23:0	RW	0x000000	NVID NVID value to be used in case of synchronous mode of operation (pixel source reference clock and link reference clock are the same). See section 2.2.3 of the DisplayPort 1.3 spec. This value goes in the MSA. If the clocks are asynchronous, controller internally calculates this value.

DPTX_VIDEO_HBLANK_INTERVAL

Address: Operational Base + offset (0x0330)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	HBLANK_INTERVAL For MST mode the programmed value should be (Hblank/16 *average_bytes_per_tu*link_clk/pixel_clk. Link_clk and pixel_clk are in Mhz. The link clock is based on the internal 32 bit datapath. In SST mode, it should be hblank *link_clk/pixel_lk.

DPTX_AUD_CONFIG1

Address: Operational Base + offset (0x0400)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:24	RW	0x12	AUDIO_TIMESTAMP_VERSION_ Audio timestamp version number.This is used as HB3[7:2] of Audio Timestamp SDP. As per DP 1.3 Spec, this should be h'12. Some compliance testers still look for old values, and therefore added this register field.
23:16	RW	0x00	AUDIO_PACKET_ID Defines the first byte of the audio SDP and the audio time stamp SDP header. Used for associating the audio sdp to the timestamp with multiple audio streams.
15	RW	0x0	AUDIO_MUTE Controls the AudioMute_Flag in the VB-ID. 1'b1: Sets the AudioMute_Flag in VB-ID 1'b0: Clears the AudioMute_Flag in VB-ID.
14:12	RW	0x1	NUM_CHANNELS Number of audio channels 1'b0: 1channel 1'b1: 2channels others: 8channels.
11	RO	0x0	reserved
10	RW	0x0	HBR_MODE_ENABLE Audio input is operating in HBR mode if set to '1'. When audio_if_select is 1 (S/PDIF), 768kHz x 2 Channels x 16 bits is delivered to controller. When '0' (I2s) 192kHz x 8 x 16 bits in 8-channel is delivered to controller.

Bit	Attr	Reset Value	Description
9:5	RW	0x10	AUDIO_DATA_WIDTH Audio input data width audio_data_width4:0 Action 5'b00000-5'b01111: Not used 5'b10000: 16 bit data samples at input 5'b10001: 17 bit data samples at input 5'b10010: 18 bit data samples at input 5'b10011: 19 bit data samples at input 5'b10100: 20 bit data samples at input 5'b10101: 21 bit data samples at input 5'b10110: 22 bit data samples at input 5'b10111: 23 bit data samples at input 5'b11000: 24 bit data samples at input 5'b11001-5'b11111: Not Used
4:1	RW	0x1	AUDIO_DATA_IN_EN Specifies which of the audio data inputs are active. Used to control I2sSPDIF input data. audio_data_in_en0 and ispdfidata0i2sdata_i0 enabled indicates channels12 is active audio_data_in_en1, ispdfidata1, and i2sdata_i1 enabled indicates channels3 and channels4 are active. audio_data_in_en2, ispdfidata2, and i2sdata_i2 enabled indicates channels5 and channels6 are active. audio_data_in_en3, ispdfidata3, and i2sdata_i3 enabled indicates that channels7 and channels8 are active. Value of 0 is invalid.
0	RW	0x0	AUDIO_INF_SELECT 1'b0: I2S is the selected audio input interface (Default). 1'b1: SPDIF is the selected audio input interface.

DPTX_SDP_VERTICAL_CTRL

Address: Operational Base + offset (0x0500)

Bit	Attr	Reset Value	Description
31	RW	0x0	FIXED_PRIORITY_ARBITRATIO When this bit is set then the scheduler searches for the next SDP to transmit based on fixed priority, otherwise it uses Round-Robin arbitration. Fixed priority means that lower numbered register sets has higher priority than higher numbered register sets.
30	RW	0x0	DISABLE_EXT_SDP When set the external SDP interface is disabled. No external SDPs are transmitted. This bit is applicable for both the vertical and horizontal blanking.
29:25	RO	0x00	reserved
24	RW	0x0	EN_128BYTES_SDP_1 When set, register bank 1, 2, 3 and 4 are used to form a 128bytes SDP. The SW should program a single 4bytes header followed by 128bytes of data and set a single enable bit that corresponds to bank 1.
23:20	RO	0x0	reserved
19:2	RW	0x00000	EN_VERTICAL_SDP_N When set, DPTX sends out SDP during the vertical intervals, using the information provided in the SDP_REGISTER BANK[n*9-1: n*9]

Bit	Attr	Reset Value	Description
1	RW	0x0	EN_AUDIO_STREAM_SDP When cleared, no Audio stream is sent during the vertical blanking period. When '1' audio stream is transmitted during vertical blanking period.
0	RW	0x0	EN_AUDIO_TIMESTAMP_SDP When set, DPTX sends out audio timestamp SDP once every video frame during the vertical blanking period. This SDP is always transmitted as the first SDP in the blanking period. Payload for the audio timestamp SDP and the header are internally generated by the controller.

DPTX_SDP_HORIZONTAL_CTRL
Address: Operational Base + offset (0x0504)

Bit	Attr	Reset Value	Description
31	RW	0x0	FIXED_PRIORITY_ARBITRATION When this bit is set then the scheduler searches for the next SDP to transmit based on fixed priority, otherwise it uses Round-Robin arbitration. Fixed priority means that lower numbered register sets has higher priority than higher numbered register sets.
30:20	RO	0x000	reserved
19:2	RW	0x00000	EN_HORIZONTAL_SDP_N When set, DPTX sends out SDP during the horizontal intervals, using the information provided in the SDP_REGISTER BANK[n*9-1: n*9]
1	RW	0x0	EN_AUDIO_STREAM_SDP When cleared, no Audio stream is sent during horizontal blanking. When '1' audio stream is transmitted during horizontal blanking period.
0	RW	0x0	EN_AUDIO_TIMESTAMP_SDP When set, DPTX sends out audio timestamp SDP once every horizontal blanking. Payload for the audio timestamp SDP and the header are internally generated by the controller.

DPTX_SDP_STATUS_REGISTER
Address: Operational Base + offset (0x0508)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:2	W1C	0x00000	SDP_N_TX_STATUS Status indicating the transmission of corresponding Nth SDP. Set to 1 by the hardware in both Auto and Manual modes. Software writes a 1 to clear this bit.
1	W1C	0x0	AUDIO_STREAM_SDP_STATUS Status indicating the transmission of an audio SDP. Set to 1 by the hardware in both Auto and Manual modes. Software writes a 1 to clear this bit.
0	W1C	0x0	AUDIO_TIMESTAMP_SDP_STAT Status indicating the transmission of an audio timestamp SDP. Set to 1 by the hardware in both Auto and Manual modes. Software writes a 1 to clear this bit.

DPTX_SDP_MANUAL_CTRL
Address: Operational Base + offset (0x050C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved

Bit	Attr	Reset Value	Description
19:0	RW	0x00000	MANUAL_MODE_SDP Setting this bit when the corresponding bit in the SDP_VERTICAL_CTRL/SDP_HORIZONTAL_CTRL registers causes the corresponding SDP to be transmitted once. After the transmission, both corresponding enable bits are reset. If the transmission done during the Vertical or the Horizontal blanking period then the enable bit in both the SDP_VERTICAL_CTRL and SDP_HORIZONTAL_CTRL registers are reset. This provides the Software the ability to decide whether an SDP is transmitted once during the Vertical period, or Horizontal period or whichever comes first.

DPTX_SDP_STATUS_EN
Address: Operational Base + offset (0x0510)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:2	RW	0x00000	SDP_STATUS_EN Setting this bit to 1 enables interrupt generation due to transmission of the corresponding SDP
1	RW	0x0	AUDIO_STREAM_SDP_STATUS Setting this bit to 1 enables interrupt generation due to transmission of an audio SPD
0	RW	0x0	AUDIO_TIMESTAMP_SDP_STAT Setting this bit to 1 enables interrupt generation due to transmission of a audio timestamp SPD

DPTX_SDP_REGISTER_BANK
Address: Operational Base + offset (0x0600)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SDP_REGS The register bank is split to SDPs where each SDP is the size of nine 32bits registers. The first register contains the SDP header and the other eight the data payload. For example, if DPTX_NUM_SDP_REGISTER_BANKS is 10, then 90 32bits registers are defined. The register set [8:0] specifies s SDP which is transmitted if the corresponding bit in SDP_AUTOEN_CTRL is set, whether the corresponding bit located at [2]. The next SDP, registers[17:9] are enabled by bit [3] in SDP_AUTOEN_CTRL.

DPTX_PHYIF_CTRL
Address: Operational Base + offset (0x0A00)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:26	RW	0x0	EDP_PHY_RATE Support for the eDP rates. 3'b000: PHY rates as defined by bits 5:4 of this register (PHYRATE) are used. 3'b001: R216(2.16Gbps) 3'b010: R243(2.43Gbps) 3'b011: R324(3.24Gbps) 3'b100: R432(4.32Gbps)

Bit	Attr	Reset Value	Description
25	RW	0x0	PHY_WIDTH This bit is used to configure the data width of the main link interface to the PHY. 1'b0: 20-bit interface 1'b1: 40-bit interface The power-on reset value of this bit can be configured by parameter.
24:21	RO	0x0	reserved
20:17	RW	0x3	PHY_POWERDOWN PHY power-down control. The value written in this field controls the Powerdown on all the lanes. 4'h0: Powered on 4'h2: Intermediate P2 power state for switching rates. 4'h3: PHY is powered down phy_clk might stop 4'hC: P4 Power state. PHY is powered down, reference clock can be stopped. Others: Reserved.
16	RW	0x0	SSC_DIS Disable SSC on the PHY.
15:12	RW	0x0	PHY_BUSY Status from the PHY per lane: Bit 12: Lane 0 Bit 13: Lane 1 Bit 14: Lane 2 Bit 15: Lane 3 This bit for each lane is set when a power state change or rate change is requested and cleared when the PHY sends a phy_laneX_phystatus pulse. This bit is also be set when phy_reset is asserted and cleared when phy_laneX_phystatus drops to 0 after reset finishes. No changes to PHY_RATE or PHY_POWERDOWN are to occur when PHY_BUSY is high. PHY_BUSY only go high in response to PHY_RATE PHY_POWERDOWN or a reset. PHY_BUSY must go high if phy_laneX_phystatus is set. The time between when this signal asserts till deassertion is specific to PHY implementation. Software can implement a timeout that is appropriate to the PHY. Generally, this is 100ms.
11:8	RW	0x0	XMIT_ENABLE Enable transmitter on the PHY per lane. If TPS_SEL is 0 then main link provides the data to be transmitted. If PHY_POWERDOWN is not 0 then the transmitter is not enabled on the PHY interface. Bit 8: Lane 0 Bit 9: Lane 1 Bit 10: Lane 2 Bit 11: Lane 3
7:6	RW	0x0	PHY_LANES Number of lanes active: 2'b00: 1 Lane 2'b01: 2 Lanes 2'b10: 4 Lanes

