMD_IDX_ERR Command Index Error. This bit is set if a Command Index error occurs in the command response in SD/eMMC mode. Values: 1'b0: No Error 1'b1: Error
2	RC/W1C	0x0	CMD_END_BIT_ERR Command End Bit Error. This bit is set when detecting that the end bit of a command response is 0 in SD/eMMC mode. Values: 1'b0: No Error 1'b1: End Bit Error generated

Bit	Attr	Reset Value	Description
1	RC/W1C	0x0	CMD_CRC_ERR Command CRC Error. Command CRC Error is generated in SD/eMMC mode for following two cases. a. If a response is returned and the Command Timeout Error is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. b. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller aborts the command (stop driving CMD line) and set this bit to 1. The Command Timeout Error is also set to 1 to distinguish a CMD line conflict. Values: 1'b0: No Error 1'b1: CRC Error generated
0	RC/W1C	0x0	CMD_TOUT_ERR Command Timeout Error. In SD/eMMC Mode, this bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict, along with Command CRC Error bit, this bit is set to 1, without waiting for 64 SD/eMMC card clock cycles. Values: 1'b0: No Error 1'b1: Time out

EMMC_AUTO_CMD_STAT

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
15:8	RO	0x00	reserved
7	RO	0x0	CMD_NOT_ISSUED_AUTO_CMD12 Command Not Issued By Auto CMD12 Error. If this bit is set to 1, CMD_wo_DAT is not executed due to an Auto CMD12 Error (D04-D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. Values: 1'b0: No Error 1'b1: Not Issued
6	RO	0x0	reserved
5	RO	0x0	AUTO_CMD_RESP_ERR Auto CMD Response Error. This bit is set when Response Error Check Enable in the Transfer Mode register is set to 1 and an error is detected in R1 response of either Auto CMD12 or CMD13. This status is ignored if any bit between D00 to D04 is set to 1. Values: 1'b0: No Error 1'b1: Error
4	RO	0x0	AUTO_CMD_IDX_ERR Auto CMD Index Error. This bit is set if the command index error occurs in response to a command. Values: 1'b0: No Error 1'b1: Error
3	RO	0x0	AUTO_CMD_EBIT_ERR Auto CMD End Bit Error. This bit is set when detecting that the end bit of command response is 0. Values: 1'b0: No Error 1'b1: End Bit Error Generated
2	RO	0x0	AUTO_CMD_CRC_ERR Auto CMD CRC Error. This bit is set when detecting a CRC error in the command response. Values: 1'b0: No Error 1'b1: CRC Error Generated

Bit	Attr	Reset Value	Description
1	RO	0x0	AUTO_CMD_TOUT_ERR Auto CMD Timeout Error. This bit is set if no response is returned with 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, error status bits (D04-D01) are meaningless. Values: 1'b0: No Error 1'b1: Time out
0	RO	0x0	AUTO_CMD12_NOT_EXEC Auto CMD12 Not Executed. If multiple memory block data transfer is not started due to a command error, this bit is not set because it is not necessary to issue an Auto CMD12. Setting this bit to 1 means that the Host Controller cannot issue Auto CMD12 to stop multiple memory block data transfer, due to some error. If this bit is set to 1, error status bits (D04-D01) is meaningless. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. Values: 1'b0: Executed 1'b1: Not Executed

EMMC_HOST_CTRL2

Address: Operational Base + offset (0x003E)

Bit	Attr	Reset Value	Description
15	RW	0x0	PRESET_VAL_ENABLE Preset Value Enable. This bit enables automatic selection of SDCLK frequency and Driver strength Preset Value registers. When Preset Value Enable is set, SDCLK frequency generation (Frequency Select and Clock Generator Select) and the driver strength selection are performed by the controller. These values are selected from set of Preset Value registers based on selected speed mode. Values: 1'b0: SDCLK and Driver Strength are controlled by Host Driver 1'b1: Automatic Selection by Preset Value are Enabled
14	RW	0x0	ASYNC_INT_ENABLE Asynchronous Interrupt Enable. This bit can be set if a card supports asynchronous interrupts and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Values: 1'b0: Disabled 1'b1: Enabled
13	RW	0x0	ADDRESSING 64-bit Addressing. This bit is effective when Host Version 4 Enable is set to 1. Values: 1'b0: 32 bits addressing 1'b1: 64 bits addressing

Bit	Attr	Reset Value	Description
12	RW	0x0	HOST_VER4_ENABLE Host Version 4 Enable. This bit selects either Version 3.00 compatible mode or Version 4 mode. Values: 1'b0: Version 3.00 compatible mode 1'b1: Version 4 mode
11	RW	0x0	CMD23_ENABLE CMD23 Enable. If the card supports CMD23, this bit is set to 1. This bit is used to select Auto CMD23 or Auto CMD12 for ADMA3 data transfer. Values: 1'b0: Auto CMD23 is disabled 1'b1: Auto CMD23 is enabled
10	RW	0x0	ADMA2_LEN_MODE ADMA2 Length Mode. This bit selects ADMA2 Length mode to be either 16-bit or 26-bit. Values: 1'b0: 16-bit Data Length Mode 1'b1: 26-bit Data Length Mode
9	RO	0x0	reserved
8	RW	0x0	UHS2_IF_ENABLE This bit should be set to 0 for SD/eMMC Interface.
7	RW	0x0	SAMPLE_CLK_SEL Sampling Clock Select. This bit is used by the Host Controller to select the sampling clock in SD/eMMC mode to receive CMD and DAT. This bit is set by the tuning procedure and is valid after the completion of tuning (when Execute Tuning is cleared). Setting this bit to 1 means that tuning is completed successfully and setting this bit to 0 means that tuning has failed. Values: 1'b0: Fixed clock is used to sample data 1'b1: Tuned clock is used to sample data
6	RW	0x0	EXEC_TUNING Execute Tuning. This bit is set to 1 to start the tuning procedure in SD/eMMC speed modes and this bit is automatically cleared when tuning procedure is completed. Values: 1'b0: Not Tuned or Tuning completed 1'b1: Execute Tuning
5:4	RO	0x0	reserved
3	RW	0x0	SIGNALING_EN 1.8V Signalling Enable. Values: 1'b0: 3.3V Signalling 1'b1: 1.8V Signalling

Bit	Attr	Reset Value	Description
2:0	RW	0x0	UHS_MODE_SEL UHS Mode/eMMC Speed Mode Select. These bits are used to select UHS mode in the SD mode of operation. In eMMC mode, these bits are used to select eMMC Speed mode. Values: UHS Mode: 3'h0: SDR12 3'h1: SDR25 3'h2: SDR50 3'h3: SDR104 3'h4: DDR50 Others: Reserved eMMC Mode: 3'h0: Legacy 3'h1: High Speed SDR 3'h3: HS200 3'h4: High Speed DDR 3'h7: HS400 Others: Reserved

EMMC_CAPABILITIES1
Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:30	RO	0x1	SLOT_TYPE Slot Type. These bits indicate usage of a slot by a specific Host System. 2'h0: Removable Card Slot 2'h1: Embedded Slot for One Device 2'h2: Shared Bus Slot (SD mode) 2'h3: Reserved
29	RO	0x0	ASYNC_INT_SUPPORT Asynchronous Interrupt Support (SD Mode only). Values: 1'b0: Asynchronous Interrupt Not Supported 1'b1: Asynchronous Interrupt Supported
28	RO	0x0	SYS_ADDR_64_V3 64-bit System Address Support for V3. This bit sets the Host controller to support 64-bit System Addressing of V3 mode. SDMA cannot be used in 64-bit Addressing in Version 3 Mode. If this bit is set to 1, 64-bit ADMA2 with using 96-bit Descriptor can be enabled by setting Host Version 4 Enable (HOST_VER4_ENABLE = 0) and DMA select (DMA_SEL =11b). Values: 1'b0: 64-bit System Address for V3 is Not Supported 1'b1: 64-bit System Address for V3 is Supported

Bit	Attr	Reset Value	Description
27	RO	0x0	SYS_ADDR_64_V4 64-bit System Address Support for V4. This bit sets the Host Controller to support 64-bit System Addressing of V4 mode. When this bit is set to 1, full or part of 64-bit address must be used to decode the Host Controller Registers so that Host Controller Registers can be placed above system memory area. 64-bit address decode of Host Controller registers is effective regardless of setting to 64-bit Addressing in Host Control 2. If this bit is set to 1, 64-bit DMA Addressing for version 4 is enabled by setting Host Version 4 Enable (HOST_VER4_ENABLE = 1) and by setting 64-bit Addressing (ADDRESSING =1) in the Host Control 2 register. SDMA can be used and ADMA2 uses 128-bit Descriptor. Values: 1'b0: 64-bit System Address for V4 is Not Supported 1'b1: 64-bit System Address for V4 is Supported
26:24	RO	0x0	reserved
23	RO	0x1	SUS_RES_SUPPORT Suspense/Resume Support. This bit indicates whether the Host Controller supports Suspend/Resume functionality. If this bit is 0, the Host Driver does not issue either Suspend or Resume commands because the Suspend and Resume mechanism is not supported. Values: 1'b0: Not Supported 1'b1: Supported
22	RO	0x1	SDMA_SUPPORT SDMA Support. This bit indicates whether the Host Controller is capable of using SDMA to transfer data between the system memory and the Host Controller directly. Values: 1'b0: SDMA not Supported 1'b1: SDMA Supported
21	RO	0x1	HIGH_SPEED_SUPPORT High Speed Support. This bit indicates whether the Host Controller and the Host System supports High Speed mode and they can supply the SD Clock frequency from 25 MHz to 50 MHz. Values: 1'b0: High Speed not Supported 1'b1: High Speed Supported
20	RO	0x0	reserved
19	RO	0x1	ADMA2_SUPPORT ADMA2 Support. This bit indicates whether the Host Controller is capable of using ADMA2. Values: 1'b0: ADMA2 not Supported 1'b1: ADMA2 Supported

Bit	Attr	Reset Value	Description
18	RO	0x1	EMBEDDED_8_BIT 8-bit Support for Embedded Device. This bit indicates whether the Host Controller is capable of using an 8-bit bus width mode. Values: 1'b0: 8-bit Bus Width not Supported 1'b1: 8-bit Bus Width Supported
17:16	RO	0x1	MAX_BLK_LEN Maximum Block Length. This bit indicates the maximum block size that the Host driver can read and write to the buffer in the Host Controller. The buffer transfers this block size without wait cycles. The transfer block length is always 512 bytes for the SD Memory irrespective of this bit. Values: 2'h0: 512 Byte 2'h1: 1024 Byte 2'h2: 2048 Byte 2'h3: Reserved
15:8	RO	0xc8	BASE_CLK_FREQ Base Clock Frequency for SD clock. These bits indicate the base (maximum) clock frequency for the SD Clock. The definition of these bits depends on the Host Controller Version. (1) 6-Bit Base Clock Frequency: This mode is supported by the Host Controller version 1.00 and 2.00. The upper 2 bits are not effective and are always 0. The unit values are 1 MHz. The supported clock range is 10 MHz to 63 MHz. 8'h0: Get information through another method 8'h0: 1 MHz 8'h1: 2 MHz .... 8'h3f: 63 MHz Others: Reserved (2) 8-Bit Base Clock Frequency: This mode is supported by the Host Controller version 3.00. The unit values are 1 MHz. The supported clock range is 10 MHz to 255 MHz. 8'h0: Get information through another method 8'h0: 1 MHz 8'h0: 2 MHz .... 8'hff: 255 MHz
7	RO	0x1	TOUT_CLK_UNIT Timeout Clock Unit. This bit shows the unit of base clock frequency used to detect Data Timeout Error. Values: 1'b0: KHz 1'b1: MHz
6	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5:0	RO	0x00	TOUT_CLK_FREQ Timeout Clock Frequency. This bit shows the base clock frequency used to detect Data Timeout Error. The Timeout Clock unit defines the unit of timeout clock frequency. It can be KHz or MHz. 6'h0: Get information through another method 6'h1: 1KHz / 1MHz 6'h2: 2KHz / 2MHz 6'h3: 3KHz / 3MHz .... 6'h3f: 63KHz / 63MHz

Bit	Attr	Reset Value	Description
9:0	RO	0x000	FREQ_SEL_VAL SDCLK Frequency Select Value. 10-bit preset value to be set in SDCLK Frequency Select field of the Clock Control register described by a Host System.

EMMC_ADMA_ID

Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ADMA_ID ADMA Integrated Descriptor Address. These bits indicate the 32-bit of the ADMA Integrated Descriptor address. The start address of Integrated Descriptor is set to these register bits. The ADMA3 fetches one Descriptor Address and increments these bits to indicate the next Descriptor address.

EMMC_SLOT_INTR_STATUS

Address: Operational Base + offset (0x00FC)

Bit	Attr	Reset Value	Description
15:8	RO	0x00	reserved
7:0	RO	0x00	INTR_SLOT Interrupt signal for each Slot. Host Controller support single card slot. This register shall always return 0.

EMMC_HOST_CNTRL_VERS

Address: Operational Base + offset (0x00FE)

Bit	Attr	Reset Value	Description
15:8	RO	0x10	VENDOR_VERSION_NUM Vendor Version Number.
7:0	RO	0x05	SPEC_VERSION_NUM Specification Version Number. Values: 8'h0: SD Host Controller Specification Version 1.00 8'h1: SD Host Controller Specification Version 2.00 8'h2: SD Host Controller Specification Version 3.00 8'h3: SD Host Controller Specification Version 4.00 8'h4: SD Host Controller Specification Version 4.10 8'h5: SD Host Controller Specification Version 4.20 Others: Reserved

EMMC_CQVER

Address: Operational Base + offset (0x0180)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	RO	0x5	EMMC_VER_MAJOR eMMC Major Version Number (1st digit left of decimal point) in BCD format
7:4	RO	0x1	EMMC_VER_MINOR eMMC Minor Version Number(1st digit right of decimal point) in BCD format
3:0	RO	0x0	EMMC_VER_SUFFIX eMMC Version Suffix (2nd digit right of decimal point) in BCD format

EMMC_CQCAP

Address: Operational Base + offset (0x0184)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RO	0x0	CRYPTO_SUPPORT Crypto Support. This bit indicates whether the Host Controller supports cryptographic operations. Values: 1'b0: Crypto not Supported 1'b1: Crypto Supported
27:16	RO	0x000	reserved
15:12	RO	0x0	ITCFMUL Internal Timer Clock Frequency Multiplier. This field indicates the frequency of the clock used for interrupt coalescing timer and for determining the SQS polling period. See ITCFVAL definition for details. 4'h0: 1 KHz clock 4'h1: 10 KHz clock 4'h2: 100 KHz clock 4'h3: 1 MHz clock 4'h4: 10 MHz clock Others: Reserved
11:10	RO	0x0	reserved
9:0	RO	0x000	ITCFVAL Internal Timer Clock Frequency Value. This field scales the frequency of the timer clock provided by ITCFMUL. The Final clock frequency of actual timer clock is calculated as ITCFVAL* ITCFMUL.

EMMC_CQCFG

Address: Operational Base + offset (0x0188)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	DCMD_EN Direct Command (DCMD) Enable. This bit indicates to the hardware whether the Task Descriptor in slot #31 of the TDL is a Data Transfer Task Descriptor, or a Direct Command Task Descriptor. CQE uses this bit when a task is issued in slot #31, to determine how to decode the Task Descriptor. Values: 1'b0: Task descriptor in slot #31 is a Data Transfer Task Descriptor 1'b1: Task descriptor in slot #31 is a DCMD Task Descriptor
11:9	RO	0x0	reserved
8	RW	0x0	TASK_DESC_SIZE This bit indicates the size of task descriptor used in host memory. This bit can only be configured when Command Queueing Enable bit is 0 (command queueing is disabled) Values: 1'b0: Task descriptor size is 64 bits 1'b1: Task descriptor size is 128 bits
7:2	RO	0x00	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	CR_GENERAL_EN Crypto General Enable. Enable/Disable bit for Crypto Engine. If cryptographic operations are not supported, this status bit is reserved. Values: 1'b0: Disable cryptographic operations for all transactions 1'b1: Enable cryptographic operations for transactions where TD.CE=1 or CRNQP.CE=1
0	RW	0x0	CQ_EN Command Queueing Enable. When CQE is disable, the software controls the eMMC bus using the registers between the addresses 0x000 to 0x1FF. Before the software writes to this bit, the software verifies that the eMMC host controller is in idle state and there are no ongoing commands or data transfers. When software wants to exit command queuing mode, it clears all previous tasks (if any) before setting this bit to 0. Values: 1'b0: Disable command queuing 1'b1: Enable command queuing

EMMC_CQCTRL

Address: Operational Base + offset (0x018C)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	CLR_ALL_TASKS Clear all tasks. This bit can only be written when the controller is halted. This bit does not clear tasks in the device. The software has to use the CMDQ_TASK_MGMT command to clear device's queue. Values: 1'b0: Programming 0 has no effect 1'b1: Clears all the tasks in the controller
7:1	RO	0x00	reserved
0	RW	0x0	HALT Halt request and resume. Values: 1'b0: RESUME_CQE. Software writes 0 to this bit to exit from the halt state and resume CQE activity. 1'b1: HALT_CQE. Software writes 1 to this bit when it wants to acquire software control over the eMMC bus and to disable CQE from issuing command on the bus. For example, issuing a Discard Task command (CMDQ_TASK_MGMT). When the software writes 1, CQE completes the ongoing task (if any in progress). After the task is completed and the CQE is in idle state, CQE does not issue new commands and indicates to the software by setting this bit to 1. The software can poll on this bit until it is set to 1 and only then send commands on the eMMC bus.

EMMC_CQIS

Address: Operational Base + offset (0x0190)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
3	RC/W1C	0x0	TCL Task Cleared Interrupt. This status bit is asserted (if CQISTE.TCL=1) when a task clear operation is completed by CQE. The completed task clear operation is either an individual task clear (CQTCLR) or clearing of all tasks (CQCTL). Values: 1'b0: TCL Interrupt is not set 1'b1: TCL Interrupt is set
2	RC/W1C	0x0	RED Response Error Detected Interrupt. This status bit is asserted (if CQISTE.RED=1) when a response is received with an error bit set in the device status field. Software uses CQRMEM register to configure which device status bit fields may trigger an interrupt, and which are masked. Values: 1'b0: RED Interrupt is not set 1'b1: RED Interrupt is set
1	RC/W1C	0x0	TCC Task Complete Interrupt. This status bit is asserted(if CQISTE.TCC=1) when at least one of the following two conditions are met: a. A task is completed and the INT bit is set in its Task Descriptor b. Interrupt caused by Interrupt Coalescing logic Values: 1'b0: TCC Interrupt is not set 1'b1: TCC Interrupt is set
0	RC/W1C	0x0	HAC Halt Complete Interrupt. This status bit is asserted (if CQISTE.HAC=1) when halt bit in CQCTL register transitions from 0 to 1 indicating that Hhost Controller has completed its current ongoing task and has entered halt state. Values: 1'b0: HAC Interrupt is not set 1'b1: HAC Interrupt is set

EMMC_CQISE

Address: Operational Base + offset (0x0194)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	TCL_STE Task Cleared Interrupt status enable. Values: 1'b0: CQIS.TCL is disabled 1'b1: CQIS.TCL is set when its interrupt condition is active
2	RW	0x0	RED_STE Response Error Detected Interrupt status enable. Values: 1'b0: CQIS.RED is disabled 1'b1: CQIS.RED is set when its interrupt condition is active

Bit	Attr	Reset Value	Description
1	RW	0x0	TCC_STE Task Complete Interrupt status enable. Values: 1'b0: CQIS.TCC is disabled 1'b1: CQIS.TCC is set when its interrupt condition is active
0	RW	0x0	HAC_STE Halt Complete Interrupt status enable. Values: 1'b0: CQIS.HAC is disabled 1'b1: CQIS.HAC is set when its interrupt condition is active

EMMC_CQISGE

Address: Operational Base + offset (0x0198)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	TCL_SGE Task Cleared Interrupt signal enable. Values: 1'b0: CQIS.TCL interrupt signal generation is disabled 1'b1: CQIS.TCL interrupt signal generation is active
2	RW	0x0	RED_SGE Response Error Detected Interrupt signal enable. Values: 1'b0: CQIS.RED interrupt signal generation is disabled 1'b1: CQIS.RED interrupt signal generation is active
1	RW	0x0	TCC_SGE Task Complete Interrupt signal enable. Values: 1'b0: CQIS.TCC interrupt signal generation is disabled 1'b1: CQIS.TCC interrupt signal generation is active
0	RW	0x0	HAC_SGE Halt Complete Interrupt signal enable. Values: 1'b0: CQIS.HAC interrupt signal generation is disabled 1'b1: CQIS.HAC interrupt signal generation is active

EMMC_CQIC

Address: Operational Base + offset (0x019C)

Bit	Attr	Reset Value	Description
31	RW	0x0	INTC_EN Interrupt Coalescing Enable Bit. Values: 1'b0: Interrupt coalescing mechanism is disabled 1'b1: Interrupt coalescing mechanism is active. Interrupts are counted and timed, and coalesced interrupts are generated
30:21	RO	0x000	reserved

Bit	Attr	Reset Value	Description
20	RO	0x0	INTC_STAT Interrupt Coalescing Status Bit. This bit indicates to the software whether any tasks (with INT=0) have completed and counted towards interrupt coalescing (that is, this is set if and only if INTC counter > 0). Values: 1'b0: INT0 Task completions have not occurred since last counter reset (INTC counter == 0) 1'b1: At least one INT0 task completion has been counted (INTC counter > 0)
19:17	RO	0x0	reserved
16	WO	0x0	INTC_RST Counter and Timer Reset. When host driver writes 1, the interrupt coalescing timer and counter are reset. Values: 1'b0: No Effect 1'b1: Interrupt coalescing timer and counter are reset
15	WO	0x0	INTC_TH_WEN Interrupt Coalescing Counter Threshold Write Enable. When software writes 1 to this bit, the value INTC_TH is updated with the contents written on the same cycle. Values: 1'b0: Clears INTC_TH_WEN 1'b1: Sets INTC_TH_WEN
14:13	RO	0x0	reserved
12:8	WO	0x00	INTC_TH Interrupt Coalescing Counter Threshold filed. Software uses this field to configure the number of task completions (only tasks with INT=0 in the Task Descriptor), which are required in order to generate an interrupt. Counter Operation: As data transfer tasks with INT=0 complete, they are counted by CQE. The counter is reset by software during the interrupt service routine. The counter stops counting when it reaches the value configured in INTC_TH, and generates interrupt. 5'h0: Interrupt coalescing feature disabled 5'h1: Interrupt coalescing interrupt generated after 1 task when INT=0 completes 5'h2: Interrupt coalescing interrupt generated after 2 tasks when INT=0 completes .... 5'h1f: Interrupt coalescing interrupt generated after 31 tasks when INT=0 completes To write to this field, the INTC_TH_WEN bit must be set during the same write operation.
7	WO	0x0	TOUT_VAL_WEN When software writes 1 to this bit, the value TOUT_VAL is updated with the contents written on the same cycle. Values: 1'b0: clears TOUT_VAL_WEN 1'b1: Sets TOUT_VAL_WEN

Bit	Attr	Reset Value	Description
6:0	RW	0x00	TOUT_VAL Interrupt Coalescing Timeout Value. Software uses this field to configure the maximum time allowed between the completion of a task on the bus and the generation of an interrupt. Timer Operation: The timer is reset by software during the interrupt service routine. It starts running when a data transfer task with INT=0 is completed, after the timer was reset. When the timer reaches the value configured in ICTOVAL field it generates an interrupt and stops. The timer's unit is equal to 1024 clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field CQCAP register. 7'h0: Timer is disabled. Timeout-based interrupt is not generated 7'h1: Timeout on 01x1024 cycles of timer clock frequency 7'h2: Timeout on 02x1024 cycles of timer clock frequency .... 7'h7f: Timeout on 127x1024 cycles of timer clock frequency In order to write to this field, the TOUT_VAL_WEN bit must be set at the same write operation.

EMMC_CQTDLBA

Address: Operational Base + offset (0x01A0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TDLBA Task Descriptor List Base Address. This register stores the LSB bits (bits 31:0) of the byte address of the head of the Task Descriptor List in system memory. The size of the task descriptor list is 32 * (Task Descriptor size + Transfer Descriptor size) as configured by Host driver. This address shall be set on 1 KB boundary. The lower 10 bits of this register shall be set to 0 by software and shall be ignored by CQE.

EMMC_CQTDBR

Address: Operational Base + offset (0x01A8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DBR Command Queueing Task Doorbell. Software shall configure TDLBA, and enable CQE in CQCFG before using this register. Writing 1 to bit n of this register triggers CQE to start processing the task encoded in slot n of the TDL. Writing 0 by the software does not have any impact on the hardware, and does not change the value of the register bit. CQE always processes tasks in-order according to the order submitted to the list by CQTDBR write transactions. CQE processes Data Transfer tasks by reading the Task Descriptor and sending QUEUED_TASK_PARAMS (CMD44) and QUEUED_TASK_ADDRESS (CMD45) commands to the device. CQE processes DCMD tasks (in slot #31, when enabled) by reading the Task Descriptor, and generating the command encoded by its index and argument. The corresponding bit is cleared to 0 by CQE in one of the following events: a. When a task execution is completed (with success or error) b. The task is cleared using CQTCLR register c. All tasks are cleared using CQCTL register d. CQE is disabled using CQCFG register Software may initiate multiple tasks at the same time (batch submission) by writing 1 to multiple bits of this register in the same transaction. In the case of batch submission, CQE shall process the tasks in order of the task index, starting with the lowest index. If one or more tasks in the batch are marked with QBR, the ordering of execution will be based on said processing order.

EMMC_CQTCN

Address: Operational Base + offset (0x01AC)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TCN Task Complete Notification. Each of the 32 bits are bit mapped to the 32 tasks. Bit-N(1): Task-N has completed execution (with success or errors) Bit-N(0): Task-N has not completed, could be pending or not submitted. On task completion, software may read this register to know which tasks have finished. After reading this register, software may clear the relevant bit fields by writing 1 to the corresponding bits.

EMMC_CQDQS

Address: Operational Base + offset (0x01B0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	DQS Device Queue Status. Each of the 32 bits are bit mapped to the 32 tasks. Bit-N(1): Device has marked task N as ready for execution Bit-N(0): Task-N is not ready for execution. This task could be pending in device or not submitted. Host controller updates this register with response of the Device Queue Status command.

EMMC_CQDPT
Address: Operational Base + offset (0x01B4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	DPT Device Pending Tasks. Each of the 32 bits are bit mapped to the 32 tasks. Bit-N(1): Task-N has been successfully queued into the device and is awaiting execution. Bit-N(0): Task-N is not yet queued. Bit n of this register is set if and only if QUEUED_TASK_PARAMS (CMD44) and QUEUED_TASK_ADDRESS (CMD45) were sent for this specific task and if this task has not been executed yet. CQE shall set this bit after receiving a successful response for CMD45. CQE shall clear this bit after the task has completed execution. Software reads this register in the task-discard procedure to determine if the task is queued in the device.

EMMC_CQTCLR
Address: Operational Base + offset (0x01B8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	TCLR Command Queueing Task Clear. Writing 1 to bit n of this register orders CQE to clear a task which software has previously issued. This bit can only be written when CQE is in Halt state as indicated in CQCFG register Halt bit. When software writes 1 to a bit in this register, CQE updates the value to 1, and starts clearing the data structures related to the task. CQE clears the bit fields (sets a value of 0) in CQTCLR and in CQTDBR once the clear operation is complete. Software must poll on the CQTCLR until it is cleared to verify that a clear operation was done.

EMMC_CQSSC1
Address: Operational Base + offset (0x01C0)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved

Bit	Attr	Reset Value	Description
19:16	RW	0x1	SQSCMD_BLK_CNT Send Status Command Block Counter. This field indicates when SQS CMD is sent while data transfer is in progress. A value of 'n' indicates that CQE sends status command on the CMD line, during the transfer of data block BLOCK_CNT-n, on the data lines, where BLOCK_CNT is the number of blocks in the current transaction. 4'h0: SEND_QUEUE_STATUS (CMD13) command is not sent during the transaction. Instead, it is sent only when the data lines are idle. 4'h1: SEND_QUEUE_STATUS command is to be sent during the last block of the transaction. 4'h2: SEND_QUEUE_STATUS command when last 2 blocks are pending. 4'h3: SEND_QUEUE_STATUS command when last 3 blocks are pending. .... 4'hf: SEND_QUEUE_STATUS command when last 15 blocks are pending. Should be programmed only when CQCFG.CQ_EN is '0'.
15:0	RW	0x1000	SQSCMD_IDLE_TMR Send Status Command Idle Timer. This field configures the polling period to be used when using periodic SEND_QUEUE_STATUS (CMD13) polling. Periodic polling is used when tasks are pending in the device, but no data transfer is in progress. When a SEND_QUEUE_STATUS response indicates that no task is ready for execution, CQE counts the configured time until it issues the next SEND_QUEUE_STATUS. Timer units are clock periods of the clock whose frequency is specified in the Internal Timer Clock Frequency field CQCAP register. The minimum value is 0x0001 (1 clock period) and the maximum value is 0xFFFF (65535 clock periods). For example, a CQCAP field value of 0 indicates a 19.2 MHz clock frequency (period = 52.08 ns). If the setting in CQSSC1.CIT is 0x1000, the calculated polling period is 4096*52.08 ns= 213.33 ns. Should be programmed only when CQCFG.CQ_EN is '0'.

EMMC_CQSSC2

Address: Operational Base + offset (0x01C4)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	SQSCMD_RCA Send Queue RCA. This field provides CQE with the contents of the 16-bit RCA field in SEND_QUEUE_STATUS (CMD13) command argument. CQE copies this field to bits 31:16 of the argument when transmitting SEND_ QUEUE_STATUS (CMD13) command.

EMMC_CQCRDCT

Address: Operational Base + offset (0x01C8)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	DCMD_RESP Direct Command Last Response. This register contains the response of the command generated by the last direct command (DCMD) task that was sent. Contents of this register are valid only after bit 31 of CQTDBR register is cleared by the controller.

EMMC_CQRMEM

Address: Operational Base + offset (0x01D0)

Bit	Attr	Reset Value	Description
31:0	RW	0xfdf9a080	RESP_ERR_MASK Response Mode Error Mask. The bits of this field are bit mapped to the device response. This bit is used as an interrupt mask on the device status filed that is received in R1/R1b responses. The reset value of this register is set to trigger an interrupt on all "Error" type bits in the device status. 1'b0: When a R1/R1b response is received, bit i in the device status is ignored. 1'b1: When a R1/R1b response is received, with a bit i in the device status set, a RED interrupt is generated. Note: Responses to CMD13 (SQS) encode the QSR so that they are ignored by this logic.

EMMC_CQTERRI

Address: Operational Base + offset (0x01D4)

Bit	Attr	Reset Value	Description
31	RO	0x0	TRANS_ERR_FIELDS_VALID Data Transfer Error Field Valid. This bit is updated when an error is detected while a data transfer transaction was in progress. Values: 1'b0: Ignore contents of TRANS_ERR_TASKID and TRANS_ERR_CMD_INDX 1'b1: Data transfer related error detected. Check contents of TRANS_ERR_TASKID and TRANS_ERR_CMD_INDX fields
30:29	RO	0x0	reserved
28:24	RO	0x00	TRANS_ERR_TASKID Data Transfer Error Task ID. This field captures the ID of the task that was executed and whose data transfer has errors.
23:22	RO	0x0	reserved
21:16	RO	0x00	TRANS_ERR_CMD_INDX Data Transfer Error Command Index. This field captures the index of the command that was executed and whose data transfer has errors.
15	RO	0x0	RESP_ERR_FIELDS_VALID Response Mode Error Fields Valid. This bit is updated when an error is detected while a command transaction was in progress. Values: 1'b0: Ignore contents of RESP_ERR_TASKID and RESP_ERR_CMD_INDX 1'b1: Response-related error is detected. Check contents of RESP_ERR_TASKID and RESP_ERR_CMD_INDX fields

Bit	Attr	Reset Value	Description
14:13	RO	0x0	reserved
12:8	RO	0x00	RESP_ERR_TASKID Response Mode Error Task ID. This field captures the ID of the task which was executed on the command line when the error occurred.
7:6	RO	0x0	reserved
5:0	RO	0x00	RESP_ERR_CMD_INDX Response Mode Error Command Index. This field captures the index of the command that was executed on the command line when the error occurred.

EMMC_CQCRI
Address: Operational Base + offset (0x01D8)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RO	0x00	CMD_RESP_INDX Last Command Response Index This field stores the index of the last received command response. CQE shall update the value every time a command response is received.

EMMC_CQCRA
Address: Operational Base + offset (0x01DC)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	CMD_RESP_ARG Last Command Response Argument. This field stores the argument of the last received command. CQE shall update the value every time a command response is received.

EMMC_VER_ID
Address: Operational Base + offset (0x0500)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	VER_ID Current version number.

EMMC_VER_TYPE
Address: Operational Base + offset (0x0504)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	VER_TYPE Version type.

EMMC_HOST_CTRL3
Address: Operational Base + offset (0x0508)

Bit	Attr	Reset Value	Description
7:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	SW_CG_DIS Internal clock gating disable control. This bit must be used to disable IP's internal clock gating when required. When disabled clocks are not gated. Clocks to the core (except AHB bus clock) must be stopped when programming this bit. Values: 1'b0: Internal clock gating is disabled, clocks are not gated internally 1'b1: Internal clock gates are active and clock gating is controlled internally
3:1	RO	0x0	reserved
0	RW	0x0	CMD_CONFLICT_CHECK Command conflict check. This bit enables command conflict check. Host Controller monitors the CMD line whenever a command is issued and checks whether the value driven on command output line matches the value on command input line at next subsequent edge of transmit clock to determine command conflict error. This bit is cleared only if the feed back delay (including IO Pad delay) is more than (card clock period - flop setup time). Values: 1'b0: Disable command conflict check 1'b1: Check for command conflict after 1 card clock cycle

EMMC_EMMC_CTRL

Address: Operational Base + offset (0x052C)

Bit	Attr	Reset Value	Description
15:11	RO	0x00	reserved
10	RW	0x0	CQE_PREFETCH_DISABLE Enable or Disable CQE's PREFETCH feature. This field allows Software to disable CQE's data prefetch feature when set to 1. Values: 1'b0: CQE can prefetch data for successive WRITE transfers and pipeline successive READ transfers 1'b1: Prefetch for WRITE and Pipeline for READ are disabled
9	RW	0x0	CQE_ALGO_SEL Scheduler algorithm selected for execution. This bit selects the Algorithm used for selecting one of the many ready tasks for execution. Values: 1'b0: Priority based reordering with FCFS to resolve equal priority tasks 1'b1: First come First serve, in the order of DBR rings
8	RW	0x0	ENH_STROBE_ENABLE Enhanced Strobe Enable. This bit instructs Host to sample the CMD line using data strobe for HS400 mode. Values: 1'b0: CMD line is sampled using receive clock for HS400 mode 1'b1: CMD line is sampled using data strobe for HS400 mode
7:3	RO	0x00	reserved

Bit	Attr	Reset Value	Description
2	RW	0x1	EMMC_RST_N EMMC Device Reset signal control. Values: 1'b0: Reset to eMMC device asserted 1'b1: Reset to eMMC device is de-asserted
1	RW	0x0	DISABLE_DATA_CRC_CHK Disable Data CRC Check. This bit controls masking of CRC16 error for Card Write in eMMC mode. This is useful in bus testing (CMD19) for an eMMC device. In bus testing, an eMMC card does not send CRC status for a block, which may generate CRC error. This CRC error can be masked using this bit during bus testing. Values: 1'b0: DATA CRC check is enabled 1'b1: DATA CRC check is disabled
0	RW	0x0	CARD_IS_EMMC eMMC Card present. This bit indicates the type of card connected. An application program this bit based on the card connected to Host Controller. Values: 1'b0: Card connected to Host Controller is a non-eMMC card 1'b1: Card connected to Host Controller is an eMMC card

EMMC_BOOT_CTRL

Address: Operational Base + offset (0x052E)

Bit	Attr	Reset Value	Description
15:12	RW	0x0	BOOT_TOUT_CNT Boot Acknowledge Timeout Counter Value. This value determines the interval by which boot acknowledge timeout (50 ms) is detected when boot acknowledge is expected during boot operation. Values: 4'h0: TMCLK x 2^13 4'h1: TMCLK x 2^14 ...... 4'hE: TMCLK x 2^27 4'hF: Reserved
11:9	RO	0x0	reserved
8	RW	0x0	BOOT_ACK_ENABLE Boot Acknowledge Enable. When this bit set, Host checks for boot acknowledge start pattern of 0-1-0 during boot operation. This bit is applicable for both mandatory and alternate boot mode. Values: 1'b1: Boot Acknowledge enable 1'b0: Boot Acknowledge disable
7	RW	0x0	VALIDATE_BOOT Validate Mandatory Boot Enable bit. This bit is used to validate the MAN_BOOT_EN bit. Values: 1'b1: Validate Mandatory boot enable bit 1'b0: Ignore Mandatory boot Enable bit
6:1	RO	0x00	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	MAN_BOOT_EN Mandatory Boot Enable. This bit is used to initiate the mandatory boot operation. The application sets this bit along with VALIDATE_BOOT bit. Writing 0 is ignored. The Host Controller clears this bit after the boot transfer is completed or terminated. Values: 1'b1: Mandatory boot enable 1'b0: Mandatory boot disable

EMMC_AT_CTRL

Address: Operational Base + offset (0x0540)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:19	RW	0x0	POST_CHANGE_DLY Time taken for phase switching and stable clock output. Values: 2'h0: Less than 1-cycle latency 2'h1: Less than 2-cycle latency 2'h2: Less than 3-cycle latency 2'h3: Less than 4-cycle latency
18:17	RW	0x0	PRE_CHANGE_DLY Maximum Latency specification between transmit clock and receive clock. Values: 2'h0: Less than 1-cycle latency 2'h1: Less than 2-cycle latency 2'h2: Less than 3-cycle latency 2'h3: Less than 4-cycle latency
16	RW	0x0	TUNE_CLK_STOP_EN Clock stopping control for Tuning and auto-tuning circuit. When enabled, clock gate control output is pulled low before changing phase select codes. This effectively stops the receive clock. Changing phase code when clocks are stopped ensures glitch free phase switching. Values: 1'b0: Clocks not stopped 1'b1: Clocks stopped during phase code change
15:5	RO	0x000	reserved
4	RW	0x0	SW_TUNE_EN This fields enables software-managed tuning flow. Values: 1'b0: Software-managed tuning disabled 1'b1: Software-managed tuning enabled
3	RW	0x0	RPT_TUNE_ERR Framing errors are not generated when executing tuning. This debug bit allows users to report these errors. Values: 1'b0: Default mode where per host no errors are reported 1'b1: Debug mode for reporting framing errors

Bit	Attr	Reset Value	Description
2	RW	0x0	SWIN_TH_EN Sampling window Threshold enable. Selects the tuning mode. Field should be programmed only when SAMPLE_CLK_SEL is '0'. Values: 1'b0: Tuning engine sweeps all taps and settles at the largest window. 1'b1: Tuning engine selects the first complete sampling window that meets the threshold set by SWIN_TH_VAL field.
1:0	RO	0x0	reserved

EMMC_AT_STAT
Address: Operational Base + offset (0x0544)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0x00	L_EDGE_PH_CODE Left Edge Phase code. Reading this field returns the phase code value used by Auto-tuning engine to sample data on Left edge of sampling window.
15:8	RO	0x00	R_EDGE_PH_CODE Right Edge Phase code. Reading this field returns the phase code value used by Auto-tuning engine to sample data on Right edge of sampling window.
7:0	RW	0x00	CENTER_PH_CODE Centered Phase code. Setting AT_CTRL.SW_TUNE_EN enables software to write to this field.

EMMC_DLL_CTRL
Address: Operational Base + offset (0x0800)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	RW	0x0	DLL_BYPASS_MODE DLL bypass mode select. 1'b0: Normal 1'b1: Bypass
23:16	RW	0x00	DLL_START_POINT DLL start point for phase detect.
15:8	RW	0x00	DLL_INCRMENT DLL increment value.
7:2	RO	0x00	reserved
1	RW	0x0	DLL_SRST DLL software reset indication. 1'b0: Normal work 1'b1: Reset
0	RW	0x0	DLL_START DLL working indication. 1'b0: DLL is not working 1'b1: DLL is working

EMMC_DLL_RXCLK
Address: Operational Base + offset (0x0804)

Bit	Attr	Reset Value	Description
31	RW	0x0	RX_CLK_ORI_GATE Receive original clock source gating enable. 1'b0: Receive original clock source is not auto gating, active when card clock is stable and enable. 1'b1: Receive original clock source is auto gating, active when card is working.
30	RO	0x0	reserved
29	RW	0x0	RX_CLK_SRC_SEL Receive clock source selection. 1'b0: Receive clock source is transmit clock output 1'b1: Receive clock source is original clock input
28	RW	0x0	RX_CLK_CHGWIN Receive clock change window configuration. When high, receive clock is gated.
27	RW	0x0	RX_CLK_DLY_ENA Delay enable for receive clock output. 1'b0: Disable delay. Receive clock output comes from receive clock source, determined by RX_CLK_SRC_SEL. 1'b1: Enable delay. Receive clock output comes from delay line output of receive clock source.
26	RW	0x0	RX_DELAY_NUM_SEL Delay element number selection for receive clock. 1'b0: Delay element number comes from hardware calculation 1'b1: Delay element number comes from software (RX_DELAY_NUM)
25	RW	0x0	RX_TAP_VALUE_SEL Tap value selection for receive clock. 1'b0: Tap value equals to (DLL_LOCK_VALUE*2)%256 1'b1: Tap value comes from software (RX_TAP_VALUE)
24	RW	0x0	RX_TAP_NUM_SEL Tap number selection for receive clock. 1'b0: Tap number comes from tuning result 1'b1: Tap number comes from software (RX_TAP_NUM)
23:16	RW	0x00	RX_DELAY_NUM Total delay element number of selected tap used for receive clock.
15:8	RW	0x00	RX_TAP_VALUE Tap value for receive clock. It denotes delay element number for receive clock cycle.
7:5	RO	0x0	reserved
4:0	RW	0x00	RX_TAP_NUM Tap number for receive clock. Every clock is divided into 32 taps equably. The selected tap number is RX_TAP_NUM+1. Use tap number to select tap used for receive clock.

EMMC_DLL_TXCLK

Address: Operational Base + offset (0x0808)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	TX_CLK_SRC_SEL Transmit clock source selection. 1'b0: Transmit clock source is invertion of original clock input 1'b1: Transmit clock source is original clock input

Bit	Attr	Reset Value	Description
28	RO	0x0	reserved
27	RW	0x0	TX_CLK_DLY_ENA Delay enable for transmit clock output. 1'b0: Disable delay. Transmit clock output comes from transmit clock source, determined by TX_CLK_SRC_SEL. 1'b1: Enable delay. Transmit clock output comes from delay line output of transmit clock source.
26	RW	0x0	TX_DELAY_NUM_SEL Delay element number selection for transmit clock. 1'b0: Delay element number comes from hardware calculation 1'b1: Delay element number comes from software (TX_DELAY_NUM)
25	RW	0x0	TX_TAP_VALUE_SEL Tap value selection for transmit clock. 1'b0: Tap value equals to (DLL_LOCK_VALUE*2)%256 1'b1: Tap value comes from software (TX_TAP_VALUE)
24	RW	0x0	TX_TAP_NUM_SEL Tap number selection for transmit clock. 1'b0: Tap number is 8 1'b1: Tap number comes from software (TX_TAP_NUM)
23:16	RW	0x00	TX_DELAY_NUM Total delay element number of selected tap used for transmit clock.
15:8	RW	0x00	TX_TAP_VALUE Tap value for transmit clock. It denotes delay element number for transmit clock cycle.
7:5	RO	0x0	reserved
4:0	RW	0x00	TX_TAP_NUM Tap number for transmit clock. Every clock is divided into 32 taps equably. The selected tap number is TX_TAP_NUM+1. Use tap number to select tap used for transmit clock.

EMMC_DLL_STRBIN

Address: Operational Base + offset (0x080C)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	STRBIN_DELAY_ENA Delay enable for strobe input. 1'b0: Disable delay. Strobe input comes from original data strobe. 1'b1: Enable delay. Strobe input comes from delay line output of original data strobe.
26	RW	0x0	STRBIN_DELAY_NUM_SEL Delay element number selection for strobe input. 1'b0: Delay element number comes from hardware calculation 1'b1: Delay element number comes from software (STRBIN_DELAY_NUM)
25	RW	0x0	STRBIN_TAP_VALUE_SEL Tap value selection for strobe input. 1'b0: Tap value equals to (DLL_LOCK_VALUE*2)%256 1'b1: Tap value comes from software (STRBIN_TAP_VALUE)
24	RW	0x0	STRBIN_TAP_NUM_SEL Tap number selection for strobe input. 1'b0: Tap number is 8 1'b1: Tap number comes from software (TAPNUM_TAP_NUM)

Bit	Attr	Reset Value	Description
23:16	RW	0x00	STRBIN_DELAY_NUM Total delay element number of selected tap used for strobe input.
15:8	RW	0x00	STRBIN_TAP_VALUE Tap value for strobe input. It denotes delay element number for strobe input cycle.
7:5	RO	0x0	reserved
4:0	RW	0x00	STRBIN_TAP_NUM Tap number for strobe input. Every clock is divided into 32 taps equably. The selected tap number is STRBIN_TAP_NUM+1. Use tap number to select tap used for strobe input.

EMMC_DLL_CMDOUT

Address: Operational Base + offset (0x0810)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:29	RW	0x0	CMDOEN_SRC_SEL Command output enable selection. 2'b00: Command output enable is from register output triggered by clock rising edge 2'b01: Command output enable is from register output triggered by clock falling edge Others: Command output enable is from both register output triggered by clock rising edge and register output triggered by clock falling edge
28	RW	0x0	CMDOUT_SRC_SEL Command output source selection. 1'b0: Command output source is from register output triggered by clock rising edge 1'b1: Command output source is from register output triggered by clock falling edge
27	RW	0x0	CMDOUT_DELAY_ENA Delay enable for command output. 1'b0: Disable delay. Command output comes from command output source, determined by CMDOUT_SRC_SEL. 1'b1: Enable delay. Command output comes from delay line output of command output source.
26	RW	0x0	CMDOUT_DELAY_NUM_SEL Delay element number selection for command output. 1'b0: Delay element number comes from hardware calculation 1'b1: Delay element number comes from software (CMDOUT_DELAY_NUM)
25	RW	0x0	CMDOUT_TAP_VALUE_SEL Tap value selection for command output. 1'b0: Tap value equals to (DLL_LOCK_VALUE*2)%256 1'b1: Tap value comes from software (CMDOUT_TAP_VALUE)
24	RW	0x0	CMDOUT_TAP_NUM_SEL Tap number selection for command output. 1'b0: Tap number is 0 1'b1: Tap number comes from software (CMDOUT_TAP_NUM)
23:16	RW	0x00	CMDOUT_DELAY_NUM Total delay element number of selected tap used for command output.

Bit	Attr	Reset Value	Description
15:8	RW	0x00	CMDOUT_TAP_VALUE Tap value for command output. It denotes delay element number for command output.
7:5	RO	0x0	reserved
4:0	RW	0x00	CMDOUT_TAP_NUM Tap number for command output. Every clock is divided into 32 taps equably. The selected tap number is CMDOUT_TAP_NUM+1. Use tap number to select tap used for command output.

EMMC_DLL_STATUS0
Address: Operational Base + offset (0x0840)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0x00	DLL_CMDOUT_DELAY_VALUE Delay element number used for command output
15:10	RO	0x00	reserved
9	RO	0x0	DLL_LOCK_TIMEOUT Delay line phase detection timeout status. 1'b0: Not timeout 1'b1: Timeout
8	RO	0x0	DLL_LOCK Delay line lock indication. 1'b0: Delay line is not locked 1'b1: Delay line is locked
7:0	RO	0x00	DLL_LOCK_VALUE Delay line lock value for half card clock cycle. It denotes the delay element number needed for delay line locked. It is valid when DLL_LOCK is high.

EMMC_DLL_STATUS1
Address: Operational Base + offset (0x0844)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0x00	DLL_STRBIN_DELAY_VALUE Delay element number used for strobe input
15:8	RO	0x00	DLL_RXCLK_DELAY_VALUE Delay element number used for receive clock
7:0	RO	0x00	DLL_TXCLK_DELAY_VALUE Delay element number used for transmit clock

4.5 Interface Description

Notes: I=input, O=output, I/O=input/output, bidirectional

4.6 Application Notes

4.6.1 Clock Adjustment

Phase detection is needed if you want to know the card clock’s precision before clock adjustment. The detection flow is as below:

(1) Set EMMC_DLL_CTRL[1]=1 to reset the EMMC DLL; then set EMMC_DLL_CTRL[1]=0 to dis-reset EMMC DLL;
(2) Set DLL_START_POINT in EMMC_DLL_CTRL[23:16]; set DLL_INCREMENT in EMMC_DLL_CTRL[15:8], and set EMMC_DLL_CTRL[0] to start the DLL phase detection.
(3) Wait for DLL lock until EMMC_DLL_STATUS0[8] equals to 1. Get the EMMC_DLL_STATUS0[7:0] as the locked value for the half card clock cycle time.
(4) If EMMC_DLL_STATUS0[9]=1 and EMMC_DLL_STATUS0[8]=0, the detection is timeout, you can adjust the DLL_START_POINT or DLL_INCREMENT to re-detection.; or bypass the detection if the total delay line length is short than half clock cycle. You need to set EMMC_DLL_CTRL[0] to 0 before you restart phase detection as(1)~(3).

After phase detection, the clock’s precision is shown in EMMC_DLL_STATUS0[7:0] (DLL_LOCK_VALUE) based on delay element.

We can calculate the delay element numbers requirement for transmit clock (TXCLK), receive clock (RXCLK), data strobe input (STRBIN), command output (CMDOUT), denoted as “XX” as follows:

(1) Get tap value: if XX_TAP_VALUE_SEL=0, tap value equals to (DLL_LOCK_VALUE*2)%256; else tap value is set by software, XX_TAP_VALUE;
(2) Get tap number: if XX_TAP_NUM_SEL=0, tap number comes from Host Controller; else tap number is set by software, XX_TAP_NUM;
(3) Get required delay element numbers: if XX_DELAY_NUM_SEL=0, delay element number equals to tap value* tap number; else delay element number is set by software, XX_DELAY_NUM.

The adjustment value for every cycle (XX) is equals to required delay element numbers*delay time of every element.

The delay time of every element is in the range of 36ps~68ps, varying with different voltage and temperature.

Chapter 5 Raster Graphic Acceleration 3 (RGA3)

5.1 Overview

RGA3 is a separate 2D graphics accelerator, used to accelerate basic operations, including: image position transformation (rotation, mirroring), size transformation (scale down, scale up), format conversion, FBC encoding and decoding, TILE encoding and decoding, and window overlap.