Bit	Attr	Reset Value	Description
5:4	RW	0x0	PHYRATE Rate setting for the PHY. If the Synopsys Combo PHY is used, the software must first program PHY_POWERDOWN to 2 or 3 first and waiting for PHYBUSY to clear. Afterwards, rate can be changed along with PHY_POWERDOWN. 2'b00: RBR 1.62 Gbs 2'b01: HBR 2.7 Gbs 2'b10: HBR2 5.4 Gbs 2'b11: HBR3 8.1 Gbs
3:0	RW	0x0	TPS_SEL Selects the training pattern to be transmitted to the PHY: 4'h0: No training pattern is transmitted. Main link data is transmitted instead. 4'h1: TPS1, D10.2 4'h2: TPS2 4'h3: TPS3 4'h4: TPS4, CP2520 Pattern 3 4'h5: Symbol Error Rate Measurement pattern 4'h6: PRBS7 4'h7: Custom 80-bit pattern. CUSTOMPAT0, CUSTOMPAT1, and CUSTOMPAT2 must be set to a valid pattern before this select is programmed 4'h8: CP2520 Pattern 1 - As defined by PHY CTS 1.2b 4'h9: CP2520 Pattern 2- - As defined by

DPTX_PHY_TX_EQ

Address: Operational Base + offset (0x0A04)

DPTX_AUX_CMD

Address: Operational Base + offset (0x0B00)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	AUX_CMD_TYPE AUX Channel Command: 4'b1000: Native Write 4'b1001: Native Read 4'b0100: I2C MOT Write 4'b0101: I2C MOT Read 4'b0000: I2C Write 4'b0001: I2C Read 4'b0010: I2C Write Status update 4'b0110: I2C MOT Write Status update All other values are reserved and triggers an interrupt, INTERRUPTS.AUX_CMD_INVALID
27:8	RW	0x00000	AUX_ADDR AUX Address
7:5	RO	0x0	reserved
4	RW	0x0	I2C_ADDR_ONLY A value of '1' indicates an I2C over aux address only transfer.

Bit	Attr	Reset Value	Description
3:0	RW	0x0	AUX_LEN_REQ AUX Length Number of bytes to transmit. 0-15 indicating between 1 to 16 bytes of data. A value of '0' should be programmed for an I2C over aux address only

DPTX_AUX_STATUS

Address: Operational Base + offset (0x0B04)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	AUX_STATE Reflects the current state of the AUX state machine. Used for hardware debug only.
27:25	RO	0x0	AUX_REPLY_ERR_CODE Error code. Valid when sink aux reply error is detected. Used for hardware debug purpose only.
24	RW	0x0	SINK_DISCONNECT_WHILE_AC The bit is set to 1 if the SINK disconnect was detected while active AUX transfer
23:19	RO	0x00	AUX_BYTES_READ The number of valid bytes received as a reply from the SINK
18	RW	0x0	AUX_REPLY_ERR The bit is set to 1 if a reply error is detected. An error could be an illegal Manchester code, or if the source and sink are out of sync. The specific error code is in bits 27:25 of this register.
17	RO	0x0	AUX_TIMEOUT The bit is set to 1 if no reply is received within 400us after a request has been sent on the AUX channel.
16	RO	0x0	AUX_REPLY_RECEIVED If '1' then Indicates an active AUX transfer. When '0' indicates that an AUX_REPLY has been received and the AUX status/data registers are valid. Note: If the AUX transfer was not successful such that the AUX transfer timed out or an error detected then the Status & Data registers might not have valid values.
15:8	RO	0x00	AUX_M The second byte received from the Sink as a reply to an AUX transfer. This value is the number of bytes written.
7:0	RO	0x00	AUX_STATUS The first byte received from the Sink as a reply to an AUX transfer. The higher 4-bits are the actual reply: 4'b0000: AUX/I2C ACK 4'b0001: AUX NACK 4'b0010: AUX Defer 4'b0100: I2C NACK 4'b1000: I2C DEFER

DPTX_AUX_DATA0

Address: Operational Base + offset (0x0B08)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	AUX_DATA0 AUX Data - First 4 bytes. If only 1 byte is to be written in the transaction, then only 3:0 has valid data

DPTX_AUX_DATA1

Address: Operational Base + offset (0x0B0C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	AUX_DATA1 AUX Data Second 4 bytes

DPTX_AUX_DATA2
Address: Operational Base + offset (0x0B10)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	AUX_DATA2 AUX Data Third 4 bytes

DPTX_AUX_DATA3
Address: Operational Base + offset (0x0B14)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	AUX_DATA3 AUX Data Fourth 4 bytes

DPTX_PHYREG_CMDADDR
Address: Operational Base + offset (0x0C00)

Bit	Attr	Reset Value	Description
31	RW	0x0	PHY_READ Initiate the read into the PHY register. This bit self-clears when the read completes and PHYREG_DATA contains valid read data.
30	RW	0x0	PHY_WRITE Initiate the write into the PHY register. This bit self-clears when the write completes in the hardware.
29:16	RO	0x0000	reserved
15:0	RW	0x0000	PHY_ADDRESS Address bus for the PHY register interface

DPTX_PHYREG_DATA
Address: Operational Base + offset (0x0C04)

Bit	Attr	Reset Value	Description
31	RW	0x0	PHY_DONE Indicates that the data is ready to be read from the PHYREG_DATA register if a read was initiated or that a write was completed
30:16	RO	0x0000	reserved
15:0	RW	0x0000	PHY_DATA Address bus for the PHY register interface

DPTX_TYPEC_CTRL
Address: Operational Base + offset (0x0C08)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	W1C	0x0	TYPEC_INTERRUPT_STATUS This is the interrupt status pin for TYPE-C. On a type-C interrupt software reads this register to confirm a Type-C interrupt. Writing 1 by the software clears the TYPE-C interrupt.
1	RO	0x0	TYPEC_DISABLE_STATUS This is a read only register bit which directly reflects the status of the primary input pin tca_disable_i. After receiving a TYPE_C interrupt, software reads this register bit to get the status of the tca_disable.

Bit	Attr	Reset Value	Description
0	RW	0x0	TYPEC_DISABLE_ACK This register bit controls the primary output pin tca_disable_ack_o. The value in this register is directly reflected on the output. Software sets or clears this bit based on the Type-C interrupt.

DPTX_GENERAL_INTERRUPT

Address: Operational Base + offset (0x0D00)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30	RO	0x0	DSC_EVENT An DSC event has occurred. Please read DSC register DSCINTSTAT to see the cause of the event. To reset the bit software need to clear the status at the source, in the DSCINTSTAT by writing to DSCINTSTAT register
29:27	RO	0x0	reserved
26	W1C	0x0	VIDEO_FIFO_OVERFLOW_STREAM3 Indicates that the video lane steering FIFO for stream2 gets an overflow. The likely cause is that the bytes_per TU programmed in the VIDEO_CONFIG5.AVERAGE_BYTES_PER_TU is wrong or the lane/rate chosen for the video format is not correct for stream2. This bit is used for debug only
25	RW	0x0	AUDIO_FIFO_OVERFLOW_STREAM3 Indicates that one or more of the audio sampler FIFOs are getting into overflow condition for stream3. This is an vindication that the audio samples are not getting drained out and is an indication that the bandwidth of the selected audio does not match with the video format being used for stream3.
24	RW	0x0	SDP_EVENT_STREAM3 An event indicating the completion of transmission of an SDP for stream3. For details on the specific SDPs that got transmitted refer to SDP Status register for stream3. To reset the bit the SW needs to clear the status at the source, in the SDP status register for stream3.
23:21	RO	0x0	reserved
20	W1C	0x0	VIDEO_FIFO_OVERFLOW_STREAM2 Indicates that the video lane steering FIFO for stream2 gets an overflow. The likely cause is that the bytes_per TU programmed in the VIDEO_CONFIG5.AVERAGE_BYTES_PER_TU is wrong or the lane/rate chosen for the video format is not correct for stream2. This bit is used for debug only
19	RW	0x0	AUDIO_FIFO_OVERFLOW_STREAM2 Indicates that one or more of the audio sampler FIFOs are getting into overflow condition for stream2. This is an indication that the audio samples are not getting drained out and is an indication that the bandwidth of the selected audio does not match with the video format being used for stream2.
18	RO	0x0	SDP_EVENT_STREAM2 An event indicating the completion of transmission of an SDP for stream2. For details on the specific SDPs that got transmitted refer to SDP Status register for stream2. To reset the bit the SW needs to clear the status at the source, in the SDP status register for stream2.
17:15	RO	0x0	reserved

Bit	Attr	Reset Value	Description
14	W1C	0x0	VIDEO_FIFO_OVERFLOW_STREAM1 Indicates that the video lane steering FIFO for stream1 gets an overflow. The likely cause is that the bytes_per TU programmed in the VIDEO_CONFIG5.AVERAGE_BYTES_PER_TU is wrong or the lane/rate chosen for the video format is not correct for stream1. This bit is used for debug only
13	RW	0x0	AUDIO_FIFO_OVERFLOW_STREAM1 Indicates that one or more of the audio sampler FIFOs are getting into overflow condition for stream1. This is an indication that the audio samples are not getting drained out and is an indication that the bandwidth of the selected audio does not match with the video format being used for stream1.
12	RO	0x0	SDP_EVENT_STREAM1 An event indicating the completion of transmission of an SDP for stream1. For details on the specific SDPs that got transmitted refer to SDP Status register for stream1. To reset the bit the SW needs to clear the status at the source, in the SDP status register for stream1.
11:8	RO	0x0	reserved
7	RO	0x0	TYPE_C_EVENT Indicates an event related to Type-C assit block. This could be an indication that the Type-C assit input pin tca_disable has changed. Read TYPE-C_CTRL register for more details.To reset this bit software need to clear the status in TYPEC_CTRL register by writing 1 to TYPEC_INTERRUPT_STATUS bit.
6	W1C	0x0	VIDEO_FIFO_OVERFLOW_STREAM0 Indicates that the video lane steering FIFO for stream0 gets an overflow. The likely cause is that the bytes_per TU programmed in the VIDEO_CONFIG5.AVERAGE_BYTES_PER_TU is wrong or the lane/rate chosen for the video format is not correct for stream0. This bit is used for debug only
5	RW	0x0	AUDIO_FIFO_OVERFLOW_STREAM0 Indicates that one or more of the audio sampler FIFOs are getting into overflow condition for stream0. This is an indication that the audio samples are not getting drained out and is an indication that the bandwidth of the selected audio does not match with the video format being used for stream0.
4	RO	0x0	SDP_EVENT_STREAM0 An event indicating the completion of transmission of an SDP for stream0. For details on the specific SDPs that got transmitted refer to SDP Status register for stream0. To reset the bit the SW needs to clear the status at the source, in the SDP status register for stream0.
3	W1C	0x0	AUX_CMD_INVALID After initiating an AUX request, this bit is set to 1, if the command or length was invalid. The AUX request is not sent out on the AUX Channel if this bit is set
2	RO	0x0	HDCP_EVENT An HDCP event has occurred. Please read HDCP register HDCPAPIINTSTAT to see the cause of the event. To reset the bit software needs to clear the status at the source, in the HDCPAPIINTSTAT by writing to HDCPAPIINTCLR register.
1	W1C	0x0	AUX_REPLY_EVENT After initiating an AUX request this bit is set to 1 after receiving a reply.

Bit	Attr	Reset Value	Description
0	RO	0x0	HPD_EVENT This bit indicates that an HPD event is captured in the HPD status register. To reset the bit the SW needs to clear the status at the source in the HPD status register.

DPTX_GENERAL_INTERRUPT_ENABLE

Address: Operational Base + offset (0x0D04)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30	RW	0x0	DSC_EVENT_EN Enable for DSC event. Set to 1 to enable events related to DSC.
29:27	RO	0x0	reserved
26	RW	0x0	VIDEO_FIFO_OVERFLOW_EN_STREAM3 Enable for VIDEO_FIFO_OVERFLOW for stream3. Set 1 to mask this event.
25	RW	0x0	AUDIO_FIFO_OVERFLOW_EN_STREAM3 Enable for AUDIO_FIFO_OVERFLOW for stream23. Set 1 to enable this event.
24	RW	0x0	SDP_EVENT_EN_STREAM3 Global enable for SDP event for stream3. Set 1 to enable the SDP event.
23:21	RO	0x0	reserved
20	RW	0x0	VIDEO_FIFO_OVERFLOW_EN_STREAM2 Enable for VIDEO_FIFO_OVERFLOW for stream2. Set 1 to mask this event.
19	RW	0x0	AUDIO_FIFO_OVERFLOW_EN_STREAM2 Enable for AUDIO_FIFO_OVERFLOW for stream2. Set 1 to enable this event.
18	RW	0x0	SDP_EVENT_EN_STREAM2 Global enable for SDP event for stream2. Set 1 to enable the SDP event.
17:15	RO	0x0	reserved
14	RW	0x0	VIDEO_FIFO_OVERFLOW_EN_STREAM1 Enable for VIDEO_FIFO_OVERFLOW for stream1. Set 1 to mask this event.
13	RW	0x0	AUDIO_FIFO_OVERFLOW_EN_STREAM1 Enable for AUDIO_FIFO_OVERFLOW for stream1. Set 1 to enable this event.
12	RW	0x0	SDP_EVENT_EN_STREAM1 Global enable for SDP event for stream1. Set 1 to enable the SDP event.
11:8	RO	0x0	reserved
7	RW	0x0	TYPE_C_EVENT_EN Enable for TYPE_C_EVENT Set to 1 to enable this event.
6	RW	0x0	VIDEO_FIFO_OVERFLOW_EN_STREAM0 Enable for VIDEO_FIFO_OVERFLOW for stream0. Set 1 to mask this event.
5	RW	0x0	AUDIO_FIFO_OVERFLOW_EN_STREAM0 Enable for AUDIO_FIFO_OVERFLOW for stream0. Set 1 to enable this event.
4	RW	0x0	SDP_EVENT_EN_STREAM0 Global enable for SDP event for stream0. Set 1 to enable the SDP event.

Bit	Attr	Reset Value	Description
3	RW	0x0	AUX_CMD_INVALID_EN Enable for AUX_CMD_INVALID. Set to 1 to enable this event.
2	RW	0x0	HDCP_EVENT_EN Enable for HDCP event. Set to 1 to enable events related to HDCP.
1	RW	0x0	AUX_REPLY_EVENT_EN Enable for Set to 1 to enable this event.
0	RW	0x0	HPD_EVENT_EN Enable for HPD_EVENT. Set to 1 to enable this event.

DPTX_HPD_STATUS

Address: Operational Base + offset (0x0D08)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RO	0x0	HPD_TIMER This field is the raw HPD timer value. Resets to 0 whenever HPD toggles and starts counting afterwards. If no other event occurs this timer increments until a plug/unplug event is detected. The unit of measure is in microseconds. This value is used for debugging.
11:9	RO	0x0	HPD_STATE The HPD state machine state. Used for debug but SW can also use the info to determine the status after receiving an interrupt. SOURCE_STATE_IDLE= 3'd0 Sink is not connected SOURCE_STATE_UNPLUG= 3'd1 HPD gets deasserted after being in the plugged state. In this state for 2mSec. SOURCE_STATE_HPD_TIMEOUT= 3'd4 The HPD is deasserted for more than 2mSec but less than 100mSec SOURCE_STATE_PLUG = 3'd7 HPD is high, the Sink is connected
8	RO	0x0	HPD_STATUS Current status of the HPD input. This value must be qualified with the HPD_TIMER.
7:4	RO	0x0	reserved
3	W1C	0x0	HPD_UNPLUG_ERR Unplug detected. This bit is set to 1 after the HPD is deasserted for less than 250uSec.
2	W1C	0x0	HPD_HOT_UNPLUG Unplug detected. This bit is set to 1 after the HPD is deasserted for at least 2mSec.
1	W1C	0x0	HPD_HOT_PLUG Hot plug detected. This bit is asserted after the sink is plugged and asserts HPD for at least 100mSec. It is also asserted If the sink was plugged then deasserts HPD for more than 2mSec but less than 100mSec. In this case this bit is set as soon as HPD is asserted by the sink. No debounce time is implemented.
0	W1C	0x0	HPD_IRQ IRQ from the HPD. This bit is set to 1 after a low pulse on HPD has been detected between 0.25-2.0 ms

DPTX_HPD_INTERRUPT_ENABLE

Address: Operational Base + offset (0x0D0C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	HPD_UNPLUG_ERR_EN Enable for HPD_UNPLUG_ERR. Setting to 1 enables this event to assert the interrupt output.
2	RW	0x0	HPD_UNPLUG_EN Enable for HPD_UNPLUG. Setting to 1 enables this event to assert the interrupt output.
1	RW	0x0	HPD_PLUG_EN Enable for HPD_PLUG. Setting to 1 enables this event to assert the interrupt output.
0	RW	0x0	HPD_IRQ_EN Enable for IRQ_HPD. Setting to 1 enables this event to assert the interrupt output.

DPTX_HDCPCFG
Address: Operational Base + offset (0x0E00)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	DPCD12PLUS DPCD revision of Sink is 1.2 or higher. Updated by software after reading the DPCD revision
6	RW	0x0	CP_IRQ CP_IRQ indication to HDCP controller. Software sets this bit on CP_IRQ interrupt
5	RW	0x0	BYPENCRYPTION Bypasses all the data encryption stages.
4	RW	0x0	HDCP_LOCK Lock the HDCP bypass and encryption disable mechanisms: 1b0: The default 1b0 value enables you to bypass HDCP through bit 5 by encryption of the HDCPCFG register or to disable the encryption through bit 3 encryption disable of HDCPCFG register. 1b1: You can still write to the bit by encryption of HDCPCFG or encryption disable bit of HDCPCFG but you cannot enable the bypass or disable encryption. Once you set the value to 1b1 you can change the value back to 1b0 only by issuing a master reset to the DPTX.
3	RW	0x0	ENCRYPTIONDISABLE Disable encryption without losing authentication
2	RW	0x0	ENABLE_HDCP_13 1'b0: Default HDCP 2.2 is enabled 1'b1: HDCP 1.3 is enabled
1	RW	0x0	ENABLE_HDCP Enable HDCP functionality. This signal is tied to I_px_gpio_in[0] of HDCP2.2 Controller clears this bit under the following condition Re-authentication request from the sink.
0	RO	0x0	reserved

DPTX_HDCPOBS
Address: Operational Base + offset (0x0E04)

Bit	Attr	Reset Value	Description
31	W1C	0x0	HDCP22_RE_AUTHENTICATION_REQ Indicates that the Sink has requested a re-authentication. Cleared when software writes a 1 to this bit.