5.2 Feature

5.2.1 Image input mode and data format

- Raster mode
  - ARGB8888/RGB888/RGB565
  - YUV420(8bit & 10bit)/YUV422(8bit &10bit)/YUYV(8bit)
  - YUV support semi-planer
  - YUV10bit support compacted/uncompacted, little/big endian
- FBCD mode
  - ARGB8888/RGB888/RGB565
  - YUV420(8bit & 10bit)/YUV422(8bit & 10bit)
- Tile8x8 mode
  - YUV420(8bit & 10bit)/YUV422(8bit & 10bit)
  - YUV 10bit support compacted

5.2.2 Image output mode and data format

- Raster mode
  - ARGB8888/RGB888/RGB565
  - YUV420(8bit &10bit)/YUV422(8bit &10bit)/YUYV(8bit)
  - YUV support semi-planer
  - YUV10bit support compacted/uncompacted, little/big endian
- FBCE mode
  - ARGB8888/RGB888/RGB565
  - YUV420(8&10bit)/YUV422(8bit &10bit)
  - FBCE payload support sparse/unsparse mode
- Tile8x8 mode
  - YUV420(8bit &10bit)/YUV422(8bit &10bit)
  - YUV support semi-planer
  - YUV10bit support compacted/uncompacted, little/big endian

5.2.3 Support 9 path

- RASTER -> RASTER
- RASTER -> FBCE
- RASTER -> TILE
- FBCD -> RASTER
- FBCD -> FBCE
- FBCD -> TILE
- TILE -> RASTER
- TILE -> FBCE
- TILE -> TILE

5.2.4 Support 2 layers and CSC

- Y2R: BT601L, BT601R, BT709,BT2020
- R2Y: BT601L, BT601R, BT709, BT2020
- RB swap, UV swap, YC swap(YUV422)

5.2.5 Input/Output resolution

- Min input/output resolution is 128x128
- Max input resolution is (8192-16) x (8192-16)
- Max output resolution is (8192-64) x (8192-64)

- Max virtual width is 8192 word

5.2.6 Resize

- Scale down: Average, max ratio is 8
- Scale up: Bicubic, max ratio is 8

5.2.7 Orient

- Normal
- Ymirror
- Xmirror
- Rot180(xmirror+ymirror)
- Rot90
- Rot90+ymirror(xmirror+rot90)
- Rot90+xmirror(xmirror+rot270)
- Rot270

5.2.8 Overlap

- 2 overlap mode: ABB and ABC
- Support YUV field and RGB field

5.2.9 Config

- Support 32bit AHB configuration setting
- support AXI command configuration setting

5.2.10 Others

- Support level interrupt
- Support 128bit AXI
- Support 128bit MMU, max mapping to 32G DDR
- 4pixel/cycle when resize is bypass, 2pixel/cycle when resize is scale up/ scale down

5.3 Block Diagram

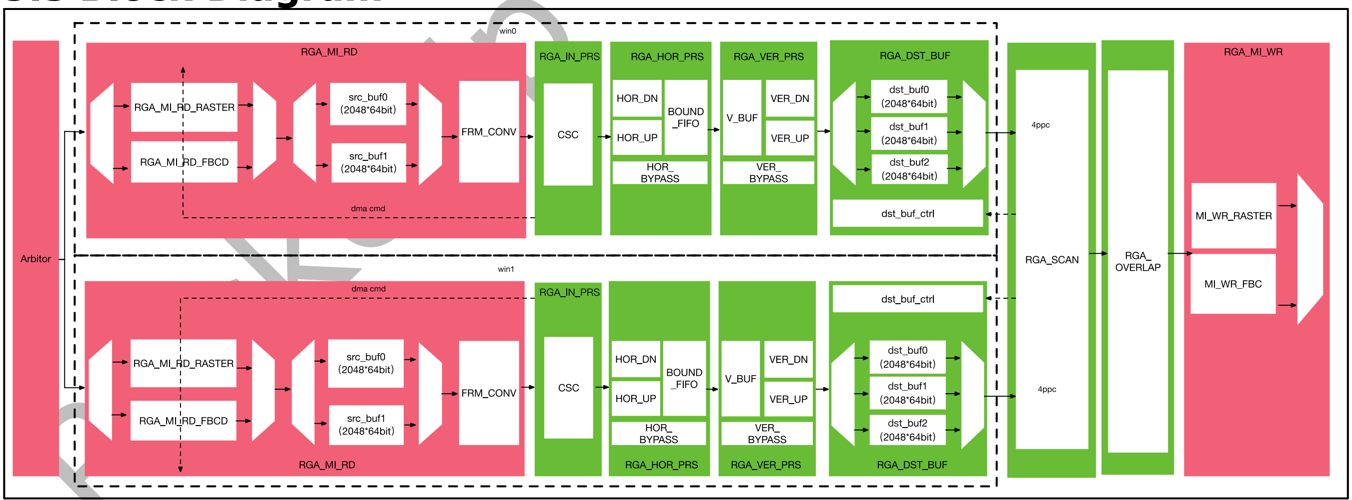

Fig. 5-1 RGA3 Block Diagram

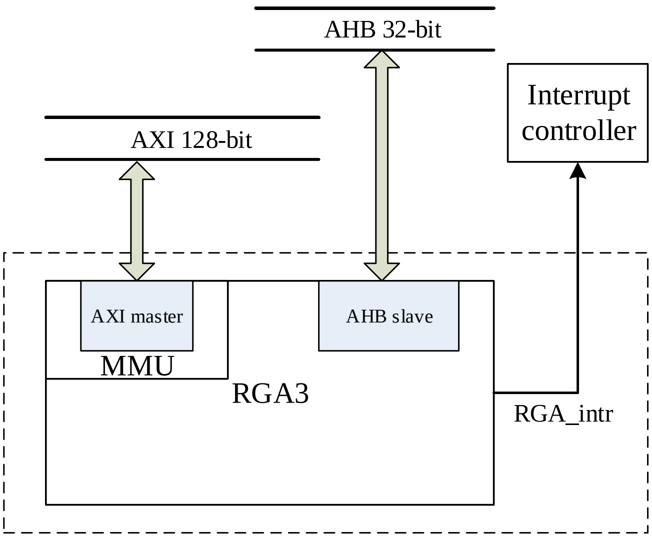

Fig. 5-2 RGA3 in SOC

5.4 Function Description

5.4.1 RGA3 Size

RGA3 common size relationship show as below:

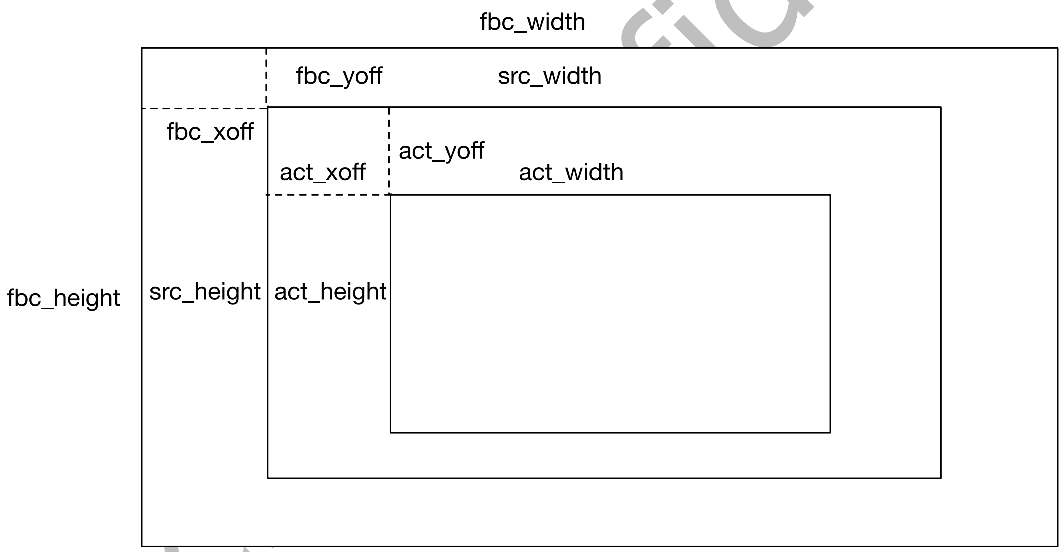

Fig. 5-3 RGA3 Size

5.4.2 Raster mode

- **RGA3 support Raster mode for input and output, which is stored in DDR as below:**

  1) rd_format/wr_format = 1 semi-planer format

YUV semi-planer format, we need two buffers in DDR(Y buffer, C buffer):

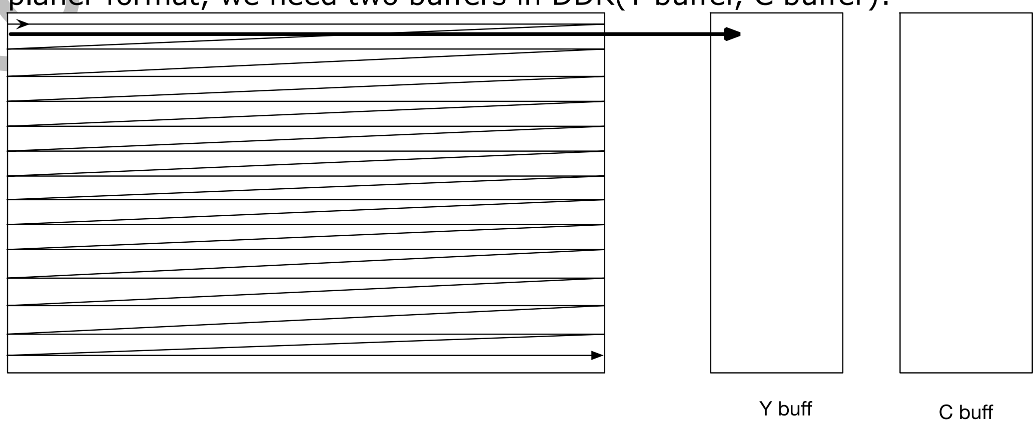

Fig. 5-4 Raster semi-planer buffer in DDR

According to different format, data will be stored in different ways as below:

YUV422sp

31 24 16 8 0

Y03	Y02	Y01	Y00
Y13	Y12	Y11	Y10

Y00	V00	Y01	U00	
Y10	V10	Y11	U10	

Fig. 5-7 Different format in DDR

5.4.3 FBCD mode

This compression format is designed to be used for textures and frame buffers. It has been optimized to decrease external bandwidth as well as being random access and decodable at line speed for the texture cache.

Random access is available to individual 16x16 blocks, which in turn index individual 4x4 blocks. This is done using a structure where a header block is stored for each 16x16 block at a predictable memory address in what is referred to as the header buffer. If the horizontal size is given by "width" and A is the start address of the head buff, the address of the header for the 16x16 block containing a given pixel at position x, y is given by A+16*(x/16+((y/16)*(width/16))). A consequence of the 16x16 block structure is that only multiples of 16 are allowed as width and height as shown below.

The data that is used to store the individual 4x4 blocks in a 16x16 block is referred to as the payload data for that block. It is stored continuously in body buff from the offset that is supplied in the header. Each section in the body buffer contains payload data which is used to decode a 16x16 block. The header contains an offset to the payload that resides inside of the body buffer, which is typically allocated after allocated after the header buffer in the memory. The offset to the payload data is relative to the start of the header buffer. In some cases it may sense to store payload data inside the header buffer, such as when encoding blocks that are less than 16x16 in size and not all sub block sizes are used in a header.

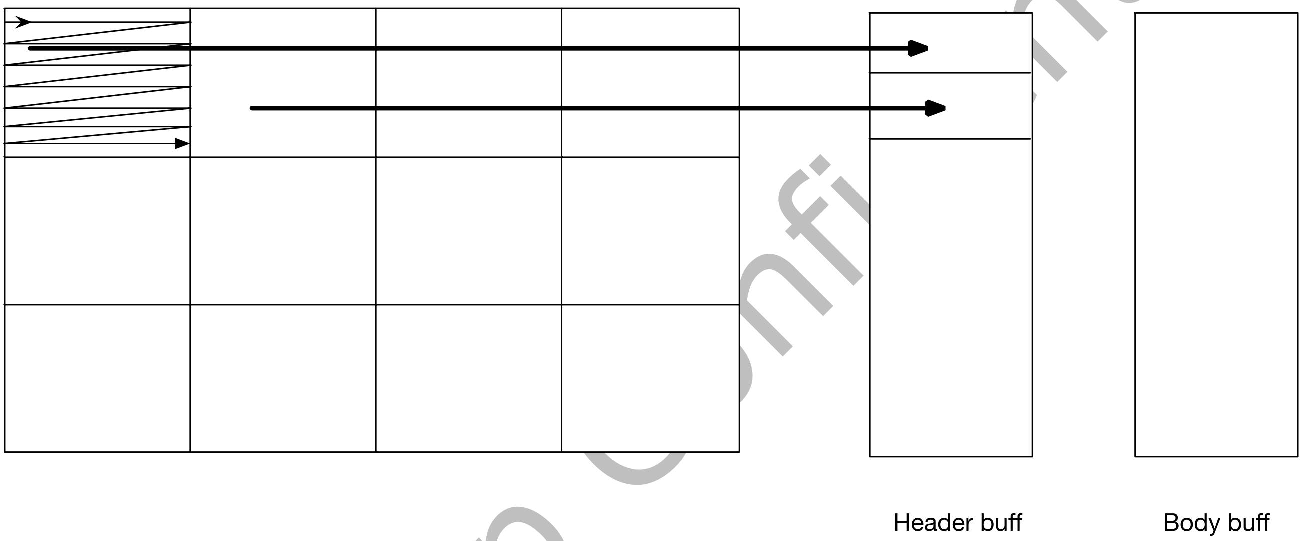

Fig. 5-8 FBC buffer in DDR

5.4.4 Tile8x8 mode

RGA3 support Tile8x8 mode for input and output(only support YUV420SP/YUV422SP/ YUV420SP 10bit/YUV422SP 10bit), we need two buffers in DDR as below:

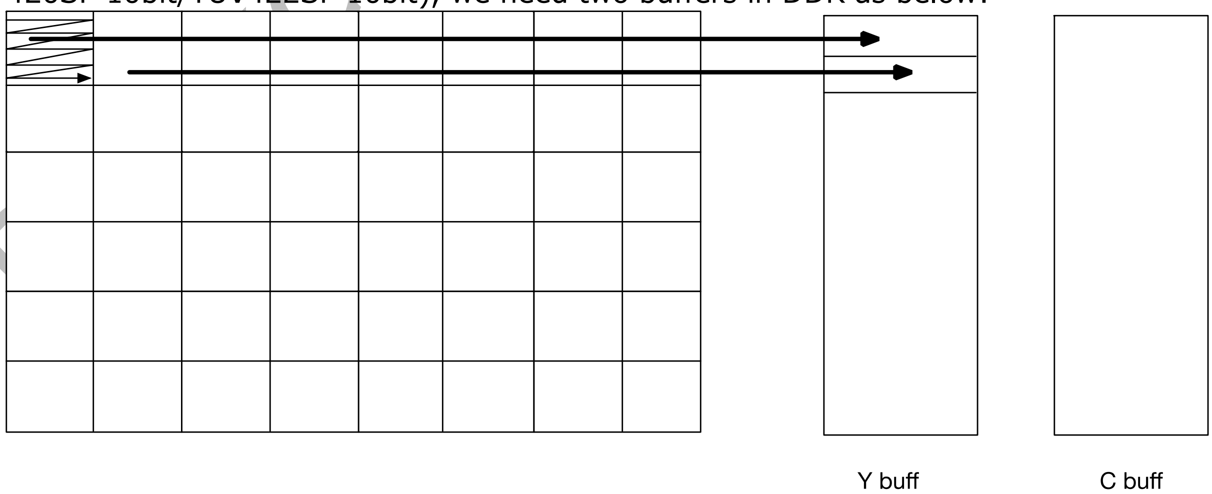

Fig. 5-9 Tile buffer in DDR

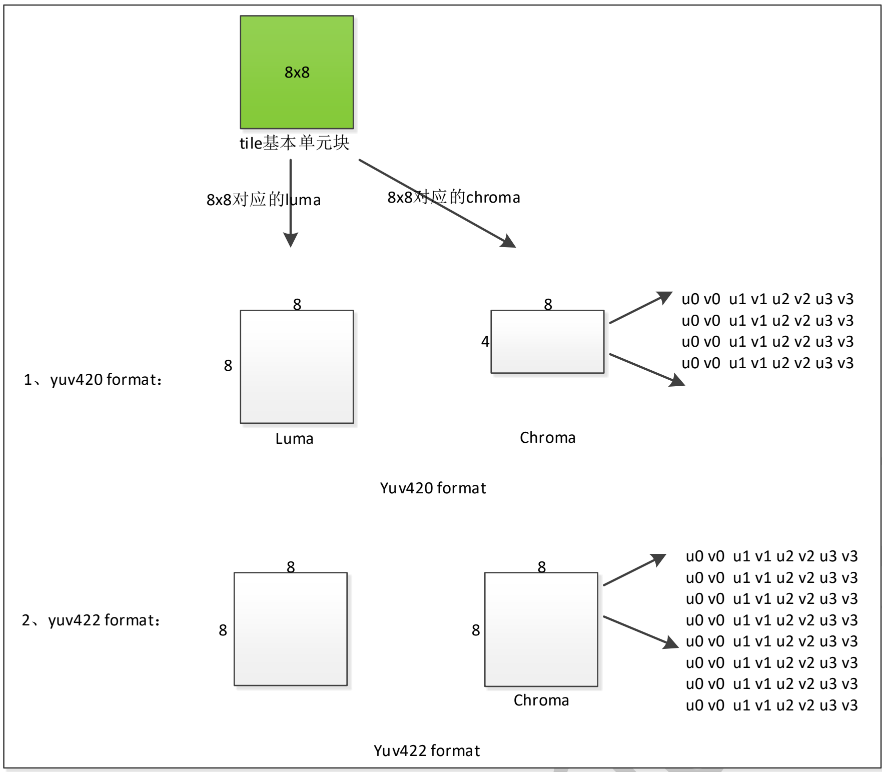

Fig. 5-10 Tile8x8 in DDR

According to different format, data will be stored in different ways as below:

5.4.5 Orient

RGA3 support rot/xmirror/ymirror, which can show as below:

rot, xmirror,ymirror	original	Orient
0, 0, 0 normal		0, 0, 1 ymirror		0, 1, 0 xmirror		0, 1, 1 rot180		1, 0, 0 rot90		
rot, xmirror,ymirror	original	Orient
1, 0, 1 rot90+ymirror		1, 1, 0 rot90+xmirror		1, 1, 1 rot-90		
5.4.6 CSC

The red, green, and blue(RGB) color space is widely used for computer graphics and displays. Red, green and blue are three primary additive colors. The YCbCr color space is used by the PAL and NTSC composite color video standards. The black-and-white system used only luma(Y) information. Color information(Cb and Cr) was added in such a way that a black-and-white

receiver would still display a normal black-and-white picture. Color receivers decoded the additional color information to display a color picture.
There are four equations used to convert between RGB and YCbCr space.

YUV2RGB:
1) YUV to RGB (BT601L)

R = 1.164(Y-16) + 1.596(V-128)
G = 1.164(Y-16) - 0.391(U-128) - 0.813(V-128)
B = 1.164(Y-16) + 2.018(U-128)

2) YUV to RGB (BT601F)

R = (Y-16) + 1.402(V-128)
G = (Y-16) - 0.344(U-128) - 0.714(V-128)
B = (Y-16) + 1.772(U-128)

3) YUV to RGB (BT709L)

R = 1.164(Y-16) + 1.793(V-128)
G = 1.164(Y-16) - 0.213(U-128) - 0.534(V-128)
B = 1.164(Y-16) + 2.115(U-128)

4) YUV to RGB (BT2020)

R = 1.1636(Y-64) + 1.6778(V-512)
G = 1.1636(Y-64) - 0.1872(U-512) - 0.6501(V-512)
B = 1.1636(Y-64) + 2.1406(U-512)

RGB2YUV:
1) RGB to YUV (BT601L)

Y = 0.257R + 0.504G + 0.098B + 16
Cb =-0.148R - 0.291G + 0.439B + 128
Cr = 0.439R - 0.368G - 0.071B + 128

2) RGB to YUV (BT601F)

Y = 0.299R + 0.5870G + 0.1140B + 0
Cb = -0.1687R - 0.3313G + 0.5000B + 512
Cr = 0.500R - 0.4187G - 0.0813B + 512

3) RGB to YUV (BT709L)

Y = 0.183R + 0.614G + 0.062B + 16
Cb =-0.101R - 0.338G + 0.439B + 128
Cr = 0.439R - 0.399G - 0.040B + 128

4) RGB to YUV (BT2020)

Y = 0.2250R + 0.5807G + 0.0508B + 64
Cb = -0.1223R - 0.3157G + 0.4380B + 512
Cr = 0.4380R - 0.4028G - 0.0352B + 512

5.4.7 Resize

Horizontal can be scale up, scale down, bypass, vertical can be scale up, scale down, bypass, max ratio is 1/8 ~ 8:

```
Scale down:
    factor = int(65536*(dst-1)/(src-1)) + 1
Scale up:
if((dst-1) % (src-1) == 0)
    factor = int(65536*(dst-1)/(src-1)) - 1
else
    factor = int(65536*(dst-1)/(src-1));
```

Scale down: s0~s11 is source pixel, d0~d3 is destination pixel, factor = 0.3, factor = 0.4, factor = 0.9:

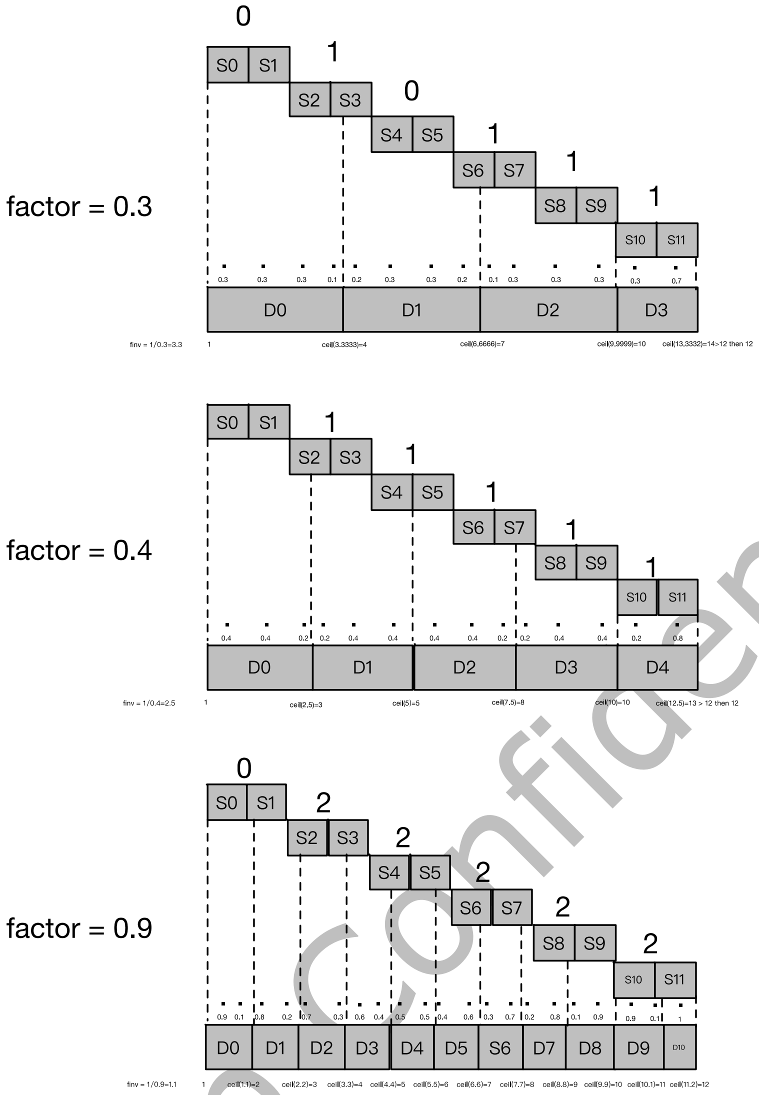

Fig. 5-12 factor = 0.3/0.4/0.9 scale down

Scale up: s0~s11 is source pixel, d0~d3 is destination pixel, factor = 0.3, factor = 0.4, factor = 0.9:

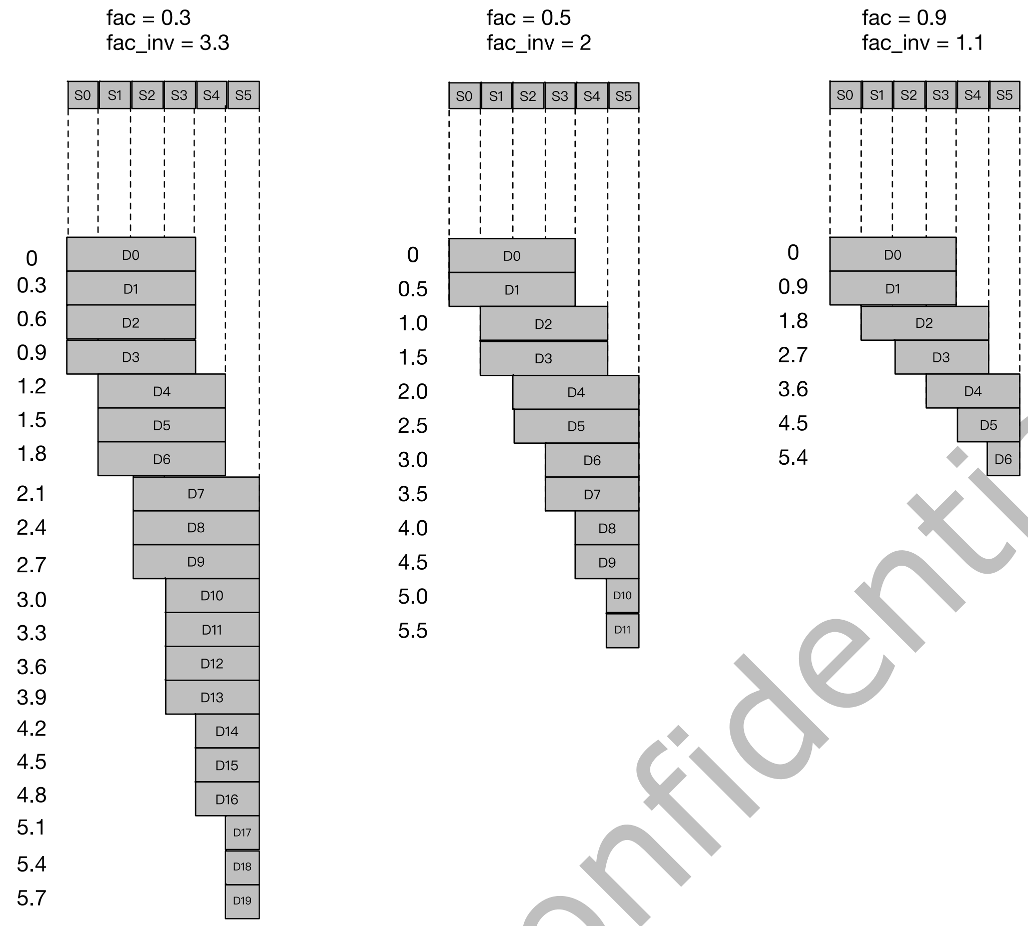

Fig. 5-13 factor = 0.3/0.5/0.9 scale up

5.4.8 Scan/Overlap

5.4.8.1 Overlap mode

RGA3 support win0/win1 layers overlap, after then can write to original DDR address or new DDR address. So RGA3 is ABB/ABC two overlap mode:

1) ABB: A+B->B
2) ABC: A+B->C

ABC mode:

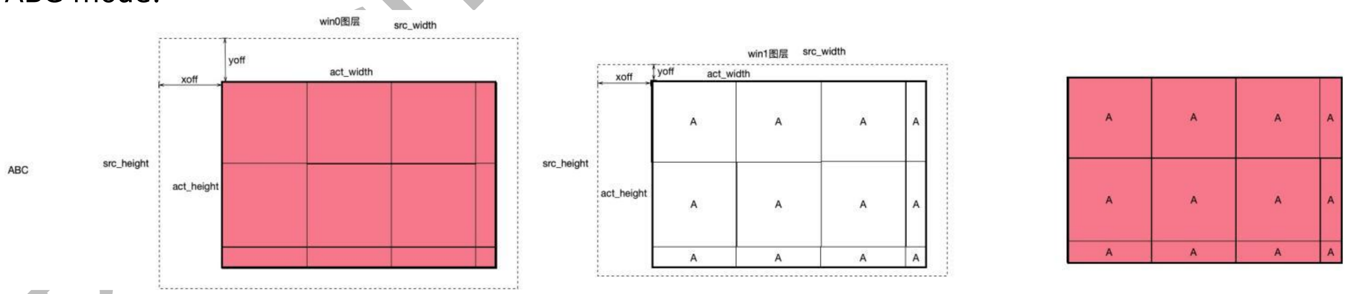

Fig. 5-14 ABC mode

ABB mode:

1) WIN0 = RASTER: win0 act_xoff, act_yoff must aligned to 4pixel by software setting when input format is 10bit, otherwise no limit is required
2) WIN0 = TILE: win0 act_xoff, act_yoff must aligned to 8pixel by software setting
3) WIN0 = FBCE: only support sparse mode, win0 act_xoff, act_yoff must aligned to 16pixel by software setting

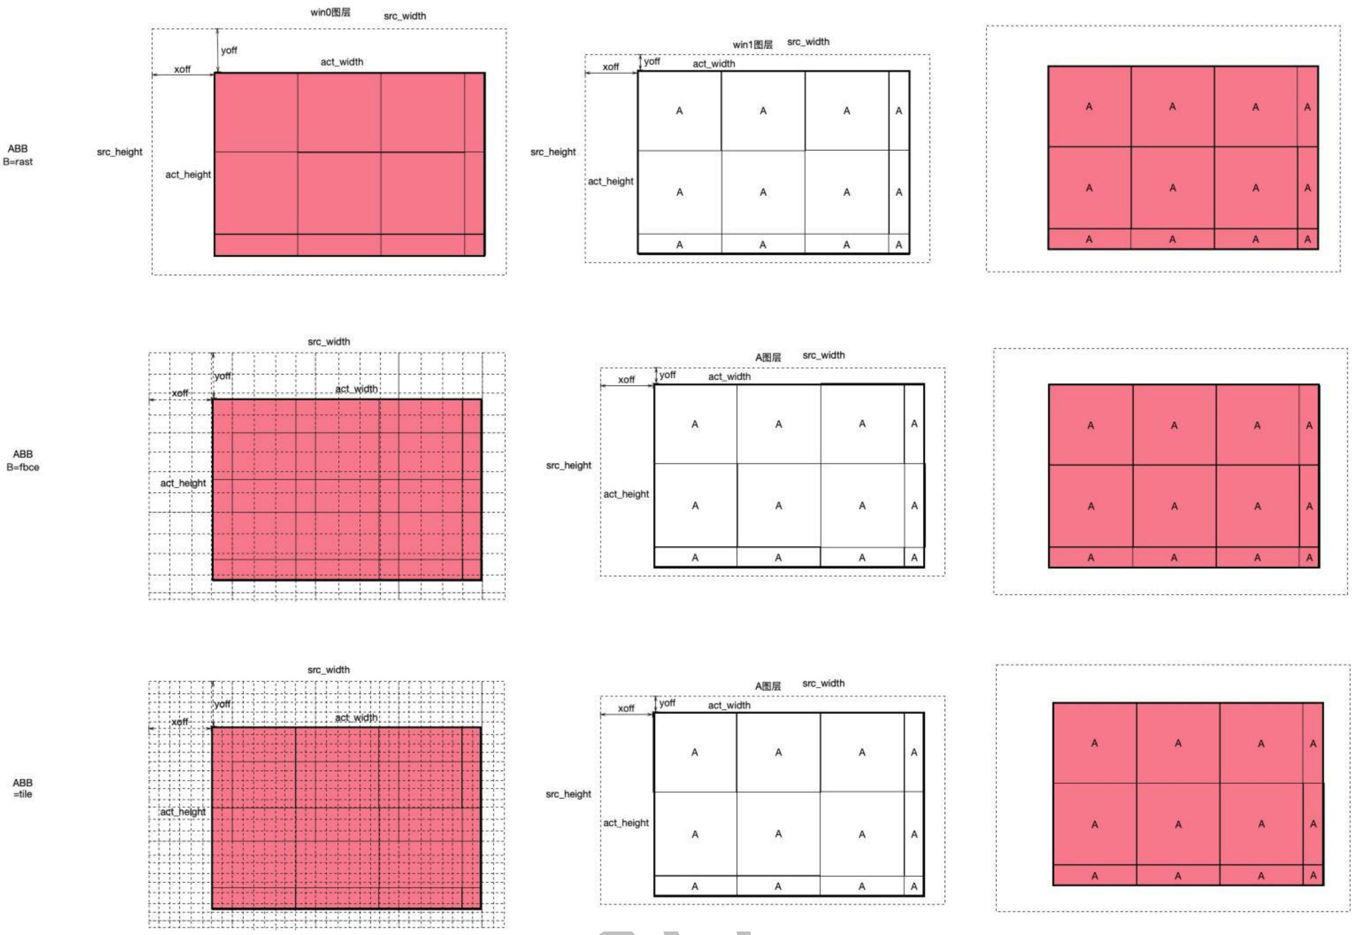

Fig. 5-15 ABB mode

5.4.8.2 Scan

Split and expand destination image using 64x32 block, as show below：
1) mi_wr_mode is fbce mode, horizontal must be aligned to 16pixel
2) mi_wr_mode is tile mode, horizontal and vertical must be aligned to 8pixel

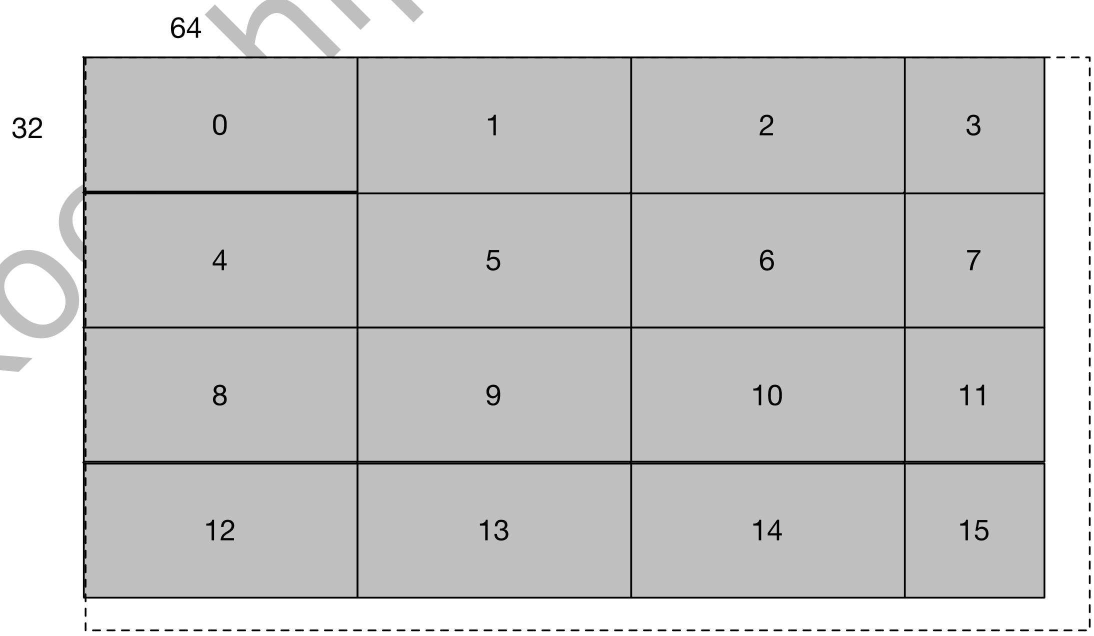

Fig. 5-16 Scan mode with 64x32

According to mi_wr_mode, will generate different scan timing, as below:

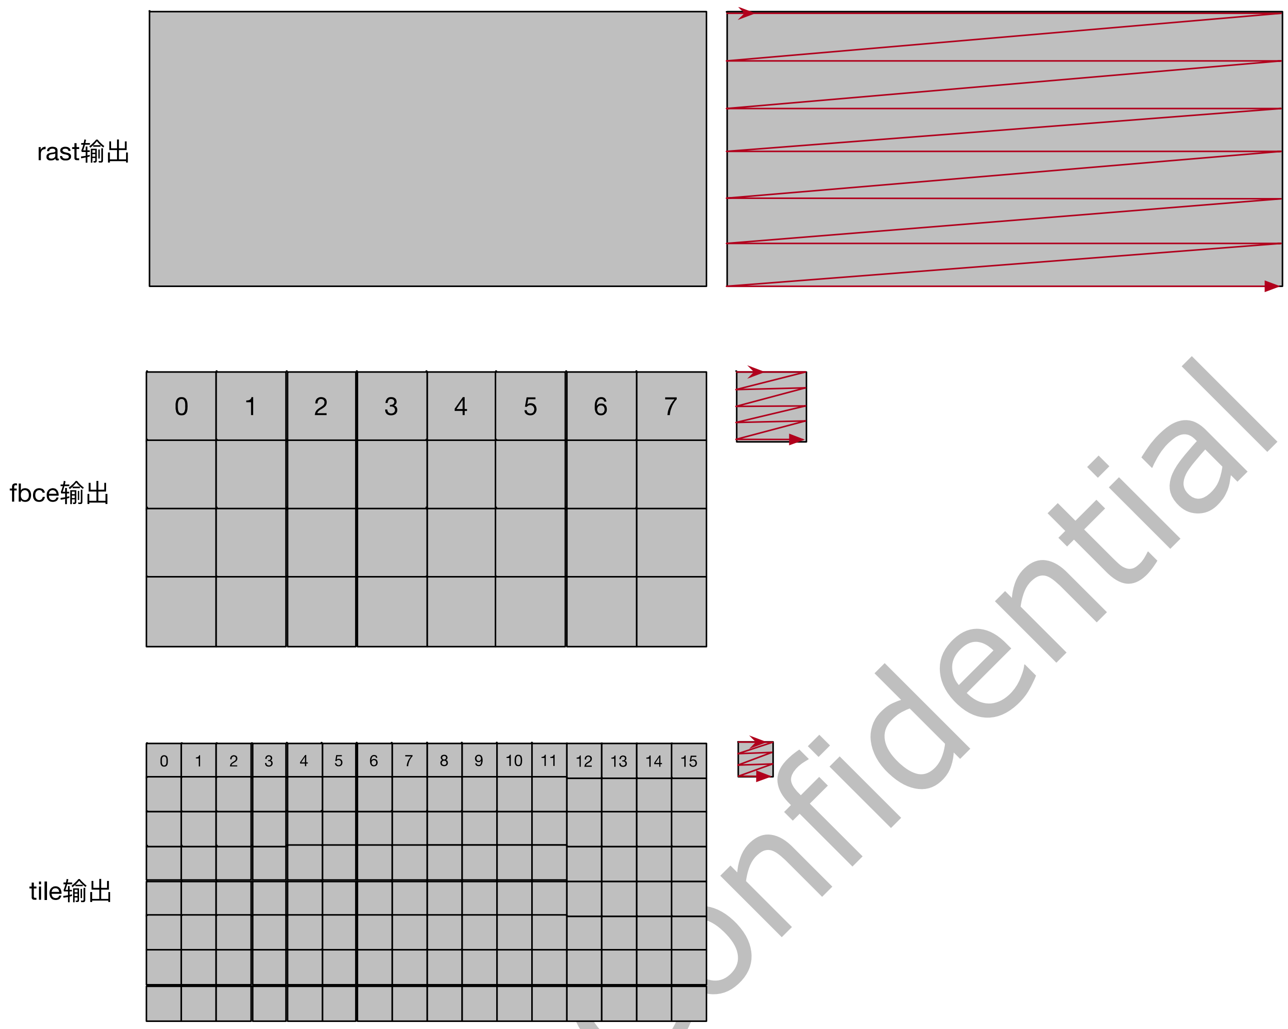

Fig. 5-17 Scan timing for raster/fbce/tile

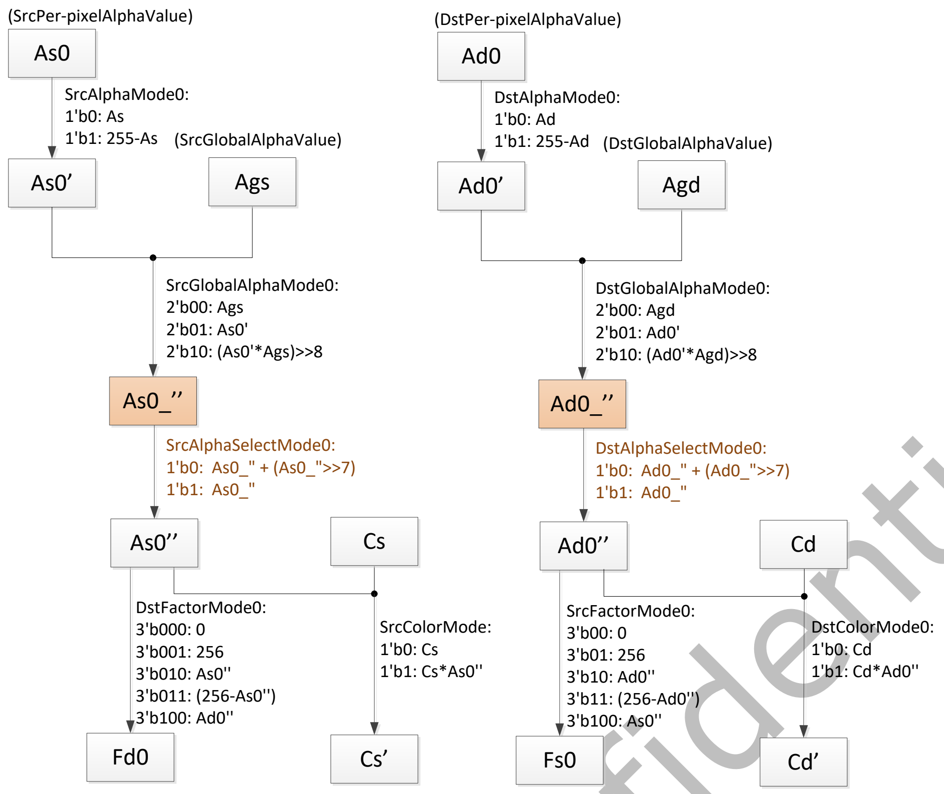
5.4.8.3 Alpha blending

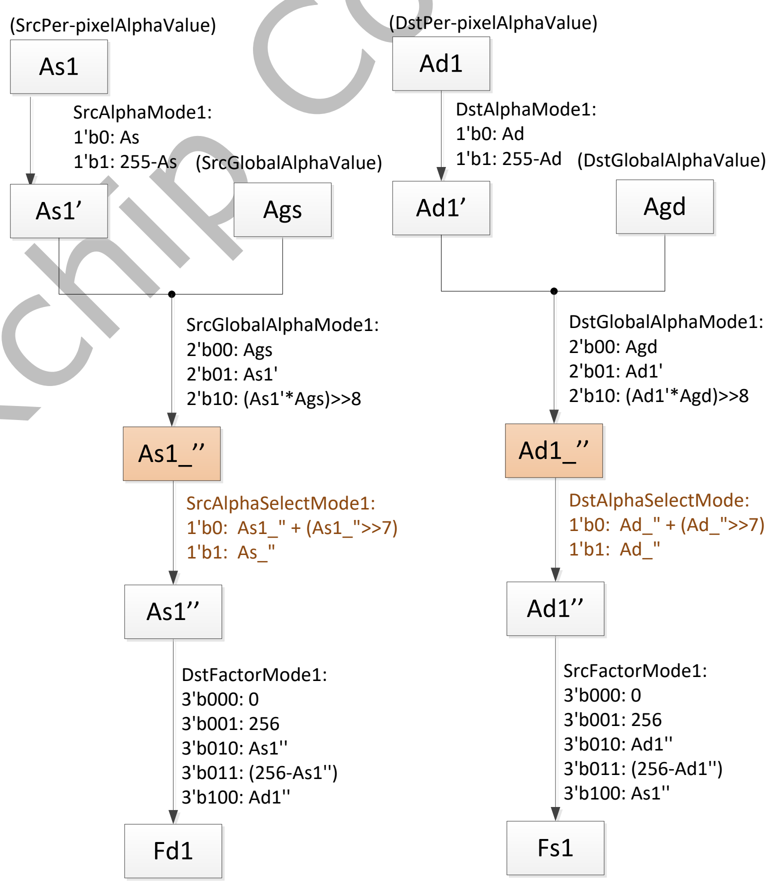
Alpha calculation flow as below:



$$Cd = Fs0 * Cs' + Fd0 * Cd' \quad (1)$$

(Cd – dst color, Fs0 – color src factor0, Cs' – src color', Fd0 – color dst factor0, Cd' – dst color')

Fig. 5-18 layer0 alpha blending calculate flow



$$Ad = Fs1 * As1'' + Fd1 * Ad1'' \quad (2)$$

(Ad – dst alpha, Fs1 – alpha src factor1, As1'' – src alpha'', Fd1 – alpha dst factor1, Ad1' – dst alpha'')

Fig. 5-19 layer1 alpha blending calculate flow

RGA3_OVLP_TOP_KEY_MIN	0x0188	W	0x00000000	Overlap top key min value
RGA3_OVLP_TOP_KEY_MAX	0x018C	W	0x00000000	Overlap top key max value
RGA3_OVLP_TOP_COLOR_CTRL	0x0190	W	0x00000000	Overlap top color control
RGA3_OVLP_BOT_COLOR_CTRL	0x0194	W	0x00000000	Overlap bottom color control
RGA3_OVLP_TOP_ALPHA_CTRL	0x0198	W	0x00000000	Overlap top alpha control
RGA3_OVLP_BOT_ALPHA_CTRL	0x019C	W	0x00000000	Overlap bottom alpha control
RGA3_WR_CTRL	0x01A0	W	0x00000000	DMA write control
RGA3_WR_FBCE_CTRL	0x01A4	W	0x00000000	DMA FBCE write control
RGA3_WR_VIR_STRIDE	0x01A8	W	0x00000000	Write virtual stride
RGA3_WR_PL_VIR_STRIDE	0x01AC	W	0x00000000	Write payload virtual stride
RGA3_WR_Y_BASE	0x01B0	W	0x00000000	Write y base address
RGA3_WR_C_BASE	0x01B4	W	0x00000000	Write c base address
RGA3_MMU_DTE_ADDR	0x0F00	W	0x00000000	MMU current page Table address
RGA3_MMU_STATUS	0x0F04	W	0x00000018	MMU status
RGA3_MMU_COMMAND	0x0F08	W	0x00000000	MMU command
RGA3_MMU_PAGE_FAULT_ADDR	0x0F0C	W	0x00000000	MMU address of last page fault
RGA3_MMU_ZAP_ONE_LINE	0x0F10	W	0x00000000	MMU address to be invalidated from the page table cache
RGA3_MMU_INT_RAWSTAT	0x0F14	W	0x00000000	MMU interrupt raw
RGA3_MMU_INT_CLEAR	0x0F18	W	0x00000000	MMU interrupt clear
RGA3_MMU_INT_MASK	0x0F1C	W	0x00000000	MMU interrupt mask

Name	Offset	Size	Reset Value	Description
RGA3_MMU_INT_STATUS	0x0F20	W	0x00000000	MMU interrupt status
RGA3_MMU_AUTO_GATING	0x0F24	W	0x00000002	MMU auto gating
RGA3_MMU_REG_LOAD_EN	0x0F28	W	0x00000001	MMU register load enable

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access*

5.5.2 Detail Register Description

RGA3_SYS_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11	RW	0x0	sw_frmend_auto_rstn_en Auto reset after frame done
10:9	RW	0x0	sw_rga_bic_mode Bicubic mode: 2'b00: Precise 2'b01: Spline 2'b10: Catrom 2'b11: Mitchell
8	RW	0x0	sw_rga_ram_clk_on RGA ram clock always on
7:5	RO	0x0	reserved
4	RW	0x0	sw_cclk_sreset Core clock soft reset
3	RW	0x0	sw_aclk_sreset Aclk soft reset
2	RW	0x0	sw_rga_lgc_clk_on RGA logic clock always on
1	RW	0x0	sw_cmd_mode Configuration mode 1'b0: Slave mode use AHB write 1'b1: Master mode use AXI read
0	W1C	0x0	rga_start RGA start

RGA3_CMD_CTRL

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:3	RW	0x000	sw_cmd_incr_num Command increase start max number

Bit	Attr	Reset Value	Description
2	RW	0x0	sw_cmd_stop_mode Command stop mode: 1'b0: Disable 1'b1: Enable
1	RW	0x0	cmd_incr_valid_p Command increase start pulse
0	RW	0x0	cmd_line_st_p Command line start pulse, clear itself 1'b0: Master mode no start 1'b1: Master mode start

RGA3_CMD_ADDR

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_cmd_base Command address when using master configuration mode, 16B aligned

RGA3_MI_GROUP_CTRL

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31	RW	0x0	sw_mi_rd_group_dis AXI read command group disable 1'b0: Disable 1'b1: Enable
30:3	RO	0x0000000	reserved
2:0	RW	0x0	sw_mi_rd_group_num AXI read command group number 3'b000: fill internal fifo to full 3'b001: Burst*2 3'b010: Burst*3 3'b011: Burst*4 3'b100: Burst*5 3'b101: Burst*6 3'b110: Burst*7 3'b111: Burst*8

RGA3_ARQOS_CTRL

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:8	RW	0x3	sw_noc_hurry_value NOC hurry value 3'b000: The Low priority to NOC 3'b111: The first High priority to NOC

Bit	Attr	Reset Value	Description
7	RO	0x0	reserved
6:4	RW	0x3	sw_ar_mmu_qos Read qos, configure 0 to 7, default 3
3:1	RO	0x0	reserved
0	RW	0x1	sw_ar_qos_en All bus channel AXI read qos enable 1'b0: Disable 1'b1: Enable

RGA3_VERSION_NUM

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	major RGA3 major number
27:20	RW	0x00	minor RGA3 minor number
19:0	RW	0x00000	svnbulid RGA3 svn build number

RGA3_VERSION_TIM

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	year RGA3 year
15:8	RW	0x00	month RGA3 month
7:0	RW	0x00	date RGA3 date

RGA3_INT_EN

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	int_en_win1_ver_fifo_ren_err RGA3 win1 vertical FIFO read error enable 1'b0: Disable 1'b1: Enable
28	RW	0x0	int_en_win1_ver_fifo_wen_err RGA3 win1 vertical FIFO write error enable 1'b0: Disable 1'b1: Enable
27	RW	0x0	int_en_win1_hor_fifo_ren_err RGA3 win1 horizontal FIFO read error enable 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
26	RW	0x0	int_en_win1_hor_fifo_wen_err RGA3 win1 horizontal FIFO write error enable 1'b0: Disable 1'b1: Enable
25	RW	0x0	int_en_win1_in_fifo_ren_err RGA3 win1 in FIFO read error enable 1'b0: Disable 1'b1: Enable
24	RW	0x0	int_en_win1_in_fifo_wen_err RGA3 win1 in FIFO write error enable 1'b0: Disable 1'b1: Enable
23:22	RO	0x0	reserved
21	RW	0x0	int_en_win0_ver_fifo_ren_err RGA3 win0 vertical FIFO read error enable 1'b0: Disable 1'b1: Enable
20	RW	0x0	int_en_win0_ver_fifo_wen_err RGA3 win0 vertical FIFO write error enable 1'b0: Disable 1'b1: Enable
19	RW	0x0	int_en_win0_hor_fifo_ren_err RGA3 win0 horizontal FIFO read error enable 1'b0: Disable 1'b1: Enable
18	RW	0x0	int_en_win0_hor_fifo_wen_err RGA3 win0 horizontal FIFO write error enable 1'b0: Disable 1'b1: Enable
17	RW	0x0	int_en_win0_in_fifo_ren_err RGA3 win0 in FIFO read error enable 1'b0: Disable 1'b1: Enable
16	RW	0x0	int_en_win0_in_fifo_wen_err RGA3 win0 in FIFO write error enable 1'b0: Disable 1'b1: Enable
15	RW	0x0	int_en_rga_mi_wr_bus_err RGA3 mi_wr bus error enable 1'b0: Disable 1'b1: Enable
14	RW	0x0	int_en_rga_mi_wr_in_herr RGA3 mi_wr horizontal error enable 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
13	RW	0x0	int_en_rga_mi_wr_in_verr RGA3 mi_wr vertical error enable 1'b0: Disable 1'b1: Enable
12	RO	0x0	reserved
11	RW	0x0	int_en_win1_v_err RGA3 win1 vertical error enable 1'b0: Disable 1'b1: Enable
10	RW	0x0	int_en_win1_h_err RGA3 win1 horizontal error enable 1'b0: Disable 1'b1: Enable
9	RW	0x0	int_en_win1_fbcd_dec_err RGA3 win1 FBCD decoder error enable 1'b0: Disable 1'b1: Enable
8	RW	0x0	int_en_win1_rd_frm_end RGA3 win1 read frame end enable 1'b0: Disable 1'b1: Enable
7	RW	0x0	int_en_win0_v_err RGA3 win0 vertical error enable 1'b0: Disable 1'b1: Enable
6	RW	0x0	int_en_win0_h_err RGA3 win0 horizontal error enable 1'b0: Disable 1'b1: Enable
5	RW	0x0	int_en_win0_fbcd_dec_err RGA3 win0 FBCD decoder error enable 1'b0: Disable 1'b1: Enable
4	RW	0x0	int_en_win0_rd_frm_end RGA3 win0 read frame end enable 1'b0: Disable 1'b1: Enable
3	RW	0x0	int_en_cmd_line_finish RGA3 command line finish enable 1'b0: Disable 1'b1: Enable
2	RW	0x0	int_en_rga_mi_rd_bus_err RGA3 DMA read bus error enable 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
1	RW	0x0	int_en_rga_mmu_intr RGA3 MMU interrupt enable 1'b0: Disable 1'b1: Enable
0	RW	0x0	int_en_frm_done RGA3 frame done enable 1'b0: Disable 1'b1: Enable

RGA3_INT_RAW

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	int_raw_win1_ver_fifo_ren_err RGA3 win1 vertical FIFO read error interrupt raw status 1'b0: Interrupt invalid 1'b1: Interrupt valid
28	RO	0x0	int_raw_win1_ver_fifo_wen_err RGA3 win1 vertical FIFO write error interrupt raw status 1'b0: Interrupt invalid 1'b1: Interrupt valid
27	RO	0x0	int_raw_win1_hor_fifo_ren_err RGA3 win1 horizontal FIFO read error interrupt raw status 1'b0: Interrupt invalid 1'b1: Interrupt valid
26	RO	0x0	int_raw_win1_hor_fifo_wen_err RGA3 win1 horizontal FIFO write error interrupt raw status 1'b0: Interrupt invalid 1'b1: Interrupt valid
25	RO	0x0	int_raw_win1_in_fifo_ren_err RGA3 win1 in FIFO read error interrupt raw status 1'b0: Interrupt invalid 1'b1: Interrupt valid
24	RO	0x0	int_raw_win1_in_fifo_wen_err RGA3 win1 in FIFO write error interrupt raw status 1'b0: Interrupt invalid 1'b1: Interrupt valid
23:22	RO	0x0	reserved
21	RW	0x0	int_raw_win0_ver_fifo_ren_err RGA3 win0 vertical FIFO read error interrupt raw status 1'b0: Interrupt invalid 1'b1: Interrupt valid

Bit	Attr	Reset Value	Description
20	RO	0x0	int_raw_win0_ver_fifo_wen_err RGA3 win0 vertical FIFO write error interrupt raw status 1'b0: Interrupt invalid 1'b1: Interrupt valid
19	RO	0x0	int_raw_win0_hor_fifo_ren_err RGA3 win0 horizontal FIFO read error interrupt raw status 1'b0: Interrupt invalid 1'b1: Interrupt valid

5.6 Application Notes

5.6.1 Register Partition

RGA3 contains two types of command modes: slave mode, master mode. The registers at the end of the address space (0x0-0xFC) are system registers, including command mode, command parameters, RGA3 status, interrupts and other related registers. Other registers (starting from 0x100) are the parameter configuration registers of the function.