Bit	Attr	Reset Value	Description
30	W1C	0x0	HDCP22_AUTHENTICATION_FAILED Set to 1 when by the hardware when the authentication is failed. Cleared when software writes a 1.
29	W1C	0x0	HDCP22_AUTHENTICATION_SUCCESS Set to 1 when by the hardware when the authentication is succeeded. Cleared when software writes a 1.
28	RO	0x0	HDCP22_CAPABLE_SINK 1'b1: HDCP 22 sink 1'b0: Sink not HDCP22 capable. If enable_hdcp_13 is set and this bit is already set then controller clears it. Re-authentication request also clears this bit.
27	W1C	0x0	HDCP22_SINK_CAP_CHECK_C Sets when the capability check is complete. Cleared when software writes a 1 to this bit.
26:24	RO	0x0	HDCP22_STATE Status of HDCP operation 3'B001: Initializing 3'B010: Authenticating 3'B011: Authenticated 3'B100: not Authenticated
23	W1C	0x0	HDCP22_BOOTED Status indicting the HDCP22 has booted. Cleared when software writes a 1 to this bit.
22:19	RO	0x0	HDCP13_BSTATUS Status indicting the HDCP22 has booted. Cleared when software writes a 1 to this bit.
18	RO	0x0	REPEATER Register read from attached sink device: Bcap bit 1
17	RO	0x0	HDCP_CAPABLE Register read from attached sink device: Bcap bit 0
16:14	RO	0x0	STATEE Observability register informs in which state the cipher machine is on.
13:11	RO	0x0	STATEOEG Observability register informs in which state the DPES machine is on.
10:8	RO	0x0	STATER Observability register informs in which state the revocation machine is on.
7:4	RO	0x0	STATEA Observability register informs in which state the authentication machine is on.
3:1	RO	0x0	SUBSTATEA Observability register informs in which sub-state the authentication is on
0	RO	0x0	HDCPENGAGED Informs that the current DP link has the HDCP protocol fully engaged.

DPTX_HDCPAPIINTCLR

Address: Operational Base + offset (0x0E08)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
8	WO	0x0	HDCP22_GPIOINT Clears the interruption related to HDCP22 GPIO output status change.
7	WO	0x0	HDCP_ENGAGED Clears the interruption related to HDCP authentication process successful.
6	WO	0x0	HDCP_FAILED Clears the interruption related to HDCP authentication process failed.
5	WO	0x0	KSVSHA1CALCDONEINT Clears the interruption related to SHA1 verification has been done.
4	WO	0x0	AUXRESPNACK7TIMES Clears the interrupt related to aux transfer NAK response for 7 times.
3	WO	0x0	AUXRESPTIMEOUT Clears the interrupt related to aux transfer response timeout.
2	WO	0x0	AUXRESPDEFER7TIMES Clears the interrupt related to aux transfer defer response for 7 times.

5	RW	0x0	KSVSHA1CALCDONEINT Masks the interruption related to SHA1 verification has been done.
4	RW	0x0	AUXRESPNACK7TIMES Masks the interrupt related to aux transfer nack response for 7 times.
3	RW	0x0	AUXRESPTIMEOUT Masks the interrupt related to aux transfer defer response for 7 times.
2	RW	0x0	AUXRESPDEFER7TIMES Masks the interrupt related to aux transfer defer response for 7 times.
1	RO	0x0	reserved
0	RW	0x0	KSVACCESSINT Masks the interrupt related to KSV memory access grant for Read-Write access.

DPTX_HDCPKSVMEMCTRL

Address: Operational Base + offset (0x0E18)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4	RW	0x0	KSVSHA1STATUS Notification whether the KSV list message digest is correct from the controller: 1b1: if digest message verification failed 1b0: if digest message verification succeeded.
3:2	RO	0x0	reserved
1	RO	0x0	KSVMEMACCESS Notification that the KSV memory access has been guaranteed.
0	RW	0x0	KSVMEMREQUEST Request access to the KSV memory; must be de-asserted after the access is completed by the system.

DPTX_HDCP_REVOC_RAM_i

Address: Operational Base + offset (0x0E20)

Bit	Attr	Reset Value	Description
31:24	RW	0xff	REVOC_RAM_BYTE3 Byte 3 of HDCP revocation ram dword If memory access has not been granted (see register a_ksvmemctrl) the value read is 8hff
23:16	RW	0xff	REVOC_RAM_BYTE2 Byte 2 of HDCP revocation ram dword If memory access has not been granted (see register a_ksvmemctrl) the value read is 8hff
15:8	RW	0xff	REVOC_RAM_BYTE1 Byte 1 of HDCP revocation ram dword If memory access has not been granted (see register a_ksvmemctrl) the value read is 8hff

Bit	Attr	Reset Value	Description
7:0	RW	0xff	REVOC_RAM_BYTE0 Byte 0 of HDCP revocation ram dword If memory access has not been granted (see register a_ksvmemctrl) the value read is 8hff

DPTX_HDCPREG_BKSV0
Address: Operational Base + offset (0x3600)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	HDCPREG_BKSV0 Contains the value of BKSV[31:0].

DPTX_HDCPREG_BKSV1
Address: Operational Base + offset (0x3604)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RO	0x00	HDCPREG_BKSV1 Contains the value of BKSV[39:32].

DPTX_HDCPREG_ANCONF
Address: Operational Base + offset (0x3608)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	OANBYPASS 1'b1: The value of AN used in the HDCP engine comes from the hdcpreg_an0 to hdcpreg_an7 registers. 1'b0: The value of AN used in the HDCP engine comes from the random number input.

DPTX_HDCPREG_AN0
Address: Operational Base + offset (0x360C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	HDCPREG_AN0 Contains the value of AN[31:0]

DPTX_HDCPREG_AN1
Address: Operational Base + offset (0x3610)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	HDCPREG_AN1 Contains the value of AN[63:32]

DPTX_HDCPREG_RMLCTL
Address: Operational Base + offset (0x3614)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	ODPK_DECRYPT_ENABLE When set 1b1 this bit activates the decryption of the Device Private keys.

DPTX_HDCPREG_RMLSTS
Address: Operational Base + offset (0x3618)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RO	0x0	IDPK_WR_OK_STS When high 1b1 it indicates that a DPK write is allowed.

Bit	Attr	Reset Value	Description
5:0	RO	0x00	IDPK_DATA_INDEX Current Device Private Key being written plus one. Position 0 is occupied by the AKSV.

DPTX_HDCPREG_SEED

Address: Operational Base + offset (0x361C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	WO	0x0000	HDCPREG_SEED Decryption seed value

DPTX_HDCPREG_DPK0

Address: Operational Base + offset (0x3620)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	DPK_DATA Encrypted DPK value. dpk[31:0] When this byte is written, a strobe signal is generated that triggers the decryption and/or storage of the DPK word on the DPK internal RAM memory.

DPTX_HDCPREG_DPK1

Address: Operational Base + offset (0x3624)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:0	WO	0x000000	DPK_DATA encrypted DPK value. dpk[55:32]

DPTX_HDCP22GPIOSTS

Address: Operational Base + offset (0x3628)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:0	RO	0x00000	HDCP22GPIOOUTSTS HDCP22 GPIO OUT Status

DPTX_HDCP22GPIOCHNGSTS

Address: Operational Base + offset (0x362C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:0	RO	0x00000	HDCP22GPIOOUTCHNGSTS HDCP22 GPIO OUT change status. If set indicates a change in HDCP22 GPIO output status. Write 1 to clear it

DPTX_HDCPREG_DPK_CRC

Address: Operational Base + offset (0x3630)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	DPK_CRC CRC32 value calculated over encrypted DPK. Application can read this value, compare it against the CRC calculated in application to confirm that the DPK write to controller was successful without any errors.

9.5 Interface Description

9.6 Application Notes

9.6.1 Programming Flow After POR

The driver performs the following steps after power-on reset:

9.6.1.1 Assert PHY Reset

1. Set the PHY soft reset by setting the SOFT_RESET_CTRL[1] register.
2. Refer the PHY document to know if anything else need to be reset at this time.
3. Wait for 5us to make sure that the soft reset takes effect and then clear the PHY soft reset bit by writing a 0 to this bit.
4. Wait for the PHYIF_CTRL.PHY_BUSY register to be 0.
5. Ensure that GENERAL_INTERRUPT_ENABLE.HPD_EVENT are cleared.

9.6.1.2 Wait for HPD (Hot Plug Detect) interrupt

Interrupt is asserted and when driver reads the GENERAL_INTERRUPT register, finds HPD_EVENT bit set. This interrupt is generated when the Sink is disconnected and with an HPD transition from 0 to 1 and has stayed at 1 for greater than 0.25ms. This section indicates how the software should handle the interrupt.

1. Software receives an interrupt and reads the GENERAL_INTERRUPT register. GENERAL_INTERRUPTS.HPD_EVENT is set. It should also see that HPD_STATUS.HPD_STATUS is 1.
2. The software should set PHYIF_CTRL.PHY_LANEX_POWERDOWN to 0 to power on the PHY for all enabled lanes.
3. Software clears the interrupt by writing 1 to GENERAL_INTERRUPTS.HPD_EVENT

9.6.1.3 Read Hardware Parameter

Read the DPTX_CONFIG_REG1, DPTX_CONFIG_REG2, DPTX_CONFIG_REG3 register to get the DPTX configuration parameters.

9.6.1.4 Read Edid of the Sink

EDID reads are done using I2C over AUX transactions. See I2C AUX Channel Read/Write for details about initiating I2C over AUX read.

9.6.1.5 Read Sink DPCD registers

Read the sink DPCD register to get at least the following sink information. DPCD registers are read using Native AUX transactions. See NATIVE AUX Channel Read/Write for details about using the Aux channel to read the DPCD.

- Read Sink Rceiver Capability (DPCD address 000000 – 000FF)

This gives the sink supported link rate, lane count, enhance_frame_cap, extended_receiver_capability_present, and so on.

- Read Sink Extended Reciver Capability (DPCD address 02200 – 022FF)

Extended Receiver capability is read only if the sink supports it. Link rate, lane count, enhance_frame_cap.

9.6.1.6 Program Sink DPCD Link Configuration registers

Link configuration registers are programmed based on the Sink setting read during Step-5, and the Video format being transmitted. It also depends on the source configs (Step-3).

9.6.1.7 Initiate link training

- Disable the fast link training if enabled. Fast link training is enabled by default.
- Follow the steps specified in "Full Link Bringup Sequence,"for initiating link training.