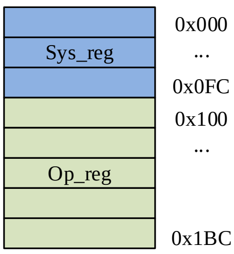

Fig. 5-20 RGA3 software main register-region

5.6.2 Command Modes

1) slave mode(using AHB Bus)
   setting RGA3_SYS_CTRL[1] = 1’b0
   setting RGA3_SYS_CTRL[0] = 1’b1 (frame start) when all configuration is set done
2) master mode(using AXI Bus)
   setting RGA3_SYS_CTRL[1] = 1’b1
   setting RGA3_CMD_ADDR
   setting AXI INCR burst number RGA3_CMD_CTRL[12:3]
   setting RGA3_CMD_CTRL[1]=1’b1 to fetch configuration from DDR:

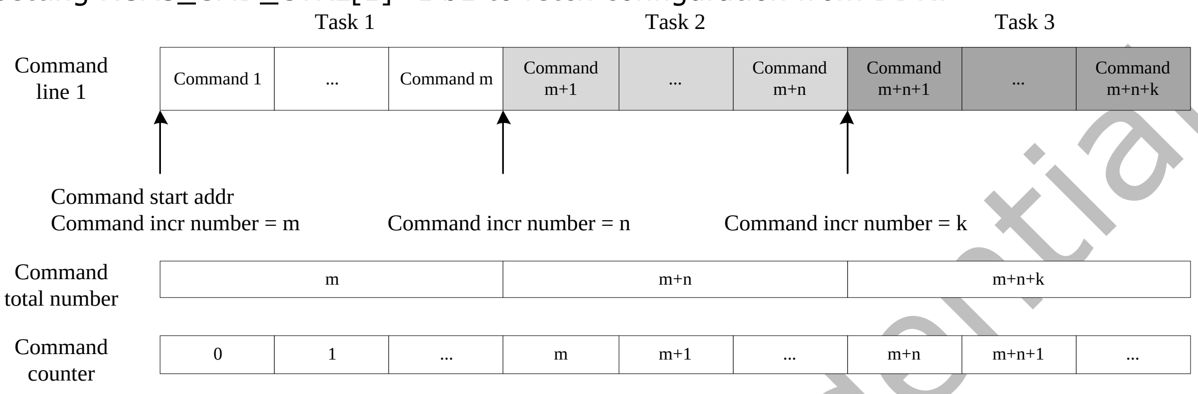

Fig. 5-21 RGA3 command line and command counter

5.6.3 Some special application constraint

1) When input format is YUV422 or YUYV, only xmirror/ymirror is supported, rotation must not be set
2) sw_win_fbc_xoff, sw_win_fbc_yoff only using when rd_mode is FBCD, and then
   sw_win_fbc_xoff + sw_win_src_width must be aligned to 16pixel
   sw_win_fbc_yoff + sw_win_src_height must be aligned to 16pixel
3) act_xoff/act_yoff/act_width/act_height constrain
   input format = YUV420 8 bit: act_xoff/act_yoff/act_width/act_height must be aligned to 2pixel
   input format = YUV420 10bit: act_xoff/act_width must be aligned to 4pixel, act_yoff /act_height must be aligned to 2pixel;
   input format = YUV422 8bit: act_xoff/act_width must be aligned to 2pixel
   input format = YUV422 10bit: act_xoff/act_width must be aligned to 4pixel
4) Overlap constrain
   sw_win0_dst_width >= sw_win1_dst_width
   sw_win0_dst_height >= sw_win1_dst_height
5) Other ABB constrains:
   a) B must not be set orient or resize
   b) B is fbcd layers(16x16), only support spared FBCD, and act_xoffset must be aligned to 16pixel, act_yoffset must be aligned to 16pixel, act_width must be aligned to 16pixel, act_height must be aligned to 16pixel
   c) B is tile layer(8x8), act_xoffset must be aligned to 8pixel, act_yoffset must be aligned to 8pixel, act_width must aligned to 8pixel, act_height must be aligned to 8pixel

Chapter 6 Raster Graphic Acceleration(RGA2)

6.1 Overview

RGA2 is a separate 2D raster graphic accelerator, use to accelerate basic 2D graphics operations, including: image scaling, rotation, BitBLT, alpha blending.

6.1.1 Features

- **Data format**
  - Input data:
    - ARGB/RGB888/RGB565/RGB4444/RGB5551
    - YUV420/YUV422/YVYU422/YVYU420/YUV422SP10bit/YUV420SP10bit
  - Output data:
    - ARGB/RGB888/RGB565/RGB4444/RGB5551
    - YUV420/YUV422/YUV400/Y4/YVYU422/YVYU420
  - Pixel Format conversion, BT.601/BT.709
  - Dither operation
  - Max resolution: 8192x8192 source, 4096x4096 destination
- **Scaling**
  - Down-scaling: Average filter
  - Up-scaling: Bi-cubic filter(source>2048 would use Bi-linear)
  - Arbitrary non-integer scaling ratio, from 1/16 to 16
- **Rotation**
  - 0, 90, 180, 270 degree rotation
  - x-mirror, y-mirror & rotation operation
- **BitBLT**
  - Block transfer
  - Color palette/Color fill, support with alpha
  - Transparency mode (color keying/stencil test, specified value/value range)
  - Two source BitBLT
  - A+B=B only BitBLT, A support rotate & scale when B fixed
  - A+B=C second source (B) has same attribute with (C) plus rotation function
- **Alpha Blending**
  - Comprehensive per-pixel alpha(color/alpha channel separately)
  - Fading
  - Support SRC1(R2Y)+SRC0(YUV) -> DST(YUV)
  - Support DST Full CSC convert for YUV2YUV
- **Others**
  - Support NN quantize (CLIP((source + offset) * scale) for RGB channel)
- **MMU**
  - 4k/64k page size
  - Four channel: SRC/SRC1/DST/CMD, individual base address and enable control bit
  - TLB pre-fetch

6.1.2 The Constraints

- YUV420/422-8bit virtual stride need 8byte align, xoff/yoff need 2byte align
- YUV420/422-10bit virtual stride need 16byte align, not support xoff/yoff
- Vertical scale down or bypass && Horizontal bi-cubic scale up src0 width<=2048
- Vertical scale up && Horizontal bi-cubic scale up src0 width<=1928
- Vertical scale down or bypass Horizontal BI-linear scale up src0 width<=4096
- Vertical scale up && Horizontal BI-linear scale up src0 width<=3856

6.2 Block Diagram

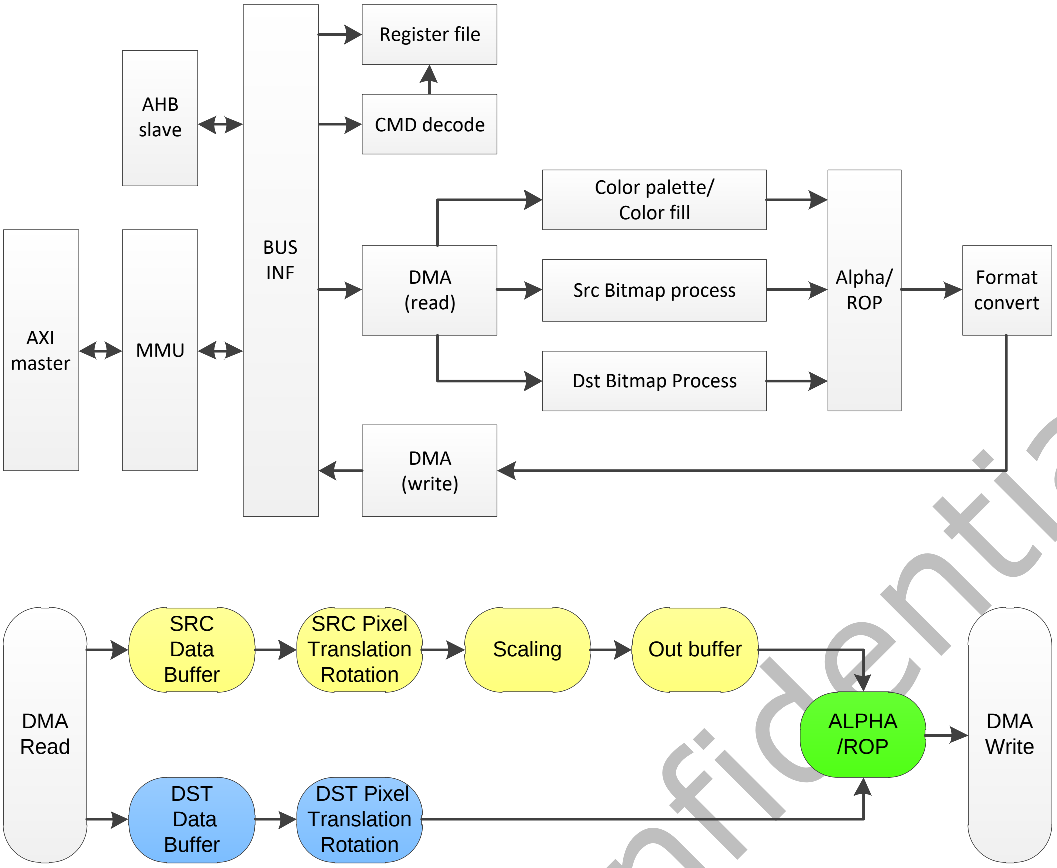

Fig. 6-1 RGA2 Block Diagram

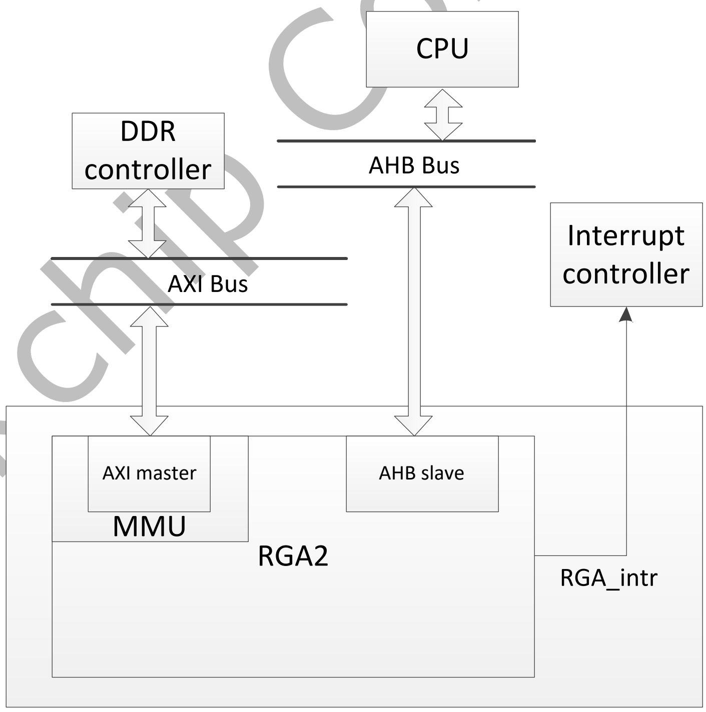

Fig. 6-2 RGA2 in SOC

6.3 Function Description

6.3.1 Data Format

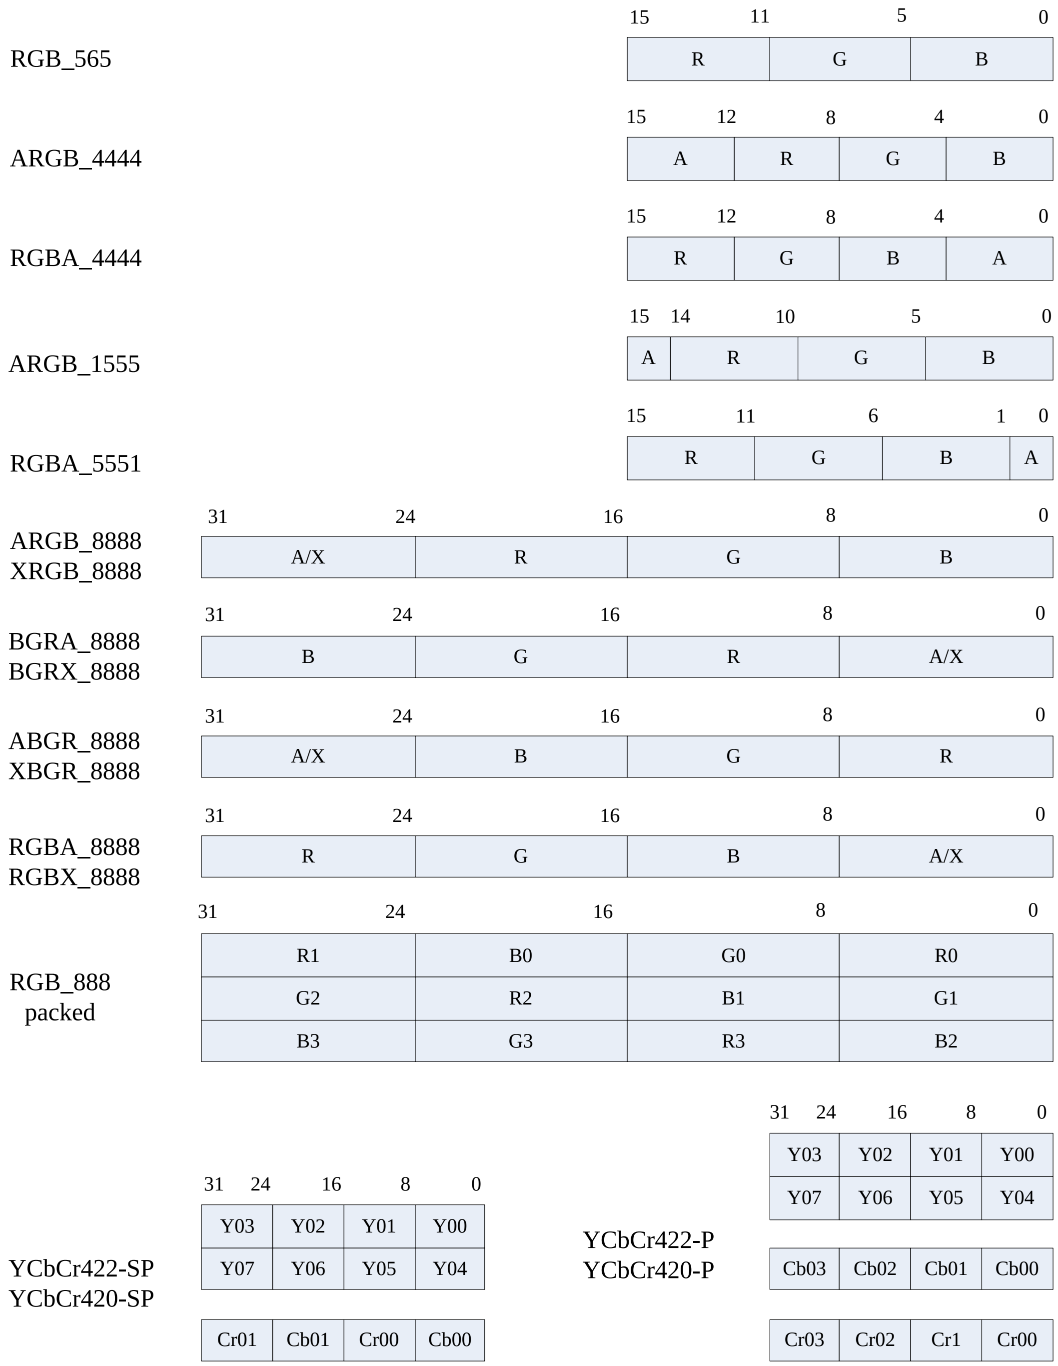

Fig. 6-3 RGA Input Data Format

All input data (defined by SRC_IN_FMT/DST_IN_FMT) are converted to ABGR8888/AUYV8888. The results are converted to the output data format (defined by DST_OUT_FMT).

6.3.2 Dithering

There could have dithering operation for source image when the source image format is not RGB565 and the destination format is RGB565.
The down-dithering is done using Dither Allegro.

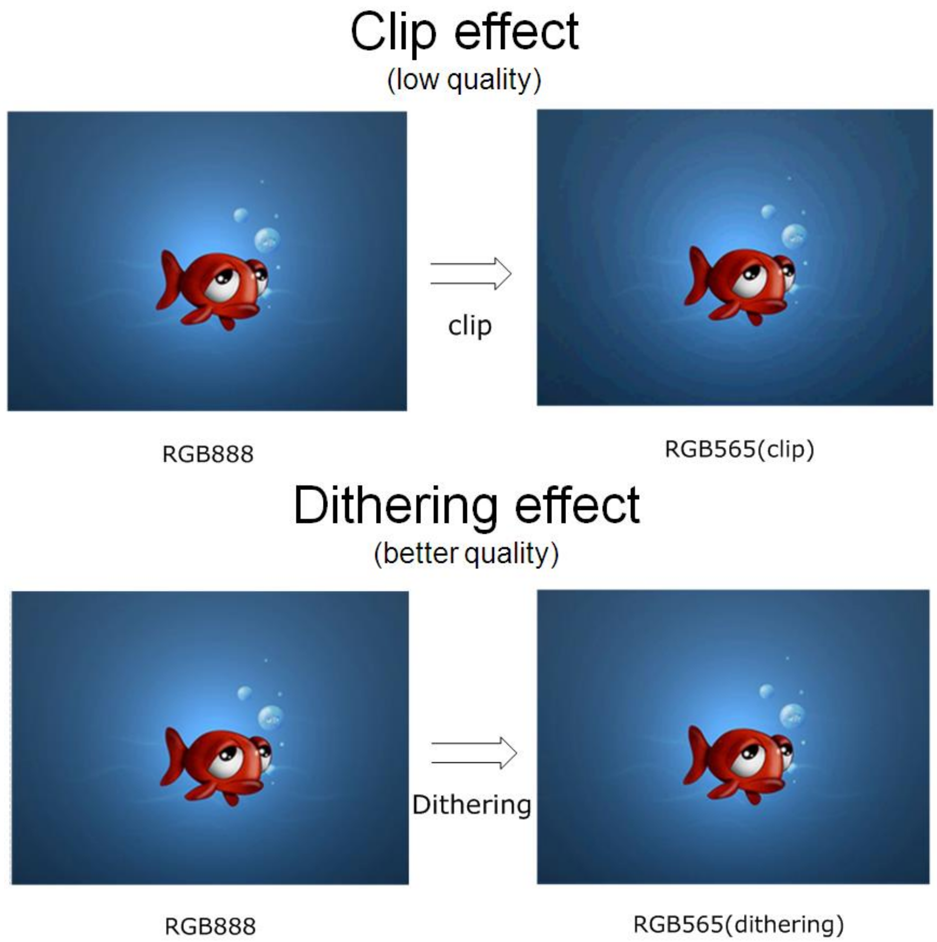

Fig. 6-4 RGA Dither effect

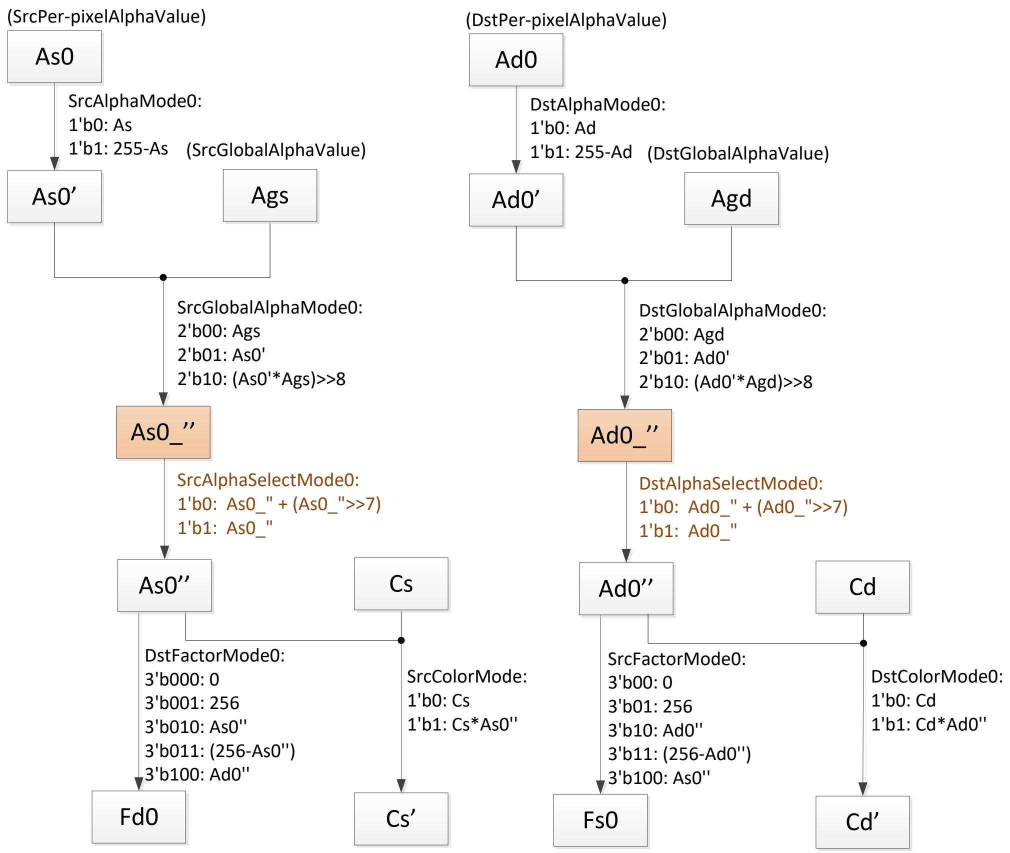
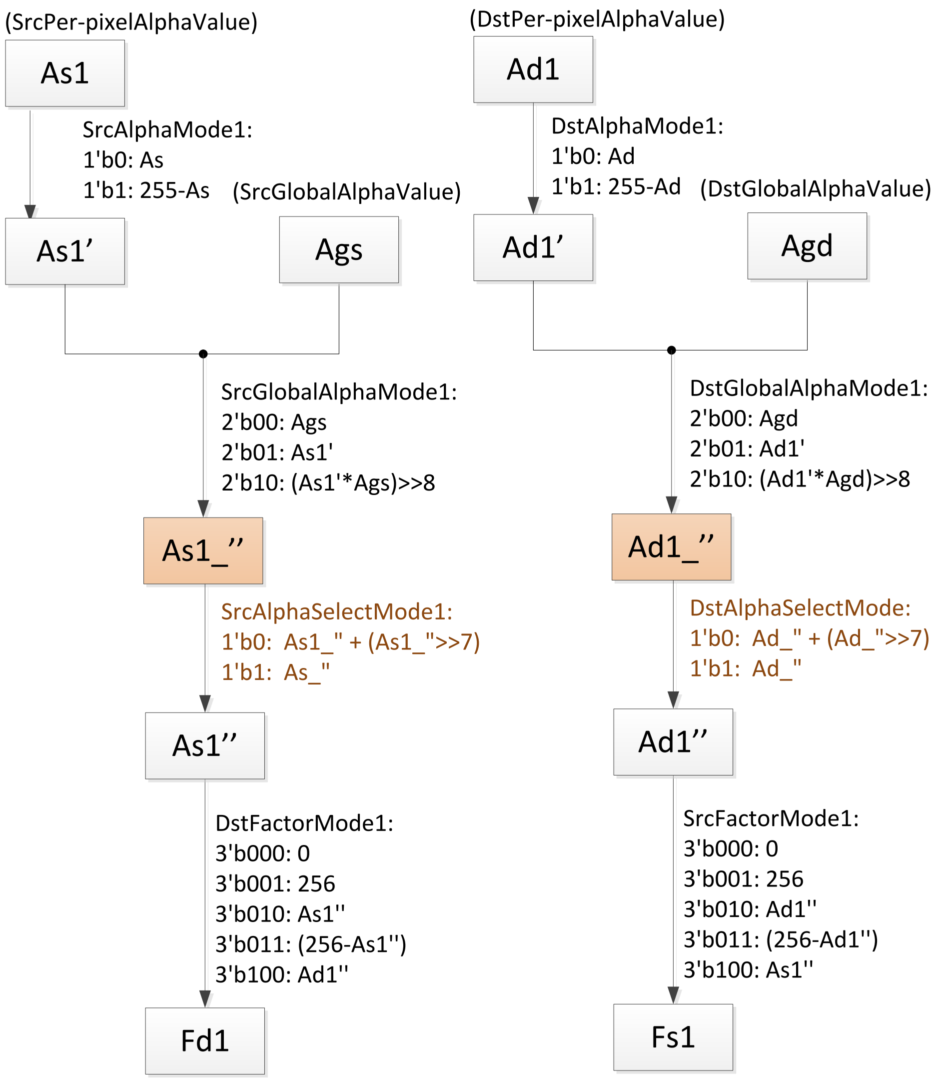
6.3.3 Alpha Mode



$$Cd = Fs0 * Cs' + Fd0 * Cd' \quad (1)$$

(Cd – dst color, Fs0 – color src factor0, Cs' – src color', Fd0 – color dst factor0, Cd' – dst color')



$$Ad = Fs1 * As1'' + Fd1 * Ad1'' \qquad (2)$$

(Ad – dst alpha, Fs1 – alpha src factor1, As1'' – src alpha'', Fd1 – alpha dst factor1, Ad1' – dst alpha'')

Fig. 6-5 alpha mode configure description

6.3.4 Color Fill

Two modes of color fill can be done by RGA: solid fill and gradient fill.

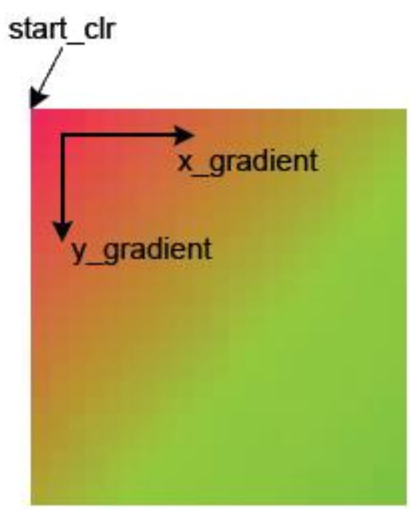


Fig. 6-6 RGA Gradient Fill

Gradient fill using following equations for ARGB calculation of every pixel in different

coordinate.
A_cur = (A_start + x*x_A_gradient) +y*y_A_gradient;
R_cur = (R_start + x*x_R_gradient) +y*y_R_gradient;
G_cur = (G_start + x*x_G_gradient) +y*y_G_gradient;
B_cur = (B_start + x*x_B_gradient) +y*y_B_gradient;

A_start, R_start, G_start, B_start is the ARGB value of start point. There are four pairs of values for horizontal and vertical gradient. Saturation operation could be enabled or disabled if the color overflows 255 or underflows 0.

6.3.5 Scaling

The scaling operation is the image reshaping processing of source image. Scaling is done base on ARGB8888 format.
There are three sampling modes: scale down (Average); scale up(Bi-cubic).

6.3.6 NN Quantize

The NN quantize is for NN pre_process using. The function is CLIP((source + offset) * scale) for R G B channel. When use this function, the signal sw_dst_nn_quantize_en and reg NN_QUANTIZE_SCALE, NN_QUANTIZE_OFFSET need be configured.

6.4 Register description

6.4.1 Register Summary

Slave address can be divided into different length for different usage, which is shown as follows.

Name	Offset	Size	Reset Value	Description
RGA2_SYS_CTRL	0x0000	W	0x00000044	RGA system control register
RGA2_CMD_CTRL	0x0004	W	0x00000000	RGA command control register
RGA2_CMD_BASE	0x0008	W	0x00000000	RGA command codes base address register
RGA2_STATUS1	0x000C	W	0x00000000	RGA status register
RGA2_INT	0x0010	W	0x00000000	RGA interrupt register

RGA2_NN_QUANTIZE_OFFSET	0x0164	W	0x00000000	Quantize offset of RGB (1bit signed + 8bit integer)
RGA2_CP_GR_R	0x0164	W	0x00000000	RGA color gradient fill step register (color fill mode)
RGA2_DST_Y4MAP_LUT1	0x0164	W	0xFEDCBA98	Y4MAP LUT REGS from lut8 to lut15
RGA2_ROP_CON1	0x0164	W	0x00000000	ROP code 1 control register
RGA2_MASK_BASE	0x0168	W	0x00000000	RGA mask base address register
RGA2_MMU_CTRL1	0x016C	W	0x00000000	RGA MMU control register 1
RGA2_MMU_SRC_BASE	0x0170	W	0x00000000	RGA source MMU TLB base address
RGA2_MMU_SRC1_BASE	0x0174	W	0x00000000	RGA source1 MMU TLB base address
RGA2_MMU_DST_BASE	0x0178	W	0x00000000	RGA destination MMU TLB base address
RGA2_MMU_ELS_BASE	0x017C	W	0x00000000	RGA else channel MMU TLB base address

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

6.4.2 Detail Registers Description

RGA2_SYS_CTRL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	sw_rst_handsave_p It would save protect-rstn into initial status if long time dead in protect-rstn status(auto clear into '0').

Bit	Attr	Reset Value	Description
6	RW	0x1	sw_rst_protect_e Protect-rstn mode enable. It would be ensure all AXI write/read operation into completion status when sw_cclk_sreset_p or sw_aclk_sreset_p valid.
5	RW	0x0	sw_auto_rst It would auto-resetn after one frame finish. 1'b0: Disable 1'b1: Enable
4	RW	0x0	sw_cclk_sreset_p RGA core clk domain Soft reset, write '1' to this would reset the RGA engine except configure registers.
3	WO	0x0	sw_aclk_sreset_p RGA aclk domain Soft reset, write '1' to this would reset the RGA engine except configure registers.
2	WO	0x1	sw_auto_ckg RGA auto clock gating enable bit 1'b0: Disable 1'b1: Enable
1	WO	0x0	sw_cmd_mode RGA command mode 1'b0: Slave mode 1'b1: Master mode
0	W1C	0x0	sw_cmd_op_st_p Only used in passive (slave) control mode

RGA2_CMD_CTRL

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:3	RW	0x000	sw_cmd_incr_num RGA command increment number
2	WO	0x0	sw_cmd_stop RGA command stop mode. Command execution would stop after the current graphic operation finish if set this bit to 1.
1	WO	0x0	sw_cmd_incr_valid_p RGA command increment valid (Auto cleared) When setting this bit, 1. The total command number would increase by the RGA_INCR_CMD_NUM. 2. RGA would continue running if idle.
0	RW	0x0	sw_cmd_line_st_p RGA command line fetch start (command line reset) (Auto cleared) When fetch start, the total command number would reset to RGA_INCR_CMD_NUM.

RGA2_CMD_BASE

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_cmd_base RGA command codes base address

RGA2_STATUS1

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	sw_cmd_total_num RGA command total number
19:8	RO	0x000	sw_cmd_cur_num RGA command current number
7:1	RO	0x00	reserved
0	RO	0x0	sw_rga_sta RGA engine status 1'b0: Idle 1'b1: Working

RGA2_INT
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10	RW	0x0	sw_intr_af_e All command finished interrupt enable
9	RW	0x0	sw_intr_mmu_e MMU interrupt enable
8	RW	0x0	sw_intr_err_e Error interrupt enable
7	WO	0x0	sw_intr_cf_clr Current command finished interrupt clear
6	WO	0x0	sw_intr_af_clr All command finished interrupt clear
5	WO	0x0	sw_intr_mmu_clr MMU interrupt clear
4	WO	0x0	sw_intr_err_clr Error interrupt clear
3	RO	0x0	sw_intr_cf Current command finished interrupt flag
2	RO	0x0	sw_intr_af All command finished interrupt flag
1	RO	0x0	sw_intr_mmu MMU interrupt
0	RO	0x0	sw_intr_err Error interrupt flag

RGA2_MMU_CTRL0
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:9	RW	0x0	sw_els_ch_priority The priority of this channel
8:7	RW	0x0	sw_dst_ch_priority The priority of this channel
6:5	RW	0x0	sw_src1_ch_priority The priority of this channel
4:3	RW	0x0	sw_src_ch_priority The priority of this channel
2	RW	0x0	sw_cmd_mmu_flush RGA CMD channel MMU TLB flush. Set 1 to this bit to flush MMU TLB, and auto clear.

Bit	Attr	Reset Value	Description
1	RW	0x0	sw_cmd_mmu_en RGA CMD channel MMU enable 1'b0: Disable 1'b1: Enable
0	RW	0x0	sw_mmu_page_size RGA MMU Page table size 1'b0: 4KB page 1'b1: 64KB page

RGA2_MMU_CMD_BASE

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:0	RW	0x0000000	sw_mmu_cmd_base RGA command MMU TLB base address (word)

RGA2_STATUS2

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:11	RO	0x0	rpp_mkram_rready Rpp mkram rready
10:6	RO	0x00	dstrpp_outbuf_rready Dstrpp outbuf rready
5:2	RO	0x0	srcrpp_outbuf_rready Srcrpp outbuf rready
1	RO	0x0	bus_error Bus error status
0	RO	0x0	rpp_error RPP error status

RGA2_WORK_CNT

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:0	RO	0x0000000	sw_work_cnt RGA total working counter

RGA2_VERSION_INFO

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	major Used for IP structure version information
23:16	RW	0x00	minor Big feature change under same structure
15:0	RW	0x0000	svnbuild RTL current SVN number

RGA2_PERF_LATENCY_CTRL0

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:8	RW	0x000	sw_rd_latency_thr AXI Read latency threshold

Bit	Attr	Reset Value	Description
7:4	RW	0x0	sw_rd_latency_id AXI read channel id for latency AXI_PERF test
3	RW	0x0	sw_axi_cnt_type 1'b0: AXI transfer test 1'b1: DDR align transfer test
2	RW	0x0	sw_axi_perf_frm_type 1'b0: Clear by software configuration 1'b1: Clear by frame end or by software configuration
1	RW	0x0	sw_axi_perf_clr_e 1'b0: Software clear disable 1'b1: Software clear enable note: user need write 1 to this bit and then write 0 to generate a clear pulse
0	RW	0x0	sw_axi_perf_work_e 1'b0: Disable 1'b1: Enable

RGA2_PERF_LATENCY_CTRL1

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	RW	0x0	sw_aw_count_id When sw_aw_cnt_id_type=1, only count the id designated by sw_aw_count_id
7:4	RW	0x0	sw_ar_count_id When sw_ar_cnt_id_type=1, only count the id designated by sw_ar_count_id
3	RW	0x0	sw_aw_cnt_id_type 1'b0: Count all write channels 1'b1: Count sw_aw_count_id write channel only
2	RW	0x0	sw_ar_cnt_id_type 1'b0: Count all read channels 1'b1: Count sw_ar_count_id read channel only
1:0	RW	0x0	sw_addr_align_type 2'b00: 16-Byte align 2'b01: 32-Byte align 2'b10: 64-Byte align 2'b11: 128-Byte align

RGA2_PERF_RD_MAX_LATENCY_NUM

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RO	0x0000	rd_max_latency_num AXI max read latency(unit: cycles)

RGA2_PERF_RD_LATENCY_SAMP_NUM

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	rd_latency_thr_num AXI read latency total sample number

RGA2_PERF_RD_LATENCY_ACC_SUM

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	rd_latency_acc_sum AXI read latency (>sw_rd_latency_thr) total number

RGA2_PERF_RD_AXI_TOTAL_BYTE
Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	perf_rd_axi_total_byte AXI active total read bytes/DDR align read bytes

RGA2_PERF_WR_AXI_TOTAL_BYTE
Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	perf_wr_axi_total_byte AXI active total write bytes/DDR align write bytes

RGA2_PERF_WORKING_CNT
Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	perf_working_cnt RKIP working counter

RGA2_DST_CSC_00
Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x0bc	sw_dst_coe_00 1bit signed+10bit factor Y: sw_dst_coe_00*R + sw_dst_coe_01*G + sw_dst_coe_02*B + sw_dst_coe_off0

RGA2_DST_CSC_01
Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x274	sw_dst_coe_01 1bit signed+10bit factor Y: sw_dst_coe_00*R + sw_dst_coe_01*G + sw_dst_coe_02*B + sw_dst_coe_off0

RGA2_DST_CSC_02
Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x040	sw_dst_coe_02 1bit signed+10bit factor Y: sw_dst_coe_00*R + sw_dst_coe_01*G + sw_dst_coe_02*B + sw_dst_coe_off0

RGA2_DST_CSC_OFF0
Address: Operational Base + offset (0x006C)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
18:0	RW	0x04200	sw_dst_coe_off0 1bit signed+8bit integer+10bit factor Y: sw_dst_coe_00*R + sw_dst_coe_01*G + sw_dst_coe_02*B + sw_dst_coe_off0

RGA2_DST_CSC_10
Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x798	sw_dst_coe_10 1bit signed+10bit factor U: sw_dst_coe_10*R + sw_dst_coe_11*G + sw_dst_coe_12*B + sw_dst_coe_off1

RGA2_DST_CSC_11
Address: Operational Base + offset (0x0074)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x6a4	sw_dst_coe_11 1bit signed+10bit factor U: sw_dst_coe_10*R + sw_dst_coe_11*G + sw_dst_coe_12*B + sw_dst_coe_off1

RGA2_DST_CSC_12
Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x1c0	sw_dst_coe_12 1bit signed+10bit factor U: sw_dst_coe_10*R + sw_dst_coe_11*G + sw_dst_coe_12*B + sw_dst_coe_off1

RGA2_DST_CSC_OFF1
Address: Operational Base + offset (0x007C)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18:0	RW	0x20200	sw_dst_coe_off1 1bit signed+8bit integer+10bit factor U: sw_dst_coe_10*R + sw_dst_coe_11*G + sw_dst_coe_12*B + sw_dst_coe_off1

RGA2_DST_CSC_20
Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x1c0	sw_dst_coe_20 1bit signed+10bit factor V: sw_dst_coe_20*R + sw_dst_coe_21*G + sw_dst_coe_22*B + sw_dst_coe_off2

RGA2_DST_CSC_21
Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
10:0	RW	0x668	sw_dst_coe_21 1bit signed+10bit factorr V: sw_dst_coe_20*R + sw_dst_coe_21*G + sw_dst_coe_22*B + sw_dst_coe_off2

RGA2_DST_CSC_22
Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:0	RW	0x7d8	sw_dst_coe_22 1bit signed+10bit factor V: sw_dst_coe_20*R + sw_dst_coe_21*G + sw_dst_coe_22*B + sw_dst_coe_off2

RGA2_DST_CSC_OFF2
Address: Operational Base + offset (0x008C)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18:0	RW	0x20200	sw_dst_coe_off2 1bit signed+8bit integer+10bit factor V: sw_dst_coe_20*R + sw_dst_coe_21*G + sw_dst_coe_22*B + sw_dst_coe_off2

RGA2_MODE_CTRL
Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	sw_intr_cf_e Current command finished interrupt enable
6	RW	0x0	sw_gradient_sat Gradient saturation calculation mode 1'b0:Clip 1'b1:Not-clip
5	RW	0x0	sw_alpha_zero_key ARGB888 alpha zero key mode 0x000000 would be changed to 0x000100(RGB888)/0x0020(RGB565)for ARGB888 to RGBX/RGB565 color key. 1'b0: Disable 1'b1: Enable
4	RW	0x0	sw_cf_rop4_pat Color fill/ROP4 pattern 1'b0: Solid color 1'b1: Pattern color
3	RW	0x0	sw_bb_mode Bitblt mode 1'b0: SRC + DST => DST 1'b1: SRC + SRC1 => DST
2:0	RW	0x0	sw_render_mode RGA 2D render mode 3'b000: Bitblt 3'b001: Color palette 3'b010: Rectangle fill 3'b011: Update palette LUT/pattern ram

RGA2_SRC_INFO

Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RW	0x0	sw_src_yuv10_round_e This bit valid when RGA2E/2L support YUV 10bit picture input 1'b0: YUV 10bit to 8bit round disable 1'b1: YUV 10bit to 8bit round enable
27	RW	0x0	sw_src_yuv10_e This bit valid when RGA2E/2L support YUV 10bit picture input. 1'b0: YUV 10bit disable 1'b1: YUV 10bit enable
26	RW	0x0	sw_vsp_mode 1'b0:By-cubic 1'b1:Bi-linear
25:24	RW	0x0	sw_bic_coe_sel SRC BI-cubic scaling coefficient select 2'b00: CATROM 2'b01: MITCHELL 2'b10: HERMITE 2'b11: B-SPLINE
23	RW	0x0	sw_src_dither_up SRC dither up enable 1'b0: Disable 1'b1: Enable
22:19	RW	0x0	sw_src_trans_e Source transparency enable bits [3]: A value stencil test enable bit [2]: B value stencil test enable bit [1]: G value stencil test enable bit [0]: R value stencil test enable bit
18	RW	0x0	sw_src_trans_mode Source transparency mode 1'b0: Normal stencil test (color key) 1'b1: Inverted stencil test
17:16	RW	0x0	sw_src_vscl_mode SRC vertical scaling mode 2'b00No scaling 2'b01: Down-scaling 2'b10: Up-scaling
15:14	RW	0x0	sw_src_hscl_mode SRC horizontal scaling mode 2'b00No scaling 2'b01: Down-scaling 2'b10: Up-scaling
13:12	RW	0x0	sw_src_mir_mode SRC mirror mode 2'b00: No mirror 2'b01: X mirror 2'b10: Y mirror 2'b11: X mirror + y mirror

Bit	Attr	Reset Value	Description
11:10	RW	0x0	sw_src_rot_mode SRC rotation mode 2'b00: 0 degree 2'b01: 90 degree 2'b10: 180 degree 2'b11: 270 degree
9:8	RW	0x0	sw_src_csc_mode Source bitmap YUV2RGB conversion mode 2'b00: Bypass 2'b01: BT.601-range0(limit range) 2'b10: BT.601-range1(full range) 2'b11: BT.709-range0(limit range)
7	RW	0x0	sw_cp_endian Source Color palette endian swap 1'b0: Big endian 1'b1: Little endian
6	RW	0x0	sw_src_uvswap Source Cb-Cr swap 1'b0: CrCb 1'b1: CbCr For YVYU422 mode, UV swap 1'b0: YVYU422(U LSB) 1'b1: YUYV422(V LSB)
5	RW	0x0	sw_src_alpha_swap Source bitmap data alpha swap 1'b0: ABGR 1'b1: BGRA
4	RW	0x0	sw_src_rbswap Source bitmap data RB swap 1'b0: BGR 1'b1: RGB For YVYU422 mode, YC swap 1'b0: YVYU422(U LSB) 1'b1: VYUY422(Y LSB)
3:0	RW	0x0	sw_src_fmt Source bitmap data format 4'b0000: ABGR888 4'b0001: XBGR888 4'b0010: BGR packed 4'b0100: RGB565 4'b0101: ARGB1555 4'b0110: ARGB4444 4'b0111: YVYU422(U LSB) 4'b1000: YUV422SP 4'b1001: YUV422P 4'b1010: YUV420SP 4'b1011: YUV420P 4'b1100: 1BPP (color palette) 4'b1101: 2BPP (color palette) 4'b1110: 4BPP (color palette) 4'b1111: 8BPP (color palette)

RGA2_SRC_BASE0
Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_src_base0 Source image Y/RGB base address

RGA2_SRC_BASE1
Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_src_base1 Source image Cb base address (YUV422/420-P) Source image Cb/Cr base address (YU,V422/420-SP)

RGA2_SRC_BASE2
Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_src_base2 Source image Cr base address (YUV422/420-P)

RGA2_SRC_BASE3
Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_src_base3 Source image 1 RGB base address(source bitblt mode1)

RGA2_SRC_VIR_INFO
Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:16	RW	0x000	sw_mask_vir_stride Mask image virtual stride (words)
15	RO	0x0	reserved
14:0	RW	0x0000	sw_src_vir_stride SRC image virtual stride (words)

RGA2_SRC_ACT_INFO
Address: Operational Base + offset (0x011C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:16	RW	0x0000	sw_src_act_height Source image active height
15:13	RO	0x0	reserved
12:0	RW	0x0000	sw_src_act_width Source image active width

RGA2_SRC_X_FACTOR
Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	sw_src_hsp_factor Source image horizontal up-scaling factor =((SRC_ACT_WIDTH-1)/(DST_ACT_WIDTH-1)) * 65536
15:0	RW	0x0000	sw_src_hsd_factor Source image horizontal down-scaling factor =(DST_ACT_WIDTH/(SRC_ACT_WIDTH) * 65536 + 1

RGA2_SRC_Y_FACTOR
Address: Operational Base + offset (0x0124)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	sw_src_vsp_factor Source image vertical up-scaling factor =((SRC_ACT_ HEIGHT -1)/(DST_ACT_ HEIGHT -1)) * 65536
15:0	RW	0x0000	sw_src_vsd_factor Source image vertical down-scaling factor =(DST_ACT_ HEIGHT /(SRC_ACT_ HEIGHT) * 65536 + 1

RGA2_SRC_BG_COLOR
Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_src_bg_color Source image background color ("0" bit color for mono expansion.)

RGA2_SRC_FG_COLOR
Address: Operational Base + offset (0x012C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_src_fg_color Source image foreground color ("1" bit color for mono expansion.) Color fill color, Pan color

RGA2_SRC_TR_COLOR0
Address: Operational Base + offset (0x0130)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	sw_src_trans_amin Source image transparency color A min value
23:16	RW	0x00	sw_src_trans_bmin Source image transparency color B min value
15:8	RW	0x00	sw_src_trans_gmin Source image transparency color G min value
7:0	RW	0x00	sw_src_trans_rmin Source image transparency color R min value

RGA2_CP_GR_A
Address: Operational Base + offset (0x0130)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	sw_gradient_y_a Y gradient value of Alpha (signed 8.8)
15:0	RW	0x0000	sw_gradient_x_a X gradient value of Alpha (signed 8.8)

RGA2_SRC_TR_COLOR1
Address: Operational Base + offset (0x0134)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	sw_src_trans_amax Source image transparency color A max value

6.5 Application Notes

6.5.1 Register Partition

There are two types of register in RGA. The first part registers (0x0 - 0xFC) are general registers for system configuration including command mode, command parameter, RGA status, general interrupts. The other registers (from 0x100) are command registers for command codes.

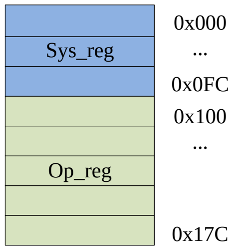

Fig. 6-7 RGA software main register-region

6.5.2 Command Modes

RGA has two command modes: slave mode and master mode. In salve mode (RGA_SYS_CTRL[1] = 1’b0), 2D graphic command only could be run one by one. CPU set all the command registers in RGA and then start RGA running by setting RGA_SYS_CTRL[0] to 1. In master mode (RGA_SYS_CTRL[1] = 1’b1), 2D graphic commands could be run sequentially. After setting command’s number to RGA_CMD_CTRL[12:3], writing 1 to RGA_CMD_CTRL[0] will start the command fetch, then Internal command DMA fetch commands from external command line.

Command line is a collection of several command codes with continuous address. At the first start, the command start address (RGA_CMD_ADDR) and command number (RGA_CMD_CTRL[12:3]) should be set, then write 1 to cmd_line_st (RGA_CMD_CTRL[0]) to start the command line fetch. Incremental command is supported by setting cmd_incr_num (RGA_CMD_CTRL[12:3]) and cmd_incr_valid (RGA_CMD_CTRL[1]=1’b1).

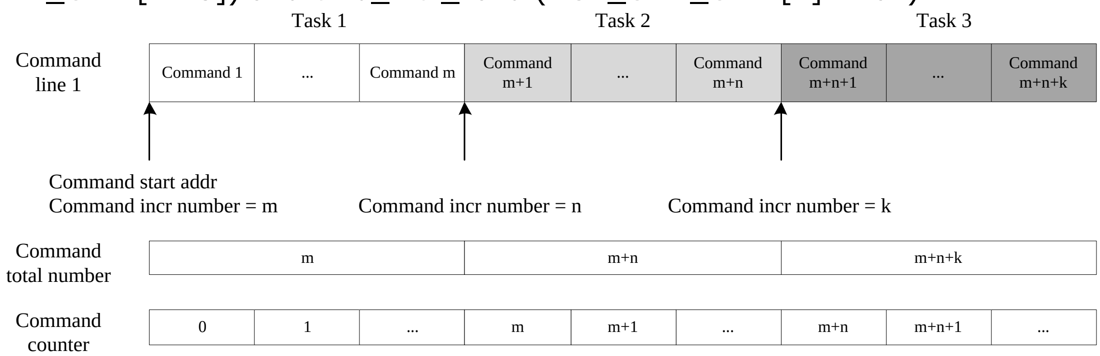

Fig. 6-8 RGA command line and command counter

6.5.3 Command Sync

In slave command mode, command sync is controlled by CPU.
In master command mode, user can enable the current_cmd_int (sw_intr_cf), command by command to generate a interrupt at the end point of target command operation.

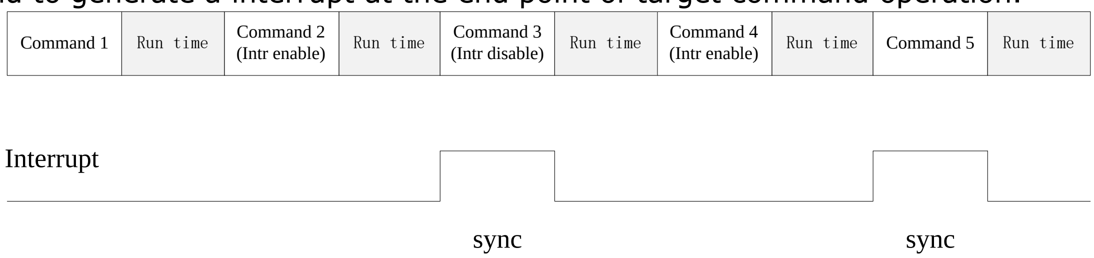

Fig. 6-9 RGA command sync generation

6.5.4 Color Palette Application Notes

1. Palette/LUT Load into special RAM in ELS_BUF_CTRL.
2. Color Palette/Pattern interval operations no need to initial LUT/pattern ram if LUT/pattern content no update.

6.5.5 Some Special Application Constraints

1. The algorithm of vertical scale up: must select BI-cubic algorithm when source picture is smaller or equal to 2k and must select BI-linear when bigger than 2k.

2. The effects that The output’s definition is near 2k or 4k may not very well when at the scenario that the vertical side is scale up and the horizontal is scale down within range of

2%(such as:2048x32→2008x64).

3. At the scenario A+B->C(A means SRC0, B means DST, C means SRC1), the size among the A B C has some constraints:
A’s size after scale must be equal to C. C’s size must equal to B when A+C is no rotation. C’s rotation (90degree)size must equal to B1 when A+C is rotation 90 degree.

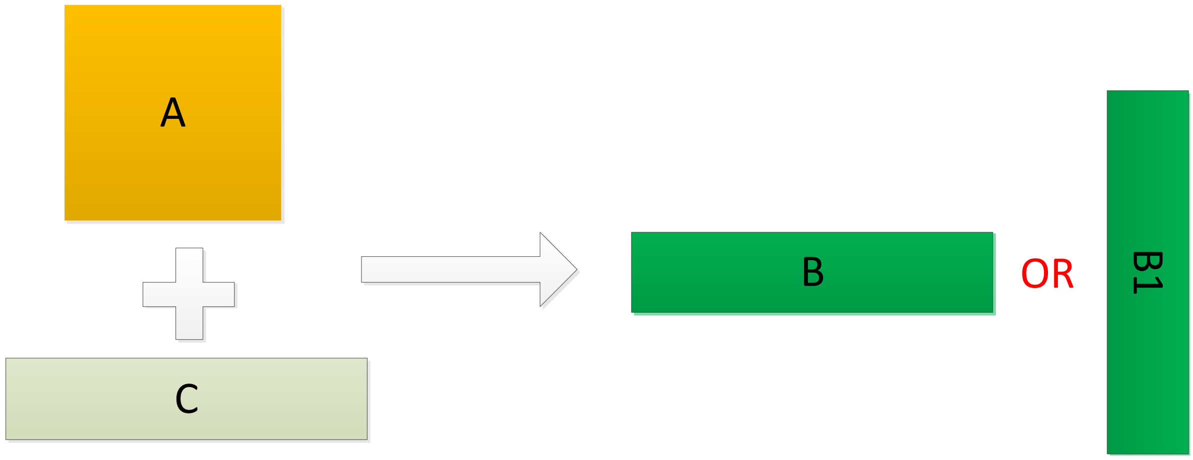

Fig. 6-10 The size constraint among A B C

Chapter 7 Video Output Processor (VOP)

7.1 Overview

The VOP (video output process) module is a display output processor. It reads video data and UI data from the frame buffer of the system memory, performs corresponding processing such as cropping, color gamut space conversion, scaling, and superposition, and outputs to each high-speed via video port display interface.

VOP2 supports the following features:

- Display Output Interface
  - Two DP Interface
    - Max support 7680x4320@30Hz
    - Support RGB/YUV444/YUV422/YUV420 (up to 10bit) format
    - Support Display Split
  - Two HDMI / eDP Combo Interface
    - HDMI
      - Max resolution support 7680x4320@60Hz
      - Support RGB/YUV444/YUV420 (up to 10bit) format
      - VESA DSC 1.2a
      - Support Display Split
    - eDP
      - Max resolution support 4096x2304@60Hz
      - Support RGB/YUV422 (up to 10bit) format
      - Support Display Split
  - Two MIPI DSI2 Interface
    - Max resolution support 4096x2304@60Hz
    - Support RGB (up to 10bit) format
    - Support Dual Channel: Left-Right display mode.
    - VESA DSC 1.1/1.2a
  - Parallel Interface
    - BT656
      - support PAL and NTSC
      - Support RGB (up to 8bit) format
    - BT1120
      - Max resolution support 1920x1080@60Hz
      - Support RGB (up to 8bit) format
- Bus
  - One 32bit AHB Slave to configure registers
  - Two 128bit AXI read bus
  - One 128bit AXI write bus
- Video Ports
  - Video Port0
    - Resolution
      - Max output resolution: 7680x4320@60Hz
      - Bits per component: 10
    - Color bar
      - Horizontal mode
      - Vertical mode
    - BCSH(10bit)
      - Brightness(8bit), Contrast(9bit), Saturation(10bit), Hue adjustment(9bit)
    - 3D_LUT
      - Support 9x9x9(12bit) LUT
    - CSC
      - YUV2RGB: bt601-f / bt709-l/bt601-l/bt2020
      - RGB2YUV: bt601-f/bt709-l/bt601-l/bt2020
    - Gamma
    - Dither down

    - Allegro
    - FRC
  - Post LB mode
    - 4096pixels x 4 mode
    - 2048pixels x 8 mode
  - Display mode
    - P2I/Interlace display
    - Blank display
    - Black display
    - Standby mode
- Video Port1
  - Resolution
    - Max output resolution: 4096x4320@60Hz
    - Bits per component: 10
  - Color bar

- Power gating: Independent power domains for cluster layer 0/1/2/3, esmart layer 1/2/3, DSC 8K/4K encoder

7.2 Block Diagram

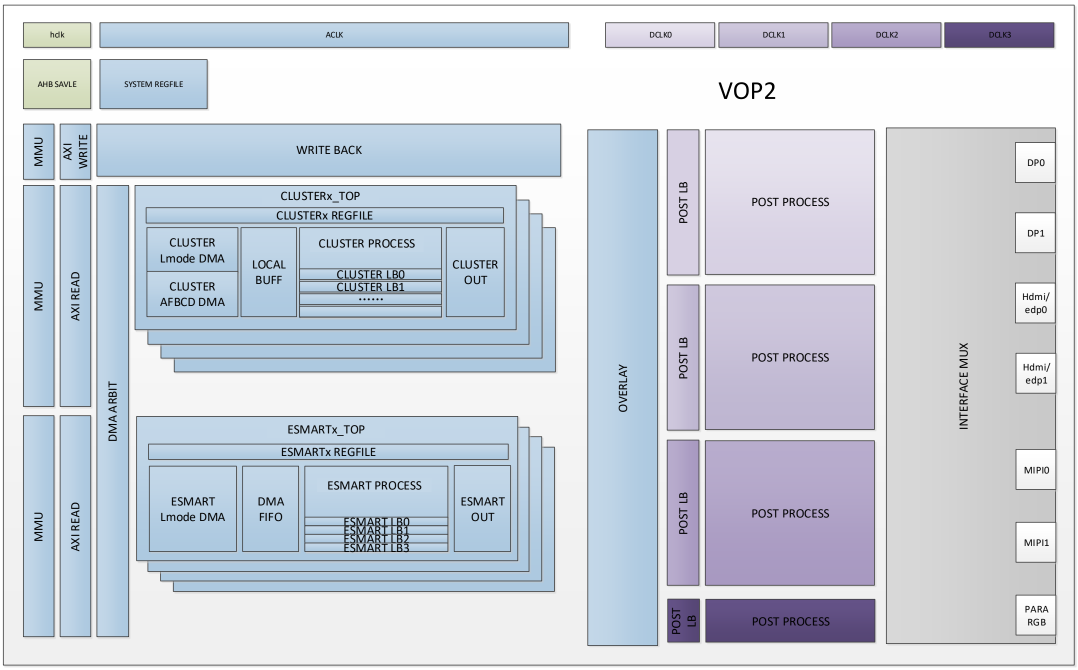

Fig. 7-1 VOP Block Diagram

VOP comprises with:

- AHB SLAVE

The VOP configuration bus is used to read and write all register configurations of the VOP. Some of the address segments are secure SLAVE address segments, which can only be accessed by a secure CPU when the security is enabled. For details, please refer to the security program description chapter.