9.6.1.8 Configure Video mode

After reading and having parsed the EDID data (step 4), program the controller with the video timings based on the video mode the sink supports and the trained link is able to support. In the single stream (SST) mode, use only stream-0, and program only the corresponding registers. If there is no video stream to transmit, then this setup is not required. Set VSAMPLE_CTRL.video_stream_enable bit to 0 forces the controller to send IDLE patterns.

Follow these steps for every active stream:

1. Program the VSAMPLE_CTRL.video_mapping bit to set the video_mapping input mode (RGB/YCbCr), based on what is supported by the sink.
2. Program the video timing information
   a. Set the Hsync/vsync polarity by programming VINPUT_POLARITY_CTRL register.

b. Program the VIDEO_CONFIG1 register by specifying the following
   - R_v_blank_in_osc – Fractional vblank.
   - I_P – Interlaced/Progressive
   - Hblank – Horizontal blanking period in pixels.
   - Hactive – Horizontal active video period in pixels.

c. Program the VIDEO_CONFIG2 register by specifying the following
   - Vactive – Vertical active video period in terms of pixels.
   - Vblank – Vertical blanking period in terms of vertical blanking lines.

d. Program the VIDEO_CONFIG3 register by specifying the following
   - H_front_porch – The horizontal front porch in terms of pixels.
   - H_sync_width – hsync active pulse width in terms of pixels.

e. Program the VIDEO_CONFIG4 register by specifying the following
   - V_front_porch – The vertical front porch in terms of number of lines.
   - V_sync_width – vsync active pulse width in terms of number of lines.

f. Program the VIDEO_CONFIG5 register by specifying the following
   Specify the Average number of symbols per TU, and average bytes per TU fractional values. Driver should program this register field based on the video format being transmitted and the link rate and lane configuration being used. Section 2.2.1.4 of the DP 1.4 spec gives details about how this average symbol count should be calculated.

3. Program the core for Main Stream Attribute parameters
   a. Program the Stream_N.VIDEO_MSA1 register with the following values
      - Hstart – Horizontal active start from the leading edge of hsync.
      - Vstart – Vertical active start from the leading edge of vsync.
   b. Program the Stream_N.VIDEO_MSA2 register with the following values
      - Mvid – MVID value to be transmitted in the synchronous mode of operation.
      - MISC0 – Specifies synchronous/asynchronous mode of operation and other colormetry values to be transmitted in the MSA.
   c. Program the Stream_N.VIDEO_MSA3 register with the following values
      - Nvid – MVID value to be transmitted in the synchronous mode of operation.
      - MISC1 – Specifies synchronous/asynchronous mode of operation and other colormetry values to be transmitted in the MSA.

9.6.1.9 Configure Audio mode

From step 4, the audio configuration of the Sink are read and the controller is configured to set up the audio mode accordingly by the following steps.

- Program the AUDIO_CONFIG1 register specifying the audio configuration controls
  - audio_inf_select – Select the primary Audio interface option, I2S or SPDIF.
  - audio_data_in_en – Specify which of the data input pins are active. For example for the i2s interface if all 8 channels are supported then all 4 data inputs must be enabled by writing h’F to this field.
  - Audio_data_width – Specify the audio sample data width (16 to 24 bits).
  - hbr_mode_enable – Specify if High Bit Rate audio is to be enabled or not
- Enable transmission of Audio Stream SDP by setting the SDP_VERTICAL_CTRL/SDP_HORIZONTAL_CTRL register bits 1 and 0. From this time, the audio sampler is enabled and the audio samples presented at the I2S/SPDIF inputs are sampled in to the audio FIFOs. Before the audio stream is enabled, the I2S or SPDIF data could be active. But these samples are not transmitted on the main link by the controller.

9.6.1.10 Configure SDPs (Secondary Data Packets)

- Program the SDP_REGISTER_BANK registers with the header and payload of the SPD that are required to be transmitted.
- Program the SDP_VERTICAL_CTRL and SDP_HORIZONTAL_CTRL registers to indicate when the specific SDP register set need to be transmitted. Also specify the priority by using Bit 31 of these registers.
- If Manual control is required, then program the SDP_MANUAL_CTRL register.

9.6.1.11 Configure HDCP2.2

The following steps must be followed for configuring the HDCP.

1. Program the Synopsys HDCP2.2 controller for the HDCP2.2 initialization. Check the Synopsys HDCP2.2 controller for details.
2. After booting the HDCP2.2 controller, Enable HDCP by setting the HDCPCFG[1] register.
3. Wait for HDCP22 GPIO status change interrupt and check HDCP sink capability by checking the HDCPOBS[28:27] bits.
4. If the sink is not HDCP2.2, go to Step12. If the sink is HDCP2.2 then Call the HL_tx_authenticate() function in the HDCP2.2 library to start the authentication process.
5. Wait for HDCP interrupt and check the authentication status by reading the HDCPOBS register bits 29 and 30.
6. If the authentication is successful, then mainstream are encrypted after this. If authentication is not successful, then it is up to the driver to take the next action.

9.6.1.12 Configure HDCP1.3

1. Configure device private keys when DPTX_HDCP_DPK_ROMLESS configuration parameter is set to true.ie Go to step 13 and return
2. Set HDCPCFG. DPCD12PLUS to 1 if the DPCD revision is 1.2 or higher
3. Write the revocation list to memory.ie Go to step 14 and return
4. Write HDCP_CONFIG [2] to enable HDCP1.3 functionality.
5. Wait for HDCP interrupt indicating authentication success/failure (HDCPAPIINTSTAT.HDCPENGAGED)
6. If authentication is successful, mainstream is encrypted after this. If authentication is not successful, then it is up to the driver to take the next action.

9.6.1.13 Configure Device private keys

1. Disable decryption logic HDCPREG_RMLCTL.ODPK_DECRYPT_ENABLE=0
2. Poll for HDCPREG_RMLSTS. IDPK_WR_OK_STS=1
3. Write unencrypted AKSV[39:32] in HDCPREG_DPK1
4. Write unencrypted AKSV[31:0] in HDCPREG_DPK0
5. Poll for HDCPREG_RMLSTS. IDPK_WR_OK_STS=1 and HDCPREG_RMLSTS. IDPK_DATA_INDEX=1
6. Enable decryption logic HDCPREG_RMLCTL.ODPK_DECRYPT_ENABLE=1
7. Write encryption seed ENC_KEY[15:0] in HDCPREG_SEED
8. Set DPK index value = 1
9. Write DPK[DPK Index value][55:32] to HDCPREG_DPK1
10. Write DPK[DPK Index value][31:0] to HDCPREG_DPK0
11. Poll for HDCPREG_RMLSTS. IDPK_WR_OK_STS=1 and HDCPREG_RMLSTS. IDPK_DATA_INDEX= (DPK Index value+1)
12. Increment DPK Index value by 1
13. Repeat step h to step m till DPK index value reaches 40
14. Read CRC32 value calculated by controller over unencrypted DPKs in HDCPREG_DPK_CRC register
15. Compare the CRC from controller with the original CRC to check for DPK programming result.

9.6.1.14 Program Revocation list

Revocation list is stored in a 8-bit data width SPRAM, though the memory data width is 8-bis, it can only be accessed through 32-bit register read writes so the 8-bit values need to accumulated and written as 32-bit values, do read modify writes if the address does not start at a dword boundary.

Following steps illustrate how it is done.

1. Read HDCP_REVOC_LIST[0]|HDCP_REVOC_SIZE[0:1]|HDCP_VH[19] values by doing a 32-bit register read to address 0x10B8. Keep HDCP_VH[19] unmodified, update HDCP_REVOC_LIST[0]|HDCP_REVOC_SIZE[0:1] and write back the values to the same 32-bit register
2. Set revocation list loop count to 0
3. Write HDCP_REVOC_LIST[2+revocation list loop count: 5+revocation list loop count] by

doing a 32-bit register write to address 0x10BC+(revocaltion list loop count*4)
4. Increment revocation list loop count
5. If (revocation list loop count *4+2) is greater than HDCP_REVOC_SIZE repeat steps step b through step e, else exit

9.6.2 Programming Flow After Re-Authentication Request/Link Integrity Failure from Sink Application

The re-authentication/Link Integrity Failure condition is detected by the driver under the following condition.

- HPD Interrupt is generated. After an interrupt is received, read the INTERRUPTS and see if HPD_EVENT is set. Then check that HPD_STATUS is 1. Clear the HPD_STATUS
- Read the DPCD register and check DPCD.CP_IRQ bit to be set. Write 1 to DPCD.CP_IRQ register field to clear the interrupt. If CP_IRQ is set proceed to next step
- Set the HDCPCFG.CPIRQ bit and clear it after 10 clock cycles.

Controller internally reads Bstatus and checks for Link Integrity failure or re-authentication request and initiates authentication if any of the bits are set. Controller stops encryption at the next CPSR boundary.

9.6.3 Programming Flow After a Hot Unplug Event

This interrupt is generated when the Sink is connected and HPD transition from 1 to 0 staying at 0 for greater than 2 ms. This section indicates how the software handles the interrupt.

1. Software receives an interrupt and reads the GENERAL_INTERRUPT register. GENERAL_INTERRUPT.HPD_EVENT is set. It should also see that HPD_STATUS.HPD_STATUS is 0.
2. The software clears PHYIF_CTRL.XMIT_ENABLE on all lanes to turn off the transmitter. Optionally, PHYIF_CTRL.PHY_LANEX_POWERDOWN can be set to 3 for all enabled lanes to save power.
3. Software clears the interrupt by writing 1 to GENERAL_INTERRUPT.HPD_EVENT.

9.6.4 Programming Flow After a Hot Unplug Event

Follow these steps for Hot plug event after an unplug event:

- Program HDCP soft reset and release it (SOFT_RESET_CTRL.HDCP_MODULE_RESET=1). This step is needed as the HDCP controller is unaware of the unplug event and needs to be reset.
- If audio is enabled, then it should be disabled along with the audio timestamp SDPs by clearing bits 0 and 1 of SDP_VERTICAL_CTRL and SDP_HORIZONTAL_CTRL registers. In addition, the audio sampler should be reset by writing to SOFT_RESET_CTRL. AUDIO_SAMPLER_RESET.
- Follow steps 4 to steps 7. This includes the EDID and DPCP reads.
- steps 8 to steps 11 might be required based on the previous steps.