- SYSTEM REGFILE

The register arrays, including system control, layer, overlay, and post process registers, are all in the ACLK domain, and read and write from HCLK to the ACLK domain through synchronization logic.

- MMU

The Memory Management Unit maps the configured virtual address to the physical address through the page table. Since there are two buses in the system, there are two MMU addresses. In the security mode, the address of the security layer is configured as a physical address from the MMU according to the configuration. The module is bypassed, so as to avoid the address being rewritten when the MMU is mapped.

- AXI READ/WRITE

There are AXI0 and AXI1 bus in VOP interface. The AXI0 supports both write and read channel, while AXI1 only supports read channel.

- DMA ARBITER

Each layer in the system will initiate a different read request, and DMA arbiter will perform a global arbitration for internal requests based on priority settings and FIFO status.

- CLUSTERx

Cluster layer, which supports AFBCD、line mode and tile mode.

- ESMARTx

Esmart layer only supports line mode and support display up to 4 regions where the regions can’t overlap horizontally.

- OVERLAY

Perform the synthesis operation between layers according to the configuration and send it to the corresponding post process modules.

- POST PROCESS

Including gamma, BCSH, 3D-LUT and other post-processing modules, the data is processed by the post-processing module and then store them into the POST line buffer.

- POST LINE BUFFER

The Post Process line buffer is used to store the data processed by the post process modules and output to corresponding display interface.

- INTERFACE MUX

The VOP supports variety of output interface including HDMI, eDP, DP, MIPI DSI2, BT.1120, BT 656. By setting the interface mux module, the corresponding PORT can be selected and output to the corresponding interface.

7.3 Operating Mode

7.3.1 Clock and Reset Description

- **HCLK**

The maximum operating frequency: 200MHz

- **ACLK**

The maximum operating frequency: 800MHz

- **DCLK0/1/2/3**

The maximum operating frequency of DCLK0/1/2: 600MHz
The maximum operating frequency of DCLK3: 200MHz

- **Hardware Reset**

System hardware reset, that is, the hardware reset of the entire VOP through the system, all the logic inside the VOP will enter the initial state, if the current screen is being displayed, there will be abnormal phenomena such as a black screen.

- **Software Frame Reset**

The frame reset of each layer is supported, that is, when the vsync signal of each frame arrives, the layer's internal logic will be reset exclude register logic.

- **MMU Frame Reset**

Support the MMU soft reset, when the MMU is abnormal, the entire MMU logic can be reset without causing the MMU to hang up.

7.3.2 Bus Description

- **AHB Bus**

Configuration bus for register/LUT

- **AXI 0 Bus**

The AXI0 bus is readable and writable, which supports write back function. In the system design, the bus performance of AXI0 is better than the AXI1, so AXI0 is used first in the bus allocation, and AXI1 is configured when the total VOP loading is heavy. In order to maintain synchronization between layers, allocating the layers used by the one port on the AXI0 and AXI1 buses respectively is not allowed.

- **AXI 1 Bus**

Read-only data bus

- **RID Default Configuration**

There are 15 IDs available for each bus. For YUV and AFBCD, two IDs are required for each layer. The driver allocates the rid according to the data of the layer on the bus. If it exceeds 15, another bus is required to be enabled.

- **Hurry/QoS**

VOP2 hurry has an enable bit and hurry value. Initiating a hurry request depends on whether the memory of the layer initiates a hurry request. When the layer's esmart_dma_rreq_hurry_en is enabled and the number of empty memory is greater than the set waterline, a hurry request is initiated.
VOP2 QoS has an enable bit in SYS_CTRL_SYS_AXI_HURRY_CTRL0_IMD. When QoS is enabled and rid is greater than or equal to 0xa, QoS signal is asserted.

- **MMU Frame Valid Mechanism**

MMU supports the bypass function in register mmu_bypass_en and mmu_bypass_id. When rid>=mmu_bypass_id, the AXI request and the returned data will bypass MMU. Noted that mmu_bypass_en and mmu_bypass_id is enabled immediately. At that time, rid is effective frame for the layer, so it can realize whether the layer data access is mmu_bypass.

- **Protection Mechanism**

In the protection mode, the port number of the protected layer can be set and sent to the designated protected port, otherwise the layer will be forcibly closed.

7.3.3 Display Output Interface Description

The following figure shows the interface connection diagram of VOP2. There are 4 ports in the VOP to distribute video data to different high-speed interfaces through the software setting interface MUX.

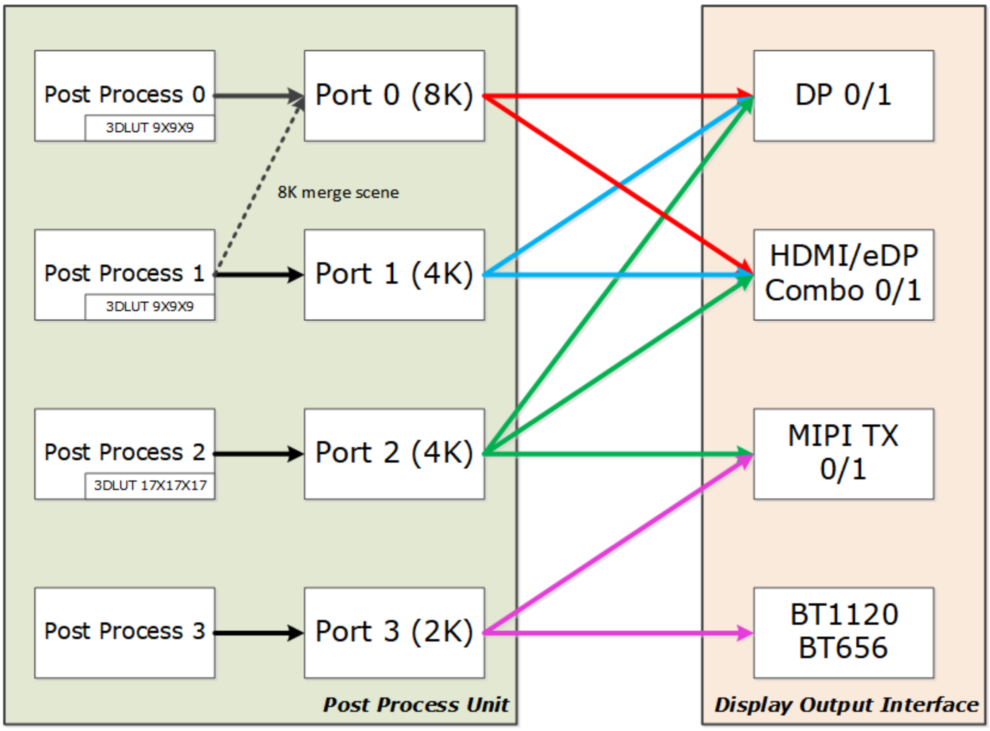

Fig. 7-2 Schematic Diagram of Display Output Interface

- HDMI/eDP Combo Interface 0/1
  - The data source of the HDMI/eDP Combo interface can come from port 0 or port 1 or port 2.
  - Maximum resolution support:
    - HDMI: 7680x4320@60 (VIC 199 using YUV420 format) supported by merged function of PORT0 and PORT1
    - eDP: 4096x2304@60 supported by single port
  - In system, HDMI TX interface and eDP interface share the one Combo PHY, which means VOP can only work in HDMI or eDP mode. There are two HDMI/eDP Combo PHYs in SoC, so application has the four scenes:
    (1) HDMI0 + HDMI1
    (2) HDMI0 + eDP1
    (3) eDP0 + HDMI1
    (4) eDP0 + eDP1.
  - Split mode: The one frame is split to left-right part which send to HDMI/eDP TX 0/1 respectively.

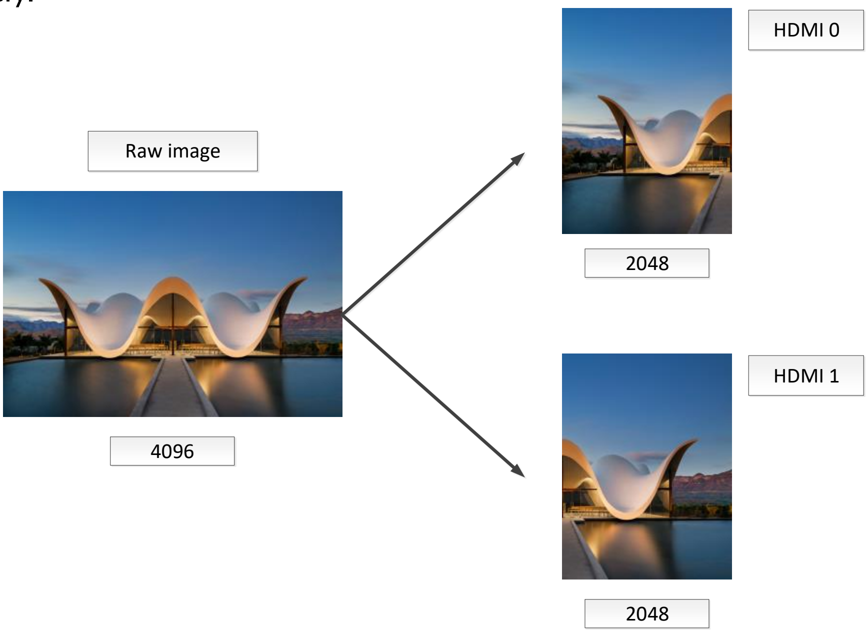

Fig. 7-3 Split (Left-Right) Display Mode

- DP Interface 0/1
  - The data source of the DP interface can come from port 0 or port 1 or port 2
  - The maximum supported resolution (limited by the DP TX PHY's maximum available bandwidth-25.92Gbps):
    7680x4320@30: supported by merged function of port 0 and port 1
    4096x2304@60: supported by port 0 or port 1 or port 2
  - Split mode: The one frame is split to left-right part which send to DP TX 0/1 respectively.
  - The DSC function is not supported.

- MIPI TX DSI2 Interface 0/1
  - The maximum resolution supports 4096x2304@60
  - The data source of the MIPI TX interface can come from port 2 (up 4096 pixel's image width) or port 3 (up 2048 pixel's image width).
  - Support operation mode:
    Copy: The MIPI TX 0 and MIPI TX 1 are driven from the same output port.
    Dual channel: The one frame is split to left-right part which send to MIPI TX 0/1 respectively.

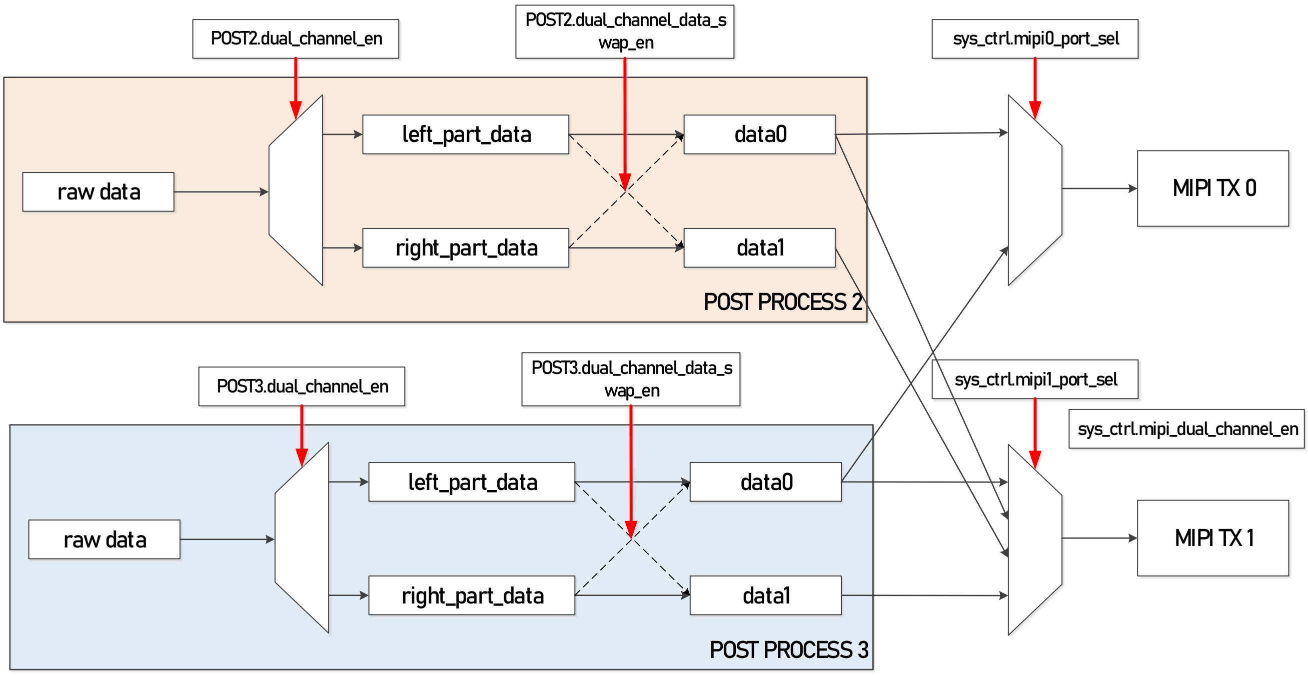

Fig. 7-4 MIPI dual channel display mode

- Support DSC:
  MIPI TX 0 is bound to DSC 8K encoder which supports up to 8 slices, which data source is bound to port 2.
  MIPI TX 1 is bound to DSC 4K encoder which supports up to 2 slices, , which data source is bound to port 1 or port3.
  The port mux of dsc function reference Fig.1-5

- BT656 / BT1120 / RGB (for debug)
  - Maximum resolution support: 1080p60, pixel rate 150M/s
  - The data source of the para interface is directly connected to port 3 (up 2048 pixel's image width).
  - The three modes share one I/O group, which contains 1-bit clock signal and 16-bit data signals.
  - The bit mapping relationship corresponding to each interface is as shown in the figure Below.

interface	RGB454(RGB)	BT656(8bit)	BT1120 (16bit)
display mode			
dsp_out_mode			
dclk	dclk	dclk	
data	data	data[7:0]	data[15:0]
d15	R7		√(D15)
d14	R6		√(D14)
d13	R5		√(D13)
d12	R4		√(D12)
d11	G7		√(D11)
d10	G6		√(D10)
d09	G5		√(D9)
d08	G4		√(D8)
d07	G3	√ (D7_m0)	√(D7)
d06	B7	√ (D6_m0)	√(D6)
d05	B6	√ (D5_m0)	√(D5)
d04	B5	√ (D4_m0)	√(D4)
d03	B4	√ (D3_m0)	√(D3)
d02	den	√ (D2_m0)	√(D2)
d01	hsync	√ (D1_m0)	√(D1)
d00	vsync	√ (D0_m0)	√(D0)

Fig. 7-5 Map of parallel port I/O output

  - The output pixel clock supports Delay-Line function which maximum adjustable range is 3~5ns.
  - support output pixel clock polarity inversion function.
  - Due to the I/O number limitation, there is only 13bit valid data output in the case of RGB mode only supports the data format of RGB454, which can be connected to the most significant 4 and most significant 5 bits to the RGB interface display panel.

Note: Though RGB454 format causes a certain color information loss, it does not affect the judgment of the image content correctness for debug purpose.

7.3.4 DSC Encoder Description

- DSC 8K encoder for HDMI TX0 / MIPI TX DSI2 Host0 interface
  - Maximum 1,2,4,8 slices per line
  - up to 8K (7680×4320) resolution
- DSC 4K encoder for HDMI TX1 / MIPI TX DSI2 Host1 interface
  - Maximum 1,2 slices per line
  - up to 4K (4096×2160) resolution
- Conformance Standard
  - VESA Display Stream Compression (DSC) Standard Version 1.2a
  - VESA Display Stream Compression (DSC) Standard Version 1.1
- Output formats
  - RGB
  - YCbCr
  - Not supported YCbCr Simple 4:2:2, Native 4:2:2, Native 4:2:0
- Coding Method
  - Constant bit rate (CBR) mode only
  - Variable bit rate mode (VBR) is not supported
- Coding Schemes
  - Modified MAP (MMAP)
  - Mid-Point Prediction (MP)
  - Block Prediction (BP)
  - Index Coloring History (ICH)
- Data Precision (maximum number of bits per component)
  - 8, 10

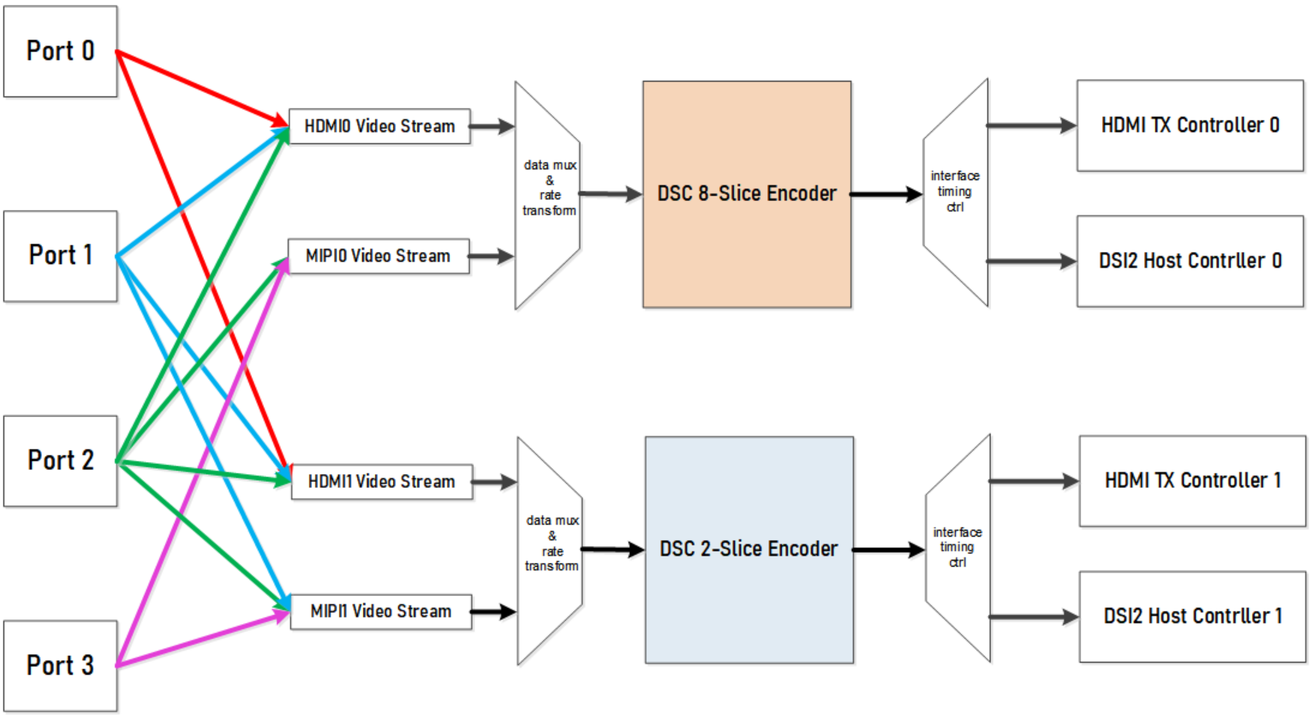

Fig. 7-6 Two DSC Encoder Architecture in VOP

The below figure shows the block diagram of a single display being split into multiple slices of equal dimensions (of equal height and width) and each slice being handled by dedicated and independent data path in DSC encoder. The pixel demultiplexer (pixel demux) separates input pixel stream based on slice dimensions. Pixel demultiplexed data are handled by different slices independently. When the input pixels are in RGB format, they are converted to YCoCg format. These pixels are reconstructed using either predicted version of the pixels or from a History lookup. Variable Length coder/Entropy Code block determines whether Prediction or Look up based reconstruction is to be used based on a cost function. Entropy code block creates separate syntax element for each sub stream corresponding to Y, Co, Cg such that syntax element contains residue values for prediction based reconstruction and look up index for History Look Up based reconstruction. Syntax element data from individual streams are written to respective balance FIFOs and size of the corresponding syntax elements are written to syntax element size FIFOs. After a specified amount of group delay time units, the sub stream multiplexer multiplexes the mux words from the sub streams based on the mux word requests from an idealized decoder model. The sub stream multiplexer outputs are written to the rate buffer. The slice multiplexer (slice mux) reads data from each of the rate buffers in units of chunk size and sends out the compressed stream.

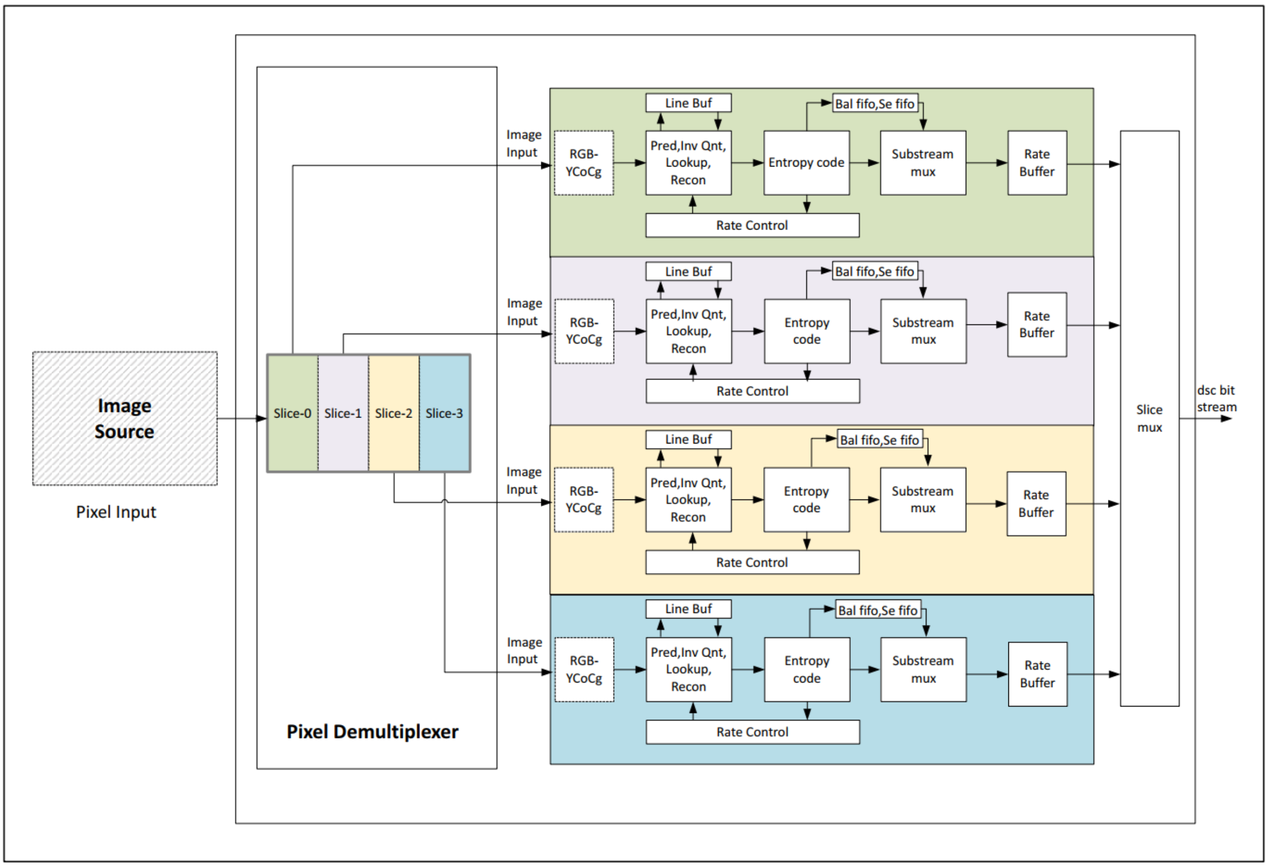

Fig. 7-7 Structure of DSC Encoder

7.3.5 Interrupt Description

There are three interrupt signals.

VOP_intr: Including the following groups of interrupt sources

- VOP_intr_sys
- VOP_intr_sys1
- VOP_intr_post
- VOP_intr_fbcd
- DSC_8K_err
- DSC_4K_err

VOP_intr_DDR: Conditional interrupt source dma_finish from DDR frequency conversion, refer to frequency conversion description for details.

VOP_intr_lb: Including the following groups of interrupt sources, which can set the buffer waterline to notify the CPU that the predetermined waterline has been reached.

- int_status_post_full0
- int_status_post_full1

- int_status_post_full2
- int_status_post_full3

7.3.6 Maximum Performance and Functional Attributes of each PORT

- PORT0
  - The maximum supported resolution in single PORT mode is 4K.
  - To support more than 4096 pixel's width, combination of PORT0 and PORT1 should be used, which the merged data stream output from PORT0.
  - Dual gamma
  - 9x9x9 3DLUT
- PORT1
  - The maximum supported resolution of single PORT mode is 4K; when it exceeds 4K, the data of the previous two channels is spliced and multiplexed to PORT0.
  - Dual gamma
  - 9x9x9 3DLUT
- PORT2
  - Only supports single PORT mode, the maximum supported resolution is 4K.
  - 600M pixel rate
  - Dual gamma
  - 17x17x17 3DLUT
- PORT3
  - Only supports single PORT mode, the maximum resolution is 2048.
  - 200M pixel rate
  - Dual gamma

7.3.7 Multi-port Configuration Instructions

The connection relationship between PORT0 and the interface is as follows.

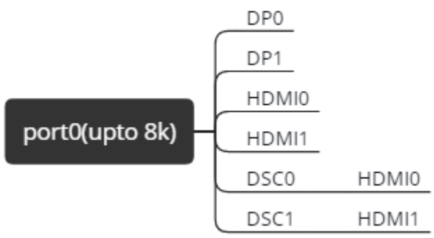

Fig. 7-8 Map of PORT0 interface

The connection relationship between PORT1 and the interface is as follows.

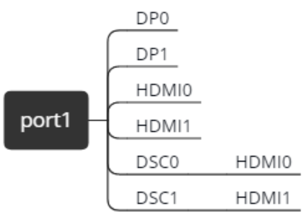

Fig. 7-9 Map of PORT1 interface

The connection relationship between PORT2 and the interface is as follows.

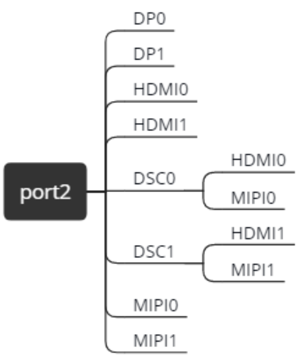

Fig. 7-10 Map of PORT2 interface

The connection relationship between PORT3 and the interface is as follows.

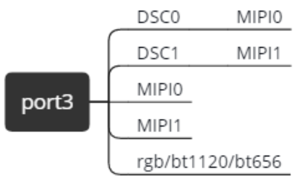

Fig. 7-11 Map of PORT3 interface

7.3.8 Power Domain Power Up/Down Description

There are seven power domains inside VOP, show as the below figures where the green border is the boundary of each power domain.

- Cluster Power Domain: Four power domains for cluster 0/1/2/3 respectively
- Esmart Power Domain: One power domain for esmart1, esmart2 and esmart3
- DSC Power Domain: Two power domains for DSC 8K encoder and DSC 4K encoder respectively

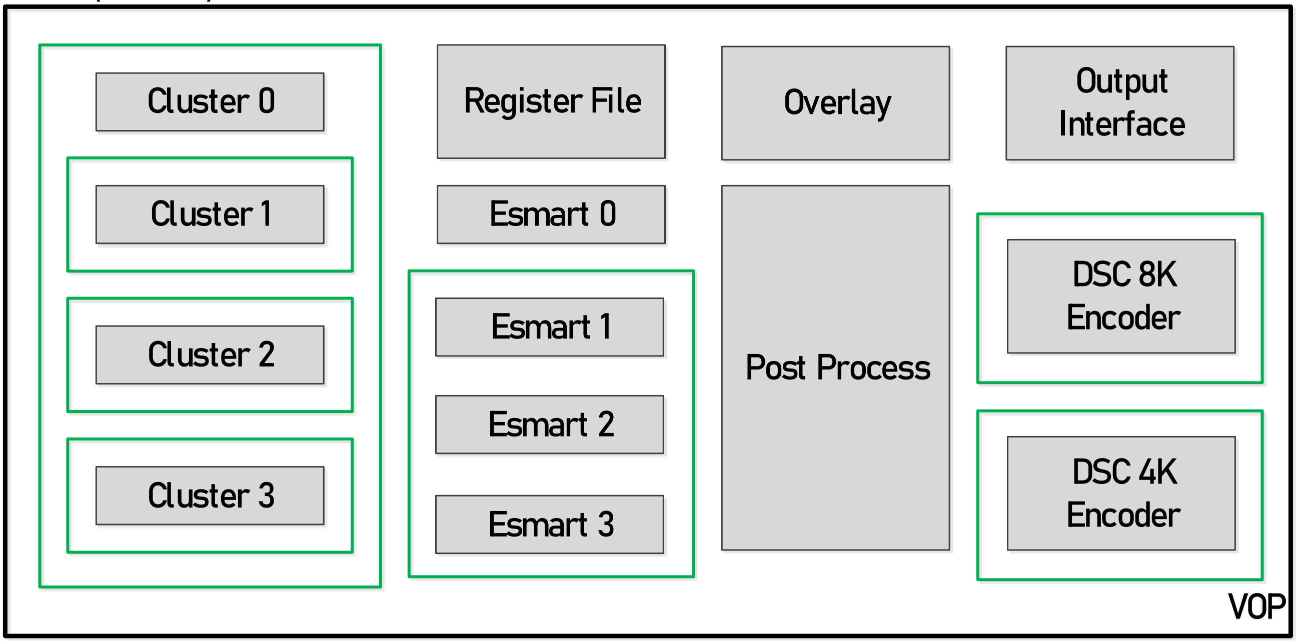

Fig. 7-12 Power Domains Structure Diagram of VOP

The cluster has 4 PDs where cluster0 PD operates as master power switch shall be powered on firstly and powered off lastly. The two DSC encoders have independent power domain. The esmart layer 1/2/3 share one power domain. It is recommended that only static switches are used according to the application scenario.

The power switching process is as follows:

- Normal display sequence:

The VOP configuration register adopts the Ping-Pong register configuration mode. The power switch configuration before the Vsync signal is completed will take effect in the next frame.

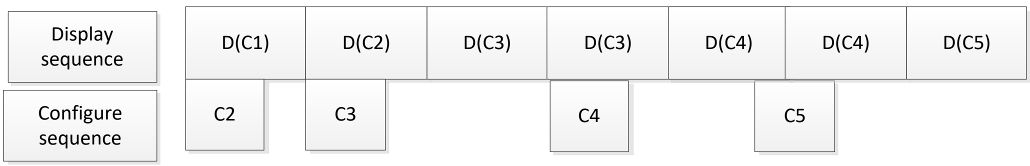

Fig. 7-13 Diagram of power domain switch configuration

Note: D(n) represents display frame; C(n) represents configure frame after the configure, it will appear after the next vsync comes.

The power status switch from power on to power off, the following steps occur inside VOP:

1. Turn off the clock

2. Enable isolation cell, clamp cell is enabled
3. Send a power off request
4. According to the feedback ack signal, the corresponding power status will be asserted

The power status switch from power off to power on, the following steps occur inside VOP:
1. Send a power on request
2. Cancel the power off request
3. After received the valid ack signal, the reset output
4. After 32 cycles, deassert clock reset
5. Recover the clock
6. Disable isolation cell
7. After a sufficient period of time, reset is released

7.3.9 Function Memory Chain Switch Description

Since the power domain cannot achieve the functional level power switch, in some application scenarios, when a memory function does not need to be dynamically turned on, the power supply of the memory chain can be turned off, which can reduce the power consumption as much as possible. It is divided into eight memory chains of WB, Post Process Module 0/1/2/3.

The register address is as follows:
- PMU_SUBMEM_PWR_GATE_SFTCON1
- PMU_SUBMEM_PWR_GATE_SFTCON2

The bit allocation of memory chain is as follows:
- #define MID_VOPPOST0 (1<<15)
- #define MID_VOPPOST1 (1<<16)
- #define MID_VOPPOST2 (1<<17)
- #define MID_VOPPOST3 (1<<18)
- #define MID_VOPWB (1<<22)

7.3.10 Security Program Description

7.3.10.1 SoC Connection Diagram

(1) The switch of the security layer and the selection of the security port controlled by register vop_sec_ctrl from the system's SGRF.

(2) Support a certain address segment (security layer address segment) of the AHB slave can be designated as a secure address on the interconnect;

(3) The bus supports MMU bypass logic according to the layer's ID.

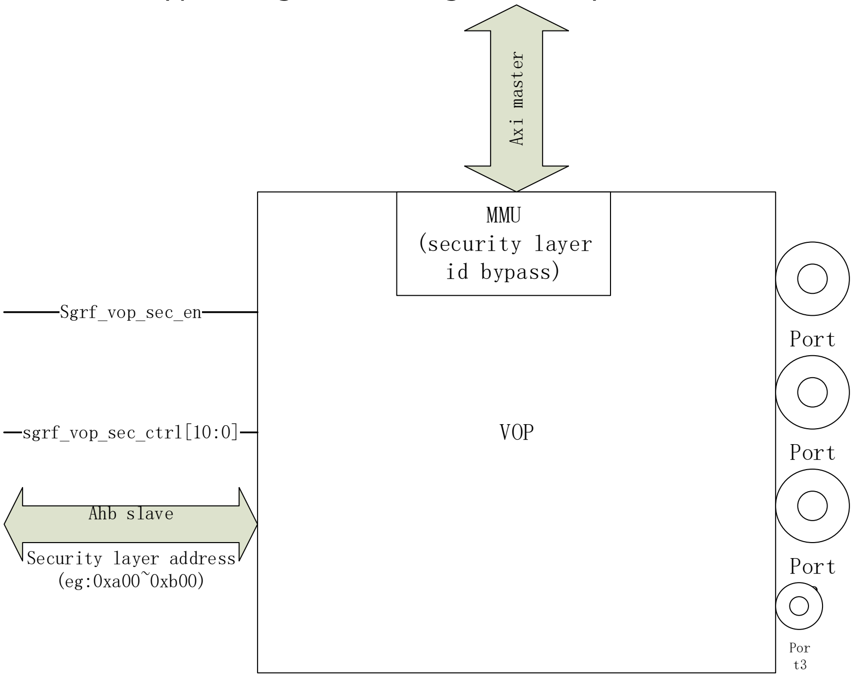

Fig. 7-14 Security schematic block diagram

7.3.10.2 Hardware Security Implementation

(1) The following points shall be guaranteed:
1) The secure layer shall only be selected to the corresponding secure PORT;
2) The secure layer shall be at the top;
3) The secure layer shall not use alpha, and directly covers the underlying layers;
4) The secure mode write back function shall be disabled;

(2) The layer address segment will not be accessed by non-secure CPU;
The address space corresponding to esmart0 is defined as a secure address, and the specific address is as follows:

0xFDD91800 ~ 0xFDD918ff

(3) MMU bypass logic ensures that the MMU page table will not be tampered with and accessed to other addresses;
vop_sec_ctrl[10:0] is added to the VOP interface, the specific description is as follows.

Table 7-1 Description of security-related registers

SGRF	bits	description
vop_sec_en	1	1'b0: non-secure mode 1'b1: secure mode
vop_sec_port	2	2'b00: video PORT0 2'b01: video PORT1 2'b10: video PORT2 2'b11: video PORT3
vop_wb_dis	1	1'b0: normal 1'b1: disable WB function
vop_post_dis	1	1'b0: normal 1'b1: disable Post process
vop_nonsec_black	1	1'b0: normal 1'b1: non-sec PORT display black
vop_sec_cfg_en	1	1'b0: disable 1'b1: enable
vop_sec_cfg	3	3'b000: Except for the secure layer, all configurations are not configurable. 3'b001: Except for layers, all configurations are not configurable 3'b010: Except for layers and overlay, all configurations are not configurable. 3'b011: Except for layer, overlay and system, all configurations are not configurable. 3'b100: Except for layer, overlay, system and post, all configurations are not configurable.
vop_drm_en	1	1. The security layer esmart0 is forced to vop_sec_port (check) 2. When secure PORT_mux=4'h8 (no layer), it is forced to be equal to 4'h1, and other PORTs are forced to have no layer, which means the value is 4'h8 3. When the non-secure PORT conflicts with the PORT_mux of the secure PORT, force the non-secure PORT mux=4'h8 (check) 4. Force the security layer to be at the top of the security PORT (check) 5. When a secure layer is selected for non-secure PORT, the layer is forcibly closed (check) 6. Alpha operation after turning off the security layer (check) 7. sys_dsp_inface_en is not configurable

7.3.10.3 Security Scene

1. Secure payment:

- esmart0 is a secure payment layer and support to specify a secure PORT. With vop_sec_en enable.
- vop_sec_port selects secure PORT;
- vop_wb_dis can disable the write-back function.
- vop_post_dis can turn off non-secure PORT.
- vop_nonsec_black can make non-secure PORT black screen.
- vop_drm_en is forcibly sent to secure layer security payment enable. The layer is placed on top of the secure PORT.
- the alpha operation of the secure layer is turned off.

2. Drm

VOP uses 0x100~0x1ff as the secure slave address segment, which is used to configure drm related operations.

- Content to layer security

support to set whether the layer is secure, and set whether to initiate secure access according to the rid.

- Content to PORT security

PORT(X) with a secure layer can be set, the secure layer can only be sent to the designated secure PORT(X), otherwise the layer will be forcibly closed.

7.3.10.4 Secure Mode Entry and Exit Process

It is recommended that driver performs the layer transfer in secure mode and normal mode.

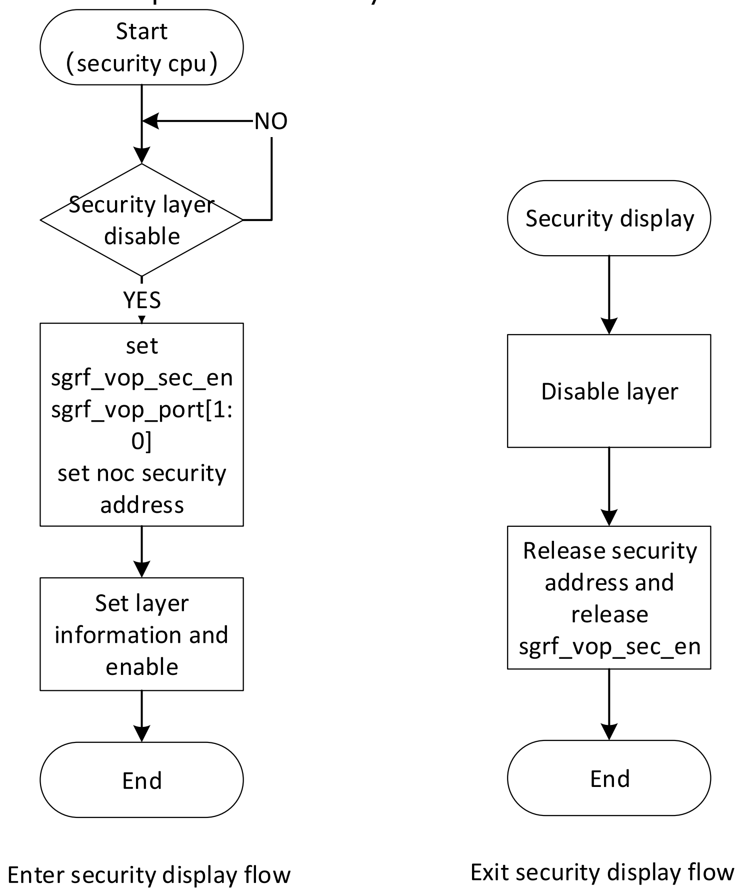

Fig. 7-15 Secure mode entry and exit diagram

7.3.11 Power Consumption Description and Recommendations

The smart layer does not have AFBCD, the logic power consumption of the layer is relatively lower, and the layer current is about 4.3MA. Because the cluster layer adds AFBCD related logic, the current of the layer is 2.2MA larger than that of smart. However, due to the addition of AFBCD, the total data volume is much smaller, and the access behavior is more friendly to DDR, and the overall power consumption of the system will be much lower. See the table below for detailed power consumption data.

Table 7-2 Data sheet for layer power consumption

Scenes	Without auto gating, current at 400MHz (mA)
Single-layer compressed data, ctrl + interconnect+ bus data toggle power consumption	12.4
Single layer uncompressed data, ctrl+ interconnect +bus data toggle power consumption	41
Total VOP cluster logic power consumption	56.1
Total VOP smart logic power consumption	54

In SoC, cluster pd, smart pd, and DSC pd are added inside the VOP. At the same time, post0/1/2/3, and wb related memorys have separate power chains.
The application recommendations are as follows:
(1) By default, all PDs are power off. Power on the cluster or smart PDs before opening the layer.
(2) Use cluster0 and smart0 firstly.
(3) In case of there are few enabled overlay layers, it is recommended that disable the useless alpha module and take the priority to subsequent pipe stage.
(4) The POST/wb blocks have the switch function of memory power chain. When it is not enabled, turn off the memory power.
(5) For simple scenes such as static desktops, it is recommended that synthesize one AFBCD layer and use cluster0 to refresh the screen.
It is not recommended to switch pd frequently, because the switch pd needs to charge and discharge the MOSFET, which can cause considerable power consumption.

7.3.12 DDR Frequency Conversion Instructions

1. dma_finish interrupt source
This interrupt is connected to DCF and DCF can handle frequency conversion.

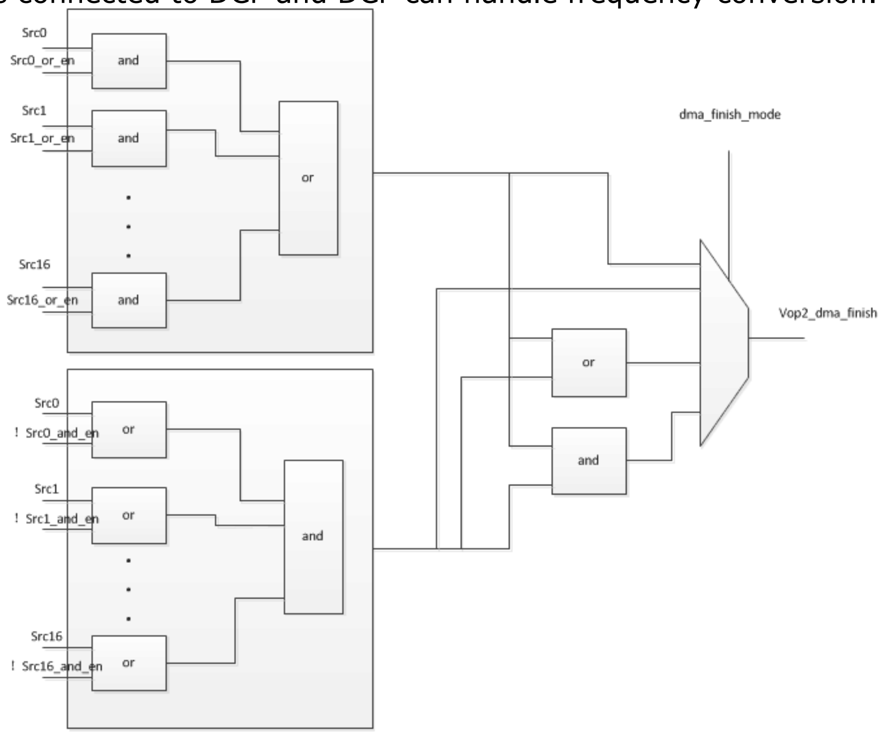

Fig. 7-16 dma finish interrupt structure diagram

The source of dma_finish is as follows, and the logic from win almost full, vp line flag, dsp hold and almost full is combined and output.

Table 7-3 dma finish interrupt source description

source list	name	remark
dma_finish	src0	AXI0_dma_finish & AXI1_dma_finish
wb_dma_finish	src1	WB DMA finish detected
vp0_line_flag	src2	When port0 line count equals the configured line flag number
vp1_line_flag	src3	When port1 line count equals the configured line flag number
vp2_line_flag	src4	When port2 line count equals the configured line flag number
vp3_line_flag	src5	When port3 line count equals the configured line flag number
vp0_dsp_hold	src6	Port0 hold status detected
vp1_dsp_hold	src7	Port1 hold status detected
vp2_dsp_hold	src8	Port2 hold status detected
vp3_dsp_hold	src9	Port3 hold status detected
vp0_almost_full	src10	When port0 post line buffer number equals dsp_almost_full_thold
vp1_almost_full	src11	When port1 post line buffer number equals dsp_almost_full_thold
vp2_almost_full	src12	When port2 post line buffer number equals dsp_almost_full_thold
vp3_almost_full	src13	When port3 post line buffer number equals dsp_almost_full_thold

2. VOP_intr_DDR
The VOP_intr_DDR signal comes from dma_finish, which is connected to the system interrupt controller through an interrupt signal, and the frequency can be converted through the interrupt, which is consistent with the DCF function.

3. VOP_intr_lb
Set the waterline of the post line buffer, and realize real-time frequency conversion through the status of line buffer, which can provide about 20us for frequency conversion.

7.4 Function Description

7.4.1 Cluster Layer

1. Basic Feature

- Support AFBCD compression mode
- Support raster line/tile mode
- Support color gamut space conversion
- Support double Gauss filter
- Support 1/4~4 times scale
- Support mirror/rotation
- Support image virtual width/cropping

7.4.1.1 Support line buffer mode description

Cluster line buffer supports the following three modes:
(1)Single window mode (mode0): In this mode, he maximum resolution supports single 4096 pixels width layer output.

(2)Two windows mode (mode1): In this mode, the cluster allows up to 2x2048 pixels width layers to be enabled and the two windows would be mixed firstly before send into overlay.

(3) AFBCD Full Mode(mode2): In this line buff mode, the cluster supports single layer rotation of 90° and 270° with AFBCD operating in full mode.

7.4.1.2 Support format description

AFBCD format:
The format needs to be written into the format register configuration related to AFBCD. There is no one-to-one correspondence between the format and the format of the layer, and the driver needs to do a mapping.
Parameter AFBCD_RGB565 =4’h0;//0000
Parameter AFBCD_RGBA1010102 =4’h2;//0010
Parameter AFBCD_RGB888 =4’h4;//0100
Parameter AFBCD_RGBA8888 =4’h5;//0101
Parameter AFBCD_YUV420_8b =4’h9;//1001
Parameter AFBCD_YUV420_10b =4’h3;//0011
Parameter AFBCD_YUV422_8b =4’hb; //1011
Parameter AFBCD_YUV422_10b =4’he;//1110

Line/tile mode format: The format is configured in the layer format register
parameter FMT_ARGB8888 = 5'b00000;
parameter FMT_RGB888 = 5'b00001;
parameter FMT_RGB565 = 5'b00010;
parameter FMT_YUV420_TILE = 5'b01100;
parameter FMT_YUV422_TILE = 5'b01101;
parameter FMT_YUV444_TILE = 5'b01110;
parameter FMT_YUV400_TILE = 5'b01111;
parameter FMT_YUV420_10B_TILE = 5'b11100;
parameter FMT_YUV422_10B_TILE = 5'b11101;
parameter FMT_YUV444_10B_TILE = 5'b11110;
parameter FMT_YUV400_10B_TILE = 5'b11111;
The following table shows the default swap configuration in various formats:

Table 7-4 The swap configuration table in the default format of the cluster

cluster					
Format		AFBCD_uv_swap	AFBCD_rb_swap	rb_swap	uv_swap
AFBCD	ARGB	0	0	0	0
	RGB888	0	0	0	0
	RGB565	0	1	0	0
	YUV444	0	1	0	0
	YUV422	1	0	0	0
	YUV420	1	0	0	0
	YUV444_10b	0	1	0	0
	YUV422_10b	1	0	0	0
	YUV420_10b	1	0	0	0
LINE	ARGB888	0	0	1	0
	RGB888	0	0	1	0
	RGB565	0	1	0	0
TILE	YUV444_TILE	0	0	0	1
	YUV422_TILE	0	0	0	1
	YUV420_TILE	0	0	0	1
	YUV400_TILE	0	0	0	0
	YUV444_TILE_10B	0	0	0	1
	YUV422_TILE_10B	0	0	0	1
	YUV420_TILE_10B	0	0	0	1
	YUV400_TILE_10B	0	0	0	0

7.4.1.3 AFBCD mode

The combinations of AFBCD define supported by VOP are as follows, divided into RGB and

YUV:
RGB format:
AFBC_SIZE_16X16
AFBC_SIZE_16X16| AFBC_CBR
AFBC_SIZE_16X16| AFBC_SPARSE
AFBC_SIZE_16X16| AFBC_CBR| AFBC_SPARSE

AFBC_SIZE_16X16| AFBC_YTR|
AFBC_SIZE_16X16| AFBC_YTR| AFBC_CBR
AFBC_SIZE_16X16| AFBC_YTR| AFBC_SPARSE
AFBC_SIZE_16X16| AFBC_YTR| AFBC_CBR| AFBC_SPARSE

YUV format:
AFBC_SIZE_16X16| AFBC_CBR AFBC_CBR
AFBC_SIZE_16X16| AFBC_CBR| AFBC_SPARSE

The various define of the kernel are described as follows:

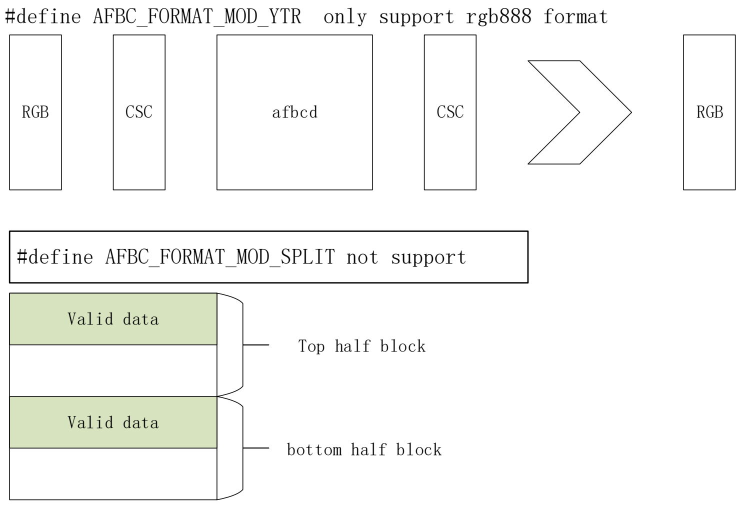

Fig. 7-17 Diagram 1 of AFBCD define

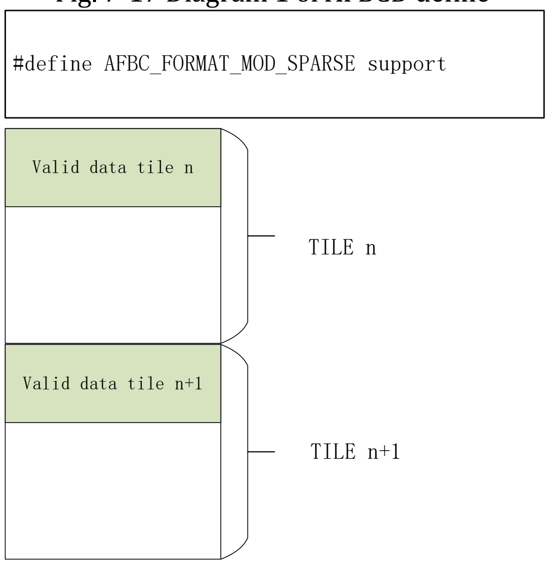

Fig. 7-18 Diagram 2 of AFBCD define

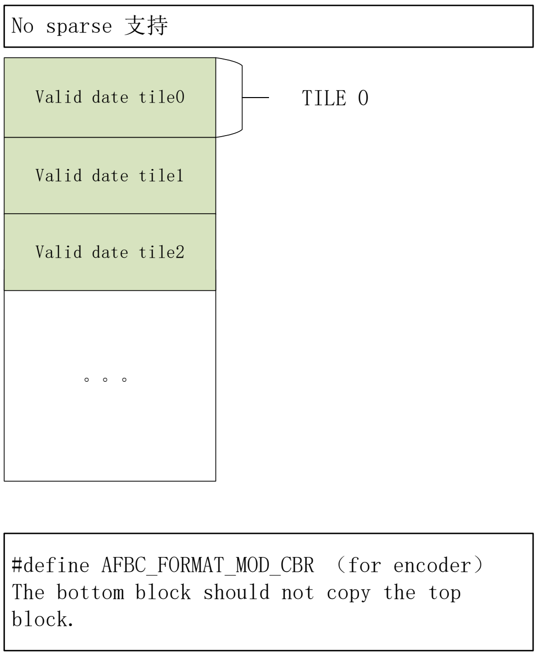

Fig. 7-19 Diagram 3 of AFBCD define

7.4.1.4 line/tile mode

When using raster sequence line/tile mode
Line mode:

- RGBA8888
- RGB888
- RGB565

Tile8x8 mode :

- YUV420 8bit/10bit
- YUV422 8bit/10bit
- YUV444 8bit/10bit

7.4.1.5 CSC module description

Support yuv2rgb, rgb2yuv color gamut space conversion, you can select the corresponding csc according to the input image format and the spatial gamut of the overlay.

RGB2YUV supports the following modes:
Parameter BT_601_L = 2’b00;
Parameter BT_709 = 2’b01;
Parameter BT_601_F = 2’b10;
Parameter BT_2020 = 2’b11;

YUV2RGB supports the following modes:
Parameter BT_601_L = 2’b00;
Parameter BT_709 = 2’b01;
Parameter BT_601_F = 2’b10;
Parameter BT_2020 = 2’b11;

In BT2020 mode, it defaults to limit range, and there is no full range option.

7.4.1.6 Gauss filter

As shown in the figure, the two-scale Gauss filter weighted sum mainly includes two steps: the first step is to calculate the edge detection and the strong and weak Gauss filter respectively; the second step is to obtain the weighting coefficient and the result of the two Gauss filter based on the edge detection result Perform a weighted sum.
In principle, denoising intensity and detail preservation are two mutually exclusive effects, so edge detection and weighting are used to balance the effects of both sides as much as possible, and the filtering effect should be strengthened in the flat area as much as possible, and filtering should be done as little as possible in the rich detail area to avoid affecting the

sharpness and detail.

Through edge detection, confirm whether the calculation point is an edge or a flat area. If it is an edge, use weak Gauss filter to preserve details. If it is a flat area, use a stronger gauss to enhance the filtering effect.

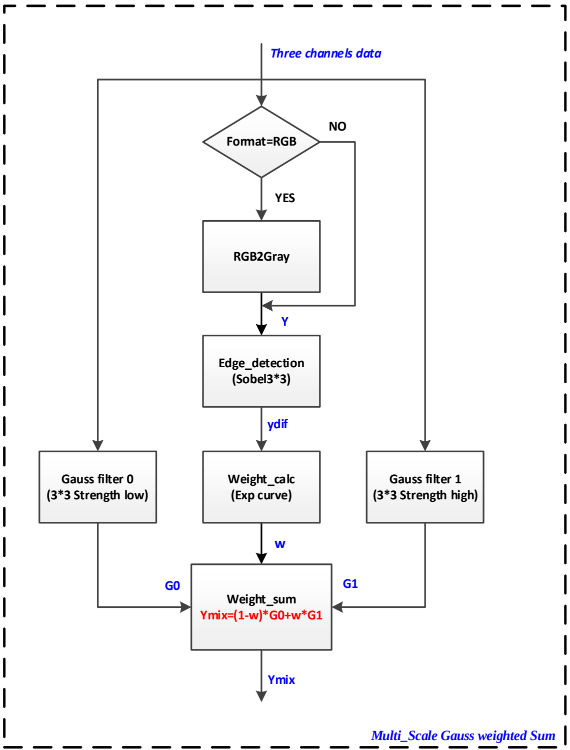

Fig. 7-20 Flow chart of dual gauss filter

In terms of configuration, filter coefficients of high and low intensities are respectively configured. If they are configured to be consistent, it can be considered as a unified Gauss filter.

7.4.1.7 Scale

In the horizontal direction: bilinear and bicubic
In the vertical direction: bilinear

7.4.1.8 Mirror/rotation

In AFBCD full mode, cluster supports X-mirror, Y-mirror, X-mirror plus Y-mirror (equivalent to rotation180°), and rotation 90° and rotation270°.

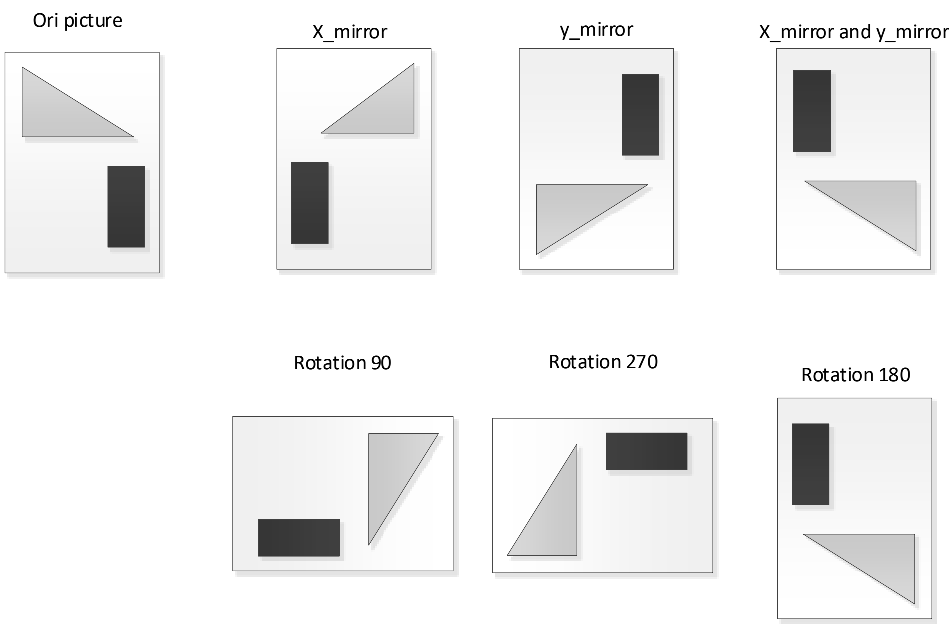

Fig. 7-21 Schematic diagram of mirror and rotation

7.4.1.9 Crop

Due to the characteristics of Android, the UI stored in the DDR is often an image larger than the actual display, so it is necessary to cut out a small image from the original image to display.

For VOP, only the following key parameters are required:
(1) pic base_DDR
(2) Vir_stride
(3) Act_width/act_height
(4) Act_x_offset/act_y_offset

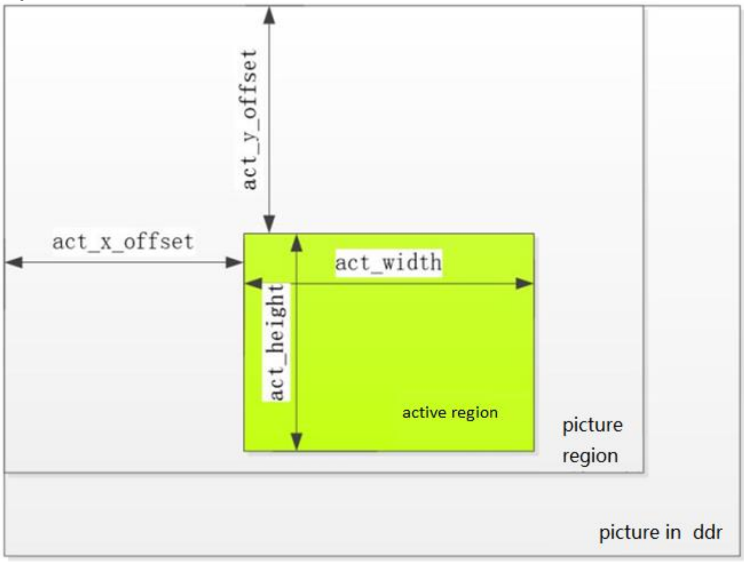

Fig. 7-22 Image storage and activation diagram

The characteristics of the Cluster layer, that is, for the AFBCD-encoded layer, the original width and height are all aligned with 16 pixels.

7.4.1.10 Cluster Usage Constraints

1. The virtual width and height need to be aligned to 16 pixels and the act_width shall not exceed 4096 or 2048 after alignment.
2. In the case of AFBCD rotation enable, virtual width need to be aligned to 64 pixels. The source picture's height cannot exceed 2048 pixels. Rotation and x-mirror can be enabled at the same time, but rotation and y-mirror are not supported at the same time. Rot90 and rot270 cannot be enabled at the same time.
3. Line/Tile mode unsupported: Guass Filter / Rotation / Mirror.
4. Line/Tile mode, the half mode bit should be set to 1.
5. Scaling ratio: (1/4~4)
6. In the case of LB two window mode, (act_width+act_xoffset%16) <= 2048 pixels.
7. In the case of LB two window mode, the parity of the two windows's dsp_xoffset、dsp_yoffset and dsp_width value shoule be same.
8. When AFBCD_mode is half mode, crop can be 0 or 1; when AFBCD_mode is full mode, crop can be 0/1/2.
9. When enable the win*_yrgb_vsd_gt4, the win*_act_yoffset should be multiple of 4.
10. When enable the win*_yrgb_vsd_gt2, the win*_act_yoffset should be multiple of 2.
11. When the data format is YUV420, the win*_act_xoffset and win*_act_yoffset should be multiple of 2.
12. When the data format is YUV422, the win*_act_xoffset should be multiple of 2.

7.4.2 Esmart layer

1. Feature
- Support line mode
- Support color gamut space conversion

- Support 4 area display
- Support 1/8~8 times infinite scale
- Support image virtual width/cropping

2. Basic bus
The bus behavior of the Smart layer is to take one row of buffers when one row is free. It cannot be taken in two rows at a time like the 8 rows of the cluster layer. Basically, each row has a part of time for bus access. The power consumption of DDR is also not very friendly.

3. Power consumption description
The logical power consumption of the smart layer is smaller than that of the cluster layer, but because the cluster has AFBCD modules, plus the power consumption of the DDR controller and phy, the overall power consumption of the smart layer is much larger than the overall power consumption of the cluster layer.

It is recommended to use AFBCD as much as possible for those AFBCD application, and smart layer may be used in multi-region features.

7.4.2.1 Format

Table 7-5 Swap configuration table in esmart default format

esmart		
Format	**rb_swap**	**uv_swap**
ARGB	1	0
RGB888	1	0
RGB565	0	0
YUV420	0	1
YUV422	0	1
YUV444	0	1
YVYU422	0	1
YVYU420	0	1
VYUY422	0	1
VYUY420	0	1
YUV420_10b	0	1
YUV422_10b	0	1
YUV444_10b	0	1

7.4.2.2 CSC

Smart's csc and cluster are the same, please refer to the cluster chapter.

7.4.2.3 Scale

Horizontal direction algorithm:
Scl up: best-neigh/bilinear/bicubic
Scl dn: best-neigh/bilinear/average

Vertical direction algorithm:
Scl up: best-neigh/bilinear/bicubic
Scl dn: best-neigh/bilinear/average

7.4.2.4 Crop

The cutting function of Smart is basically the same as that of cluster, and the film source does not have the limitation of 16align.

7.4.2.5 Usage Constraints

(1) YUV422/420_10b act_offset in smart must be an integral multiple of 8.
(2) vrev_en is not supported under YUYV420.
(3) Under the YUYV/VYUY420 format, the uv component does not support the bic/average algorithm in the Y direction.

(4) In YUYV/VYUY420 format, the Y direction cannot exceed 2 times when scaling (bil/nei algorithm).

7.4.3 8K Senario

7.4.3.1 Layer stitching

Since 8K(7680x4320) is 4 times the performance of 4K, the performance of a single layer 2pixel rate*750M cannot meet the requirements of 8K (4pixel rate*600M). So two layers are needed to stitch together to get 4pixel rate * 750M computing performance to meet actual needs.

Fig. 7-23 Description of 8K layer left and right stitching

7.4.3.2 8K Scaling

7.4.3.2.1 No scale

For the scene without scaling, a picture size between 4K and 8K is displayed on the screen of 7680x4320 as follows. It is recommended that the left 4K part is handed over to a cluster or esmart layer to process, and the remaining right part is handed over to the other layer.

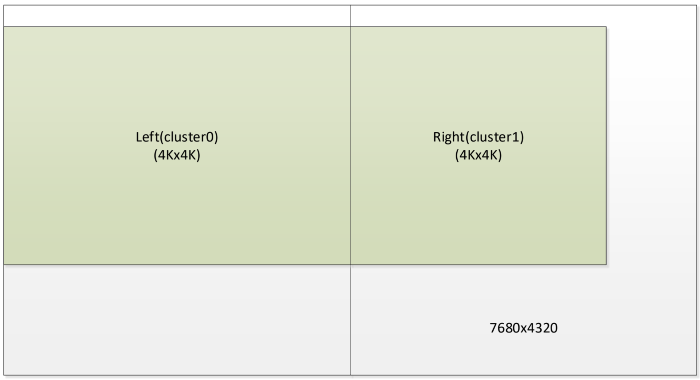

Fig. 7-24 8K Diagram without Scaling

7.4.3.2.2 Scale up

As shown in the figure below, if a 4K picture needs to be placed in 6.5K and displayed on an 8K interface; the configuration needs to reverse the left and right of dst to src and enlarge them respectively.

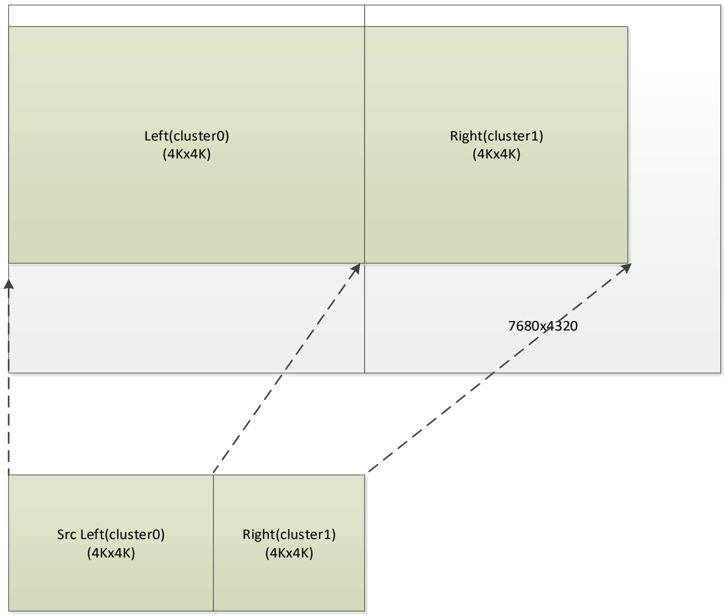

Fig. 7-25 8K scale up schematic diagram

7.4.3.2.3 Scale down

- Cluster:

Due to the performance problems of the previous layer processing under 8K, the cluster performance cannot meet the downscale requirement. At the same time, the structure of the cluster is the data advanced line buffer and then scaled, so try not to use the cluster layer When scaling out, scaling can only scale out in the center of the layer. It can meet 8096->7680. That is, the processing scene is that the source is 8K and the screen is 7680. in addition, it can meet the reduction problem of TV over-scanning.

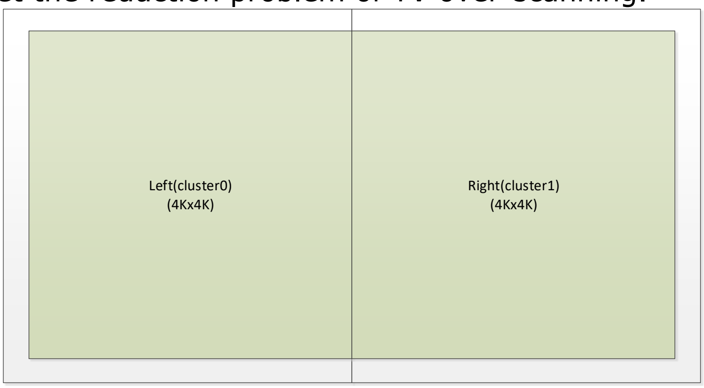

Fig. 7-26 8K centered scaling diagram

- Smart:

Because the structure of smart is different from cluster, the scaling process for X direction is finished before writing to the buffer, so for smart, 8K scaling has no effect, as long as destination picture size does not exceed 4K, source picture size could support 8K. As shown in the figure below, a 6.5K source picture needs to be displayed on the left half of the screen, so only one layer needs to be enabled.

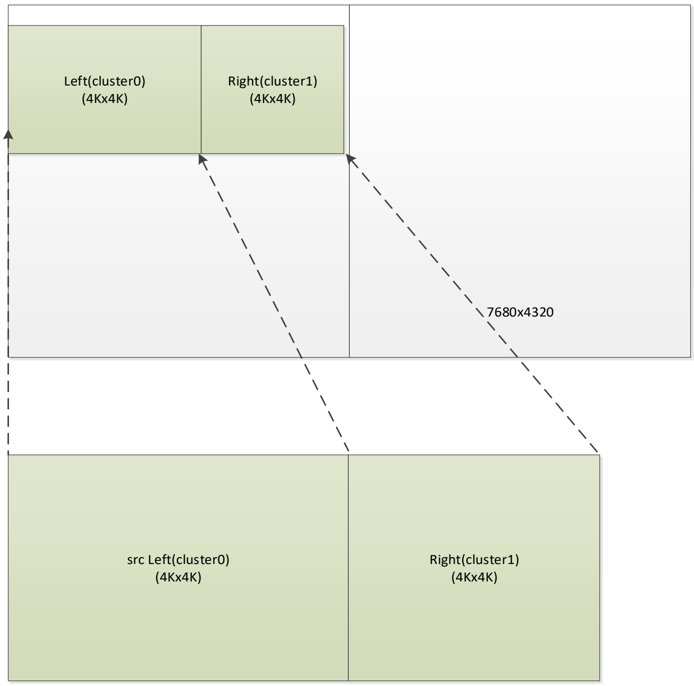

Fig. 7-27 8K smart scaler down schematic diagram

7.4.3.3 PORT splicing and configuration

For the post-processing module, it is also required to support the 8K resolution through the cooperative processing of the two PORTs where enable port0 and port1 at the same time. And the subsequent processing of the two PORTs both are processed in accordance with the 4Kx4K image processing of the left and right half screens, and are written into the post line buffer according to a certain data order relationship. Finally, under the control of the scan timing of port 0, the left half and the right half of the image data are sequentially read from the line buffer 0 and the line buffer 1 to form a complete 8K picture.

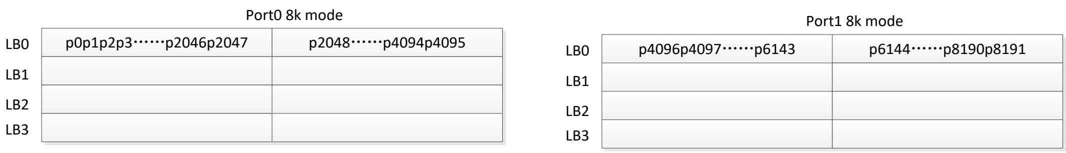

Fig. 7-28 Description of PORT0/1 Post Line Buffer in 8K Mode

7.4.3.4 8K Usage Constraints

(1) It is recommended that the cluster does not enable scaling function.
(2) To support over 4K resolution, the width of picture shall be 8 pixel's alignment.
(3) Unsupport feature: rotation

7.4.4 HDR10

7.4.4.1 Basic process introduction

- **SDR2HDR**

In order to get a better viewing experience, not only the bit depth and the ITU standard have been upgraded to 10bit BT2020, but also HDR has been studied in recent years, with a higher dynamic range to better produce bright and dark scenes.
The conversion process is shown in the figure below:

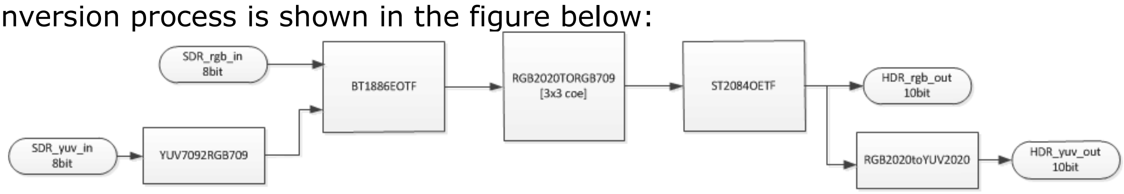

Fig. 7-29 SDR2HDR conversion flowchart

- **HDR2SDR**

The conversion process is shown in the figure below:

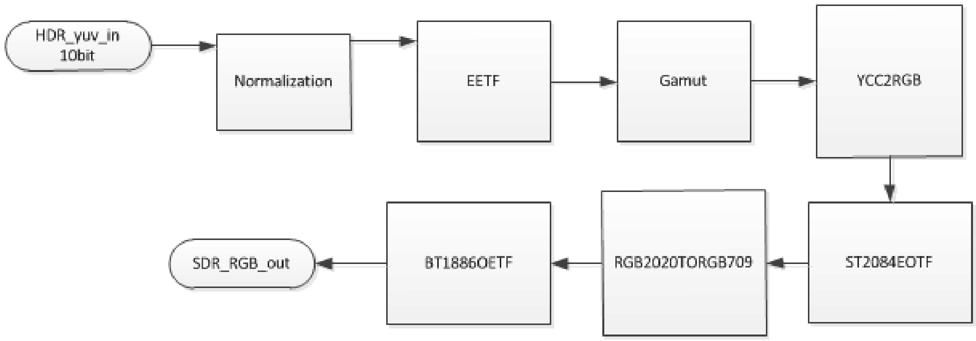

Fig. 7-30 HDR2SDR conversion flowchart

7.4.4.2 LUT configuration instructions

7.4.4.3 Display Effect

If the TV is in HDR mode, then the original SDR source or SDR UI needs to be converted accordingly, otherwise the displayed color will have a great sense of distortion (such as over-saturated, over-brilliant).

If the TV interface is SDR, user need to do the corresponding conversion when playing HDR source, otherwise there will be great distortion in the displayed color (such as loss of saturation and pale color).

7.4.5 Overlay

7.4.5.1 Schematic diagram of layer data path

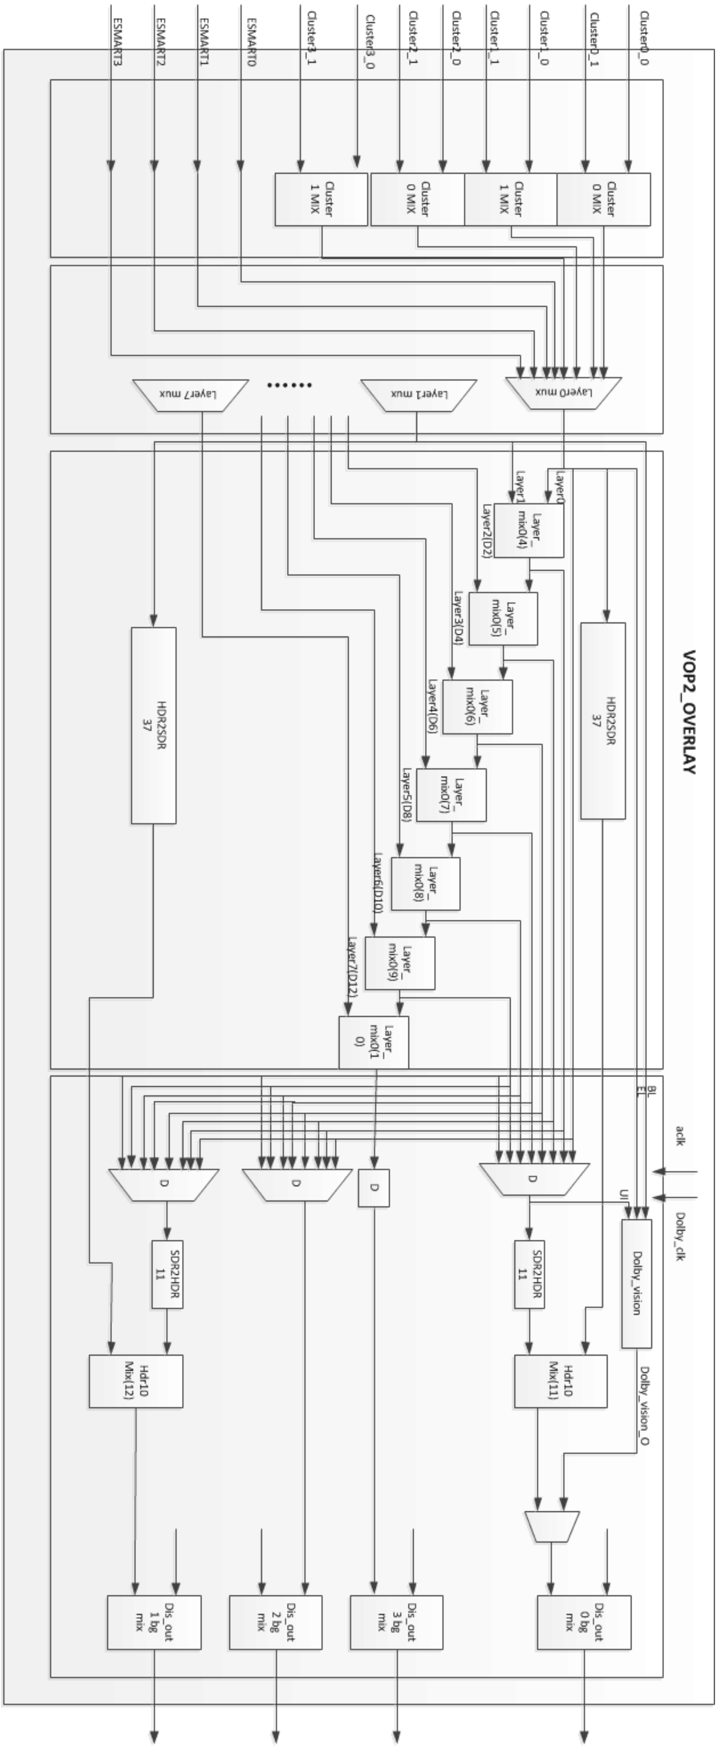

Fig. 7-31 VOP2 overlay block diagram

7.4.5.2 Delay setting of each function

As shown in the figure below, the upper part is the basic delay of each module, the lower

part is the typical delay number setting. Bg is set according to the output of the last level of mux, if the output from the previous level is reduced by 2 on this basis.
The following conditions shall be met:
Cluster default delay+HDR default delay+the delay set by the cluster software =
Smart default delay+HDR default delay+the delay set by the smart software =
Delay set by Bg
Typical settings are as follows:

Table 7-6 Default table of layer delay number

Block		**Delay_num**
HDR2SDR		37
SDR2HDR		11
cluster		33
esmart		14
The delay of the last mux output	ovl_PORT0/1	17
	ovl_PORT2/3	15

Table 7-7 Default table of layer delay number

	cluster	**esmart**	**bg0/1(The delay of the last level mux output)**	**bg2/3(The delay of the last level mux output)**
normal	4	23	54	52
HDR2SDR	26(SDR)	45(SDR)	76	NA
	4(HDR10)	23(HDR10)		
SDR2HDR	4(SDR)	23(SDR)	65	NA
	29(HDR10)	48(HDR10)		

7.4.5.3 Alpha module

If there is no alpha processing, it is a direct coverage effect. Therefore, it is necessary to do an alpha effect on the corresponding layer or the corresponding position to achieve the superposition of the UI and the background or video. Most of them are aimed at the RGB data with alpha output by the GPU, such as RGBA8888; or the global alpha of the layer is configured inside the VOP to realize the special effect of superimposing between the layers. The following picture shows the basic alpha overlay effect:

Fig. 7-32 Schematic diagram of alpha effect

1. Per-pixel Alpha

Per-pixel alpha, as the name implies, is that each point has corresponding alpha information. As shown in the picture above, the alpha value of each point in Jordan's picture increases from 0 to 255 in cycles from left to right, and the effect gradually changes from fully transparent to impermeable.

2. Global Alpha

The global alpha has nothing to do with the original data. You can set the alpha value of the entire layer separately. As shown in the figure above, the little bee layer is a global alpha effect, and the transparency of the entire layer is the same.

3. Pre-mult Alpha

Pre-multiplied alpha means that in the process of GPU operation, the original data and alpha have been multiplied accordingly, and there is no need to multiply alpha by its own RGB value during subsequent superposition.

The modes of Alpha are shown in the figure below:

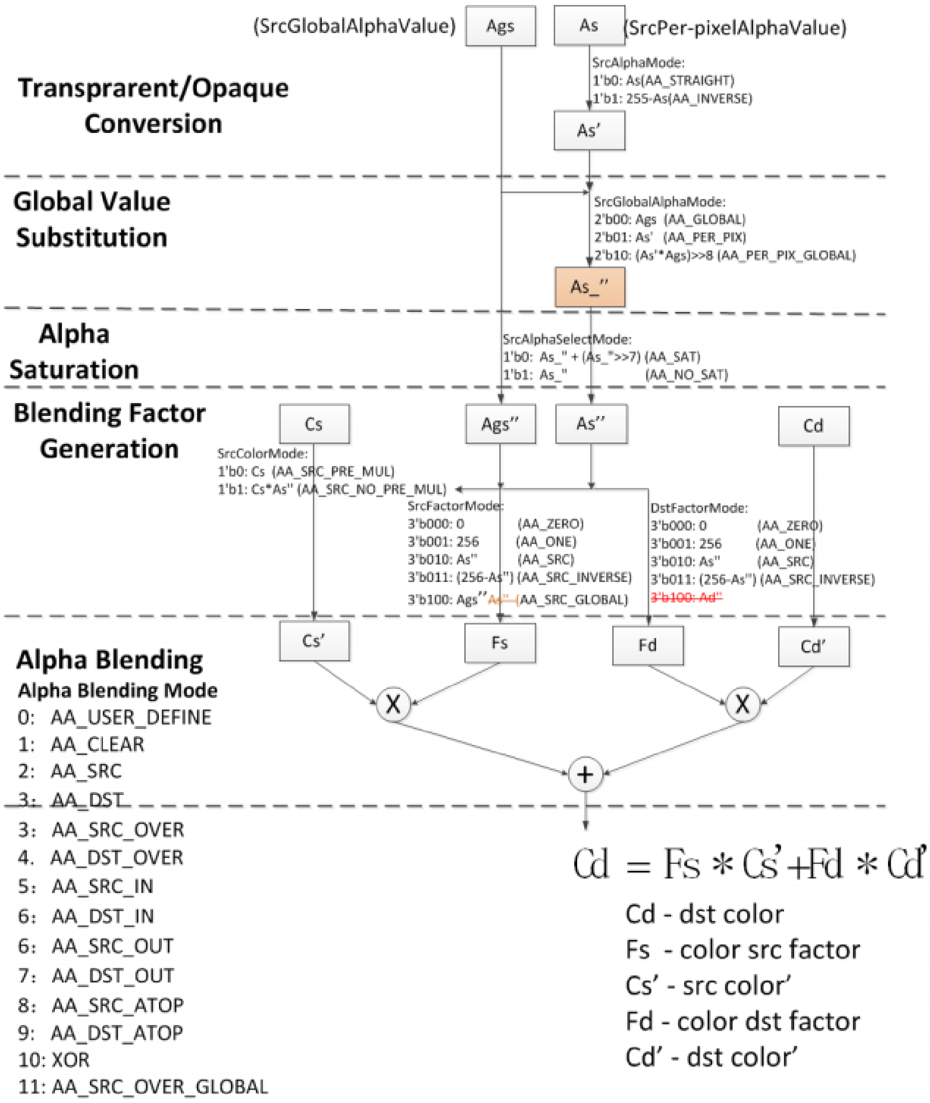

Fig. 7-33 Alpha structure diagram

7.4.5.4 Secure Mode

The secure mode hardware will put the secure layer on the top layer of the selected PORT. For details, please refer to the description of 1.3.9 secure scheme.

7.4.5.5 Usage Constraints

(1) When the layer is switched by bus, the layer shall be disabled.
(2) When the post is switching mix, all the layers involved shall be disabled.

7.4.6 Write Back

7.4.6.1 Support format

1. Support format

- ARGB888
- RGB888
- RGB565

- YUV420

2. Color gamut conversion
Since the main application scenario output is RGB, but there is a need for YUV420 write-back, the write-back module adds RGB2YUV format conversion, which is enabled by configuring wb_rgb2yuv_en register bit.

7.4.6.2 Single frame/multi frame mode

(1) Single frame mode
Operating in single frame mode, enable the oneframe_clr register, and automatically disable wb_en after each frame is written, so that only one frame of content will be written out.

(2) Multi-frame mode
Each frame is configured with a different address, and the wb module will continuously write out the corresponding whole frame content.

(3) Line write mode
After enabling, the pixels accumulated in a row are written back to DDR in a concentrated manner to improve the efficiency of write back.

7.4.6.3 Horizontal scaling

The bilinear scaling algorithm is used in the horizontal direction.

7.4.6.4 Vertical stroke

Due to the limitation of memory, there is not enough linebuffer opened separately, so no scaling is done in the y direction. If more than twice, wb_ythrow_en is configured to control the line-throwing operation to reduce the output bandwidth.

7.4.6.5 Usage Constraints

(1) In the case of YUV domain output, the conversion of YUV2RGB is not supported, that is, RGB format cannot be written back under YUV domain.
(2) Act_width must be an integer multiple of 16 in write-back mode.

7.4.7 Post process

Function of each PORT 0/1/2/3 and the post-processing modules included in each PORT.

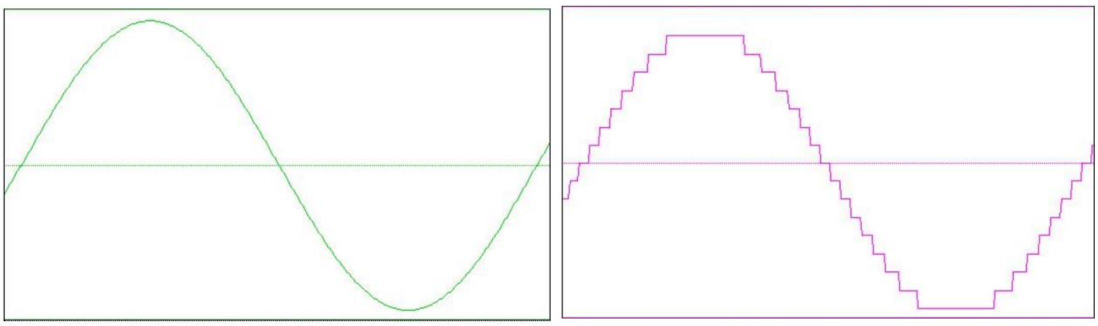
7.4.7.1 Color bar

Each PORT has a corresponding color bar setting, which can be used to debug to eliminate bus and layer problems, and it can also bypass the layer to directly adjust each high-speed output interface.
Control register color_bar_en to enable colorbar of PORT;
Control register color_bar_mode to switch horizontal colorbar or vertical colorbar.

7.4.7.2 Dither

If an 8bit film source needs to be output to the rgb666 screen, if there is no dither, it is directly connected to the screen with a high 6bit. In this case, the color gradation will be caused.

In principle, the smooth curve becomes a ladder after losing the low position. In order to solve this problem, noise is added to the ladder, so that the transition can restore the original smooth curve as much as possible.



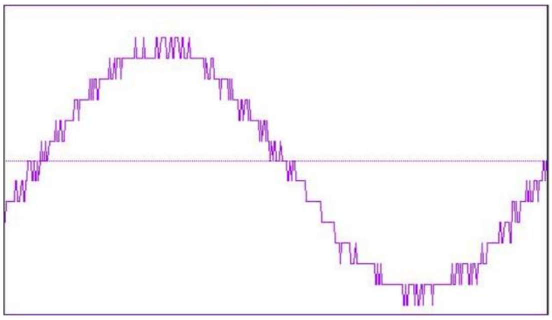


Fig. 7-34 Schematic diagram of dither principle

VOP has ALG in the dither algorithm of 10bit->8bit; there are ALG and FRC in the dither algorithm for 8bit->666/565, which can be selected by dither_down_mode.

ALG algorithm: Add fixed noise, the possible negative effect is that there will be more regular stripes similar to tire tracks;

FRC algorithm: time-domain jitter is added to the space, which works well in high frame rate scenes, and low frame rate scenes may feel a little flickering and jittery.

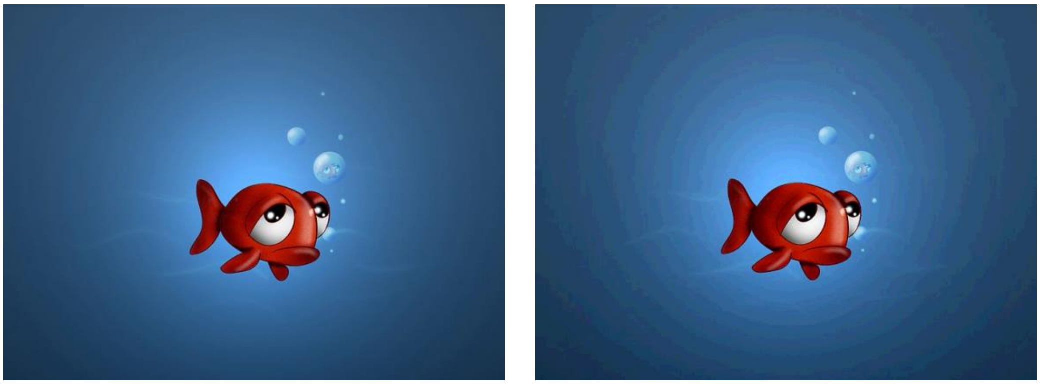

Fig. 7-35 Dither effect diagram

Left: original picture; right: direct clip effect

The above picture shows the color scale effect of the original picture and the direct clip. The figure below is the figure processed by the dither algorithm. The overall effect is obvious to solve the color gradation problem caused by dither, but after partial magnification, the tire-like effect on the right side of the figure below will appear.

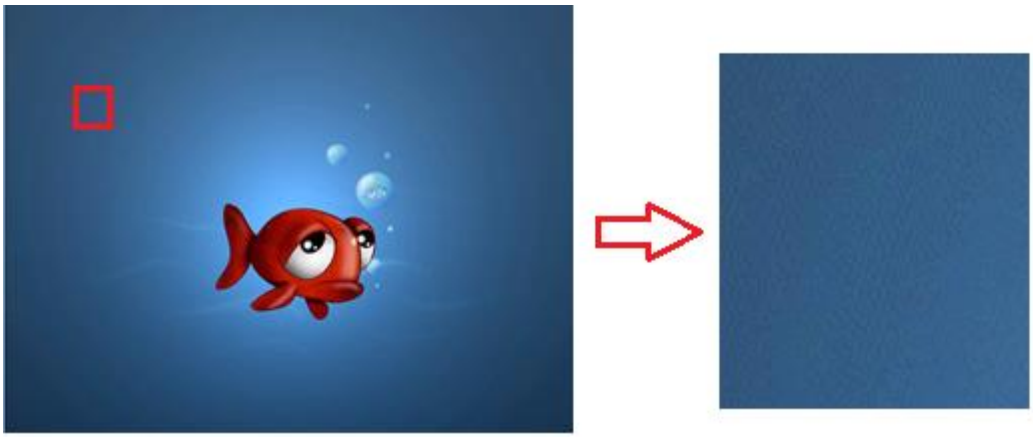

Fig. 7-36 Schematic diagram of dither's tire pattern

7.4.7.3 BCSH

BCSH mainly adjusts the following effects:

(1) CON: Contrast coefficient

(2) BRT: Bright picture adjustment value

(3) HUE: hue adjustment angle

(4) SAT: Saturation coefficient

Y processing calculation formula
Y0=Y_{input}-16;   (0<Y0<239)
Y1=Y0*CON; (0<CON<1.992)   (0<Y1<478)
Y2=Y1+BRT;(-32<BRT<31)   (-32<Y2<509)
Y3=Y2+16;   (-16<Y3<525)
Y_{output}= 4 mux 1

U processing calculation formula
U0=U_{input}-128;   (-128，127)
U1=U0*cosHUE + V0*sinHUE （-30º<HUE<30º）   (-175，174)
U2=U1*CON*SAT; (0<CON<1.992，0<SAT<1.992)   (-695，691)
U3=U2+128;   (-567，819)
U_{output}= 4 mux 1
Cos(HUE)+sin(HUE) = $(1+1/2*\sin(2HUE))^{1/2}$;
So this value increases monotonically with the increase of the value of HUE. The value range of HUE is -30~30.

V processing calculation formula
V0=V_{input}-128;   （-128，127）
V1=V0*cosHUE - U0*sinHUE （-30º<HUE<30º）   （-175，174）
V2=V1*CON*SAT; (0<CON<1.992，0<SAT<1.992)   （-695，691）
V3=V2+128;   （-567，819）
V_{output}= 4 mux 1
cosHUE-sinHUE = $(1+1/2*\sin(-2HUE))^{1/2}$;

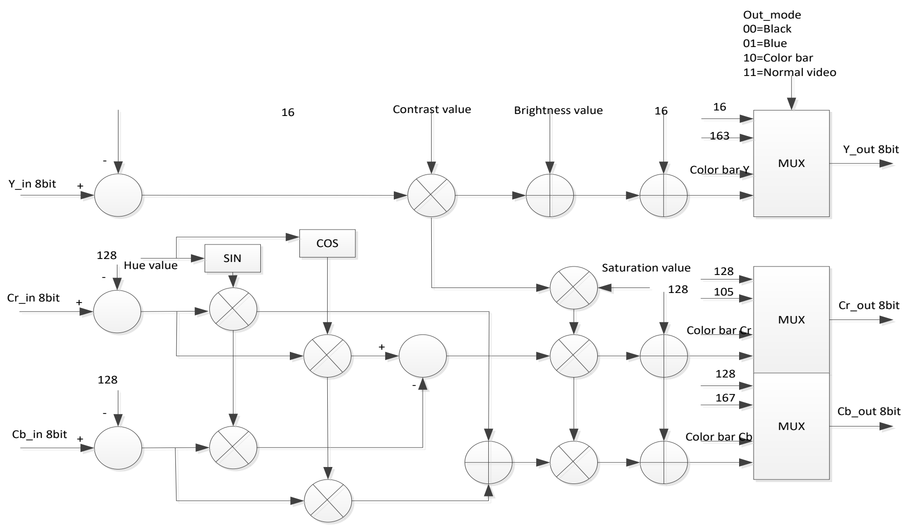

Fig. 7-37 Schematic diagram of BCSH algorithm

7.4.7.4 Gamma

Gamma basic principle:
Gamma can be understood as a 1:1 remapping of the RGB on the display channel. The three RGB curves can be consistent or inconsistent. Therefore, the display color temperature and blue light removal effects can be adjusted through the mapping relationship of the three curves.

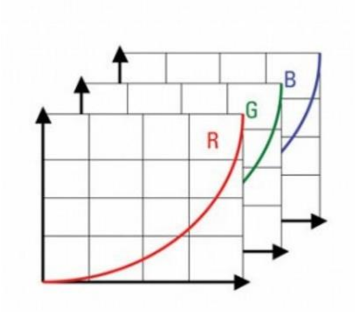

Fig. 7-38 Schematic of gamma

Dual gamma:
Because the application may adjust the gamma curve to achieve dynamic adjustment of some color temperature effects. However, the memory of the gamma table is a single-port memory. When a new table is written, it is necessary to disable gamma, which will cause screen flicker when dynamically adjusting the gamma curve.

In order to solve this flicker phenomenon, VOP adopts the ping-pong dual gamma. By statically switching gamma, one table is displayed and used in real time, and the other table is a new table that can be configured.

7.4.7.5 3D LUT

Gamma can be regarded as a 1D LUT. The RGB data in the 1D LUT are independent of each other, which means that the 1D LUT can only control the gamma value, RGB balance (gray scale) and white point. In order to overcome the limitation of 1D LUT, we can form a 3×3 matrix of three 1D LUTs of RGB to control the color saturation and brightness, and perform linear scaling in the complete color space. The 3D LUT can affect the hue, saturation, brightness, etc. in a full three-dimensional color space control method.

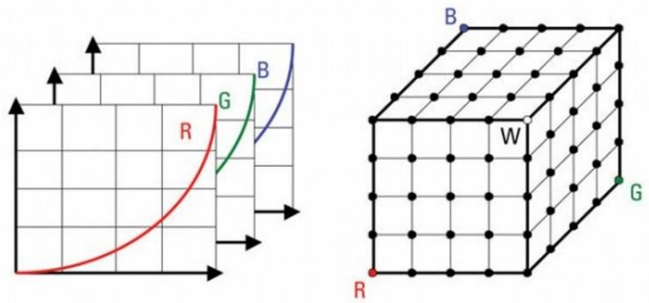

Fig. 7-39 Schematic diagram of 2D/3D-LUT

3D LUT application scenarios:
(1) Calibration (calibration LUT)
It is mainly used for the calibration of hardware and display equipment in color management. The video will be processed by different systems during the shooting, post-processing and final projection, and will appear in different forms. Therefore, the 3D LUT color space mapping can ensure that the video remains visually consistent in different systems.

(2) Technology (Technical LUT)
It is mostly used for conversion under different characteristic curves in different color spaces. Mapping from Log to Rec709 belongs to this type. The color standards of computer monitors, televisions, mobile phones, and Pads that we come into contact with in work and life are very close to Rec.709. However, now a large number of cameras and even SLRs can shoot log (Log) video. If the log video is sent to the Rec.709 standard monitor for monitoring, it cannot be restored normally. The fundamental reason is that the gamma difference between the two is very large, so it needs to be artificially corrected to the display system gamma.

Fig. 7-40 Effect picture before correction

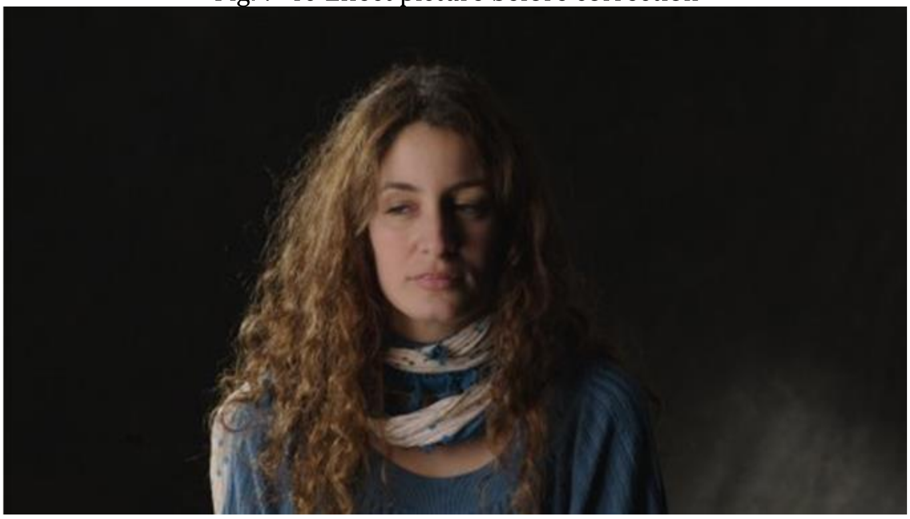

Fig. 7-41 Effect picture after correction

(3) Style (Creative LUT/Looks LUT)

In order to realize a certain style of LUT, the LUT produced by the director of photography during the pre-shooting and can be previewed on-site. Using LUT to calibrate the color of the monitor does not creatively process the video. Another type of use of LUT is to color, that is, creatively process the video.

Fig. 7-42 Effect picture before and after toning

Comparison of 3D LUT before (left) and after (right) toning

Accuracy description

Most 3D LUTs use stereo in the range of 9^3 to 65^3. A 9^3 LUT means that each axis has 9 points from input to output, and between these points Interpolation is required for the value between. Different systems will achieve this with varying degrees of accuracy.

In the evaluation of accuracy, the linear table adds a random value of 0 to 0.1 to make a non-linear 3DLUT table. Then use 9x9x9, 17x17x17, 33x33x33 table item evaluation respectively, it can be seen that the more table items, the closer the polyline effect can be. Some scenes need to use 33x33x33 3d LUT.

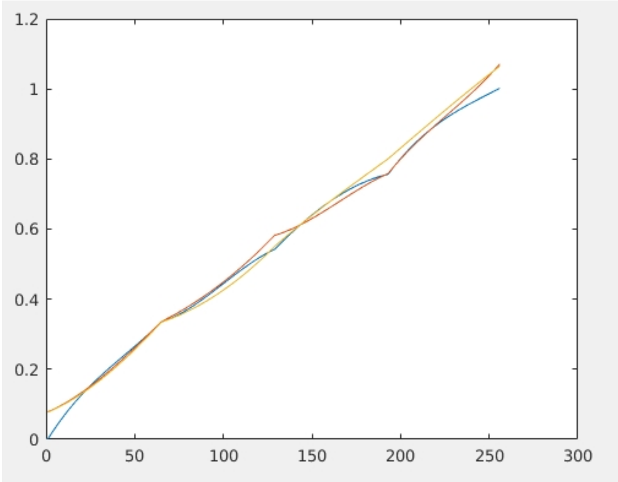

Fig. 7-43 9x9x9 table renderings

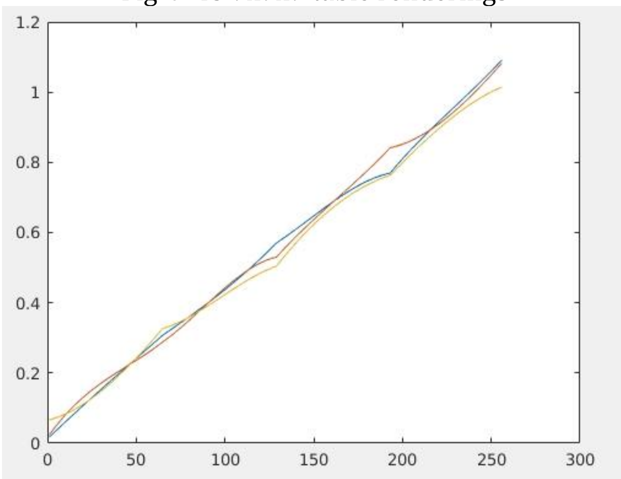

Fig. 7-44 17x17x17 table renderings

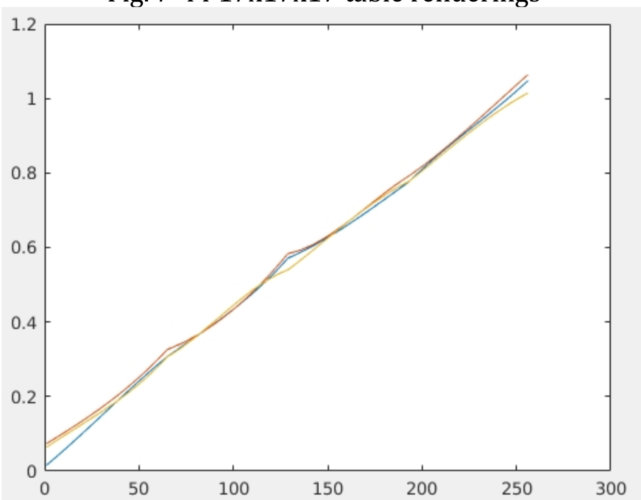

Fig. 7-45 33x33x33 table renderings

But from an implementation point of view, the memory area occupied by 33x33x33 is too large.
7*7*7 memory area 0.0638*2 = 0.1276 mm2
17*17*17 memory area 0.1742*2 = 0.3484 mm2
33*33*33 memory area 0.4683*2 = 0.9366 mm2

According to the compromise between application scenarios and area in VOP, the accuracy of 3D LUT is allocated as follows:
PORT0 and PORT1: 9x9x9;
PORT2: 17x17x17;
PORT3: 3DLUT is not supported.

Application and configuration

In the application, user can adjust the required scene effects through the 3D LUT Creator software and save the 3D LUT table configuration corresponding to 9x9x9 or 17x17x17 to the address corresponding to the VOP.

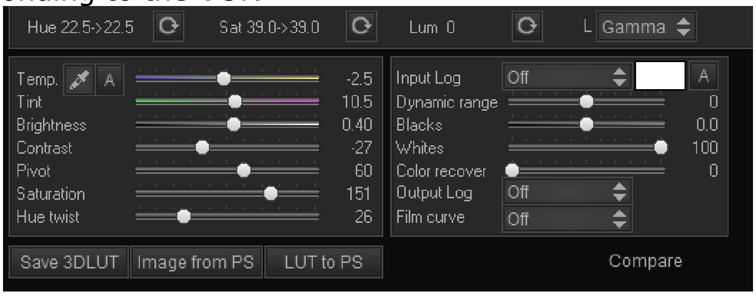

Fig. 7-46 Basic operation interface of 3D LUT Creator

For example, for a 9x9x9 LUT table, a 729-point constant needs to be written to the corresponding memory, which can be written through AXI or AHB. The arrangement is as follows:

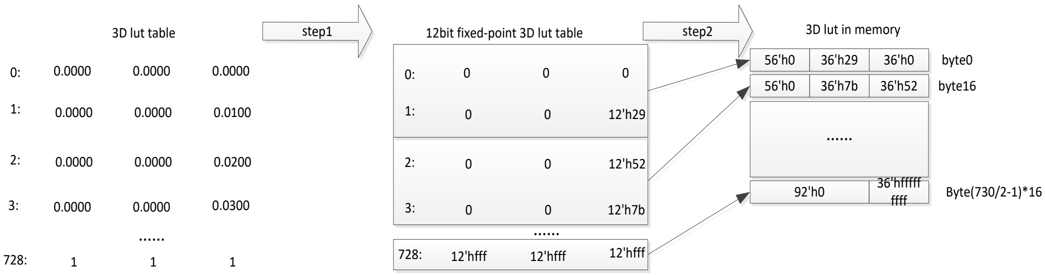

Fig. 7-47 3D LUT table sorting diagram

7.4.7.6 Split

Port0/1/2

7.4.7.7 Timing description

A. Progressive timing configuration

The POST*_PROC registers need to configure:

- VOP_DSP_HTOTAL_HS_END
- VOP_DSP_HACT_ST_END
- VOP_DSP_VTOTAL_VS_END
- VOP_DSP_VACT_ST_END

B. p timing chart example

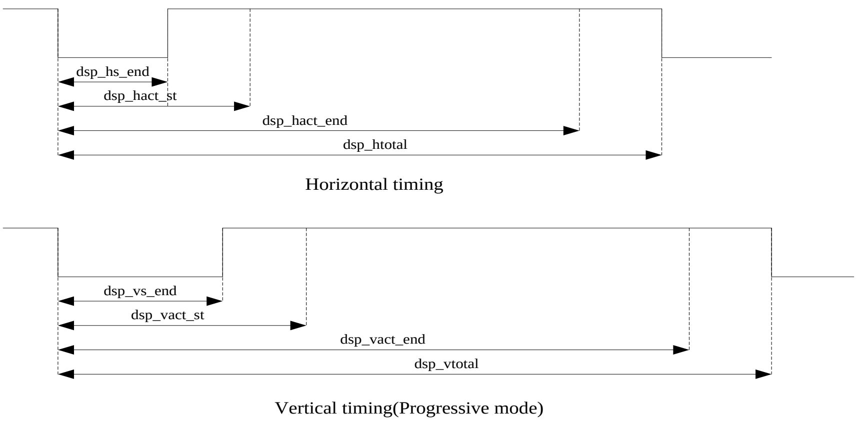

Fig. 7-48 VOP RGB interface timing diagram (progressive mode)

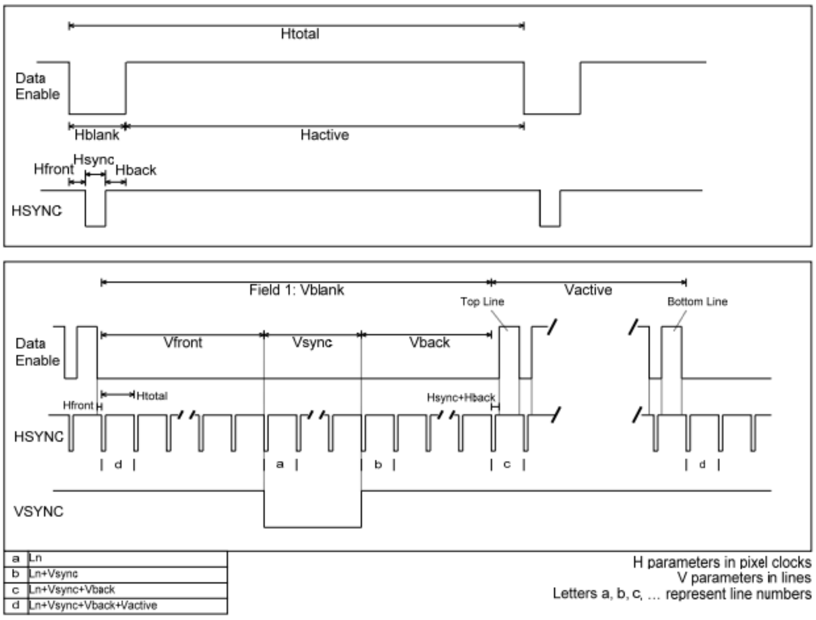

Fig. 7-49 CTA-861 standard timing diagram (progressive mode)

C. Interlace timing configuration

Need to configure the following timing registers:

- VOP_DSP_HTOTAL_HS_END
- VOP_DSP_HACT_ST_END
- VOP_DSP_VTOTAL_VS_END
- VOP_DSP_VACT_ST_END
- VOP_DSP_VS_ST_END_F1
- VOP_DSP_VACT_ST_END_F1

D. i timing chart example

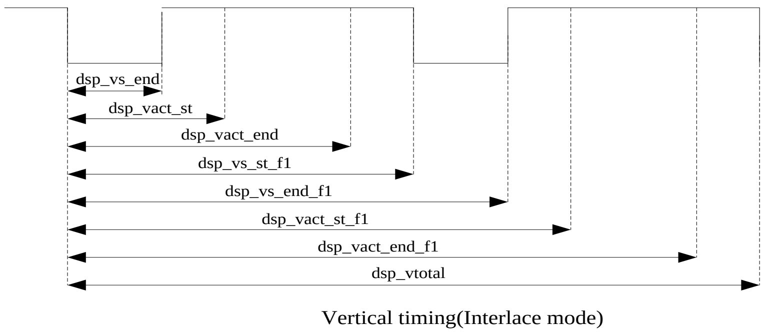

Fig. 7-50 VOP RGB interface timing diagram (interlace mode)

Points to note, the starting point of the second field is at 1/2 of htotal.