9.6.5 Programming Flow Sequence for HDCP

Figure 65-5 shows the programming flow sequence for HDCP.

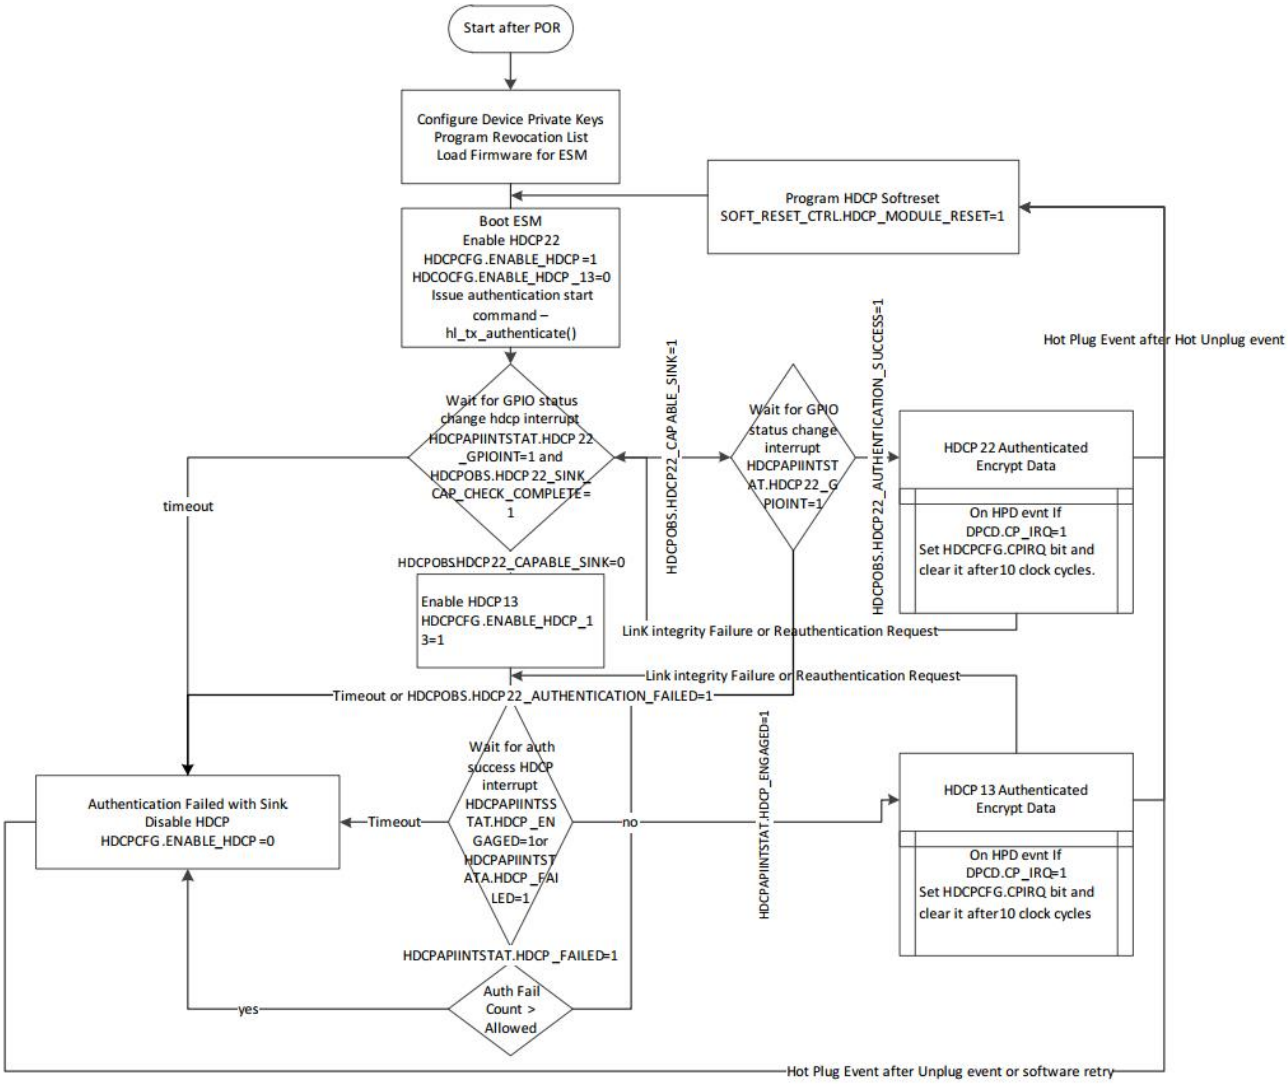

Fig. 65-5 Programming Flow Sequence for HDCP

9.6.6 Link training Sequence

9.6.6.1 Initialization Without Link Training

This initialization sequence assumes that the PHY does not need to go through the link training sequence. This is used to speed up RTL simulation or if the DP Sink Device is capable of receiving Main-Link signal without link training.

1. Set the PHY soft reset. Clear after 5us.
2. Ensure that PHYIF_CTRL.PHY_LANEX_POWERDOWN=0 for all enabled lanes.
3. Set PHYIF_CTRL.PHY_LANES to the desired number of lanes and PHYIF_CTRL.PHY_RATE to the desired rate.
4. Wait until PHYIF_CTRL.PHY_BUSY is cleared for the desired lanes that have been enabled. For example, if 4 lanes are enabled, then wait until PHYIF_CTRL.PHY_BUSY[3:0]=4’h0. If only 1 lane enabled, then wait until PHYIF_CTRL.PHY_BUSY[0]=0
5. Program the predetermined pre-emphasis and voltage swing values into the PHY_TX_EQ registers if required.
6. Enable the transmitter by setting PHYIF_CTRL.XMIT_EN for each enabled lane.

9.6.6.2 Basic Link Bring up Sequence with Fast Link Training

This sequence is applicable if the PHY is to use predetermined pre-emphasis and swing values. This sequence occurs if the Sink DPCD 00003h NO_AUX_TRANSACTION_LINK_TRAINING is read to be 1 and if the source policy is to initiate TPS1 and TPS2/3/4 for 500us each.

1. Set the PHY soft reset. Wait for the read to return 0.
2. Ensure that GENERAL_INTERRUPT_ENABLE.HPD_EVENT is cleared.

3. Wait for the sink to be connected
   a. After an interrupt is received, read the INTERRUPTS and see if HPD_EVENT is set. Then check that HPD_STATUS.HPD_STATUS is 1. This indicates that the Sink has been connected.
   b. If IRQ_HPD is received instead of HPD_EVENT and DPCD Revision is 1.2 or greater, then check LINK_SERVICE_IRQ_VECTOR_ESI0.RX_CAP_CHANGED bit. This also indicates that the Sink has been connected. Also recheck if NO_AUX_TRANSACTION_LINK_TRAINING is still set. If it is cleared, then do a full link training process.
4. Ensure that PHYIF_CTRL.PHY_LANEX_POWERDOWN=0 for all enabled lanes.
5. Based on the highest link rate, highest number of lanes supported, and Source policy, set PHYIF_CTRL.PHY_LANES, and PHYIF_CTRL.PH_YRATE.
6. Wait until PHYIF_CTRL.PHY_BUSY is cleared for the desired lanes that have been enabled. For example, if 4 lanes are enabled, then wait until PHYIF_CTRL.PHY_BUSY[3:0]=4’h0. If only 1 lane enabled, then wait until PHYIF_CTRL.PHY_BUSY[0]=0
7. Program the predetermined pre-emphasis and voltage swing values into the PHY_TX_EQ registers if required.
8. Set PHYIF_CTRL.TPS_SEL=1 to send TPS1
9. Enable the transmitter by setting PHYIF_CTRL.XMIT_EN for each enabled lane.
10. Wait for 500us.
11. Set PHYIF_CTRL.TPS_SEL to the following:
    a. 2 if HBR is the highest desired rate
    b. 3 if HBR2 is the highest desired rate
    c. 4 if HBR3 is the highest desired rate
12. Wait for 500us.
13. Set PHYIF_CTRL.TPS_SEL to 0

9.6.6.3 Full Link Bring up Sequence

By default, fast link training is enabled, which allows the controller to transmit fail safe video format, as specified in section “Fast Link Training”. This feature should be disabled by clearing the CCTL.DEFAULT_FAST_LINK_TRAIN_EN register bit.
The default value of PHY power state from the controller is P3. For any PHY rate change operation, the power state must be P3 or P2.

1. Based on the highest link rate, highest number of lanes supported, and Source policy, set PHYIF_CTRL.PHY_LANES, and PHYIF_CTRL.PHY_RATE. If Rocket IO PHY is used, set PHYIF_CTRL.SSC_DIS=1.
2. Wait until PHYIF_CTRL.PHY_BUSY is cleared for the desired lanes that have been enabled. For example, if 4 lanes are enabled, then wait until PHYIF_CTRL.PHY_BUSY[3:0]=4’h0. If only 1 lane enabled, then wait until PHYIF_CTRL.PHY_BUSY[0]=0.
3. Set PHYIF_CTRL.TPS_SEL=0 to force the transmitted pattern to none.
   While using a PHY with Pipe Interface (DPTX_PHYIF_TYPE=2), transition the unused lanes to P3 before going to step 4. For example, if the number of lanes programmed in step 1 is 1, then the lanes 2, 3, and 4 should be transitioned to P3. Use the PHYIF_POWERDOWN_CTRL[0] register at offset 0xA18 for this. The PHYIF_PWRDOWN_CTRL[0].PER_LANE_PWRDOWN_CTL_EN register should be set to 1. The PHYIF_CTRL.PHY_POWERDOWN register is not used for controlling individual lanes powerdown.
4. Program the pre-emphasis and voltage swing values into the PHY_TX_EQ registers corresponding to voltage swing level 0 and pre-emphasis level 0 for all enabled lanes.
5. Set PHYIF_CTRL.TPS_SEL=1 to send TPS1.
6. Enable the transmitter by setting PHYIF_CTRL.XMIT_EN for each enabled lane.
7. Set the following DPCD registers on the Sink – using AUX Channel Interface Registers:
   a. LINK_BW_SET register (DPCD Address 00100h) to the desired rate.
   b. LANE_COUNT_SET field in the LANE_COUNT_SET register (DPCD Address 00101h, bits 4:0) to the desired # of lanes.
   c. DOWNSPREAD_CTRL register (DPCD Address 00107h), SPREAD_AMP must be set to 1

for a regular PHY and 0 for Rocket IO.
d. MAIN_LINK_CHANNEL_CODING_SET register (DPCD Address 00108h) to 01h.
e. TRAINING_PATTERN_SET register (DPCD Address 00102h) to 21h.
f. TRAINING_LANEx_SET register (DPCD Addresses 00103h through 00106h) for each lane to voltage swing level 0 and pre-emphasis level 0.
g. Note that TRAINING_PATTERN_SET and TRAINING_LANEx_SET registers must be written in one AUX CH burst write transaction.

8. Read the DPCD Sink TRAINING_AUX_RD_INTERVAL field in the TRAINING_AUX_RD_INTERVAL register (DPCD Address 0000Eh, bits 6:0) and wait the specified time period before reading the LANEx_CR_DONE bit of the lane in the LANEx_y_STATUS register (DPCD Address 00202h, bits 0 and 4, and DPCD Address 00203h, bits 0 and 4, for Lanes 0, 1, 2, and 3, respectively, as appropriate).
   a. If LANEx_CR_DONE is not set for all enabled lane, then read for ADJUST_REQUEST_LANEx_y register (DPCD Address(es) 00206h and 00207h) for all enabled lanes, then set the local register PHY_TX_EQ to the requested level. Wait TRAINING_AUX_RD_INTERVAL and then re-read LANEx_CR_DONE.
   b. if LANEx_CR_DONE is still not set and the same voltage and swing levels have been tried 5times, then reduce the link rate by one level. Set PHYIF_CTRL.PHY_RATE accordingly. Wait until PHYIF_CTRL.PHY_BUSY is cleared for the desired lanes that have been enabled. Repeat <XREF>.
   c. If the rate is already reduced to RBR, but LANEx_CR_DONE is only set for 1 or 2 lanes, then set PHYIF_CTRL.PHY_LANES to match, and PHYIF_CTRL.PHY_RATE to the high supported rate. Repeat <XREF>. Training fails if LANEx_CR_DONE is never set for any lane.
   d. If LANEx_CR_DONE is set for all enabled lanes, then move on to the next step.
9. Set PHYIF_CTRL.TPS_SEL to the following
   - if HBR is the highest desired rate
   - 3 if HBR2 is the highest desired rate
   - 4 if HBR3 is the highest desired rate
10. Write the following to the DPCD sink registers: 22h for TPS2, 23h for TPS3, or 07h for TPS4 to the TRAINING_PATTERN_SET register (DPCD Address 00102h) and the current drive setting to the TRAINING_LANEx_SET register (DPCD Addresses 00103h through 00106h). Ensure that scrambling (CCTL.SCRAMBLE_DISABLE = 0) is enabled if TPS4 is transmitted.
11. Wait TRAINING_AUX_RD_INTERVAL, and then read the following:
   - LANEx_CR_DONE
   - LANEx_CHANNEL_EQ_DONE bit in the LANEx_y_STATUS register (DPCD Address 00202h, bits 1 and 5, and DPCD Address 00203h, bits 1 and 5, for Lanes 0, 1, 2, and 3, respectively, as appropriate)
   - LANEx_SYMBOL_LOCKED bit in the LANEx_y_STATUS register (DPCD Address 00202h, bits 2 and 6, and DPCD Address 00203h, bits 2 and 6, for Lanes 0, 1, 2, and 3, respectively, as appropriate)
   - INTERLANE_ALIGN_DONE bits in the LANE_ALIGN__STATUS_UPDATED and LANE_ALIGN__STATUS_UPDATED_ESI registers (DPCD Addresses 00204h and 0200Eh, bit 0, respectively)
12. Wait TRAINING_AUX_RD_INTERVAL, and then read the following:
   - If some of the register values are still 0, then ADJUST_REQUEST_LANEx_y register (DPCD Address(es) 00206h and 00207h) and adjust PHY_TX_EQ according the requested drive level settings. Repeat step 9.
   - If after 5 iterations, the EQ bits are not set, then reduce rate. Set PHYIF_CTRL.PHY_RATE accordingly. Wait until PHYIF_CTRL.PHY_BUSY is cleared for the desired lanes that have been enabled. Repeat step 9.
   - If the rate is already reduced to RBR, then do the following:
     Clear the TRAINING_PATTERN_SET register (DPCD Address 00102h).
     Set PHYIF_CTRL.TPS_SEL =1 and set PHY_TX_EQ to default voltage swing and pre-emphasis (400mV, no pre-emphasis).
     Write 21h to the TRAINING_PATTERN_SET register (and appropriate values to the

TRAINING_LANEx_SET register (DPCD Addresses 00103h through 00106h)) to initiate training

13. Set PHYIF_CTRL.TPS_SEL to 0 when finished. Set DPCD Sink TRAINING_PATTERN_SET register to 00h.

9.6.6.4 Combo PHY

- For rate changes, PHYIF_CTRL.PHY_LANE0_POWERDOWN must be set to 2 or 3 and PHYIF_CTRL.PHY_BUSY must be low before PHYIF_CTRL.PHY_RATE is changed. P2 can be used to change rates more quickly than P3.
- Only PHYIF_CTRL.PHY_LANE0_POWERDOWN is used for the Combo PHY. PHYIF_CTRL.PHY_LANE{1,2,3}_POWERDOWN have no effect.
- Every bit of PHYIF_CTRL.PHY_BUSY[15:13] is the same as PHYIF_CTRL.PHY_BUSY[12].

9.6.7 AUX Channel Access

1. If write set AUX_DATA 0/1/2/3 first. Then write the CMD register with the desired CMD_TYPE, ADDR and LENGTH. Note the CMD register is transmitted as-is over the AUX channel so make sure unused bits are ‘0’.
2. Once the write to the CMD register is done, the request is queued for execution and additional writes to the data/cmd registers are disabled. The register bit AUX_STATUS.AUX_REPLY_RECEIVED is set to indicate the AUX channel is ACTIVE/BUSY.
3. Wait for an interrupt, and check to see if GENERAL_INTERRUPT.AUX_REPLY_EVENT is set. Alternatively, if INTERRUPT_ENABLE.AUX_REPLY_EVENT_EN is reset, software can poll AUX_STATUS.AUX_REPLY_RECEIVED to see if a response has been received. This bit resets to ‘0’ when the AUX transfer completes.
4. If GENERAL_INTERRUPT.AUX_REPLY_EVENT=1, then software can read AUX_STATUS to find the outcome of the AUX transfer.
   - If the AUX_STATUS.AUX_STATUS is AUX ACK then the AUX request is fully executed and read data is available in AUX_DATA0/1/2/3.
   - If it is AUX WRITE NACK, then the software can read AUX_STATUS.AUX_M indicates the number of bytes that are written.
5. If AUX_STATUS.AUX_TIMEOUT is set or the AUX_STATUS.AUX_STATUS is AUX NACK or AUX DEFER, then AUX_DATA0/1/2/3 are not valid.
6. Clear GENERAL_INTERRUPT.AUX_REPLY_EVENT.
7. If the SINK response is other than ACK, it is the SW responsibility to follow the DP spec and continue with the appropriate AUX request.

9.6.8 Test 80-bit Custom Pattern Programming

1. Read DPCD TEST_80BIT_CUSTOM_PATTERN (00250h to 025Bh)
2. Program CUSTOMPAT0/1/2 according to the TEST_80BIT_CUSTOM_PATTERN[79:0] read from the DPCD.
3. Based on the desired link rate, highest number of lanes supported, and Source policy, set PHYIF_CTRL.PHY_LANES and PHYIF_CTRL.PHY_RATE.
4. Wait until PHYIF_CTRL.PHY_BUSY is cleared for the desired lanes that have been enabled. For example, if 4 lanes are enabled, then wait until PHYIF_CTRL.PHY_BUSY[3:0]=4’h0. If only 1 lane enabled, then wait until PHYIF_CTRL.PHY_BUSY[0]=0
5. Set PHYIF_CTRL.XMIT_ENABLE for each enabled lane to enable the transmission.
6. You can check the CONTINUOUS_80BIT_PATTERN_FROM_DPRX_AUX_CH_CAP is supported and set CONTINUOUS_80BIT_PATTERN_FROM_DPRX_AUX_CH_EN=1 along with the DURATION_CTRL=1. (DPCD 0025Bh). This step can be omitted for standalone testing with an oscilloscope.

9.6.9 INIT_THRESHOLD Value Calculation

The INIT_THRESHOLD determines how many clock cycles the link packetizer logic should wait after the pixel data is available in the lane steering FIFO, before reading it and transmitting it on the link. Based on the lane steering logic push rate and the link rate, this value changes for various modes of operations. The calculated value should be programmed into the INIT_THRESHOLD, and INIT_THRESHOLD_HI fields of the VIDEO_CONFIG5 register.