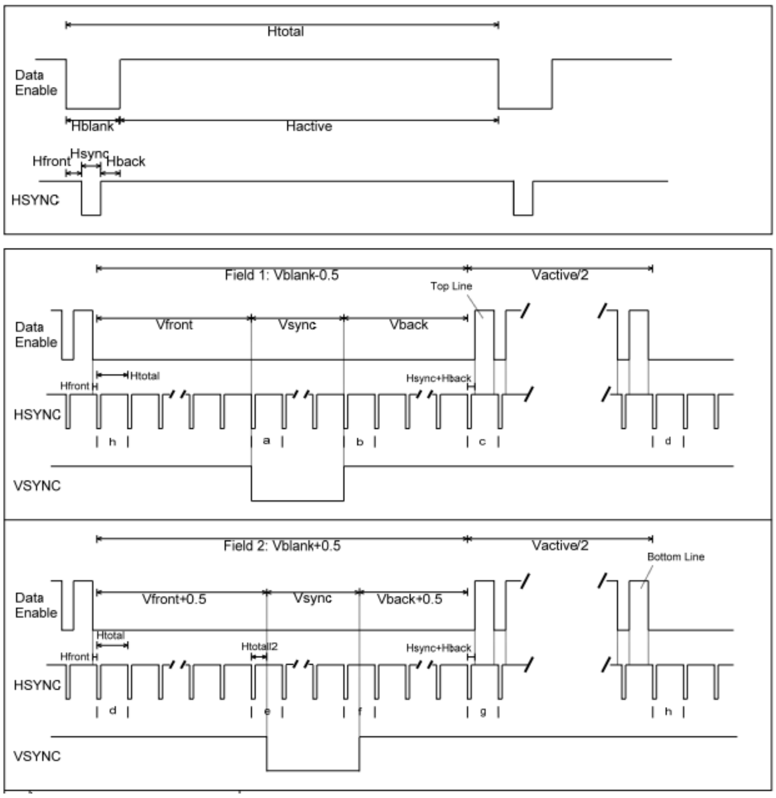

Fig. 7-51 CTA-861 standard timing diagram (interlace mode)

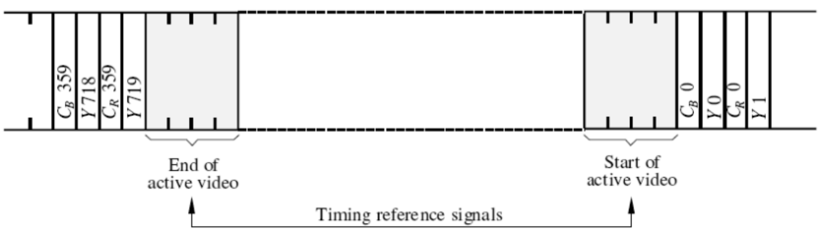
E. BT.656 encoder

VOP extracts the BT656 encoder module separately, the input interface is RGB parallel timing input, and the output is the standard bt656 interface output.

BT656 embeds the line and field synchronization information into the data stream in the form of encoding, which is the so-called Video timing reference codes. Each line includes four parts: SAV, EAV, blanking and video data:

每一行包括SAV、EAV、blanking和video data四个部分：



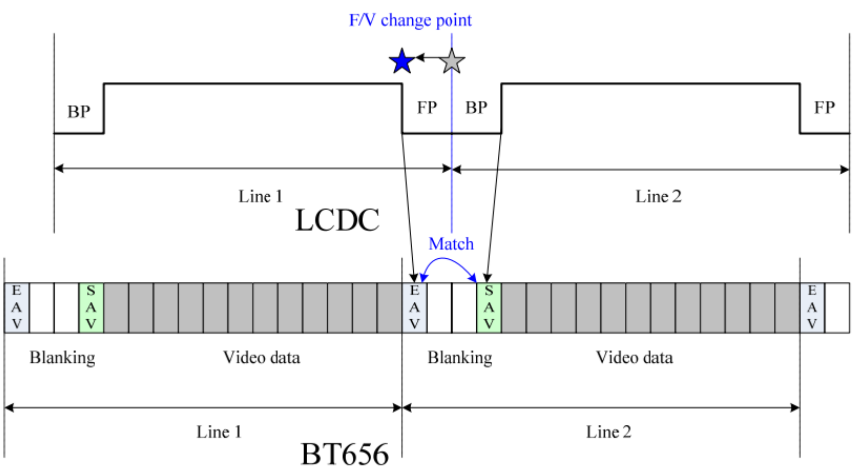


Fig. 7-52 Timing description of BT656

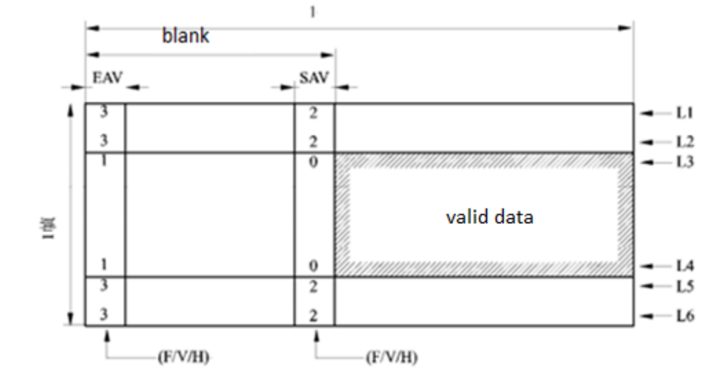
F. BT.1120 encoder

The encoding method is almost the same as BT656, except that the number of data bits increases and the frequency becomes larger to support the transmission of HD data. Maximum support for data transmission up to 1080p, DCLK to 150M. Supports both interlace and progressive transmission at the same time. The specific timing diagram is as follows.



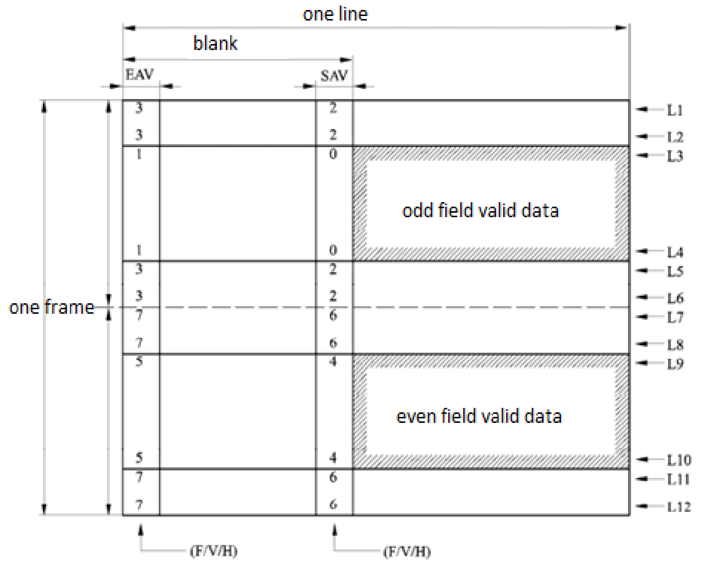


Fig. 7-53 Timing description of BT1120

7.5 Register Description

7.5.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 7-8 VOP2 Address Mapping

Base Address[15:8]	Module	Address Length	Offset Address Range
0x00	SYS_CTRL	256 BYTE	0X0000 ~ 0X00FF
0x02	DSC_SYS_CTRL	256 BYTE	0X0200 ~ 0X02FF
0x06	OVERLAY	256 BYTE	0X0600 ~ 0X06FF
0x0c	POST0	256 BYTE	0X0C00 ~ 0X0CFF
0x0d	POST1	256 BYTE	0X0D00 ~ 0X0DFF
0x0e	POST2	256 BYTE	0X0E00 ~ 0X0EFF
0x0f	POST3	256 BYTE	0X0F00 ~ 0X0FFF
0x10	CLUSTER0	512 BYTE	0X1000 ~ 0X11FF
0x12	CLUSTER1	512 BYTE	0X1200 ~ 0X13FF

Base Address[15:8]	Module	Address Length	Offset Address Range
0x14	CLUSTER2	512 BYTE	0X1400 ~ 0X15FF
0x16	CLUSTER3	512 BYTE	0X1600 ~ 0X17FF
0x18	ESMART0	512 BYTE	0X1800 ~ 0X19FF
0x1a	ESMART1	512 BYTE	0X1A00 ~ 0X1BFF
0x1c	ESMART2	512 BYTE	0X1C00 ~ 0X1DFF
0x1e	ESMART3	512 BYTE	0X1E00 ~ 0X1FFF
0x40	DSC_8K	256 BYTE	0X4000 ~ 0X40FF
0x41	DSC_4K	256 BYTE	0X4100 ~ 0X41FF
0x50	GAMMA_LUT_ADDR	4096 BYTE	0X5000 ~ 0X5FFF
0x60	BPP_LUT_ADDR	1024 BYTE	0X6000 ~ 0X63FF
0x7e	MMU0	256 BYTE	0X7E00 ~ 0X7EFF
0x7f	MMU1	256 BYTE	0X7F00 ~ 0X7FFF

7.5.2 Registers Summary

7.5.2.1 SYS_CTRL

Name	Offset	Size	Reset Value	Description
SYS_CTRL_REG_CFG_DONE	0x0000	W	0x00008000	Register configure done flag
SYS_CTRL_VERSION_INFO	0x0004	W	0x00000000	RTL version
SYS_CTRL_AUTO_GATING_CTRL_IMD	0x0008	W	0x9FFF7DFF	To control auto-gating
SYS_CTRL_WIN_REG_CFG_DONE	0x000C	W	0x00000000	Win register configure done flag
SYS_CTRL_AXI_CTRL0_IMD	0x0010	W	0x00000000	To control AXI
SYS_CTRL_AXI_HURRY_CTRL0_IMD	0x0014	W	0x00000000	To control AXI0 hurry mode
SYS_CTRL_AXI_HURRY_CTRL1_IMD	0x0018	W	0x00000000	To control AXI1 hurry mode
SYS_CTRL_AXI_OUTSTANDING_CTRL0_IMD	0x001C	W	0x00000000	To control AXI outstanding number
SYS_CTRL_AXI_LUT_CTRL_IMD	0x0024	W	0x00000000	To control the DMA of fetching LUT
SYS_CTRL_DSP_INFACE_EN	0x0028	W	0x00000000	Enable display IF and choose the port
SYS_CTRL_DSP_INFACE_CTRL	0x002C	W	0x00000000	Select Display Interface Pixel Clock Frequency
SYS_CTRL_DSP_INFACE_POL	0x0030	W	0x00000000	To control the polarity of interface
SYS_CTRL_POWER_CTRL	0x0034	W	0x0000000F	To control VOP sub Power Domain
SYS_CTRL_VAR_FERQ_CTRL_IMD	0x0038	W	0x00000000	The address is used to bypass MCU command
SYS_CTRL_MMU_RADDR_RANGE	0x003C	W	0x00000000	To control TVE
SYS_CTRL_WB_CTRL0	0x0040	W	0x70680000	To control WB
SYS_CTRL_WB_XSPD_FACTOR	0x0044	W	0x00000000	To configure the scale factor of WB

Name	Offset	Size	Reset Value	Description
SYS_CTRL_WB_YRGB_MST	0x0048	W	0x00000000	WB YRGB memory starting address
SYS_CTRL_WB_CBR_MST	0x004C	W	0x00000000	WB CbCr memory starting address
SYS_CTRL_OTP_WIN_EN_IMD	0x0050	W	0x00000000	To enable optional function
SYS_CTRL_OTP_MIRR_CTRL_IMD	0x0054	W	0x00000000	To disable optional function
SYS_CTRL_LUT_PORT_SEL	0x0058	W	0x00000000	To select the video output for LUT
SYS_CTRL_POWER_STABLE_CTRL	0x005C	W	0x00000000	control VOP sub power domain stable count value
SYS_CTRL_STATUS0	0x0060	W	0x00000000	The system status of video output0
SYS_CTRL_STATUS1	0x0064	W	0x00000000	The system status of video output1
SYS_CTRL_STATUS2	0x0068	W	0x00000000	The system status of video output2
SYS_CTRL_STATUS3	0x006C	W	0x00000000	The system status of video output2

7.5.3 Detail Register Description

7.5.3.1 SYS_CTRL

SYS_CTRL_REG_CFG_DONE

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	write_mask When every bit HIGH, enable the writing corresponding bit. When every bit LOW, don't care the writing corresponding bit.
15	RW	0x1	sw_global_regdone_en Global regdone enable. 1'b0: Disable 1'b1: Enable
14	RW	0x0	reg_load_wb_en In the first setting of the register, the new value was saved into the mirror register. When all the wb register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
13:8	RO	0x00	reserved
7	RW	0x0	reg_load_sys3_en In the first setting of the register, the new value was saved into the mirror register. When all the system3 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
6	RW	0x0	reg_load_sys2_en In the first setting of the register, the new value was saved into the mirror register. When all the system2 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
5	RW	0x0	reg_load_sys1_en In the first setting of the register, the new value was saved into the mirror register. When all the system1 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
4	RW	0x0	reg_load_sys0_en In the first setting of the register, the new value was saved into the mirror register. When all the system0 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
3	RW	0x0	reg_load_global3_en In the first setting of the register, the new value was saved into the mirror register. When all the register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
2	RW	0x0	reg_load_global2_en In the first setting of the register, the new value was saved into the mirror register. When all the register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.

Bit	Attr	Reset Value	Description
1	RW	0x0	reg_load_global1_en In the first setting of the register, the new value was saved into the mirror register. When all the register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
0	RW	0x0	reg_load_global0_en In the first setting of the register, the new value was saved into the mirror register. When all the register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.

SYS_CTRL_VERSION_INFO
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	major Used for IP structure.
23:16	RW	0x00	minor Big feature change under same structure.
15:0	RW	0x0000	svnbuild RTL current SVN number.

SYS_CTRL_AUTO_GATING_CTRL_IMD
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31	RW	0x1	auto_gating_en 1'b0: Disable auto gating 1'b1: Enable auto gating default auto gating enable
30:29	RO	0x0	reserved
28	RW	0x1	port3_aclk_enable Configure 1 to enable clock
27	RW	0x1	port2_aclk_enable Configure 1 to enable clock
26	RW	0x1	port1_aclk_enable Configure 1 to enable clock
25	RW	0x1	port0_aclk_enable Configure 1 to enable clock
24	RW	0x1	rgb_clk_enable Configure 1 to enable clock
23	RW	0x1	dsc4k_clk_enable Configure 1 to enable clock
22	RW	0x1	dsc8k_clk_enable Configure 1 to enable clock
21	RW	0x1	mipi1_pixclk_enable Configure 1 to enable clock
20	RW	0x1	mipi0_pixclk_enable Configure 1 to enable clock
19	RW	0x1	hdmiedp1_pixclk_enable Configure 1 to enable clock
18	RW	0x1	hdmiedp0_pixclk_enable Configure 1 to enable clock
17	RW	0x1	dp1_pixclk_enable Configure 1 to enable clock

Bit	Attr	Reset Value	Description
16	RW	0x1	dp0_pixclk_enable Configure 1 to enable clock
15	RO	0x0	reserved
14	RW	0x1	port_dclk_gating_en 1'b0: Disable 1'b1: Enable
13	RW	0x1	prescan_aclk_gating_en 1'b0: Disable 1'b1: Enable
12	RW	0x1	pwm_pwmclk_gating_en 1'b0: Disable 1'b1: Enable
11	RW	0x1	wb_aclk_gating_en 1'b0: Disable 1'b1: Enable
10	RW	0x1	cabc_dclk_gating_en 1'b0: Disable 1'b1: Enable
9	RW	0x0	gamma_dclk_gating_en 1'b0: Disable 1'b1: Enable
8	RW	0x1	overlay_aclk_gating_en 1'b0: Disable 1'b1: Enable
7	RW	0x1	smart1_aclk_gating_en 1'b0: Disable 1'b1: Enable
6	RW	0x1	smart0_aclk_gating_en 1'b0: Disable 1'b1: Enable
5	RW	0x1	esmart1_aclk_gating_en 1'b0: Disable 1'b1: Enable
4	RW	0x1	esmart0_aclk_gating_en 1'b0: Disable 1'b1: Enable
3	RW	0x1	cluster3_aclk_gating_en 1'b0: Disable 1'b1: Enable
2	RW	0x1	cluster2_aclk_gating_en 1'b0: Disable 1'b1: Enable
1	RW	0x1	cluster1_aclk_gating_en 1'b0: Disable 1'b1: Enable
0	RW	0x1	cluster0_aclk_gating_en 1'b0: Disable 1'b1: Enable

SYS_CTRL_WIN_REG_CFG_DONE

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	write_mask When every bit HIGH, enable the writing corresponding bit. When every bit LOW, don't care the writing corresponding bit.

Bit	Attr	Reset Value	Description
15:8	RO	0x00	reserved
7	RW	0x0	reg_load_esmart3_en In the first setting of the register, the new value was saved into the mirror register. When all the esmart3 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
6	RW	0x0	reg_load_esmart2_en In the first setting of the register, the new value was saved into the mirror register. When all the esmart2 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
5	RW	0x0	reg_load_esmart1_en In the first setting of the register, the new value was saved into the mirror register. When all the esmart1 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
4	RW	0x0	reg_load_esmart0_en In the first setting of the register, the new value was saved into the mirror register. When all the esmart0 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
3	RW	0x0	reg_load_cluster3_en In the first setting of the register, the new value was saved into the mirror register. When all the cluster3 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
2	RW	0x0	reg_load_cluster2_en In the first setting of the register, the new value was saved into the mirror register. When all the cluster2 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
1	RW	0x0	reg_load_cluster1_en In the first setting of the register, the new value was saved into the mirror register. When all the Cluster 1 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.
0	RW	0x0	reg_load_cluster0_en In the first setting of the register, the new value was saved into the mirror register. When all the cluster0 register configuration finish, writing this register to enable the copyright of the mirror register to real register. Then register would be updated at the start of every frame.

SYS_CTRL_AXI_CTRL0_IMD

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	lut_use_axi1 Select AXI1. 1'b0: Disable 1'b1: Enable
3:2	RO	0x0	reserved
1	RW	0x0	axi1_dma_stop Stop AXI1 DMA. 1'b0: Disable 1'b1: Enable
0	RW	0x0	axi0_dma_stop Stop AXI0 DMA. 1'b0: Disable 1'b1: Enable

SYS_CTRL_AXI_HURRY_CTRL0_IMD

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14:13	RW	0x0	axi0_qos_value Interconnect qos value
12	RW	0x0	axi0_qos_en Interconnect qos enable.
11	RW	0x0	axi0_hurry_threshold Interconnect hurry threshold value.
10:9	RW	0x0	axi0_hurry_value Interconnect hurry value.
8	RW	0x0	axi0_hurry_en Interconnect hurry enable.
7:5	RO	0x0	reserved
4:3	RW	0x0	axi0_hurry_w_mode 2'b00: Interconnect_hurry_w disable 2'b01: Left 1/4 FIFO empty 2'b10: Left 1/2 FIFO empty 2'b11: Left 3/4 FIFO empty
2:1	RW	0x0	axi0_hurry_w_value Interconnect hurry value. 2'b00: Low priority 2'b11: High priority
0	RW	0x0	axi0_hurry_w_en Interconnect hurry enable.

SYS_CTRL_AXI_HURRY_CTRL1_IMD

7.5.3.2 DSC_SYS_CTRL

DSC_SYS_CTRL_DSC_8K_SYS_CTRL
Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18	RW	0x0	dsc_halt_en Enable DSC output timing operating in bypass mode. Only used for MIPI DSI command mode.

Bit	Attr	Reset Value	Description
17	RW	0x0	dsc_scan_en Enable DSC output timing operating in scan timing mode, which controlled by DSC_8K_HTOTAL_HS_END/DSC_8K_HACT_ST_END/DSC_8K_VTOTAL_HS_END/DSC_8K_VACT_ST_END/ registers.
16	RW	0x0	dsc_init_dly_mode Configures DSC output delay mode: 1'b0: Delay number manual mode 1'b1: Delay number auto mode
15:14	RW	0x0	dsc_txp_clk_div Configures DSC txp_clk clock divider. The txp_clk drives DSC input pixel interface. 2'b00: txp_clk = dclk N 2'b01: txp_clk = dclk N / 2 2'b10: txp_clk = dclk N / 4 N is determined by dsc_port_sel.
13:12	RW	0x0	dsc_cds_clk_div Configures DSC cds_clk clock divider. The cds_clk drives DSC output compressed data stream interface. 2'b00: cds_clk = txp_clk 2'b01: cds_clk = txp_clk / 2 2'b10: cds_clk = txp_clk / 4
11:9	RO	0x0	reserved
8	RW	0x0	dsc_pxl_clk_div Configures DSC pxl_clk clock divider. The pxl_clk drives DSC slice's data path operations. 1'b0: pxl_clk = txp_clk 1'b1: pxl_clk = txp_clk / 2
7:6	RW	0x0	dsc_pixel_num Configures DSC input pixel number per cycle. The number of slices per lines must be more than or equal to the number of pixels per clock fed at the DSC encoder pixel input interface. 2'b00: 1 Pixels/cycle 2'b01: 2 Pixels/cycle Others: 4 Pixels/cycle
5:4	RW	0x0	dsc_inface_mode Configures DSC output compressed data stream interface mode 2'b00: Disable 2'b01: HDMI0 2'b10: MIPI0 Command(DataStream) Mode 2'b11: MIPI0 Video Mode
3	RO	0x0	reserved
2	RW	0x0	dsc_man_mode Enable DSC pixel source selection manual mode. The default pixel source come from MIPI interface 0 or HDMI interface 0.
1:0	RW	0x0	dsc_port_sel Configures the DSC pixel stream and pixel clock source. 2'b00: Port0 2'b01: Port1 2'b10: Port2 2'b11: Port3

DSC_SYS_CTRL_DSC_8K_RST

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	dsc_flush DSC datapath flush control. Flush control input is to be asserted to recover from an error condition and subsequently to bring DSC encoder to its initial state. Active level of this input is dependent on the state of Flush Active Level control bit (FLAL - bit 4 in DSC encoder register DSC_CTRL0).
15:1	RO	0x0000	reserved
0	RW	0x0	dsc_soft_rst DSC power on reset. Active Low.

DSC_SYS_CTRL_DSC_8K_CFG_DONE

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	cfg_done When all the register of DSC encoder has been done, writing this bit 1 to unmask input to encoder which will be valid at the next frame start. When received the frame start, the hardware will clear this bit.

DSC_SYS_CTRL_DSC_8K_INIT_DLY_NUM

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	scan_timing_para_imd_en Configure this field to 1 to enable scan timing parameters with immediate effect.
15:0	RW	0x0000	dsc_init_dly_num Configures the initial delay number of compressed clock cycles. Valid at the next frame start after set cfg_done = 1.

DSC_SYS_CTRL_DSC_8K_HTOTAL_HS_END

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	dsc_htotal DSC output compressed interface scanning horizontal period. Valid at the next frame start after set cfg_done = 1.
15:0	RW	0x0000	dsc_hs_end DSC output compressed interface scanning hsync pulse width. Valid at the next frame start after set cfg_done = 1.

DSC_SYS_CTRL_DSC_8K_HACT_ST_END

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	dsc_hact_end DSC output compressed interface scanning horizontal active end point. Valid at the next frame start after set cfg_done = 1.
15:0	RW	0x0000	dsc_hact_st DSC output compressed interface scanning horizontal active start point. Valid at the next frame start after set cfg_done = 1.

DSC_SYS_CTRL_DSC_8K_VTOTAL_VS_END

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	dsc_vtotal DSC output compressed interface scanning vertical period. Valid at the next frame start after set cfg_done = 1.
15:0	RW	0x0000	dsc_vs_end DSC output compressed interface scanning vsync pulse width. Valid at the next frame start after set cfg_done = 1.

DSC_SYS_CTRL_DSC_8K_VACT_ST_END
Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	dsc_vact_end DSC output compressed interface scanning vertical active end point. Valid at the next frame start after set cfg_done = 1.
15:0	RW	0x0000	dsc_vact_st DSC output compressed interface scanning vertical active start point. Valid at the next frame start after set cfg_done = 1.

DSC_SYS_CTRL_DSC_8K_STATUS
Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	dsc error status This bit equal 1 indicates an error condition detected in DSC encoder. This bit will be clear when host has read the Error Code Word Register in DSC encoder.

DSC_SYS_CTRL_DSC_8K_DEBUG_0
Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RW	0x0	compressed_if_n_ready_err This bit assert when compressed data interface ready signal is valid but DSC encoder is not ready to output valid data content. Only used in scan mode.
1	RC	0x0	pixel_if_n_ready_err This bit assert when pixel stream fed in DSC encoder pixel data interface is valid but DSC encoder is not ready to accept data.
0	RO	0x0	reserved

DSC_SYS_CTRL_DSC_8K_DEBUG_1
Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	cds_frame_cnt Current DSC output compressed data frame count for debug observation.
15:0	RO	0x0000	cds_line_cnt Current DSC output compressed data line count for debug observation.

DSC_SYS_CTRL_DSC_8K_DEBUG_2
Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	cds_frame_num_err Record the frame number when error status detected.

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	cds_line_num_err Record the line number when error status detected.

DSC_SYS_CTRL_DSC_4K_SYS_CTRL

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18	RW	0x0	dsc_halt_en Enable DSC output timing operating in bypass mode. Only used for MIPI DSI command mode.
17	RW	0x0	dsc_scan_en Enable DSC output timing operating in scan timing mode, which controlled by DSC_4K_HTOTAL_HS_END/DSC_4K_HACT_ST_END/DSC_4K_VTOTAL_HS_END/DSC_4K_VACT_ST_END/ registers.
16	RW	0x0	dsc_init_dly_mode Configures DSC output delay mode: 1'b0: Delay number manual mode 1'b1: Delay number auto mode
15:14	RW	0x0	dsc_txp_clk_div Configures DSC txp_clk clock divider. The txp_clk drives DSC input pixel interface. 2'b00: txp_clk = dclk N 2'b01: txp_clk = dclk N / 2 2'b10: txp_clk = dclk N / 4 N is determined by dsc_port_sel.
13:12	RW	0x0	dsc_cds_clk_div Configures DSC cds_clk clock divider. The cds_clk drives DSC output compressed data stream interface. 2'b00: cds_clk = txp_clk 2'b01: cds_clk = txp_clk / 2 2'b10: cds_clk = txp_clk / 4
11:9	RO	0x0	reserved

DSC_8K_PPS4_7

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RW	0xe0	PCHL Picture height, lower bits. This field specifies the lower 8 bits of picture height, in units of pixel rows. Picture height {PCHH [7:0], PCHL [7:0]} is the number of pixel rows within the raster. Although not required, it is recommended that picture height be close to integer multiples of slice height. Minimum Slice height is 4.
23:16	RW	0x10	PCHH Picture height, higher bits.
15:8	RW	0x60	BPPL Bits per pixel lower bits. This field specifies the lower 8bits of target per pixel for the compressed bit stream. The resolution per bit 1/16 of a bit per pixel; Minimum value of BPP={BPPH[1:0], BPPL[7:0]} >= 0x60,corresponds to 6.0;
7:6	RO	0x0	reserved
5	RW	0x1	BPE Block prediction enable. 1'b0: Block prediction is not used. 1'b1: Block prediction is used.
4	RW	0x1	CRGB The field indicates whether the color space is RGB/YCbCr. In color space RGB mode, conversion from RGB to YCoCg-R and vice versa is supported. 1'b0: YCbCr 1'b1: RGB

Bit	Attr	Reset Value	Description
3	RW	0x0	S422 Simple 422 mode of operation. S422 bit must be 0 when operation in native modes. 1'b0: Not operating in simple 422 mode. 1'b1: Operating in simple 422 mode.
2	RW	0x0	VBR Variable bit rate mode (VBR) is not supported. This field indicates variable bit rate mode of operation. 1'b0: Variable bit rate disabled. 1'b1: Variable bit rate enabled.
1:0	RW	0x0	BPPH This field specifies the upper 2 bits of target bits per pixel for the compressed bit stream. The resolution per bit 1/16 of a bit per pixel; Minimum value of BPP={BPPH[1:0], BPPL[7:0]} >= 0x60,corresponds to 6.0;

15:0	RO	0x10e0	MSLH Maximum Slice Height

DSC_8K_CTRL0
Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31	RW	0x0	PPS_UPD PPS update. This field provides a control to indicate to DSC encoder that a PPS update has been done. The host can intimate PPS update by setting this bit. DSC encoder clears this bit after the PPS update is accepted. Note: This bit must be written only after all the necessary PPS registers are programmed with desired values. Otherwise, behavior of DSC encoder is undefined.

Bit	Attr	Reset Value	Description
30	RO	0x0	reserved
29	RW	0x1	IFEP ICH full error precision. Note: The IFEP bit is available only in VESA DSC 1.2a Encoder configuration. Its programmed value is considered when operating in VESA DSC ENC v1.2a mode only. 1'b0: ICH error is truncated in accordance with the bits per component programmed in the PPS. 1'b1: Full precision of ICH error is retained.
28	RW	0x0	SBO Single burst output. 1'b0: DSC output data can be discontinuous for a data line. 1'b1: DSC outputs data in a single burst for a data line.
27:19	RO	0x000	reserved
18:16	RW	0x0	NSLC Number of slices per line. This field provides control to enable required number of data path units (equivalently number of slices per line) in a configuration. 3'b000: 1 slice per line 3'b001: 2 slice per line 3'b010: 4 slice per line 3'b100: 8 slice per line
15:9	RO	0x00	reserved
8	RW	0x0	INIT Datapath initialization control. 1'b0: Init control is not asserted 1'b1: Init control is asserted
7	RW	0x0	EPL Enable partial bytes at every line end on CDS interface. 1'b0: Disable 1'b1: Enable
6	RW	0x0	EPB Enable partial bytes at chunk ends on CDS interface. 1'b0: Disable 1'b1: Enable
5	RW	0x0	MER This field provides a way to mask the error reporting through the dsc_err_o port. An error detected in DSC encoder results in assertion of dsc_err_o port and the corresponding Error Status is captured in the Error Status Register. 0x0: Error reporting on dsc_err_o is not masked. So, when an error is detected, dsc_err_o is asserted and the corresponding error code word is captured in the Error Status Register. 0x1: Error reporting on dsc_err_o is masked and only the Error status is captured in the Error Status register.
4	RW	0x1	FLAL This field provides a way to specify the active level of the flush control input, dsc_flush_i. By default, dsc_flush_i is considered as active high signal. 0x0: Dsc_flush_i is treated as active low signal and a falling edge of dsc_flush_i triggers an initialization cycle in DSC encoder. 0x1: Dsc_flush_i is treated as active high signal and a rising edge of dsc_flush_i triggers an initialization cycle in DSC encoder.

Bit	Attr	Reset Value	Description
3	RW	0x0	RBYT Reverse data bytes. This field controls the order of packing of data bytes on the compressed data interface. This field provides a control to reverse byte positions of data bytes on CDS interface. 1'b0: Disable 1'b1: Enable
2	RW	0x0	RBIT This field controls the order of packing of data bits on the compressed data interface. This field provides a control to reverse bits' organization in each byte of the data bytes on Compressed Data Interface. 1'b0: Disable 1'b1: Enable
1	RO	0x0	FSEL 1'b0: Encoder function
0	RW	0x0	EN This field is used to control the operation of DSC encoder. Host has to write to this bit to enable the operation of DSC encoder. Failing to follow the recommended initialization sequence might lead to undefined behavior.

DSC_8K_CTRL1
Address: Operational Base + offset (0x00A4)

Bit	Attr	Reset Value	Description

DSC_4K_CTRL0

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31	RW	0x0	PPS_UPD This field provides a control to indicate to DSC encoder that a PPS update has been done. The host can intimate PPS update by setting this bit. DSC encoder clears this bit after the PPS update is accepted. Note: This bit must be written only after all the necessary PPS registers are programmed with desired values. Otherwise, behavior of DSC encoder is undefined.
30	RO	0x0	reserved
29	RW	0x1	IFEP ICH full error precision. Note: The IFEP bit is available only in VESA DSC 1.2a Encoder configuration. Its programmed value is considered when operating in VESA DSC ENC v1.2a mode only. 1'b0: ICH error is truncated in accordance with the bits per component programmed in the PPS. 1'b1: Full precision of ICH error is retained.
28	RW	0x0	SBO Single burst output. 1'b0: DSC output data can be discontinuous for a data line. 1'b1: DSC outputs data in a single burst for a data line.
27:19	RO	0x000	reserved
18:16	RW	0x0	NSLC Number of slices per line. This field provides control to enable required number of data path units (equivalently number of slices per line) in a configuration. 3'b000: 1 slice per line 3'b001: 2 slice per line
15:9	RO	0x00	reserved
8	RW	0x0	INIT Datapath initialization control. 1'b0: Init control is not asserted 1'b1: Init control is asserted
7	RW	0x0	EPL Enable partial bytes at every line end on CDS interface. 1'b0: Disable 1'b1: Enable
6	RW	0x0	EPB Enable partial bytes at chunk ends on CDS interface. 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
5	RW	0x0	MER This field provides a way to mask the error reporting through the dsc_err_o port.An error detected in DSC encoder results in assertion of dsc_err_o port and the corresponding Error Status is captured in the Error Status Register. 0x0: Error reporting on dsc_err_o is not masked. So, when an error is detected, dsc_err_o is asserted and the corresponding error code word is captured in the Error Status Register. 0x1: Error reporting on dsc_err_o is masked and only the Error status is captured in the Error Status register.
4	RW	0x1	FLAL This field provides a way to specify the active level of the flush control input, dsc_flush_i. By default, dsc_flush_i is considered as active high signal. 0x0: Dsc_flush_i is treated as active low signal and a falling edge of dsc_flush_i triggers an initialization cycle in DSC encoder. 0x1: Dsc_flush_i is treated as active high signal and a rising edge of dsc_flush_i triggers an initialization cycle in DSC encoder.
3	RW	0x0	RBYT Reverse data bytes. This field controls the order of packing of data bytes on the compressed data interface. This field provides a control to reverse byte positions of data bytes on CDS interface. 1'b0: Disable 1'b1: Enable
2	RW	0x0	RBIT This field controls the order of packing of data bits on the compressed data interface. This field provides a control to reverse bits' organization in each byte of the data bytes on Compressed Data Interface. 1'b0: Disable 1'b1: Enable
1	RO	0x0	FSEL 1'b0: Encoder function
0	RW	0x0	EN This field is used to control the operation of DSC encoder. Host has to write to this bit to enable the operation of DSC encoder. Failing to follow the recommended initialization sequence might lead to undefined behavior.

0	RW	0x0	mmu_auto_gating When it is 1'b1, the mmu will auto gating itself.

7.6 Application Notes

7.6.1 VOP Pixel Clock Configuration

- **dclk**: The clock source of the post-processing module and interface pixel clock, provided by the CRU module in the pd_VOP subsystem.
- **dclk_core**: The operating clock of the scanning timing of the post-processing module.
- **dclk_out**: Output interface operating clock, used by DP and MIPI interfaces.

7.6.1.1 dclk Frequency Requirements

Because it is necessary to provide clock sources for post-processing modules (dclk_core, dclk_out) and various output display interfaces (mipi_pixel_clock, eDP_pixel_clock, etc.), it is necessary to ensure that dclk is the highest frequency to meet various interface format rate conversion and frequency division requirements.

7.6.1.2 dclk_core Frequency Requirements

Matching with the pixel rate of the post-processing module, the post-processing pixel operating rate of VOP is 4pixel/cycle:

dclk_core = (Video Timing Pixel Rate) / 4

For example, the expected video timing is 4K@60hz format, where pixel rate equals 594Mhz, so the dclk_core frequency shall be configured as 148.5M.

7.6.1.3 dclk_out Frequency Requirements

Match the pixel rate of the output interface, for example, the pixel clock of the DP interface comes from the corresponding dclk_out.

7.6.1.4 RGB Interface Clock Frequency Requirements

The processing rate of the RGB interface is 1pixel/cycle, and the scan timing of the VOP post-processing is 4pixel/cycle, that is, the dclk frequency provided by the SoC to the VOP is required to be equal to the Pixel Rate. For example, the current video timing is 1080p@60hz format, and dclk is 148.5M and dclk_core is 37.125M.

RGB Interface Pixel Rate =dclk = dclk_core × 4

7.6.1.5 DP Interface Clock Frequency Requirements

The pixel clock of the DP interface is derived from the dclk_out clock of the corresponding port.

When transmitting RGB format, the DP interface rate is 4 pixels/cycle:

Video Timing Pixel Rate = 4×dclk_out =4×dclk_core

When transmitting the YUV420 format, the DP interface rate is 8 pixels/cycle:

Video Timing Pixel Rate = 8×dclk_out =4×dclk_core

7.6.1.6 HDMI/eDP Combo Interface Clock Frequency Requirements

The frequency division selection of hdmieDP*_dclk_sel controls the processing clock hdmieDP_dclk of the VOP HDMI/eDP combo interface.

The hdmieDP*_pixclk_sel frequency division selection controls the transmission clock hdmieDP_pixel_clk sent by the HDMI/eDP Combo to the HDMI TX controller or eDP controller.

When configured in eDP interface mode, the processing rate of the eDP interface is 1pixel/cycle, and the scan timing of the VOP post-processing is 4pixel/cycle, so the dclk frequency provided by the SoC to the VOP is required to be equal to the eDP Interface Pixel Rate. For example, the current video timing is 4K@60hz format, and dclk shall be set to 600M and dclk_core to 148.5M.

Video Timing Pixel Rate = (hdmieDP_pixel_clk × K)
= (hdmieDP_dclk × K)
= (dclk_core × 4)

When eDP is configured in SPLIT display mode, K is equal to 2, and in other cases, K is equal to 1.

When configured in HDMI interface mode and operating in uncompressed mode, the processing rate of the HDMI interface is 4pixel/cycle, which is consistent with the VOP post-processing rate. The special treatment is that because there is a rate conversion circuit that reduces the bit width of the data bus by half between the VOP and the HDMI TX controller, the channel transmission clock hdmieDP_pixel_clk needs to be twice the hdmieDP_dclk.

(Video Timing Pixel Rate)/ (4) = ((hdmieDP_pixel_clk)/2×K) = (hdmieDP_dclk×K) = dclk_core

When HDMI transmits YUV420 format or is configured as SPLIT display mode, K is equal to 2, and in other cases, K is equal to 1.

When operating in compressed mode:

((hdmieDP_pixel_clk) / 2) = hdmieDP_dclk = cds_clk

cds_clk: DSC encoder Compressed Data Stream output interface drive clock

7.6.1.7 MIPI Interface Clock Frequency Requirements

When MIPI works in uncompressed mode, the MIPI interface rate is 4Pixel/cycle.

(Video Timing Pixel Rate)/(4) = (MIPI Pixel Clock×K)=(dclk_out×K)=dclk_core

When MIPI works in compressed mode:

MIPI Pixel Clock = cds_clk / 2

Since the MIPI DSI controller's pixel interface is 192bit data width and DSC encoder CDS interface is 96bit data width.

Note that when MIPI is configured as double channel display mode, K=2, otherwise K=1.

7.6.1.8 Example of Typical Video Timing Configuration

Table 7-9 Frequency and select configuration table in typical mode

Video Timing	Pixel Format	dclk Freq	dclk_core (dclk_core_sel)	dclk_out (dclk_out_sel)	DP Pixel Clock
8K@24Hz (VIC 194)	RGB	297	297 (0)	297 (0)	297
4K@60Hz (VIC 97)	RGB	148.5	148.5 (0)	148.5 (0)	148.5
4K@60Hz - Split	RGB	148.5	148.5 (0)	74.25 (1)	74.25
1080p@60Hz (VIC 16)	RGB	37.125	37.125 (0)	37.125 (0)	37.125
720x480i@60Hz(VIC 6)	RGB	27	13.5 (1)	27 (0)	27

The cru picture inside the VOP is shown below, refer to VOP2_cru.pdf for details.

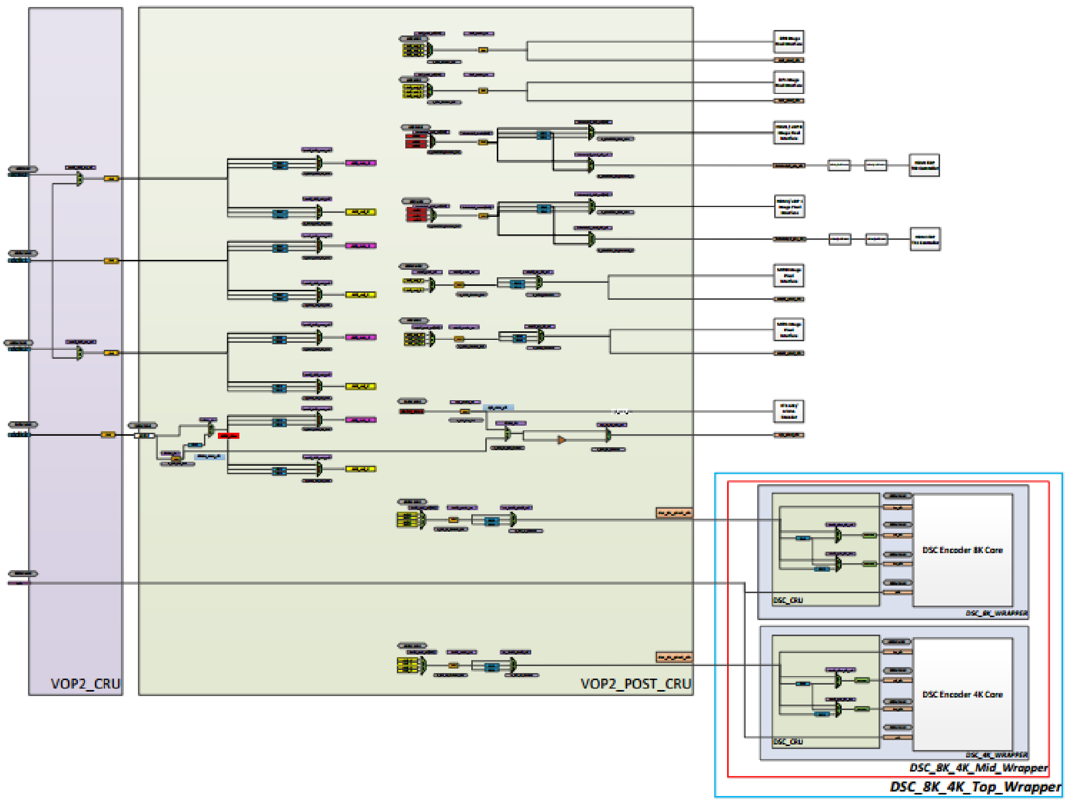

Fig. 7-54 VOP2 internal cru block diagram

The post operating clock mux inside each PORT is shown in the figure below:

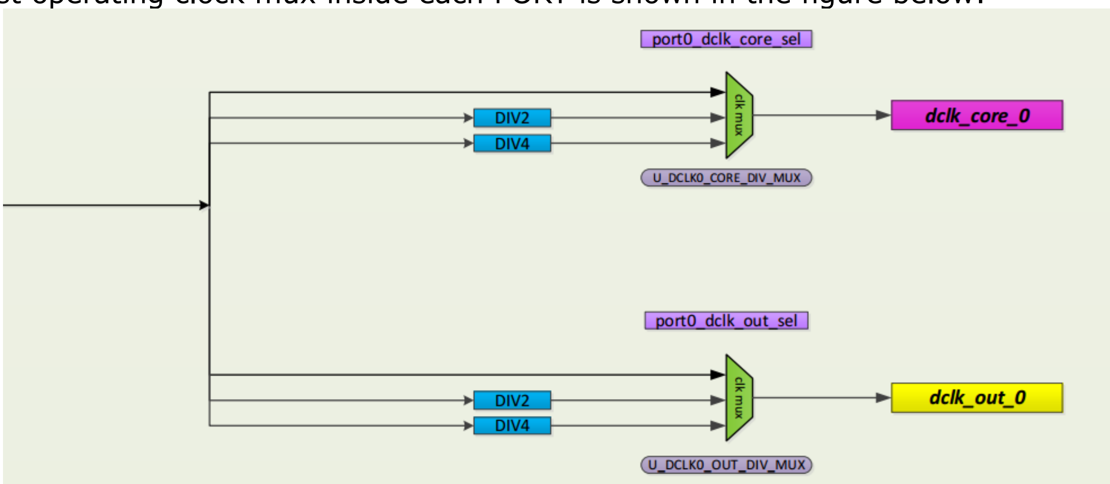

Fig. 7-55 PORT operating clock mux

The clock mux diagram of each high-speed interface is as follows:

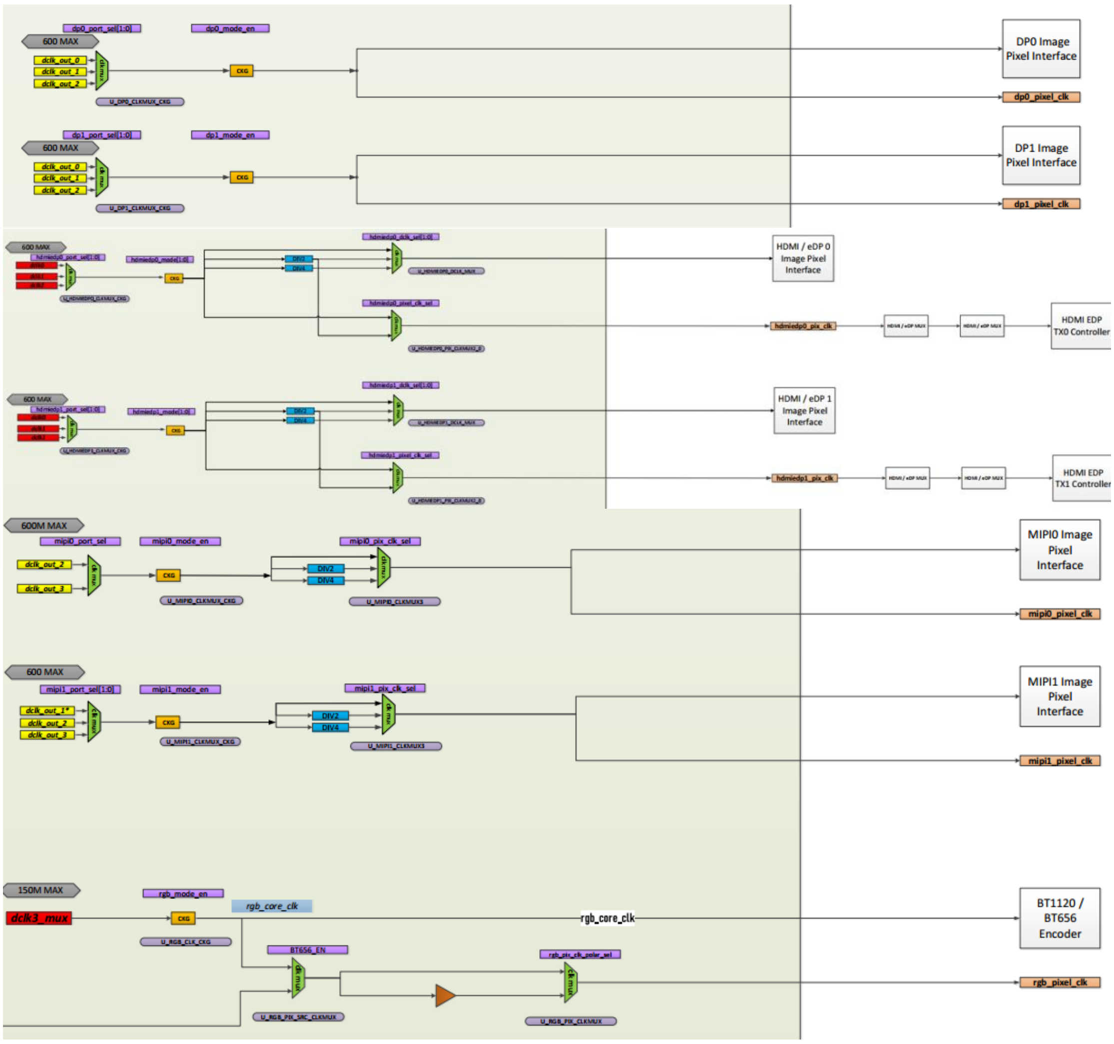

Fig. 7-56 Clock mux of each output interface

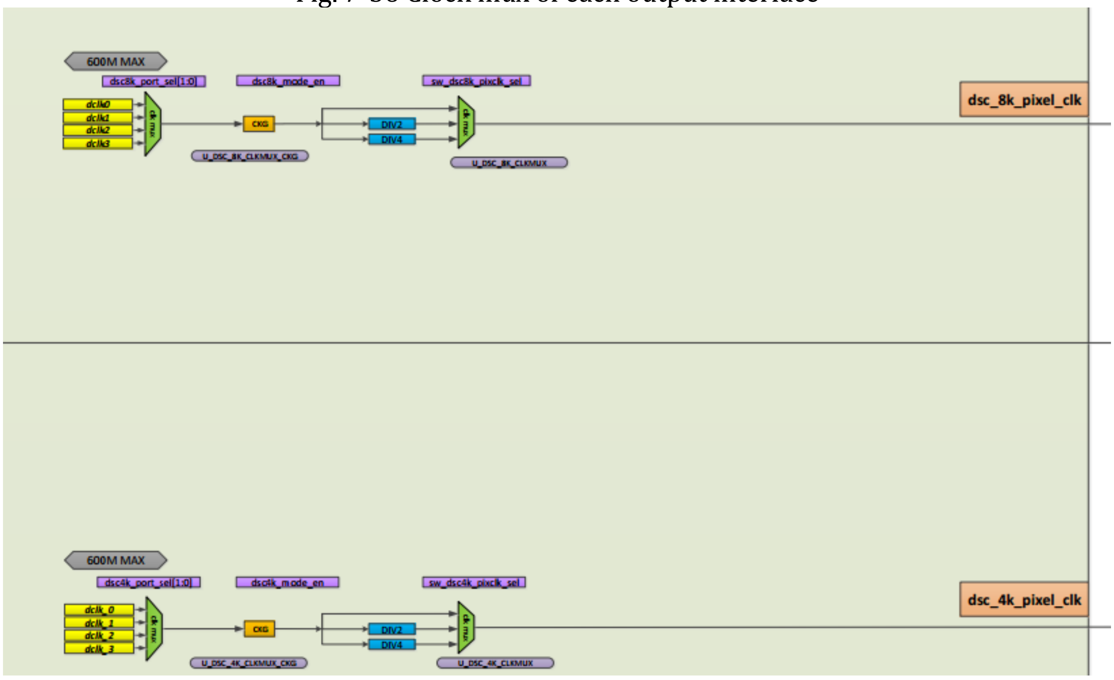

Fig. 7-57 Clock mux structure output to DSC

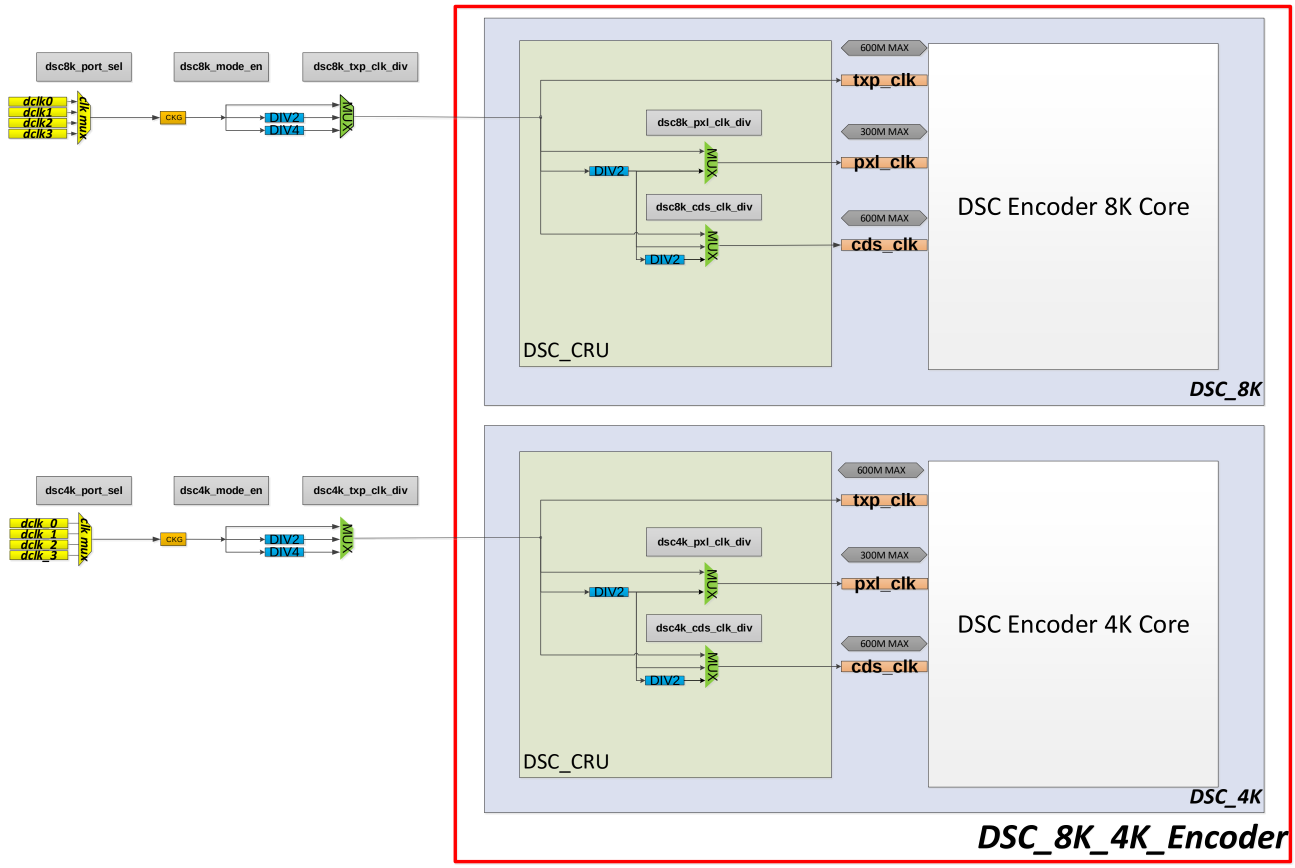

Fig. 7-58 Clock structure inside DSC

7.6.2 DSC Encoder Configuration

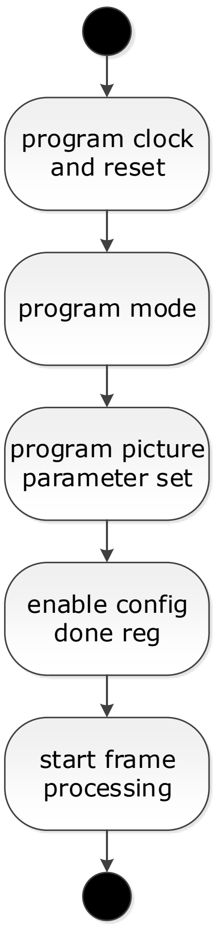

Fig. 7-59 Configuration Sequence of DSC Encoder

7.6.2.1 Clock and Reset

The process path of DSC encoder pixel clock includes, 4 to 1 clock mux, clock gating, clock divider. DSC encoder clock are configurable to select the source from dclk0/dclk1/dclk2/dclk3, which should be matched the video source. for example, if use DSC 8K encoder process MIPI0 video data which comes from the port2 data path, the DSC_8K_SYS_CTRL.dsc_port_sel register field should be set to 0x2 to select dclk2.

- **txp_clk:** the clock feed input pixels to DSC encoder, max frequency 600MHz, divided from dclk programmed by register VOP.DSC_SYS_CTRL.dsc_txp_clk_div. Frequency of txp_clk clock must be more than or equal that of pxl_clk.

$$\text{Frequence of txp\_clk} = \frac{(\text{Vtotal} \times \text{Htotal} \times \text{RefreshRate})}{(\text{Number of pixel feed into DSC encoder per clock} \times \text{K})}$$

- **pxl_clk:** used for slice's data path operations, max frequency 300MHz, divided from txp_clk programmed by register VOP.DSC_SYS_CTRL.dsc_pxl_clk_div.

$$\text{Frequence of pxl\_clk} >= \frac{(\text{Vtotal} \times \text{Htotal} \times \text{RefreshRate})}{(\text{Number of active slices} \times \text{K})}$$

- **cds_clk:** used to drive the output CDS (Compressed Data Stream) interface, max frequency 600MHz, divided from txp_clk programmed by register VOP.DSC_SYS_CTRL.dsc_cds_clk_div.

$$\text{Frequence of cds\_clk} >= \frac{(\text{Vtotal} \times \text{Htotal} \times \text{RefreshRate})}{\left(\left(\text{CDS\_Data\_Width}/\text{Bits per pixel}\right) \times \text{K}\right)}$$

where CDS_Data_Width is DSC encoder output data width which is fixed 96bit.

Note that the number of active slices per lines must be more than or equal to the number of pixels per clock fed at the DSC encoder pixel input interface.
Note that when MIPI is configured as double channel display mode K = 2, otherwise K = 1.

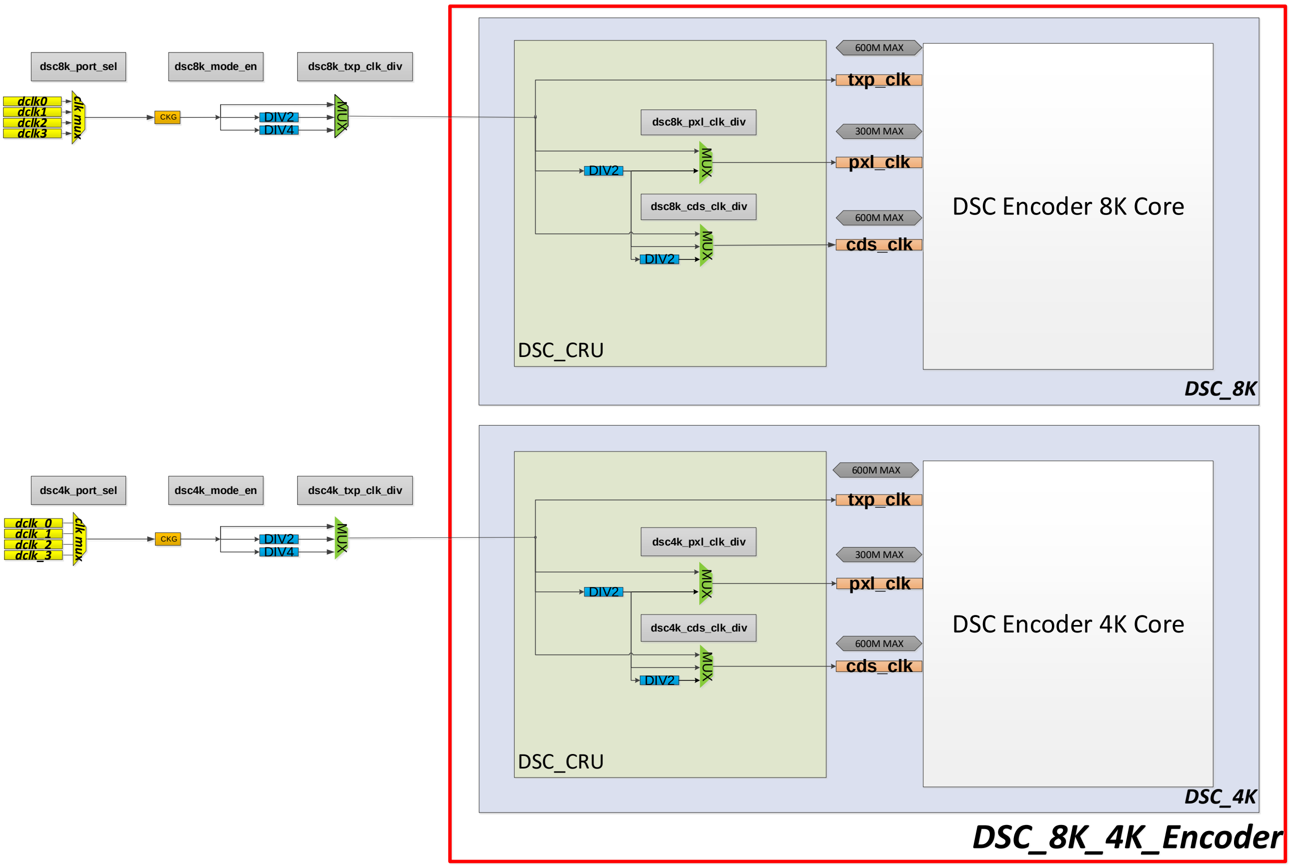

Fig. 7-60 Clock Structure of DSC Encoder

DSC encoder power_on_resetn signal is controlled in register field DSC_SYS_CTRL.DSC_8K_RST.dsc_soft_rst.

7.6.2.2 Programming encoder

7.6.2.2.1 program mode

Based on the configuration settings, use the DSC encoder CTRL0 and DSC encoder CTRL1 control registers to enable or disable the available features.

The SBO field of DSC encoder CTRL0[28] should be set to 1'b1 for output data in a single burst for a data line.

7.6.2.2.2 Program Picture Parameter Set

1. To enable the DSC encoder operation, set the EN field to 1, in the DSC encoder CTRL0 register by writing 1'b1 to bit [0] of DSC encoder CTRL0.
2. Program the PPS register fields.
3. For the new PPS values to take effect, set the PPS_UPD field in the DSC encoder CTRL0 register to 1 by writing 1'b1 to bit [31] of DSC encoder CTRL0 register.
4. Wait for the PPS to be updated
   - PPS_UPD field is cleared by DSC encoder after the PPS update is complete. This marks the completion of PPS update procedure.
   - Read/Poll bit [31] of DSC encoder CTRL0 register

The field definitions of PPS56_59 and registers from PPS60_63 to PPS84_87 needs special attention, as there is a subtle difference between the mapping of fields in DSC encoder and in VESA PPS, as shown in the below figure.

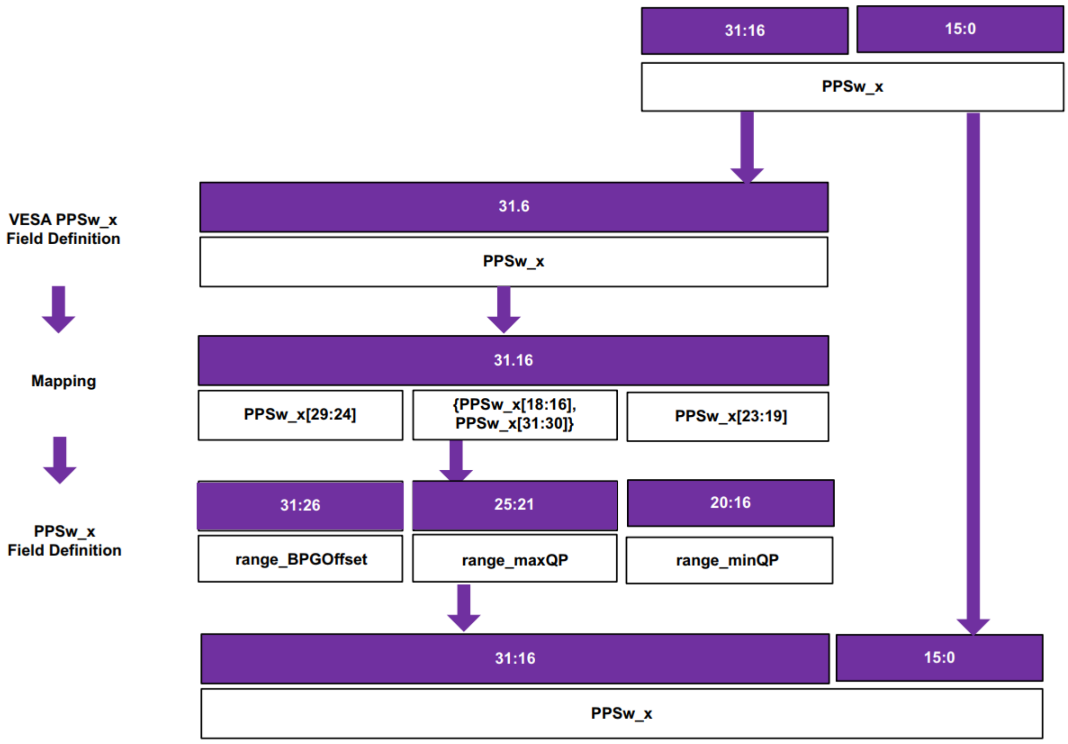

Fig. 7-61 Mapping of DSC encoder Register field to PPS56_59

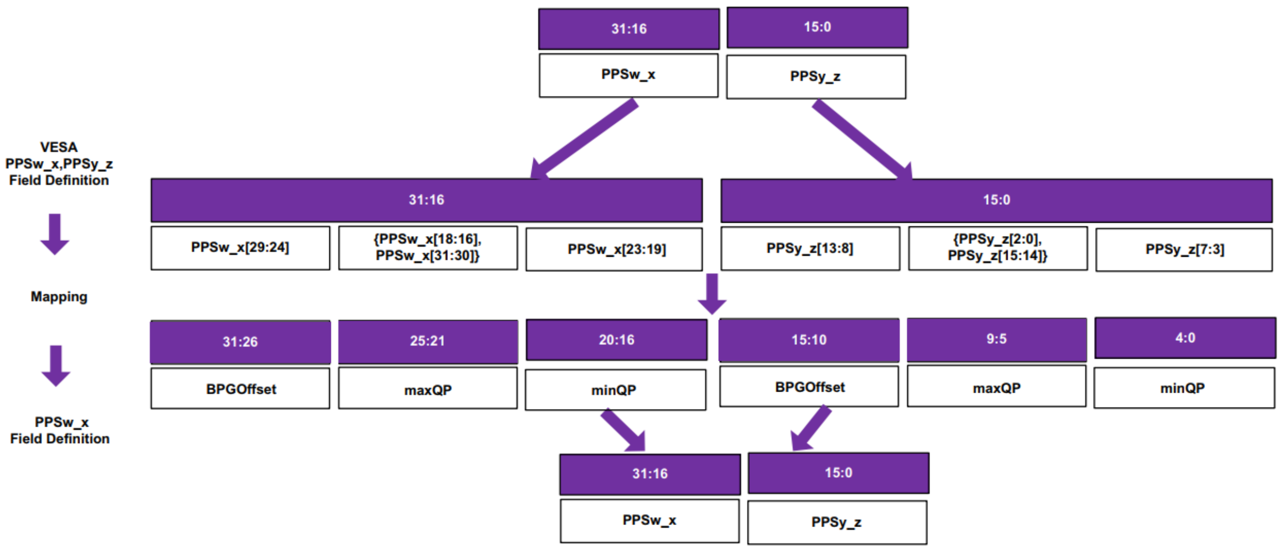

Fig. 7-62 Mapping of DSC encoder Register field PPS60_63 to PPS84_87

7.6.2.3 Set Configuration done signal

When the above register of DSC encoder has been configured, set DSC_8K_CFG_DONE = 1 (DSC_SYS_CTRL.DSC_8K_CFG_DONE) to unmask video data input to encoder which will be valid at the next frame start pulse. When encoder received the valid frame start, the hardware will clear this bit.

7.6.2.4 Error Monitoring

DSC encoder can detect and report error under the following conditions:

1. An inappropriate value programmed for a Picture Parameter Set (PPS) field
   DSC encoder validates programmed PPS fields value against target configuration and reports error if PPS value programmed does not correspond to or is not supported by the target configuration.

2. An overflow condition detected in any of the buffer stages is reported as an error. The buffer overflow error can be due to either rate mismatch or insufficient rate buffer size.
   DSC encoder reports error by asserting dsc_err_o port. The below figure shows how to monitor the reported error through the dsc_err_o signal.

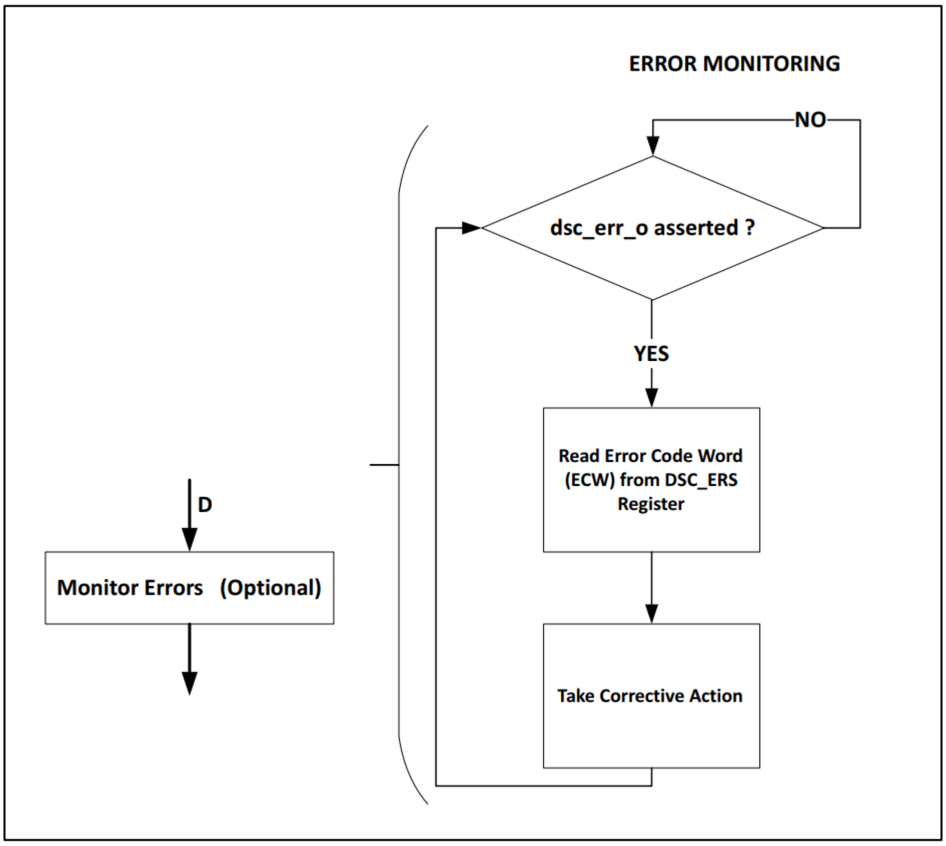

Fig. 7-63 Error Monitoring of DSC Encoder

Following steps are involved in Error Monitoring:
1. Continuously monitor dsc_err_o (through register or interrupt). If DSC encoder encounters an error, dsc_err_o is asserted.
2. Read ECW in DSC_ERS register to determine the source of error, on detecting dsc_err_o assertion.
3. Take corrective action to fix the error.
The dsc_err_o signal is connected to DSC_SYS_CTRL register “dsc_error_status” and VOP interrupt pin which connected to the GIC.

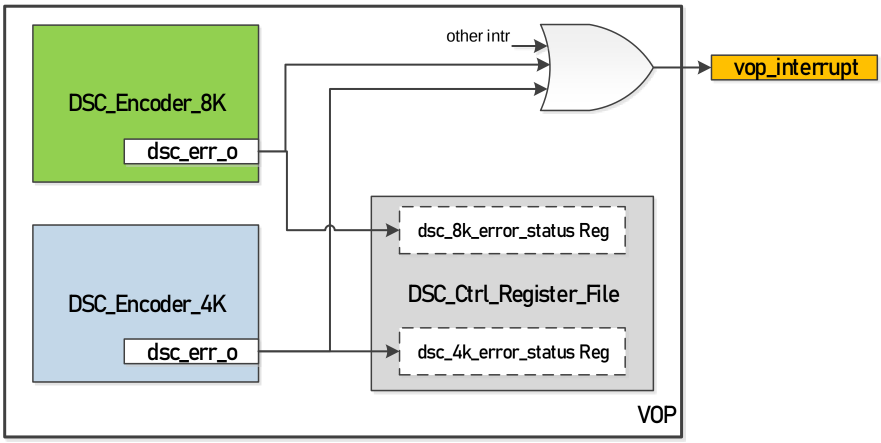

Fig. 7-64 Error Report Structure of DSC Encoder

7.6.2.4.1 Error Conditions and Error Codes

The below table lists the various error conditions and error codes:

Table 7-10 DSC Encoder Error Codes

Error Condition and Description	Error Code Word
No error detected by DSC encoder	0x0

Error Condition and Description	Error Code Word
Bits per component error when the programmed bits per component value is invalid. Also, BPC error is reported if the programmed BPC value is more than the maximum BPC value supported in the configuration.	0x0030ffff
Multiple mode error is reported when more than one mode is enabled in the PPS. for example if the PPS programmed has both Native 420 mode and Native 422 mode enabled, multi-mode error is reported.	0x0040ffff
Line buffer depth Error is reported when the value of Line-buffer Depth field in the PPS is more than the maximum Line-buffer depth (DWCDSC_LBf_DPTH) specified in the configuration	0x0050ffff
Minor version error is reported if the programmed value of Minor version is not supported in the configuration. for example, in a DSC 1.2a configuration, both DSC 1.1 mode and DSC1.2a modes are supported. Accordingly, the minor version field is to be set to either 1 or 2. If the minor version field is set to any other value, minor version Error is reported.	0x0060ffff
Picture height error is reported when the programmed picture height in the PPS is beyond the limits of the picture height supported in the configuration. Minimum and maximum value of picture height are 4 and DWCDSC_MAX_LNS respectively.	0x0070ffff
Picture width error is reported if the programmed picture width is beyond the valid range of picture width supported in the configuration.	0x0080ffff
Number of slices error is reported when the programmed number of slices per line is more than the number of slices per line specified in the configuration.	0x0090ffff
Slice height Error is reported when the programmed slice height is invalid.	0x00c0ffff
Slice width error is reported when the programmed slice width is invalid.	0x00d0ffff
Second Line BPG Offset Error is reported when a non-zero value is programmed for Second Line BPG offset field in modes other than Native 420.	0x00e0ffff
Non Second Line BPG Offset Error is reported when a non- zero value is programmed for Non Second Line BPG offset field in modes other than Native 420 mode.	0x00f0ffff
PPS ID Error, if the programmed PPS ID exceeds the Number of PPS IDs supported in the configuration. for single PPS ID support, a non-zero value of PPS ID results in error.	0x0100ffff
Bits per Pixel (BPP) Error is reported when the programmed Bits per Pixel value is beyond the valid range.	0x0110ffff
Buffer flow error detected in one of the buffers. To determine the buffer that has an overflow, read the overflow status flags from the registers. ● Rate buffer ● Line buffer ● Decoder model ● Pixel buffer	0x0120ffff

Error Condition and Description	Error Code Word
● Balance FIFO buffer ● Syntax Element FIFO buffer	
RC Buffer model overflow Error detected in slice 0	0x01510001
RC Buffer model overflow Error detected in slice 1	0x01510002
RC Buffer model overflow Error detected in slice 2	0x01510004
RC Buffer model overflow Error detected in slice 3	0x01510008
RC Buffer model overflow Error detected in slice 4	0x01510010
RC Buffer model overflow Error detected in slice 5	0x01510020
RC Buffer model overflow Error detected in slice 6	0x01510040
RC Buffer model overflow Error detected in slice 7	0x01510080
RC Buffer underflow condition detected in slice0	0x01610001
RC Buffer underflow condition detected in slice1	0x01610002
RC Buffer underflow condition detected in slice2	0x01610004
RC Buffer underflow condition detected in slice3	0x01610008
RC Buffer underflow condition detected in slice4	0x01610010
RC Buffer underflow condition detected in slice5	0x01610020
RC Buffer underflow condition detected in slice6	0x01610040
RC Buffer underflow condition detected in slice7	0x01610080
Unsuccessful RESET Cycle Status.	0xffffffff
ICH full Error Precision Settings Error This error is reported when IFEP (ICH full Error Precision) field of DSC_CRTL0 register is set to 1'b1 in VESA DSC ENC v1.1 mode. Note: The IfEP field of the DSC_CRTL0 register is available only in VESA DSC 1.2a encoder configuration.	0x00a0ffff
Native mode error is reported when either of Native 420 or Native 422 mode is enabled in DSC v1.1 mode.	0x0020ffff

7.6.2.5 Example Programming Sequences

7.6.2.5.1 Case1 (VOP Port2 → DSC 4K → MIPI 1)

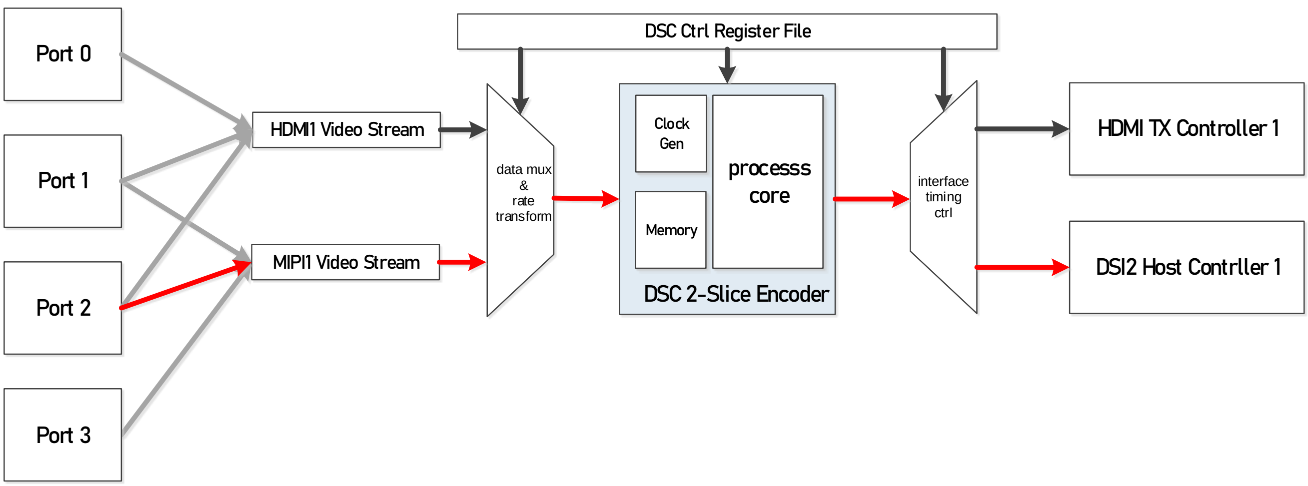

Fig. 7-65 Case1 DSC 4K - MIPI Video Stream

Sequence:

1. Power up DSC_4K encoder through VOP.SYS_CTRL.SYS_POWER_CTRL.dsc_4K_pd_en

2. Wait DSC_4K encoder power up completed by polling dsc4K_power_domain_status = 0
3. Program esmart0, overlay, post process 2.
4. Enable MIPI1 interface in VOP.SYS_CTRL.SYS_DSP_INFACE_EN register mipi1_mode_en bit and select dclk2 in mipi1_port_sel bit.
5. Program VOP.DSC_SYS_CTRL.DSC_4K_SYS_CTRL = 0x00044066 to set DSC operation mode, pixel clock source, data source port.
6. Program VOP.DSC_SYS_CTRL.DSC_4K_RST = 0x1 to release power-up reset of DSC encoder.
7. Program VOP.DSC_4K.CTRL0 = 0x10010095 to specify active slice number, bit order.
8. Program PPS register
   1) PPS0~3 = 0x89000011
   2) PPS4~7 = 0x18068030
   3) PPS8~11 = 0x3400d002
   4) PPS12~15= 0x68016801
   5) PPS16~19= 0xb4010002
   6) PPS20~23= 0x04042000
   7) PPS24~27= 0x0c000500
   8) PPS28~31= 0xef02e201
   9) PPS32~35= 0xf0100018
   10) PPS36~39= 0x00200c03
   11) PPS40~43= 0x330b0b06
   12) PPS44~47= 0x382a1c0e
   13) PPS48~51= 0x69625446
   14) PPS51~55= 0x7b797770
   15) PPS56~59= 0x08807e7d
   16) PPS60~63= 0x00a10080
   17) PPS64~67= 0xf0e3f8c1
   18) PPS68~71= 0xe0e3e8e3
   19) PPS72~75= 0xe123e103
   20) PPS76~79= 0xd965d943
   21) PPS80~83= 0xd1a5d185
   22) PPS84~87= 0xd1edd1a7
9. Program DSC_4K CTRL0 = 0x90010095 to enable PPS update.
10. Poll for the PPS UPDATE acknowledgment (auto clearing of VOP.DSC_4K.CTRL0.PPS_UPD field) by DSC encoder.
11. Power up MIPI Combo PHY and DSI2 Host Controller.
12. Program VOP.DSC_SYS_CTRL.DSC_4K_CFG_DONE.cfg_done = 1
13. Program VOP.SYS_CTRL.SYS_REG_CFG_DONE to start frame processing.

7.6.2.5.2 Case2 (VOP Port0 → DSC 8K → HDMI 0)

- Cluster 0/1, Port0, DSC 8K Encoder, HDMI TX0
- picture size = 7680x4320
- bits_per_component = 0xa (10bit)
- bits_per_pixel = 0xa0 (10.0 bpp)
- slice_width = 960
- slice_height = 2160
- RGB format

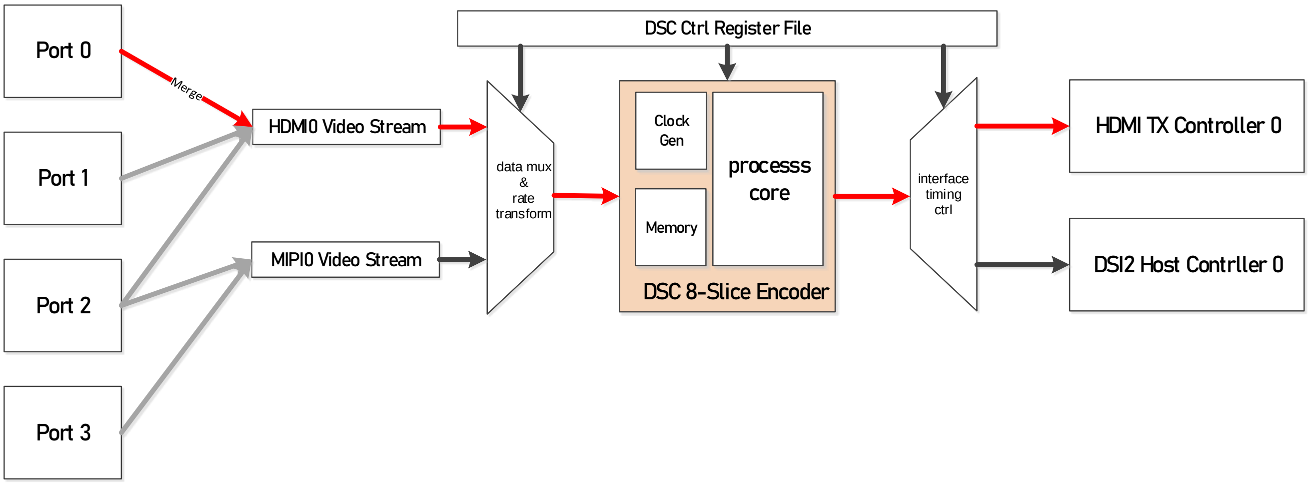

Fig. 7-66 Case2 DSC 8K - HDMI Video Stream

Sequence:

1. Power up cluster 0/1 and DSC_8K encoder through VOP.SYS_CTRL.SYS_POWER_CTRL
2. Wait cluster 0/1 and DSC_8K encoder power up completed by polling cluster 0/1 and DSC_8K power_domain_status = 0
3. Enable HDMI 0 interface in VOP.SYS_CTRL.SYS_DSP_INFACE_EN register hdmieDP0_mode bit and select dclk0 in hdmieDP0_port_sel bit.
4. Enable hdmi0 pixel clock by setting VOP.SYS_CTRL.SYS_AUTO_GATING_CTRL_IMD.hdmieDP0_pixclk_enable = 1
5. Program esmart0/1, overlay, post process 0/1.
6. Program VOP.DSC_SYS_CTRL.DSC_8K_SYS_CTRL = 0x00021190 to set DSC operating as HDMI mode, pixel clock source, data source port.
7. Program VOP.DSC_SYS_CTRL.DSC_8K_RST = 0x1 to release power-up reset of DSC encoder.
8. Program compressed output video timing through DSC_8K_HTOTAL_HS_END / DSC_8K_HACT_ST_END / DSC_8K_VTOTAL_VS_END / DSC_8K_VACT_ST_END
9. Program output timing scan delay number through DSC_8K_INIT_DLY_NUM (2~3 lines delay)
10. Program VOP.DSC_8K.CTRL0 = 0x30030095 to specify active slice number, bit order.
11. Program 128 bytes PPS register
12. Program VOP.DSC_8K.CTRL0 = 0xb0030095 to enable PPS update.
13. Poll for the PPS update acknowledgment (auto clearing of VOP.DSC_8K.CTRL0.PPS_UPD field) by DSC encoder.
14. Program VOP.DSC_SYS_CTRL.DSC_8K_CFG_DONE.CFG_done = 1
15. Power up HDMI TX PHY and HDMI TX Controller.
16. Program VOP.SYS_CTRL.SYS_REG_CFG_DONE to start frame processing.

Chapter 8 Image Enhancement Processor（IEP)

8.1 Overview

The Image Enhancement Processor (IEP) receives data from system main memory and transmits data to system main memory by AXI bus.

The features of IEP are as follows:

- **Image format**
  - Input data: YUV420/YUV422; Semi-planar/planar; UV swap
  - Output data: YUV420/YUV422; Semi-planar; UV swap; Tile mode
  - YUV down sampling conversion from 422 to 420
  - Max resolution for dynamic image up to 1920x1080
- **De-interlace**
  - **I5O2**: Input 5 Fields Output 2 frames mode
  - **I5O1T**: Input 5 Fields Output 1 Top frame mode
  - **I5O1B**: Input 5 Fields Output 1 Bottom frame mode
  - **I2O2**: Input 2 Fields Output 2 frames mode
  - **I1O1T**: Input 1 Field Output 1 Top frame mode
  - **I1O1B**: Input 1 Field Output 1 Bottom frame mode
  - **PULLDOWN_REC**: Pull-down Recovery mode
  - **DETECT_ONLY**: Detect Only mode
  - **MVHIST**: De-interlace MV Histogram
  - **MD**: Motion Detection
  - **ME**: Motion Estimate
  - **MC**: Motion Compensation
  - **EEDI**: Enhanced Edge based Interpolation
  - **OSD DETECT**: On-Screen Display Detection
  - **FF DETECT**: Frame Field Detection
  - **FO DETECT**: Field Order Detection
  - **PD DETECT**: Pull Down Detection
  - **CC**: Combining Check
- **Interface**
  - 32bit AHB bus slave
  - 128bit AXI bus master
  - Combined interrupt output

8.2 Block Diagram

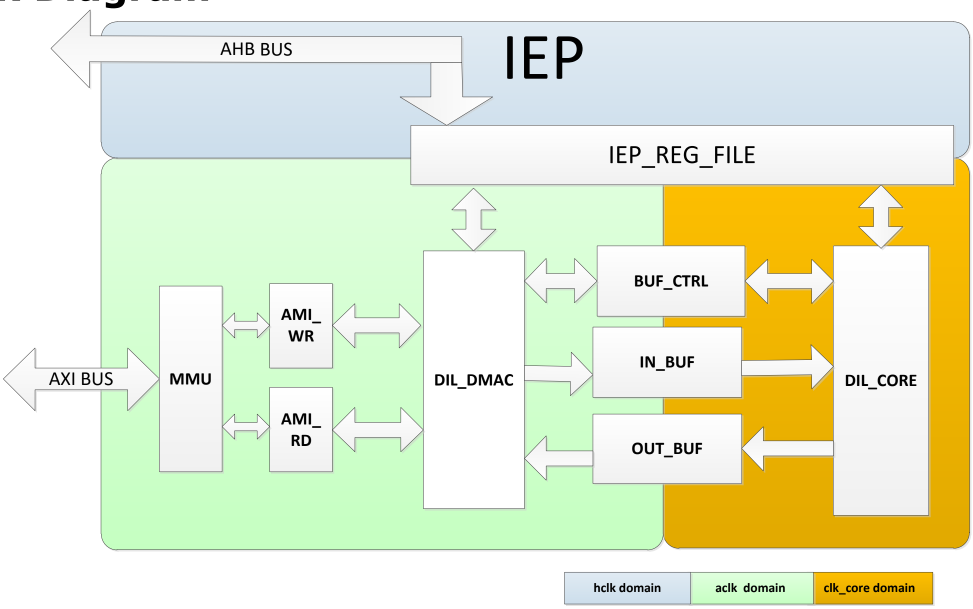

Fig. 8-1 IEP block diagram

The data path in IEP is in the previously diagram. The IEP comprises with:

Deinterlace Core Processing
There are eight de-interlace modes (refer to feature description above) in the DIL_CORE block. Some important functions for deinterlace are in this module such as MD, ME, MC, EEDI.

DMA
DMA block responses for reading interlaced video data from DDR and writing frame data to DDR.

REG FILE
All configurable signals will be configured in this block and send to other function modules for using. Detect data and MVHIST data will be read back to user in this module by AHB bus.

8.3 Function Description

8.3.1 Deinterlace

There are eight deinterlace modes including I5O2, I5O1B, I5O1T, I2O2, I1O1B, I1O1T and detect only mode in the deinterlace block.

I5O2 mode
The I5O2 mode represents for 5 fields of input images and 2 frames of output images. This mode is the most frequently used. The input source images are stored as interlaced mode which means top field and bottom field are stored by the method that one top field line follows one bottom field or conversely. So, current, next and preview input frame address (SRC_ADDR_CURY, SRC_ADDR_NXTY and SRC_ADDR_PREY for Y channel) need to be configured. Top frame and bottom frame address (DST_ADDR_TOPY, DST_ADDR_BOTY for Y channel) need to be configured for output 2 frames.

I5O1B/T mode
The I5O1B and I5O1T mode have the same input images as the I5O2 mode, but only one frame output is generated which means only need configure one output frame address(top frame address for I5O1T mode and bottom frame address for I5O1B mode).

I2O2 mode
The I2O2 mode only need current input source frame, output is the same as I5O2 mode. This mode is the fastest and the most bandwidth saving.

I1O1B/T mode
The I1O1B and I1O1T mode just need read one filed. The output is same as I5O1B and I5O1T mode.

Bypass mode
If bypass mode is selected, there are not any deinterlace operations.

Pulldown Recovery mode
If the pulldown detection block detects the current source is pulldown interlace video. IEP supports pulldown recovery by setting this mode.

Detect Only mode
This mode has no output frames for saving power and bandwidth. All of the detection results will be read back though AHB bus.

8.4 Register Description

8.4.1 Registers Summary

Slave address can be divided into different length for different usage, which is shown as follows.

Name	Offset	Size	Reset Value	Description
IEP2_FRM_START	0x0000	W	0x00000000	Frame start and frame state register
IEP2_IEP_CONFIG0	0x0004	W	0x00000303	IEP configuration register0
IEP2_GATING_CTRL	0x0010	W	0x00000800	IEP auto gating register
IEP2_STATUS	0x0014	W	0x00000000	IEP status
IEP2_INT_EN	0x0020	W	0x00000011	IEP interrupt enable
IEP2_INT_CLR	0x0024	W	0x00000000	IEP interrupt clear
IEP2_INT_STS	0x0028	W	0x00000000	IEP interrupt status
IEP2_INT_RAW_STS	0x002C	W	0x00000000	IEP interrupt raw status
IEP2_VIR_SRC_IMG_WIDTH	0x0030	W	0x00000000	Source image virtual width
IEP2_VIR_DST_IMG_WIDTH	0x0034	W	0x00000000	Destination image virtual width
IEP2_SRC_IMG_SIZE	0x0038	W	0x00000000	Source image size
IEP2_DIL_CONFIG0	0x0040	W	0x00029F01	Deinterlace configuration register0
IEP2_IEP_TIMEOUT_CFG	0x0050	W	0x0065B9AA	Timeout configuration
IEP2_IEP_VERSION_INFO	0x0054	W	0x20000000	IEP version information
IEP2_DBG_FRM_CNT	0x0058	W	0x00000000	Frame counter
IEP2_DBG_TIMEOUT_CNT	0x005C	W	0x00000000	Timeout counter
IEP2_SRC_ADDR_CURY	0x0060	W	0x00000000	Start address of source current image(Y), frame address
IEP2_SRC_ADDR_NXTY	0x0064	W	0x00000000	Start address of source next image(Y), frame address
IEP2_SRC_ADDR_PREY	0x0068	W	0x00000000	Start address of source previous image(Y), frame address
IEP2_SRC_ADDR_CURUV	0x006C	W	0x00000000	Start address of source current image(UV), SP mode UV frame or U P mode frame address
IEP2_SRC_ADDR_CURV	0x0070	W	0x00000000	Start address of source current image(V), P mode V frame address
IEP2_SRC_ADDR_NXTUV	0x0074	W	0x00000000	Start address of source next image(UV), SP mode UV frame or U P mode frame address
IEP2_SRC_ADDR_NXTV	0x0078	W	0x00000000	Start address of source next image(V), P mode V frame address
IEP2_SRC_ADDR_PREUV	0x007C	W	0x00000000	Start address of source previous image(UV), SP mode UV frame address or U P mode frame address
IEP2_SRC_ADDR_PREV	0x0080	W	0x00000000	Start address of source previous image(V), P mode V frame address
IEP2_SRC_ADDR_MD	0x0084	W	0x00000000	MD load address base register0
IEP2_SRC_ADDR_MV	0x0088	W	0x00000000	MV load address base register0
IEP2_ROI_ADDR	0x008C	W	0x00000000	ROI address register

Name	Offset	Size	Reset Value	Description
IEP2_DST_ADDR_TOPY	0x00B0	W	0x00000000	DST top frame luma address register
IEP2_DST_ADDR_BOTY	0x00B4	W	0x00000000	DST bottom frame luma address register
IEP2_DST_ADDR_TOPC	0x00B8	W	0x00000000	DST top frame chroma address register
IEP2_DST_ADDR_BOTC	0x00BC	W	0x00000000	DST bottom frame chroma address register
IEP2_DST_ADDR_MD	0x00C0	W	0x00000000	MD output base address register
IEP2_DST_ADDR_MV	0x00C4	W	0x00000000	MV output base address register
IEP2_MD_CONFIG0	0x00E0	W	0x00000044	Motion Detection configuration
IEP2_DECT_CONFIG0	0x00E4	W	0x3C3C001E	Frame field detection, pulldown detection, OSD detection, combine detection
IEP2_OSD_LIMIT_CONFIG	0x00F0	W	0x00000000	OSD limit area detection configuration
IEP2_OSD_LIMIT_AREA0	0x00F4	W	0x00000000	OSD limit area 0
IEP2_OSD_LIMIT_AREA1	0x00F8	W	0x00000000	OSD limit area 1
IEP2_OSD_CONFIG0	0x00FC	W	0x00020032	OSD detection configuration
IEP2_OSD_AREA_CONF0	0x0100	W	0x00000000	OSD area 0
IEP2_OSD_AREA_CONF1	0x0104	W	0x00000000	OSD area 1
IEP2_OSD_AREA_CONF2	0x0108	W	0x00000000	OSD area 2
IEP2_OSD_AREA_CONF3	0x010C	W	0x00000000	OSD area 3
IEP2_OSD_AREA_CONF4	0x0110	W	0x00000000	OSD area 4
IEP2_OSD_AREA_CONF5	0x0114	W	0x00000000	OSD area 5
IEP2_OSD_AREA_CONF6	0x0118	W	0x00000000	OSD area 6
IEP2_OSD_AREA_CONF7	0x011C	W	0x00000000	OSD area 7
IEP2_ME_CONFIG0	0x0120	W	0x001443A4	ME search configuration
IEP2_ME_LIMIT_CONFIG	0x0124	W	0x00001B25	ME search limit
IEP2_MV_TRU_LIST0	0x0128	W	0x00000000	MV trust list0~3
IEP2_MV_TRU_LIST1	0x012C	W	0x00000000	MV trust list4~7
IEP2_EEDI_CONFIG0	0x0130	W	0x0000000C	EEDI configuration register0
IEP2_BLE_CONFIG0	0x0134	W	0x00000001	BLE configuration register0
IEP2_COMB_CONFIG0	0x0138	W	0x001004FF	COMB DECT configuration register0
IEP2_DIL_MTN_TAB0	0x0140	W	0x00000000	DIL_MTN_TAB0 table value

8.4.2 Detail Registers Description

IEP2_FRM_START

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	sw_iep_frm_en Frame start, Write 1, frame work enable, frame end self clear

IEP2_IEP_CONFIG0

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved
22	RW	0x0	sw_iep_init_dis 1'b1: Frame start not initial 1'b0: Frame start initial
21	W1C	0x0	sys_iep_sreset_p Write 1 to global reset iep, auto clear
20	RW	0x0	sw_iep_rst_protect_dis DMA bus error, default protect soft reset 1'b0: Protect reset 1'b1: Direct reset
19:17	RO	0x0	reserved
16	RW	0x0	sw_iep_debug_data_en If assert this bit, the debug signals will have data(just for power saving)
15:14	RO	0x0	reserved
13:12	RW	0x0	sw_iep_dst_yuv_swap 2'b00: SP UV 2'b01: SP VU 2'b10, 2'b11: Reserved
11:10	RO	0x0	reserved
9:8	RW	0x3	sw_iep_dst_fmt 2'b00, 2'b01: Reserved 2'b10: YUV422 2'b11: YUV420
7:6	RO	0x0	reserved

Bit	Attr	Reset Value	Description
5:4	RW	0x0	sw_iep_src_yuv_swap 2'b00: SP UV 2'b01: SP VU 2'b10, 2'b11: P
3:2	RO	0x0	reserved
1:0	RW	0x3	sw_iep_src_fmt 2'b00,2'b01: Reserved 2'b10: YUV422 2'b11: YUV420

IEP2_GATING_CTRL

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11	RW	0x1	sw_reg_clk_on Reg clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.
10	RW	0x0	sw_dma_clk_on Aclk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on.
9	RW	0x0	sw_ram_clk_on All ram clk always on 1'b0: Clk gating 1'b1: Clk always on
8	RW	0x0	sw_ctrl_clk_on CTRL clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on
7	RW	0x0	sw_out_clk_on OUT clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on
6	RW	0x0	sw_ble_clk_on BLE clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on
5	RW	0x0	sw_eedi_clk_on EEDI clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on
4	RW	0x0	sw_mc_clk_on MC clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on
3	RW	0x0	sw_me_clk_on ME clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on
2	RW	0x0	sw_dect_clk_on DECT clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on
1	RW	0x0	sw_md_clk_on MD clk is auto gating, if write 1, clk always on, not gating, also control by sw_iep_clk_on
0	RW	0x0	sw_iep_clk_on IEP clk is auto gating, if write 1, clk always on, not gating

IEP2_STATUS

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
0	W1C	0x0	ro_arst_finish_done IEP protect safety reset success status, write 1 clear or frame start clear.

IEP2_INT_EN

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RW	0x0	sw_iep_timeout_int_en Timeout interruption enable
4	RW	0x1	sw_iep_bus_error_en Bus error interruption enable
3:2	RO	0x0	reserved
1	RW	0x0	sw_iep_osd_max_en Frame process OSD detection done interrupt 1'b0: Inactive 1'b1: Active
0	RW	0x1	sw_iep_frm_done_en Frame process done interrupt 1'b0: Inactive 1'b1: Active

IEP2_INT_CLR

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	W1C	0x0	sw_iep_timeout_int_clr Time out interruption clear
4	W1C	0x0	sw_iep_bus_error_clr Bus error interruption clear
3:2	RO	0x0	reserved
1	W1C	0x0	sw_iep_osd_max_clr OSD max interruption clear
0	W1C	0x0	sw_iep_frm_done_clr Frame process done interrupt clear

IEP2_INT_STS

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RO	0x0	ro_timeout_sts Timeout error interruption status
4	RO	0x0	ro_bus_error_sts Bus error interruption status
3:2	RO	0x0	reserved
1	RO	0x0	ro_osd_max_sts Frame process OSD detection done interrupt status
0	RO	0x0	ro_frm_done_sts Frame process done interrupt status

IEP2_INT_RAW_STS

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
5	RO	0x0	ro_timeout_raw Timeout interruption raw status
4	RO	0x0	ro_bus_error_raw Bus error interruption raw status
3:2	RO	0x0	reserved
1	RO	0x0	ro_osd_max_raw OSD max interruption raw status
0	RO	0x0	ro_frm_done_raw Frame done interruption raw status

IEP2_VIR_SRC_IMG_WIDTH

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	sw_iep_src_vir_uv_stride Source uv virtual image width(word align)
15:0	RW	0x0000	sw_iep_src_vir_y_stride Source y virtual image width(word align)

IEP2_VIR_DST_IMG_WIDTH

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	sw_iep_dst_vir_stride Destination virtual image width(word align)

IEP2_SRC_IMG_SIZE

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26:16	RW	0x000	sw_iep_src_pic_height Source and destination image height(pixel align and need minus 1, for example 1080 need configuration 1079)
15:11	RO	0x00	reserved
10:0	RW	0x000	sw_iep_src_pic_width Source and destination image width(pixel align and need minus 1, for example 1920 need configuration 1919)

IEP2_DIL_CONFIG0

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RW	0x1	sw_dil_mv_hist_en Deinterlace MV histogram enable. 1'b1: Deinterlace need MV histogram 1'b0: MV histogram not work

Bit	Attr	Reset Value	Description
16	RW	0x0	sw_dil_roi_en Deinterlace ROI function enable bit 1'b1: Deinterlace use ROI mode 1'b0: ROI not work When ROI mode enable,each tile has 4bit for ROI mode 4'b0000: Normal mode 4'b0001: Bypass mode 4'b0010: EEDI only mode 4'b0011: Ma only mode 4'b0100: Ma mc mode(no cc) 4'b0101: Mc EEDI mode 4'b0110:4'b0111:Reserved 4'b1xxx: Mc only mode(MC's MV will be appointed by global MV based on roi[2:0])
15	RW	0x1	sw_dil_comb_en Deinterlace output result combine dectection, if is combine block back to original data, else select deinterlace result. 1'b1: Output data combine detection enable 1'b0: Output data not combine detection
14:13	RO	0x0	reserved
12	RW	0x1	sw_dil_memc_en Deinterlace use ME, MC result. 1'b1: ME, MC work enable 1'b0: ME, MC not work enable
11	RW	0x1	sw_dil_osd_en On screen display detection enable. 1'b1: OSD detection enable 1'b0: OSD not detection(下同)
10	RW	0x1	sw_dil_pd_en Pulldown detection enable. 1'b1: Pulldown detection enable 1'b0: Pulldown not dect
9	RW	0x1	sw_dil_ff_en Frame field detection work enable. 1'b1: Frame field detection enable 1'b0: Frame field not dect
8	RW	0x1	sw_dil_md_pre_en 1'b1: MD use previous frame data enable 1'b0: MD only use current frame data to calculate
7:6	RO	0x0	reserved
5	RW	0x0	sw_dil_field_order Field display order. 1'b0: TFF, top field display first 1'b1: BFF, bottom field display first
4	RW	0x0	sw_dil_out_mode Output deinterlace result to DDR, line mode or tile mode. 1'b0: LINE mode 1'b1: TILE mode

Bit	Attr	Reset Value	Description
3:0	RW	0x1	sw_dil_mode 4'b0000: DIL disable 4'b0001: I5O2 mode 4'b0010: I5O1T mode 4'b0011: I5O1B mode 4'b0100: I2O2 mode 4'b0101: I1O1T mode 4'b0110: I1O1B mode 4'b0111: Pulldown recovery mode 4'b1000: Bypass mode 4'b1001: Dectect only mode Other: Reserved

IEP2_IEP_TIMEOUT_CFG
Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31	RW	0x0	sw_iep_timeout_en IEP timeout enable
30:0	RW	0x0065b9aa	sw_iep_timeout_cnt When sw_iep_timeout_en ==1, timeout_cnt == sw_iep_timeout_cnt, IEP timeout

IEP2_IEP_VERSION_INFO
Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:28	RO	0x2	major Used for IP structure version information
27:20	RO	0x00	minor Big feature change under same structure
19:0	RO	0x00000	svnbuild RTL current SVN number

IEP2_DBG_FRM_CNT
Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	W1C	0x0000	dbg_frm_cnt Self increase one after a frame operation is finished. Write arbitrary value to clear to zero.

IEP2_DBG_TIMEOUT_CNT
Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:0	RO	0x00000000	dbg_timeout_cnt When sw_iep_timeout_en==1, frame counter, frame start auto clear

IEP2_SRC_ADDR_CURY
Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_cury Current frame luma address, frame address

IEP2_SRC_ADDR_NXTY

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_nxty Next frame luma addr, frame address

IEP2_SRC_ADDR_PREY
Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_prey Start address of source previous image(Y), frame address

IEP2_SRC_ADDR_CURUV
Address: Operational Base + offset (0x006C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_curuv Start address of source current image(UV), SP mode UV frame address or U P mode frame address.

IEP2_SRC_ADDR_CURV
Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_curv Start address of source current image(V), P mode V frame address

IEP2_SRC_ADDR_NXTUV
Address: Operational Base + offset (0x0074)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_nxtuv Start address of source next image(UV), SP mode UV frame address or U P mode frame address.

IEP2_SRC_ADDR_NXTV
Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_nxtv Start address of source next image(V), P mode V frame address

IEP2_SRC_ADDR_PREUV
Address: Operational Base + offset (0x007C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_preuv Start address of source previous image(UV), SP mode UV frame address or U P mode frame address.

IEP2_SRC_ADDR_PREV
Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_prev Start address of source previous image(V), P mode V frame address.

IEP2_SRC_ADDR_MD
Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_md Md address, save previous frame MD gradient

IEP2_SRC_ADDR_MV
Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_src_addr_mv Md addr, save previous frame MV

IEP2_ROI_ADDR
Address: Operational Base + offset (0x008C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_addr_roi ROI address base

IEP2_DST_ADDR_TOPY
Address: Operational Base + offset (0x00B0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_dst_addr_topy DST top frame luma start address

IEP2_DST_ADDR_BOTY
Address: Operational Base + offset (0x00B4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_dst_addr_boty Dst bottom frame luma start address

IEP2_DST_ADDR_TOPC
Address: Operational Base + offset (0x00B8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_dst_addr_topc DST top frame chroma start address, UV save together

IEP2_DST_ADDR_BOTC
Address: Operational Base + offset (0x00BC)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_dst_addr_botc Dst bottom frame chroma start addr, uv save together

IEP2_DST_ADDR_MD
Address: Operational Base + offset (0x00C0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_dst_addr_md MD addr, save previous frame md gradt, and also save current frame md grad

IEP2_DST_ADDR_MV
Address: Operational Base + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_iep_dst_addr_mv Output MV addr, save previous frame MV and also save current frame MV

IEP2_MD_CONFIG0

Address: Operational Base + offset (0x00E0)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9:8	RW	0x0	sw_md_theta GRADtc = CLIP(GRADtf -sw_md_theta, 0, 255);
7:4	RW	0x4	sw_md_r Gradtf *md_r*63/(gradtf*md_r*63 + gradv)
3:0	RW	0x4	sw_md_lambda Current grad * md_lambda/8 + pre grad*(8-md_lambda)/8, value range from 0~8

IEP2_DECT_CONFIG0
Address: Operational Base + offset (0x00E4)

Bit	Attr	Reset Value	Description
31:24	RW	0x3c	sw_osd_gradv_thr Origial data grad compare with gradv thr, if more than gradv_thr, may be OSD area
23:16	RW	0x3c	sw_osd_gradh_thr Origial data grad compare with gradh thr, if more than gradh_thr, may be OSD area
15:12	RO	0x0	reserved
11:8	RW	0x0	sw_osd_area_num OSD area number, frame field dect, pulldown not detection this area, combine detection also use this value, 0~8
7:0	RW	0x1e	sw_dect_resi_thr For resi to bin, frame field, pulldown, OSD detection use this value

IEP2_OSD_LIMIT_CONFIG
Address: Operational Base + offset (0x00F0)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4	RW	0x0	sw_osd_pos_limit_num OSD constrain area detection number, real value = OSD_pos_num + 1
3:1	RO	0x0	reserved
0	RW	0x0	sw_osd_pos_limit_en OSD area constrain detection enable

IEP2_OSD_LIMIT_AREA0
Address: Operational Base + offset (0x00F4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_osd_limit_area0 OSD constrain area 0 [6:0]: OSD constrain area0 x start, 16pixel number [13:7]: OSD constrain area0 x end, 16pixel number [22:14]: OSD constrain area0 y start, 4 pixel number [31:23]: OSD constrain area0 y end, 4 pixel number

IEP2_OSD_LIMIT_AREA1
Address: Operational Base + offset (0x00F8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sw_osd_limit_area1 OSD limite area 1 [6:0]: OSD constrain area0 x start, 16pixel number [13:7]: OSD constrain area0 x end, 16pixel number [22:14]: OSD constrain area0 y start, 4 pixel number [31:23]: OSD constrain area0 y end, 4 pixel number

IEP2_OSD_CONFIG0
Address: Operational Base + offset (0x00FC)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24:16	RW	0x002	sw_osd_line_num Dectecting line number should more than OSD_line_num * 4, this lines may be OSD area
15:11	RO	0x00	reserved
10:0	RW	0x032	sw_osd_pec_thr A line should more than OSD_per_thr, this line may be OSD area

IEP2_OSD_AREA_CONF0
Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	sw_osd_y_end0 OSD area y end, 4 pixel number
22:14	RW	0x000	sw_osd_y_sta0 OSD area y start, 4 pixel number
13:7	RW	0x00	sw_osd_x_end0 OSD area x end, 16pixel number
6:0	RW	0x00	sw_osd_x_sta0 OSD area x start, 16pixel number

IEP2_OSD_AREA_CONF1
Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	sw_osd_y_end1 OSD area y end, 4 pixel number
22:14	RW	0x000	sw_osd_y_sta1 OSD area y start, 4 pixel number
13:7	RW	0x00	sw_osd_x_end1 OSD area x end, 16pixel number
6:0	RW	0x00	sw_osd_x_sta1 OSD area x start, 16pixel number

IEP2_OSD_AREA_CONF2
Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	sw_osd_y_end2 OSD area y end, 4 pixel number
22:14	RW	0x000	sw_osd_y_sta2 OSD area y start, 4 pixel number
13:7	RW	0x00	sw_osd_x_end2 OSD area x end, 16pixel number
6:0	RW	0x00	sw_osd_x_sta2 OSD area x start, 16pixel number

IEP2_OSD_AREA_CONF3

Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	sw_osd_y_end3 OSD area y end, 4 pixel number
22:14	RW	0x000	sw_osd_y_sta3 OSD area y start, 4 pixel number
13:7	RW	0x00	sw_osd_x_end3 OSD area x end, 16pixel number
6:0	RW	0x00	sw_osd_x_sta3 OSD area x start, 16pixel number

IEP2_OSD_AREA_CONF4

Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	sw_osd_y_end4 OSD area y end, 4 pixel number
22:14	RW	0x000	sw_osd_y_sta4 OSD area y start, 4 pixel number
13:7	RW	0x00	sw_osd_x_end4 OSD area x end, 16pixel number
6:0	RW	0x00	sw_osd_x_sta4 OSD area x start, 16pixel number

IEP2_OSD_AREA_CONF5

Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	sw_osd_y_end5 OSD area y end, 4 pixel number
22:14	RW	0x000	sw_osd_y_sta5 OSD area y start, 4 pixel number
13:7	RW	0x00	sw_osd_x_end5 OSD area x end, 16pixel number
6:0	RW	0x00	sw_osd_x_sta5 OSD area x start, 16pixel number

IEP2_OSD_AREA_CONF6

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:23	RW	0x000	sw_osd_y_end6 OSD area y end, 4 pixel number
22:14	RW	0x000	sw_osd_y_sta6 OSD area y start, 4 pixel number

8.5 Application Notes

Input source definition constraint
The input source definition must be 16x4 aligned, which means the image width 16 aligned and image height 4 aligned.

Normal configuration flow

- Set IEP2 related signals based on current video source information and deinterlace mode (must open frame done interruption by asserting the sw_iep_frm_done_en signal)
- Set frame start by setting signal sw_iep_frm_en = 1
- Wait for IEP2 frame done interruption
- Read back many kinds of Detection data and MVHIST, analyze these data, get the global MV, OSD information etc
- Configure the MV, OSD information back
- Set frame start for deinterlace loop

Chapter 9 DisplayPort Transmitter Controller (DPTX)

9.1 Overview

The DisplayPort Transmitter Controller (DPTX), which provides support for next generation video display interface technology. The Video Electronics Standards Association (VESA) defines the DisplayPort standard as an open digital communications interface for use in internal as well as external connections, such as:

- Interfaces within a PC or monitor (internal)
- External display connections, including interfaces between a PC and monitor or projector, between a PC and TV, or between a device such as a DVD player and TV display.

DPTX is compliant with the DisplayPort Specification Version 1.4 and supports both HDCP 1.3 and HDCP 2.2 standards. The DPTX digital controller interfaces with the DisplayPort/USB Type-C combo PHY, enabling the integration of a complete DisplayPort Interface in a USB Type-C environment.

9.2 Features

The features listed below which may or may not be present in actual product, may be subject to the third party licensing requirements. Please contact Rockchip for actual product feature configurations and licensing requirements.

DPTX supports the following features:

- General Features
  - DisplayPort 1.4a
  - Main Link: 1/2/4 lanes
  - Main Link: RBR/HBR/HBR2/HBR3
  - 1Mbps AUX channel
  - Single Stream Transport (SST)
  - Type-C support (alternate mode)
  - HDCP 2.2, HDCP 1.3
  - Quad Pixel Mode
  - YCrCb (3 formats), RGB support
  - Up to 48 bits per pixel
  - Support for Register based SDP (Secondary Data Packets)
  - Native AUX, I2C over AUX
  - AMBA APB Interface for internal register access and AUX access
- Video-Related Features
  - Video formats
    - CEA-861-F
    - VESA DMT
    - VESA CVT
  - Colorimetry
    - Supports up to 8/10 bits per color component
    - Supports RBG, YCbCr4:4:4, YCbCr4:2:2, YCbCr4:2:0
  - Pixel clock up to 594MHz
- Audio-Related Features
  - Up to 192 KHz, 24 bits per sample LPCM
  - Up to 8 audio channels
  - I2S, S/PDIF interface supported
  - High Bit-Rate audio @768 KHz
- DPTX are not support the following features:
  - DSC(Display Stream Compression)
  - Multistream Transport (MST)
  - Dual Mode Support

9.3 Function Description

9.3.1 Architecture Overview

Fig.65-1 shows the architecture overview of DPTX.

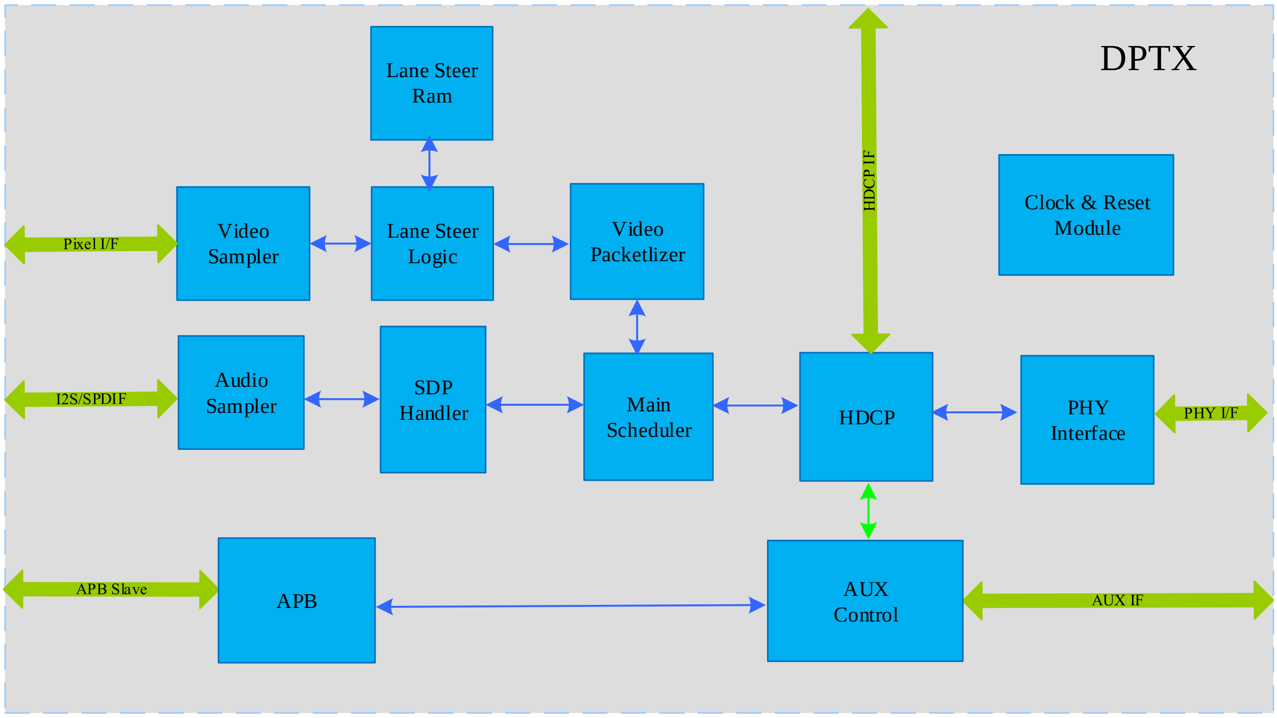

Fig. 9-1 DPTX Architecture Overview

The following sections describe the various blocks and their functionalities. DPTX uses a 32 bits internal data path for the main link.

9.3.2 Video Pixel Sampler

The video pixel sampler captures video pixel data on the video interface based on the various video formats, deep color modes. It outputs the captured video pixel data to the Video lane steering module as three separate color components.

Input data coming is registered once before it goes through a 3-stage pipeline. The 3-stage pipeline is required to capture the three-color components in various input video formats. The default delay in the video sampler is 4 cycles, which includes 3 stage pipeline and 1 stage input registering.

The video pixel sampler also gives the hsync and vsync to the lane steering logic based on what is presented on the video interface. To maintain the same pipeline delay, the hsync and vsync signals also go through the lane steering FIFO. On the rising edge and on the falling edge of the hsync and vsync a separate entry is pushed into the lane steering FIFO. When the packetizer pops out the hsync/vsync entry, it generates the hsync/vsync signals to the main scheduler.

The video is input on a 48-bit interface for supporting up to 16 bits per component mode. The data inputs are MSB aligned and for 6 bits per component mode; only the MSB 6 bits are valid for each component. The input video is sampled by the video sampler. The video sampler manipulates the video format that is input to the core, and then presents the data to the lane steering logic. The video sampler has pipelines to assemble the data and present to the lane steering logic.

9.3.3 Lane Steering Logic

The lane steering logic interfaces between the video pixel sampler and the Video packetizer. The lane steering logic takes three pixel components from the video pixel sampler and splits it into 32/64/128-bit data for each of up to four lanes in single/dual/quad pixel modes and sends it to the video Packetizer module.

The lane steering logic contains internal pipelines to assemble the data coming in from the video pixel sampler and push this data into the lane steering FIFOs in a 32/64/128-bit format. The lane steering FIFO is a 2-clock FIFO, with the pixel_clk being the write clock and the link clock being the read clock. The 32/64/128-bit data is pushed in simultaneously for all lanes. There is separate lane steering logic modules to take care of different video modes like RGB,YCbCr etc.

In the lane steering logic, the video data crosses the clock domains, from the pixel clock

(pixel_clk) domain to the link clock (link_clk) domain.
This module contains a dual clock FIFO per lane which is 39-bit wide. The lane steering FIFO is popped out by the video packetizer. The packetizer and the downstream logics run on the link clock. When the PHY interface is operating at 40 bits, then the link clock is the same as the phy_clk. But if the PHY interface is running at 20bits, then the link clock is half of the phy_clk. The video packetizer is instantiated per lane.
The lane_steer_fsm state machine in this module controls the data packing. This state machine looks at the input pixel pipeline and packs the data into 32 bits of data for each lane and pushes them into a 2-clock FIFO. The FIFO is written by the video packetizer on the pixel clock and read on the link clock. On seeing the lane steering FIFO being non empty, the video packetizer waits for threshold amount of link clock. By default, it waits for 16 clocks which is equivalent to 64 symbols (since the data width is 32), where 64 is the Transfer unit size. This threshold value could be changed by reprogramming VIDEO_CONFIG5 register. After waiting for the threshold number of link clocks, the packetizer pops out the data and send to the main scheduler. The packetizer keeps track of the transfer unit count. If the symbols transmitted is greater than the average number of symbols that is define for a particular video format (defined in VIDOE_CONFIG5.AVERAGE_SYMBOLS_PER_TU) and link rate, or if the FIFO is empty, it inserts fillers into the transfer unit until the transfer unit size of 64 is reached. During this filling time, data gets accumulated in the lane steering FIFO. During the transmission of the valid symbols, data gets filled into the FIFO and also gets popped out. The rate at which the push/pop happens varies.
The lane steering logic uses 12-stage pipelining. Each of the color components (R/G/B) go through the 12-stage pipelining. The 12 stages are required only for 6bpp mode with 4 lanes. Because this is not a configurable option, these pipeline stages are always present. If the number of lanes configured is less than 4, only a 5-stage pipeline is required.

9.3.4 Video Packetizer

The video packetizer takes data from the Video Lane Splitter to form packets based on the Tranfer Unit. The Transfer Unit Size is fixed to 64 bytes and internal data width is 32 bytes. The number of valid bytes to pack in a Transfer Unit is governed by the register fields AVERGAE_BYTES_PER_TU and AVERAGE_BYTES_PER_TU_FRAC in the VIDEO_CONFIG5 register. The software calculates this value based on the pixel rate for a given video format and the link rates, and then programs the value into the register.
The video packetizer acts on each lane. A 4-lane configuration contains four instances of the packetizer. Each instance of the packetizer must also know the total number of lanes for the packetizing logic.
The video packetizer works on a single clock domain, the link clock (link_clk).
When the lane steering FIFO goes non-empty, the packetizer waits for threshold amount of link clocks which is equivalent to a Transfer Unit. The threshold accumulates pixels in the lane steering FIFO. After threshold amounts of clocks, the packetizer transmits the pixels until the FIFO becomes empty. After average_bytes_per_tu bytes has been transmitted, based on Valid symbols per TU and TU size, video packetizer module inserts dummy data symbols and the corresponding framing symbols if required. For the following TU, it does not wait for 16 clocks, and transmits the available data in the FIFO. When the dummy data symbols are being inserted the video packetizer stops reading the lane steering FIFO.
When the Lane steering logic FIFO has a threshold amount of data, it starts reading data and transmits to the Link. The threshold is controlled by the VIDEO_CONFIG5.INIT_THRESHOLD. The FIFO must not get empty while active video is being transmitted. When the packetizer sees that the FIFO is almost empty or when average_bytes_per_tu bytes have been transmitted, it starts to insert fillers until the end of transfer unit. It also adds zero padding towards the end of active video period. The data output from the Video packetizer is multiplexed with SDP data from the SDP packetizer inside the main scheduler.
The packetizer works in the single stream mode. The data from the lane steering FIFO directly go to the scheduler. In SST mode, the lane steering FIFO is popped by the SST packetizer. But in MST mode this pop function needs to be handled by the Rate governor module through the scheduler.
When a stream is enabled but there is no pixel data on the pixel interface OR stream is not

enabled in MST mode, the stream symbol sequence generator generates the SF symbols in its VC payload timeslot and every 1024 time slot VB-ID should be inserted. This is done by the scheduler. Scheduler is in the VBLANK state during this time. In SST mode, this functionality is handled by the scheduler.

9.3.5 Main Scheduler

The main scheduler multiplexes the data coming from the video and the secondary data packets (SDP) stream. It also inserts the blanking-start and blanking-end symbols. The main scheduler maintains a timer module that tracks the start and end of each horizontal and vertical blanking.

When the data valid goes low, indicating the end of active pixels, the main scheduler inserts blanking-start control symbol and follows it up with the VB-ID information. When the data valid goes high, indicating valid pixels, the main scheduler inserts blanking-start control symbol and follows it up with the pixel transmission.

The main scheduler

- Keeps track of active video period and the blanking intervals
- Multiplexes the data from the video stream and the SDP stream to the link based on blanking intervals.
- Uses video_daten and various programmed timing parameters to derive the horizontal and vertical intervals.
- Is responsible for transmitting the blanking start (BS) and blanking end (BE) control symbols at the blanking boundary.
- Gives control to the SDP scheduler for scheduling the SDP streams at the blanking intervals.
- Transmits VB-ID, Mvid and Mauid at the start of the blanking intervals
- Gives arbitration to SDP streams, in the absence of video stream, so that dummy symbols are inserted from the SDP packetizer (Figure 2-11 of DP 1.3 spec).
- The main scheduler module also takes care of generating the video timestamp values Mvid and Nvid.

With the fixed priority arbitration, the lower numbered register sets get priority over higher numbered register sets. The SDP module frames the SDP packet based on the information programmed in the SDP register set, and also calculates the ECC for the SDP.

9.3.6 Audio Sampler

The audio sampler is responsible for capturing the audio input received, and writing it into the audio FIFO for processing by the SDP module.

9.3.6.1 I2S Interface

I2S is one of the interfaces available in the DPTX for interfacing the audio stream.

The width of the audio samples is programmable through audio register AUD_CONFIG1. I2s_data_width, to be 16 to 24 bits.

The following control bits are to be transmitted in the audio stream as per IEC specification:

- P - Parity bit
- C - Channel Status
- U - User Data
- V – Validity
- PR - Start of Block Preamble (2 bits used to indicate Preamble for start of block. The PR bit in the audio stream SDP is encoded using this bit).
  - 00: Subframe 1 and start of audio block
  - 01: Subframe 1
  - 10: Subframe 2

Each I2S data supports two audio channels. For DPTX, there are 4 i2sdata signals for supporting up to 8 audio channels, with a maximum sample frequency of 192Khz (non HBR).

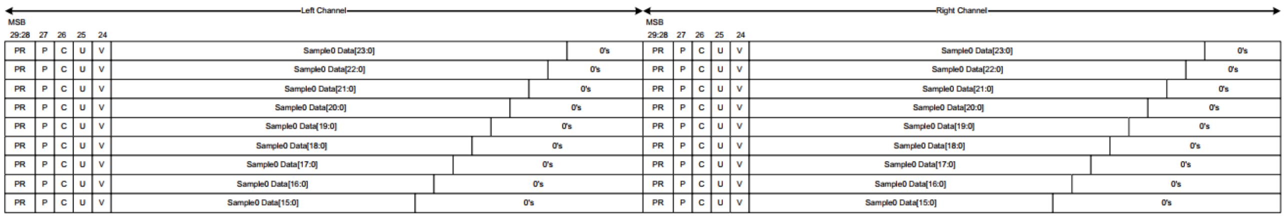

Fig. 65-2 i2s Data Input Format

Each audio sample per channel is 22 to 30 bits including preamble, control bits (auxiliary bits) and the sample data itself 16-24 bits). In one sampling frequency period, 2 sub-frames are provided or 2 samples (for the left and right channels). Since the input clock is 512 *fs, the remaining data in the subframe is ignored by the core.

High Bit Rate (HBR) Audio Support over I2S Interface

For supporting HBR audio over the I2S interface, perform the following steps:

1. Split the stream in four sub-streams by sending the stream to a FIFO with four outputs each. Each sub stream consists of a pair of samples.
2. Apply the i2sclk clock to the I2S interface with a frequency of 512*fs/4 (for example, 98.3 MHz for a 768 kHz input).
3. Set the I2S sample width to 22 bits by using the AUD_CONFIG1. I2s_data_width field register.
4. Configure the I2S interface by using the AUD_CONFIG1.audio_inf_select register. Enable all the four channels so that each channel carries a pair of samples using AUD_CONFIG1. i2s_in_en.
5. Map the I2S data sample, sampleI2S[21:0], in the following way: data[21:0] = {PR,P,C,U,V,
dataHBR[15:0]} (Where PR,P,C,U,V are IEC61937 parameters, PR is the encoded preamble, and data[15:0] is the actual HBR sample data.)
6. The I2S data must be driven according to the following table.

9.3.6.2 SPDIF Interface

The SPDIF interface uses a clock (spdifclk_i) and serial data (spdifdata_i]) to transfer audio samples / audio stream into the DPTX. Each bits of the ispdif[3:0] data corresponds to a pair of channels. Data input on the SPDIF must be BMC coded. The spdifclk_i must be synchronous to the ispdifdata_i and the frequency must be 512*fs, where fs is the original audio sampling frequency.

Each audio sample per channel is 32 bits including preamble, control bits (auxiliary bits) and the sample data itself 16-24 bits). In one sampling frequency period, 2 sub-frames are provided or 2 samples (for the left and right channels) or 64 bits. Since the SPDIF data input is BMC (Bi-Phase mark coding) coded, it takes 2 input clocks to represent a bit. So, one frame (or 2 sub frames) are represented in 128 clocks. Since the input clock is 512 *fs, the remaining data is zero coded.

Fig. 65-3 SPDIF Data Input Format

The High Bit Rate Audio is fed on the SPDIF interface in the standard 2-channel format, with ispdifdata[0] only used for data transmission.

9.3.7 PHY Interface Layer

The controller supports Pipe complaint interface which can be used for interfacing with Synopsys PHY with the PCC logic inside the PHY.

The behavior of phy_powerdown, phy_laneX_phystatus, and phy_rate is similar to the signals in the PIPE 3.0 Spec with some minor modifications. The controller supports both 20- and 40-bit wide data interface to the PHY. The output from the main scheduler goes to the PHY interface unit. The PHY interface unit has the scrambler, the 8b/10 encoder and the training pattern generator unit. The training pattern generator is responsible for generating the patterns during link training at the request of the software. The link training is driven by the software. The software instructs the PHY interface unit and sequences it through each step of the link training. The PHY interface unit also has PCC (Power and clock control) module which is specific to interfacing with Synopsys PHY. This module is responsible for taking care of the power down changes and the clock multiplexing based on the data rate of the link. The PHY interface unit also has a Rocket IO wrapper which is used for interfacing to the rocket IO for prototyping.

9.3.8 AUX Channel Interface

The AUX channel interface is used by the DPTX controller for AUX transfers.
The AUX module uses a 16 MHz input AUX clock for oversampling and regenerating the AUX data from the serial interface in AUX Rx. The AUX module also has the Manchester encoder and decoder. Various registers are provided for the software to get notification on aux transaction completion or error status.
The AUX channel is responsible for executing the AUX transfers as requested by the software driver, via the APB interface, or by internal modules via a dedicated internal interface. The request by the software is initiated by programming the AUX registers which are implemented in the APB clock domain. Once a write to the AUX_CMD register is detected, the AUX channel initiates an AUX transfer and sets the AUX_REPLY_RECEIVED bit in the AUX_STATUS register. The transmitted data is encoded using a Manchester-II encoder. When the encoder is not driving the bus, then the transmit enable for the bidirectional AUX is not asserted. This interface runs at a nominal 1MHz (1Mbps). For a 16MHz clock for AUX is used, then each UI requires 16 clock periods to generate. The encoder generates the following sequence before any data stream is to be transmitted:

- Pre-charge: 16 zeros
- Pre-amble: 16 zeros
- AUX_SYNC_END: 2 High periods followed by 2 Low periods
- Data to be transmitted
- AUX_STOP: 2 High periods followed by 2 Low periods

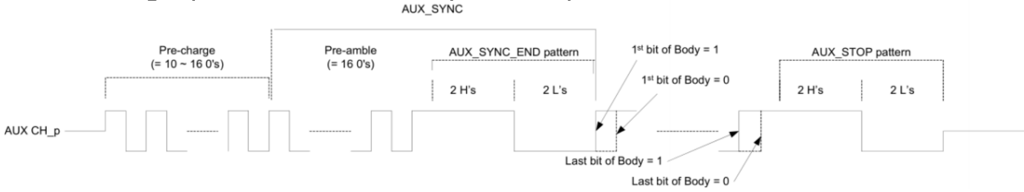

Fig. 65-4 AUX sequence

When all the data is transmitted, the AUX channel waits for a response. A 400uSec timer starts to limit the reply wait time. The Sink reply is captured & latched into the AUX status and data registers implemented in the APB block but also available on the internal bus to be consumed by the internal requesters. It's the SW responsibility to interpret the status and decide about the next transfer. The internal requests from the HDCP modules are limited to Native AUX. The internal requesters are expected to interpret correctly the ACK/NACK/DEFER responses, then decide how to proceed. The AUX_REPLY_RECEIVED bit is reset after the reply is received or timeout occurred.
Once the SW initiates an AUX request, some checks are performed to make sure its a legal request. The AUX_CMD.AUX_CMD_TYPE setting are compared with the 8 possible legal commands and the AUX_CMD.AUX_Byte_Length is checked so that:

- Read request is 1 byte
- Write does not exceed 16 bytes (1 + N, where N is 1-16)

9.3.9 Secondary Data Packet (SDP)

This section explains the how SDPs other than the Audio Stream SDPs are handled by the DPTX.
The DPTX controller has various software programmable registers through which the driver programs the header and the payload of the various SDPs, then programs the SDP Vertical/Horizontal & Manual control registers to enable specific SDP transmission and set whether the SDP is transmitted in the vertical, horizontal or both blanking intervals. The Manual control is used to control whether a SDP is transmitted once or continuously in the specified intervals.
DPTX always transmits the SDP as size of 32 bytes. Payloads less than this size are padded with zeros to make it 32 bytes.

- **Vendor Specific Infoframe Scheduling**

According to DP spec 1.3, section 2.2.5.1, the source should comply with the CEA861-F spec

for transmission of any Infoframe. As per CEA861-F, a source should support transmission of more than one VSIFs in a vertical blanking interval. DPTX SDP register banks allows transmission of more than one VSIFs in a vertical blanking interval. CEA861-F also talks about transmitting the version1/version2, where version2 used to indicate a change in the payload of the VSIF. This is also supported by the controller. The driver has to make sure that the multiple VSIFs to be transmitted in a vertical interval has to be programmed from a lower to higher continuously in the SDP register bank. For example if there are 4 VSIFs to be transmitted in an interval, then the 1 to 4 VSIFs should be programmed in SDP register bank N to N+4, where the first VSIF should be programmed in register bank N and fourth VSIF should be programmed in register bank N+4.
Either auto or manual mode can be used to transmit the VSIFs. If not using manual mode, then the specific register banks should be disabled before making a change and re enabling.

- **Audio Timestamp SDP**

Audio Timestamp SDP payload, which has the Maud and Naud values are generated by the hardware. There is no separate register for programming the payload for Audio Timestamp SPDs. The software still needs to set the corresponding auto enable bit in the Replace this with SDP_VERTICAL/HORIZONTAL_CTRL register for enabling the transmission of the Audio Timestamp SDP.
In the absence of Main video stream, controller makes sure that the Audio Timestamp SDP is transmitted once every 512th BS symbol set.

- **Audio Stream SDPs**

The audio samples are packed into the audio stream SDP in a 2-channel format or an 8-channel format. 2 channel mode is only used when only channel 1 /2 are active. In this case the AUD_CONFIG1.num_channels should be set to 2, and AUD_CONFIG1.audio_data_in_en should have a value of only 1. 8 channel mode is used whenever audio samples are available for channels 3-8. In this case AUD_CONFIG1.num_channels should be set to 8 and the AUD_CONFIG1.audio_data_in_en can be set to any value based on which channels the samples are available on.
In an 8 channel operation if only 4 channels have samples active (AUD_CONFIG1.audio_data_in_en[3:0] == 4'b1001), then the audio stream SDPs are transmitted in an 8-channel mode and data for channels 3,4,5,6 are zeroed out. The sample present bit for these channels are still set.
Zero padding of sample data at the audio interface is required in case the number of transmitted audio channels is odd. No zero padding is required if the corresponding AUD_CONFIG1.AUDIO_DATA_IN_EN is set to 1’b0.
In the absence of Main video stream, controller makes sure that the Audio Infoframe SDP if enabled, is transmitted once every 512th BS symbol set.

9.3.10 High-Bandwidth Digital Content Protection (HDCP)

The DPTX core can be configured to support HDCP. When HDCP is enabled, it can be programmed to support HDCP 2.2 or HDCP 1.3 authentication protocols.
The HDCP 2.2 core contains a processor to fetch the instructions and data from the system memory. So, the HDCP core has a DMA master AXI interface.
This module is responsible for reading the ciphers and using them to encrypt the data. When encryption is enabled, this module reads cipher from HDCP1.3 or HDCP2.2 block based on the mode of operation and XORs the cipher with data; control symbols are bypassed.
It also maintains the Link verification pattern. Link verification pattern is shifted by one on every blanking interval and reset when encryption is disabled.
There is also a debug option to bypass encryption by not XORing the data with cipher with encryption enabled. This is only for debug purpose and must be locked using the HDCPCFG.HDCP_LOCK bit

9.3.10.1 Overview of HDCP 2.2

On NACK, DEFER response or ACK response with fewer bytes from sink, the ESM retries the entire AUX transaction — but not the full HDCP transaction. For example, when the ESM reads 522-byte Rx certificate and has successfully read the first 128 bytes, then it does a 16-byte read request for bytes 129-144 and gets a NACK, DEFER, or ACK with fewer than 16 bytes. It then re-attempts from byte 129, not from byte 1 (and not from byte (129 + # of bytes received)).

The SHALE hardware can be programmed to break up transfers into chunks of 4, 8 or 16 bytes but this is a static configuration parameter and cannot be adjusted on the fly. Re-attempts are always done with the same transaction size.
Retrying authentication is the responsibility of the application software controlling the ESM. When it has been determined that the Rx is 2.2 capable, the Tx retries infinitely until the device is disconnected or HDCP is wiggled. Retries are done at the rate of the send cert timeout (100 ms), so it is effective immediately.

9.3.10.2 Overview of HDCP 1.3

All AUX transfer requests from authentication and revocation state machine are handled in this module. It is responsible for forming the aux transfer commands and holding the values read in internal registers for use by authentication and revocation state machine (KSV list read is stored in the revocation RAM).
On NACK, DEFER response or ACK response with fewer bytes from sink, the transfer is retried
automatically from the point where the transfer stopped. For example, if HDCP1.3 reads 16 bytes, but sinks return 1byte with NAK response, HDCP1.3 retries only for the remaining 15bytes.
When seven consecutive NACK or DEFER response is received, HDCP interrupt event is generated.

- HDCP1.3 Encryption Signaling block implements the display port encryption signaling defined in HDCP1.3 spec.
- HDCP API Interface register Bank contains registers related to KSVs, AN, DPK programming, SHA calculation and GPIO status.
- HDCP SFR register Bank contains HDCP configuration register, HDCP observation register, HDCP interrupt related registers.
- HDCP1.3 DPK registers are used when ROM less configuration is chosen. DPKs are programmed by software and are stored in this module. It is used by cipher module for the keys.

Controller retries authentication indefinitely until the HDCP enable bit is reset by the application.

9.4 Register Description

9.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

9.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
DPTX_VERSION_NUMBER	0x0000	W	0x3231312A	Version Number Register
DPTX_VERSION_TYPE	0x0004	W	0x65613038	Version Type Register
DPTX_CONFIG_REG1	0x0100	W	0x02212D0D	RTL Configuration Parameter Register 1
DPTX_CONFIG_REG2	0x0104	W	0x08001000	RTL Configuration Parameter Register 2
DPTX_CONFIG_REG3	0x0108	W	0x0000016C	RTL Configuration Parameter Register 3
DPTX_CCTL	0x0200	W	0x00000004	Global Control Register
DPTX_SOFT_RESET_CTRL	0x0204	W	0x00000000	Software Initiated Reset Register
DPTX_VSAMPLE_CTRL	0x0300	W	0x00000000	Video Sampler Control Register
DPTX_VSAMPLE_STUFF_CTRL1	0x0304	W	0x00000000	Video Sampler Data Stuff Control Register
DPTX_VSAMPLE_STUFF_CTRL2	0x0308	W	0x00000000	Stuff Control for RCR/GY Data Register
DPTX_VINPUT_POLARITY_CTRL	0x030C	W	0x00000000	Video Input Polarity Control Register

Name	Offset	Size	Reset Value	Description
DPTX_VIDEO_CONFIG1	0x0310	W	0x02800280	Video Configuration Register1
DPTX_VIDEO_CONFIG2	0x0314	W	0x002D01E0	Video Configuration Register2
DPTX_VIDEO_CONFIG3	0x0318	W	0x00600010	Video Configuration Register3
DPTX_VIDEO_CONFIG4	0x031C	W	0x0002000A	Video Configuration Register4
DPTX_VIDEO_CONFIG5	0x0320	W	0x00030796	Video Configuration Register5
DPTX_VIDEO_MSA1	0x0324	W	0x00230090	Main Stream Attribute Register 1
DPTX_VIDEO_MSA2	0x0328	W	0x00000000	Main Stream Attribute Register 2
DPTX_VIDEO_MSA3	0x032C	W	0x00000000	Main Stream Attribute Register 3
DPTX_VIDEO_HBLANK_INTERVAL	0x0330	W	0x00000000	Hblank Interval Symbol Register
DPTX_AUD_CONFIG1	0x0400	W	0x12001202	Audio Input Control Register
DPTX_SDP_VERTICAL_CTRL	0x0500	W	0x00000000	Secondary Data Packets Vertical Blanking Register
DPTX_SDP_HORIZONTAL_CTRL	0x0504	W	0x00000000	Secondary Data Packets Horizontal Blanking Register
DPTX_SDP_STATUS_REGISTER	0x0508	W	0x00000000	Secondary Data Packets Status Register
DPTX_SDP_MANUAL_CTRL	0x050C	W	0x00000000	Manual Controlled Transmit of SDP
DPTX_SDP_STATUS_EN	0x0510	W	0x00000000	SDP Status Interrupt Enable Register
DPTX_SDP_REGISTER_BANK	0x0600	W	0x00000000	SDP Register bank
DPTX_PHYIF_CTRL	0x0A00	W	0x00060000	PHY Interface Control Register
DPTX_PHY_TX_EQ	0x0A04	W	0x00000000	PHY Pre-emphasis and Voltage Swing Control Register
DPTX_CUSTOMPAT0	0x0A08	W	0x00000000	Custom 80-bit pattern Position Register 0
DPTX_CUSTOMPAT1	0x0A0C	W	0x00000000	Custom 80-bit pattern Position Register 1
DPTX_CUSTOMPAT2	0x0A10	W	0x00000000	Highest 20-bits of the 80-bit pattern.
DPTX_HBR2_COMPLIANCE_SCRAMBLER_RESET	0x0A14	W	0x000000FC	CP2520 Pattern Length
DPTX_PHYIF_PWRDOWN_CTRL	0x0A18	W	0x00000000	Lane Powerdown Control
DPTX_AUX_CMD	0x0B00	W	0x00000000	AUX Configuration Register
DPTX_AUX_STATUS	0x0B04	W	0x00000000	AUX Status Register
DPTX_AUX_DATA0	0x0B08	W	0x00000000	AUX Data- First 4 bytes
DPTX_AUX_DATA1	0x0B0C	W	0x00000000	AUX Data Second 4 bytes.
DPTX_AUX_DATA2	0x0B10	W	0x00000000	AUX Data Third 4 bytes
DPTX_AUX_DATA3	0x0B14	W	0x00000000	AUX Data Fourth 4 bytes
DPTX_PHYREG_CMDADDR	0x0C00	W	0x00000000	PHY Address Register
DPTX_PHYREG_DATA	0x0C04	W	0x00000000	PHY Write and Read DATA
DPTX_TYPEC_CTRL	0x0C08	W	0x00000000	Type-C Control Register

9.4.3 Detail Registers Description

DPTX_VERSION_NUMBER

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RO	0x3231312a	VERSION_NUMBER Version Number of the DPTX

DPTX_VERSION_TYPE

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:0	RO	0x65613038	VERSION_TYPE Version type of the DPTX

DPTX_CONFIG_REG1

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	DSC The value of the parameter DPTX_DSC_EN
29	RO	0x0	GEN2_PHY The value of the parameter DPTX_COMBO_PHY_C10_GEN2.
28:25	RO	0x1	NUM_DSC_ENC The value of the parameter DPTX_NUM_DSC_ENC.

Bit	Attr	Reset Value	Description
24	RO	0x0	FEC_EN The value of the parameter DPTX_FEC_EN
23	RO	0x0	EDP_EN The value of the parameter DPTX_EDP_EN.
22	RO	0x0	DSC_EN Indicates if Internal DSC is enabled or not
21:19	RO	0x4	MP_MODE 3'b001: Single Pixel Mode. 3'b010: Dual Pixel Mode. 3'b100: Quad Pixel Mode.
18:16	RO	0x1	NUM_STREAMS 3'h1: SST Mode. 3'h2: Two Streams 3'h3: Three Streams 3'h4: Four Streams
15:14	RO	0x0	reserved_15_14 Reserved
13:12	RO	0x2	SYNC_DEPTH 2'b10: Indicates that 2 stage synchronizers being used 2'b11: Indicates that 3 stage synchronizers being used
11	RO	0x1	DPK_8BIT 1'b1: ROM width is 8 bits 1'b0: ROM width is 56bits
10	RO	0x1	DPK_ROMLESS When 1, disables the use of External ROM for storing Device Private Keys
9	RO	0x0	FPGA_EN When enabled, configures the core to have the audio and video generators instantiated inside the DPTX top level.
8:4	RO	0x10	SDP_REG_BANK_SIZE Specifies the number of SDP register banks supported. Enabling each register bank instantiates nine 32-bit registers for the transmission of 32Byte SDP packet.
3	RO	0x1	PHY_USED The value of the parameter DPTX_PHYIF_TYPE 1'b0: Vendor PHY 1'b1: PIPE Compliant PHY
2:1	RO	0x2	AUDIO_SELECT The value of parameter audio_select 2'b00: I2S Interface 2'b01: SPDIF Interface 2'b10: I2S and SPDIF Interface 2'b11: None
0	RO	0x1	HDCP_SELECT Reflects the hardware parameter hdcp_en 1'b0: No 1'b1: Yes

DPTX_CONFIG_REG2

Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:16	RO	0x0800	DSC_MAX_NUM_LINES The value of the parameter DSC_MAX_NUM_LINES

DPTX_CCTL
Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	ENHANCE_FRAMING_WITH_FE When set controller follows enhanced framing with FEC as specified in section 3.5.1.1 of the DP1.4 spec. Configure this bit when enabling FEC on sink ie before setting FEC_READY bit in sink
28	RW	0x0	INITIATE_MST_ACT_SEQ Only used in MST mode and should be programmed to trigger the link to start an ACT sequence with the DPRX of the branch device immediately connected to the DPTX.
27	RW	0x0	ENABLE_eDP This bit is used to control the operation of the controller as an Embedded DisplayPort controller (eDP) or a standard DisplayPort Controller compliant with the DisplayPort Spec Ver 1.4. 1'b1: Controller operates in eDP mode 1'b0: Controller operates in standard DisplayPort mode eDP features are disabled by default. Program this bit only if you have chosen to enable eDP features by seeing the parameter DPTX_EDP_EN = 1. When eDP is enabled FEC should not be enabled (ENABLE_FEC should be 0).
26	RW	0x0	ENABLE_FEC This bit is used to enable the FEC feature. Set this bit to 1 to enable the FEC functionality. If FEC is disabled during core configuration (DPTX_FEC_EN=0), then writing to this bit has no effect.
25	RW	0x0	ENABLE_MST_MODE This bit is used for enabling the MST mode of operation.
24:17	RW	0x00	BS_512_SCALE_DOWN When SR_SCALE_DOWN is set, this controls the 512 scale down count.

Bit	Attr	Reset Value	Description
16	RW	0x0	SR_SCALE_DOWN "Every 512th BS symbol must be replaced with an SR symbol by a DPTX to reset the LFSR of the scrambler". For simulation, a scale down factor has been added and this bit controls the scaledown. When set to 1 the scrambler reset replaces Blanking Start after CCTL.BS_512_SCALE_DOWN value. When set to 0 scrambler reset replaces Blanking Start after 512 Blanking Starts
15:12	RO	0x0	reserved
11:8	RW	0x0	DEBUG_CONTROL Used for controlling the debug bus output. By configuring this register different signals selected to the output 64bits debug bus. No signal is selected and the output is '0' when the register is in its default state. 4'b0000: No signal is selected. 4'b0001: AUX 4'b0010: AUDIO 4'b0011: VIDEO 4'b0100: LINK 4'b0101: HDCP1.3 4'b0110: HDCP2.2 4'b0111: SDP 4'b1XXX: reserved
7	RO	0x0	reserved
6	RW	0x0	SEL_AUX_TIMEOUT_32MS When set to 1 the Aux timeout value is 3.2ms instead of 400us
5	RW	0x0	DISABLE_INTERLEAVING When set to 1 the nibble interleaving logic implemented as part of SDP packets generation is disabled.
4	RW	0x0	FORCE_HPD Used for testing only. It allows software to force the HPD value to 1 when writing 1. Otherwise does not impact the external HPD input.
3	RW	0x0	SCALE_DOWN_MODE When programmed to 1 the debounce filter on the HPD input is reduced from 100mSec in normal operation to 10uSec. This bit does not have any impact on the IRQ generation timing.
2	RW	0x1	DEFAULT_FAST_LINK_TRAIN_E When set after coming out of power on reset the controller starts fast link training for 1lane RBR rate without the driver intervention. The default video timings are set for 640x480 timing format 6bpc.
1	RW	0x0	ENHANCE_FRAMING_EN When set, controller follows enhanced framing. Configure this bit based on enhanced framing support of sink
0	RW	0x0	SCRAMBLE_DIS 1'b1: Disable scramble. 1'b0: Scramble enabled (default). When set, DPTX link does not scramble data on the main link. Enabling or disabling this bit resets the scrambler.

DPTX_SOFT_RESET_CTRL

Address: Operational Base + offset (0x0204)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved

Bit	Attr	Reset Value	Description
11	RW	0x0	AUDIO_SAMPLER_RESET_STREAM3 Software sets this bit to start the audio sampler reset. This also clears the audio FIFOs. This field is valid only for MST mode and is used for the reset of audio streams 3.
10	RW	0x0	AUDIO_SAMPLER_RESET_STREAM2 Software sets this bit to start the audio sampler reset. This also clears the audio FIFOs. This field is valid only for MST mode and is used for the reset of audio streams 2.
9	RW	0x0	AUDIO_SAMPLER_RESET_STREAM1 Software sets this bit to start the audio sampler reset. This also clears the audio FIFOs. This field is valid only for MST mode and is used for the reset of audio streams 1.
8:5	RW	0x0	VIDEO_RESET Software sets this bit to reset the video logic. In MST mode each bit controls the reset of a specific Video Stream. Bit5-8 controls the soft reset of Video stream-0 to 3.
4	RW	0x0	AUX_RESET Software sets this bit to start the aux channel reset.
3	RW	0x0	AUDIO_SAMPLER_RESET Software sets this bit to start the audio sampler reset. This also clears the audio FIFOs. In MST mode, this bit is used for Stream0.
2	RW	0x0	HDCP_MODULE_RESET Software sets this bit to start the HDCP module reset
1	RW	0x0	PHY_SOFT_RESET Software sets this bit to start the PHY reset process.
0	RW	0x0	CONTROLLER_RESET Software sets this bit to start the controller reset process. This also initiates a PHY reset.

DPTX_VSAMPLE_CTRL

Address: Operational Base + offset (0x0300)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RW	0x0	STREAM_TYPE This is a per stream control defining the stream type. RepeaterAuth_Stream_Manage of HDCP2.2 specification. This field is valid only when HDCP MST are enabled.
24	RW	0x0	ENCRYPTION_ENABLE This is a per stream control to enable encryption. Setting ofthis bit has significance only when operating in MST mode or eDP. In non eDP SST operation, this bit has no significance. In MST mode or when eDP is enabled, this bit control the encryption to be used. In MST mode, this bit control HDCP encryption for a specific stream. HDCPCFG register controls the global enable of HDCP. In eDP mode this bit controls the enabling of ASSR feature as specified in section 3.5 of eDP1.4b spec and Section 2.10 of DP1.4 spec. When eDP is enabled, HDCP should be disabled and HDCPCFG[1] should not be set.
23	RW	0x0	ENABLE_DSC Set this bit to 1 to enable Display Stream Compression (DSC) on this specific stream. The software driver can set this bit only if DSC is enabled during configuration (DPTX_DSC_EN = 1 or 2). Otherwise writing 1 1 to this bit does not take effect.

Bit	Attr	Reset Value	Description

0	RW	0x0	VSYNC_IN_POLARITY Vsync input polarity 1'b1: Active high 1'b0: Active low

DPTX_VIDEO_CONFIG1

Address: Operational Base + offset (0x0310)

Bit	Attr	Reset Value	Description
31:16	RW	0x0280	HACTIVE Input video Horizontal active pixel region width. Number of Horizontal active pixels [0...8191].
15:2	RW	0x00a0	HBLANK Input video Horizontal blanking pixel region width. Number of Horizontal blanking pixels [0...4095].
1	RW	0x0	I_P Input video mode 1'b1: Interlaced 1'b0: Progressive
0	RW	0x0	R_V_BLANK_IN_OSC Used for CEA861-D modes with fractional Vblank (for example, modes 5, 6, 7, 10, 11, 20, 21, and 22). For more modes, see the CEA861-D specification. Note: Set this field to 1 for video mode 39, although there is no Vblank oscillation. 1b: Active high

DPTX_VIDEO_CONFIG2

Address: Operational Base + offset (0x0314)

Bit	Attr	Reset Value	Description
31:16	RW	0x002d	VBLANK Input video Vertical blanking pixel region width. Number of Vertical blanking lines.
15:0	RW	0x01e0	VACTIVE Input video Vertical active pixel region width. This bit field holds bits 15:0 of number of Vertical active pixels.

DPTX_VIDEO_CONFIG3

Address: Operational Base + offset (0x0318)

Bit	Attr	Reset Value	Description
31:16	RW	0x0060	H_SYNC_WIDTH Input video Hsync active pulse width. Integer number of pixel clock cycles [0...511].
15:0	RW	0x0010	H_FRONT_PORCH Input video Hsync active edge delay. Integer number of pixel clock cycles from "de" non active edge of the last "de" valid period [0...4095].

DPTX_VIDEO_CONFIG4

Address: Operational Base + offset (0x031C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0002	V_SYNC_WIDTH Input video Vsync active pulse width. Integer number of video lines [0...63].
15:0	RW	0x000a	V_FRONT_PORCH Input video Vsync active edge delay. Integer number of hsync pulses from "de" non active edge of the last "de" valid period. [0...255]. Specified in terms of number of lines. Value After Reset: 0

DPTX_VIDEO_CONFIG5

Address: Operational Base + offset (0x0320)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved
22:21	RW	0x0	INIT_THRESHOLD_HI Most Significant two bits of INT_THRESHOLD.
20	RW	0x0	ENABLE_3D_FRAME_FIELD_SE Set this bit to 1 if the video format being transmitted is 3D video format and Frame/Filed sequential 3D mode is used. Set this bit to 0 (default) if no 3D video is being transmitted, or Frame/Filed sequential 3D format is not being used. Refer to section "3D Stereo Mode Support" for more details.

Bit	Attr	Reset Value	Description
19:14	RW	0x0c	AVERAGE_BYTES_PER_TU_FR This is the fractional portion of the value calculated in the average bytes per TU. The first decimal value in the fractional part should be programmed here. For example, if the average bytes per TU is 24.34, then this field should be programmed to a value of 3. In SST mode only bits 19:16 is used. In MST mode, this field should be programmed with the fractional value of the VC payload size calculated by the Payload bandwidth manager. as specified in Section 2.6.4.3 of DisplayPort 1.4 Spec. The fractional value calculated times 64 should be programmed in this field. For example if the vc_payload_size calculated is 34.23, a value of 0.23*64 = 15 (14.72 rounded to the nearest integer) should be programmed here. For over 64 MTPs controller transmits AVERAGE_BYTES_PER_TU+1 timeslots with valid symbols for average_bytes_per_tu MTPs for this streams and for 64-average_bytes_per_tu MTPS AVERAGE_BYTES_PER_TU timeslots will have valid symbols. Here is an example for calculating the average_bytes_per_tu_frac in MST mode for the video format VIC-1 (640x480) RGB, 8bpc, at a frame rate of 60Hz. The Link is assumed to be HBR 4 lanes. Peak_stream_bandwidth = Pixel_clock_frequency*bytes_per_pixel = 25.175*3 = 75.52MBps Link Bandwidth = link_rate * 100 * number_of_lanes .= 2.7 * 100 *4 = 1080MBps Average_bytes_per_tu_frac = frac((peak_stream_bandwidth/link_bandwidth)*64))*64 = frac(4.475) *64= 0.47*64 = 30.08 . Program the frac value rounded to the nearest integer which is 30.
13:7	RW	0x0f	INIT_THRESHOLD This is the number of clock cycles the link should wait for the pixels to accumulate at the beginning of every video line before it starts transmitting. This threshold influences the link capability to maintain the avarge valid symbols per TU. For Non-DSC Mode: If the calculated average bytes per tu value is less than 6 then the threshold value should be programmed to 32. For RGB or YCbCr444 modes if the hblank is less than or equal to 80pixels, then a value of 12 should be used. For 4:2:0 mode if the hblank is less than 40, then a value of 3 should be used. For dual and quad pixel modes a value of 64 should be used. In all other cases the default value of 16 is sufficient. The link has a 32 bit data path and the 16 clocks is to wait for TU size clocks which is 16*4 = 64 (TU size) symbols. For DSC Mode: INIT_THRESHOLD = pixel_push_rate * link_pixel_clock_ratio * slot_count where Pixel Push rate = (8/bpp)*lane_count. slot_count for sst =average_bytes_per_tu + FEC symbols inserted per lane(13 in 1-lane and 7 in 2/4lane if fec is enabled, 0 if fec is disabled) slot count is rounded to nearest multiples of 4(ceiling). If slot count calculated is greater than 64, then slot count is fixed to 64. slot_count for mst = (32/lane_count) + average_bytes_per_tu + FEC symbols inserted per lane(13 in 1-lane and 7 in 2/4lane if fec is enabled, 0 if fec is disabled). Slot count is rounded to nearest multiples of 4(ceiling). If slot count calculated is greater than 64, then slot count is fixed to 64. bpp = PPS.bits_per_pixel in simple modes and PPS.bits_per_pixel/2 in native modes link_pixel_clock_ratio = link clock frequency in Mhz/ pixel clock frequency in Mhz.

Bit	Attr	Reset Value	Description
6:0	RW	0x16	AVERAGE_BYTES_PER_TU This is the average number of valid bytes in a transfer Unit. Driver should program this register based on the video format being transmitted and the link rate and lane configuration being used. Section 2.2.1.4 of the DP 1.43 spec give details on how this average symbol count should be calculated. In MST mode, this register is programmed with the calculated TS_INT as specified in Section 2.6.4.3 of DisplayPort 1.4 Spec. In MST mode, The driver programs the avarege_bytes_per_tu using the following equation. Average_bytes_per_tu= floor((Peak_stream_bandiwth/Link_bandwidth*64) Here is an example for calculating the Average_bytes_per_tu in MST mode for the video format VIC-1 (640x480) RGB, 8bpc, at a frame rate of 60Hz. The Link is assumed to be HBR 4 lanes. Peak_stream_bandwidth = Pixel_clock_frequency*bytes_per_pixel = 25.175*3 = 75.52MBps Link Bandwidth = link_rate * 100 * number_of_lanes .= 2.7 * 100 *4 = 1080MBps Average_bytes_per_tu = floor((peak_stream_bandwidth/link_bandwidth)*64) = floor((75.52/1080)*64)) = floor(4.475) = 4.

DPTX_VIDEO_MSA1

Address: Operational Base + offset (0x0324)

Bit	Attr	Reset Value	Description
31:16	RW	0x0023	VSTART Vertical start from the leading edge of Vsync, measured in line count. This is the vstart value that is specified in the MSA.This is same as vsync width + Vertical back porch.
15:0	RW	0x0090	HSTART Horizontal active start from leading edge of Hsync, measured in pixel count. This is the hstart value that is specified in the MSA. This is same as hsync width + Horizontal back porch.