Chapter 10 CRYPTO

10.1 Overview

CRYPTO is a hardware accelerator for encrypting or decrypting. It supports the most commonly used algorithm: DES/3DES, AES, SHA1, SHA256, MD5 and PKA.
The CRYPTO is divided into NSCRYPTO(CRYPTO for nonsecure) and SCRYPTO(CRYPTO for secure). NSCRYPTO is different from SCRYPTO base address and has the same function. SCRYPTO has more characteristics than NSCRYPTO.
The CRYPTO supports following features:

- Support Link List Item (LLI) DMA transfer
- Support SHA-1, SHA-256/224, SHA-512/384, MD5, SM3 with hardware padding
- Support HMAC of SHA-1, SHA-256, SHA-512, MD5, SM3 with hardware padding
- Support AES-128, AES-192, AES-256 encrypt & decrypt cipher
- Support DES & TDES cipher
- Support AES ECB/CBC/OFB/CFB/CTR/CTS/XTS/CCM/GCM/CBC-MAC/CMAC mode
- Support SM4 ECB/CBC/OFB/CFB/CTR/CTS/XTS/CCM/GCM/CBC-MAC/CMAC mode
- Support DES/TDES ECB/CBC/OFB/CFB mode
- Support up to 4096 bits PKA mathematical operations for RSA/ECC/SM2
- Support up to 8-channels configuration
- Support generating random numbers
- SCRYPTO AES/DES/TDES/SM4/HASH supports lockstep error monitoring
- SCRYPTO AES/DES/TDES/SM4 supports anti side channel attack
- SCRYPTO supports receiving KEY from KEYLAD

10.2 Block Diagram

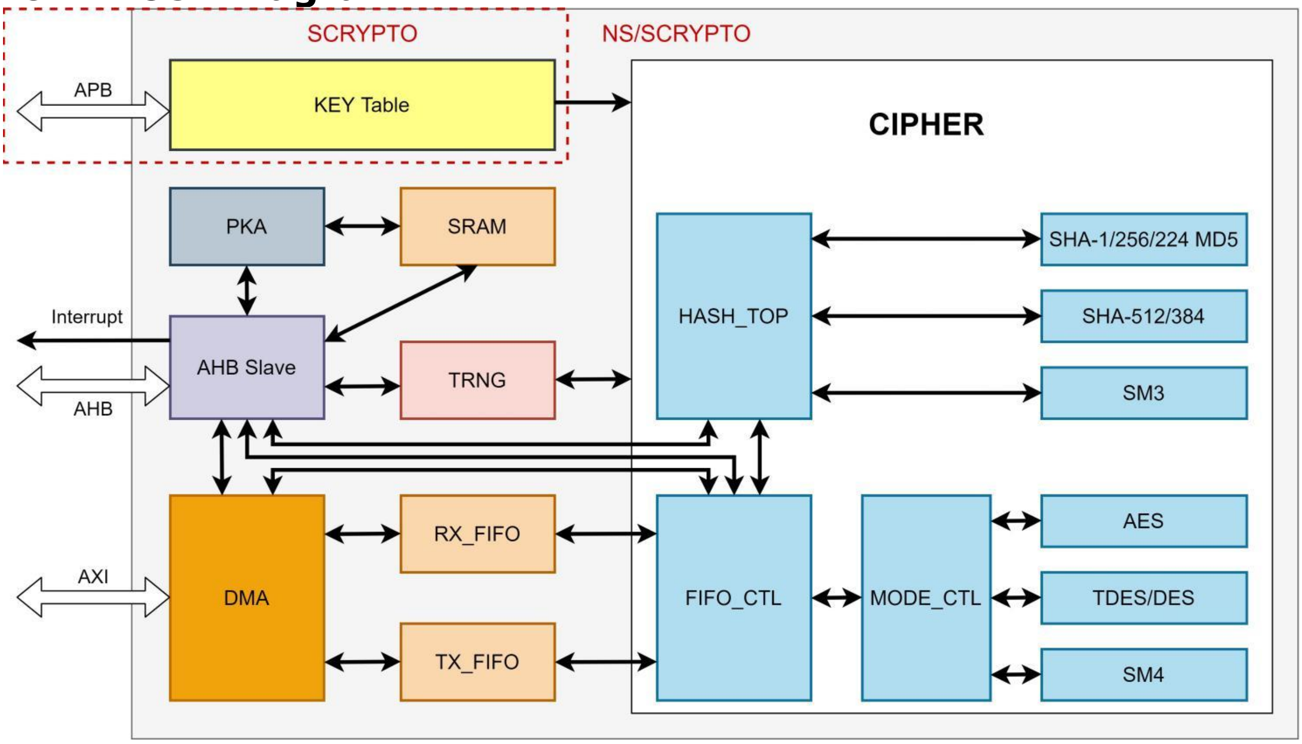

Fig. 10-1 CRYPTO Architecture

CRYPTO contains several modules: AHB_Slave, DMA, CIPHER, PKA. SCRYPTO also contains a special module: KEY_Table.

AHB_Slave

AHB_Slave is used to configure registers. This module is in HCLK domain.

DMA

DMA is used to transfer data from external memory to RX_FIFO, or from TX_FIFO to external memory. DMA uses 64-bits AXI3 protocol with max burst length to 16. LLI transfer is also supported for performance and convenience consideration. This module is in ACLK domain.

CIPHER
CIPHER contains AES, SM4, DES/TDES and HASH engines. And it also supports various mode operations. The source data is either from RX_FIFO, or from other engine output. The result data is sending either to TX_FIFO, or Registers in module AHB_Slave. This module is in CLK_CORE domain.

PKA
PKA is used to accelerate mathematical operations for big numbers. It supports - Modular arithmetic (addition, subtraction, multiplication and division), Regular arithmetic (addition, subtraction, multiplication and division), Modular inversion, Modular exponentiation, □ Logical operations (AND, OR, XOR, SHIFT). PKA has a SRAM which is used to store source, result and intermediate data for PKA operations. The software driver could use PKA operations to implement complicate calculation, such as RSA, ECC etc. It could support up to 4096 bits RSA modular exponentiation calculation. This module is in CLK_PKA domain.

TRNG
TRNG is used to collects random bits from the ring oscillator, up to 256 random bits per time. In SCRYPTO, TRNG also provides CIPHER with mask to prevent side channel attack. This module is in CLK_RNG domain.

KEY_Table
KEY Table is an extra module of SCRYPTO compared with NSCRYPTO. KEY Table is used to receive and temporarily store the KEY sent by KEYLAD through APB, and provide the KEY to CIPHER operation. This module is in PCLK domain.

10.3 Register Description

10.3.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

10.3.2 Registers Summary

The register prefixed with CRYPTO is the same function register of NSCRYPTO and SCRYPTO. The register with prefix of NSCRYPTO and SCRYPTO is the register that NSCRYPTO and SCRYPTO are different or need to be distinguished.

Name	Offset	Size	Reset Value	Description
CRYPTO_CLK_CTL	0x0000	W	0x00000001	Clock Control Register
CRYPTO_RST_CTL	0x0004	W	0x00000000	Reset Control Register
NSCRYPTO_DMA_INT_EN	0x0008	W	0x00000000	DMA Interrupt Enable Register
SCRYPTO_DMA_INT_EN	0x0008	W	0x00000000	DMA Interrupt Enable Register
NSCRYPTO_DMA_INT_ST	0x000C	W	0x00000000	DMA Interrupt Status Register
SCRYPTO_DMA_INT_ST	0x000C	W	0x00000000	DMA Interrupt Status Register
CRYPTO_DMA_CTL	0x0010	W	0x00000000	DMA Control Register
CRYPTO_DMA_LLI_ADDR	0x0014	W	0x00000000	DMA LIST Start Address Register
CRYPTO_DMA_ST	0x0018	W	0x00000000	DMA Status Register
CRYPTO_DMA_STATE	0x001C	W	0x00000000	DMA State Register
CRYPTO_DMA_LLI_RADDR	0x0020	W	0x00000000	DMA LLI Read Address Register
CRYPTO_DMA_SRC_RADDR	0x0024	W	0x00000000	DMA Source Data Read Address Register
CRYPTO_DMA_DST_WADDR	0x0028	W	0x00000000	DMA Destination Data Read Address Register
CRYPTO_DMA_ITEM_ID	0x002C	W	0x00000000	DMA Descriptor ID Register
CRYPTO_FIFO_CTL	0x0040	W	0x00000003	FIFO Control Register

Name	Offset	Size	Reset Value	Description
CRYPTO_BC_CTL	0x0044	W	0x00000000	Block Cipher Control Register
CRYPTO_HASH_CTL	0x0048	W	0x00000004	Hash Control Register
CRYPTO_CIPHER_ST	0x004C	W	0x00000000	Cipher Status Register

SCRYPTO_PKA_VERSION	0x0698	W	0x01000000	PKA_VERSION code is 0x0100_0000
NSCRYPTO_CRYPTO_VERSION	0x06F0	W	0x02000001	CRYPTO_VERSION code is 0x0200_0001
SCRYPTO_CRYPTO_VERSION	0x06F0	W	0x02000002	CRYPTO_VERSION code is 0x0200_0002
CRYPTO_PKA_MEM_MAPn	0x0800 +n*0x4	W	0x00000000	PKA Memory Map n Register
CRYPTO_PKA_OPCODE	0x0880	W	0x00000000	PKA Operation Code Register
CRYPTO_N_NP_T0_T1_ADDR	0x0884	W	0x000FF820	N_NP_T0_T1_ADDR Register
CRYPTO_PKA_STATUS	0x0888	W	0x00000001	PKA Status Register
CRYPTO_PKA_SW_RESET	0x088C	W	0x00000000	software reset of PKA
CRYPTO_PKA_Ln	0x0890 +n*0x4	W	0x00000000	PKA Length n Register
CRYPTO_PKA_PIPE_RDY	0x08B0	W	0x00000001	PKA pipe is ready for new opcode
CRYPTO_PKA_DONE	0x08B4	W	0x00000001	PKA Done Register
CRYPTO_PKA_MON_SELECT	0x08B8	W	0x00000000	PKA Monitor Select Register

Name	Offset	Size	Reset Value	Description
CRYPTO_PKA_DEBUG_REG_EN	0x08BC	W	0x00000000	PKA Debug Enable Register
CRYPTO_DEBUG_CNT_ADDR	0x08C0	W	0x00000000	Debug Counter Address Register
CRYPTO_DEBUG_EXT_ADDR	0x08C4	W	0x00000000	Debug Extra Address Register
CRYPTO_PKA_DEBUG_HALT	0x08C8	W	0x00000000	PKA Debug Halt State Register
CRYPTO_PKA_MON_READ	0x08D0	W	0x0000FEEF	PKA Monitor Read Register
CRYPTO_PKA_INT_ENA	0x08D4	W	0x00000000	PKA Interrupt Enable Register
CRYPTO_PKA_INT_ST	0x08D8	W	0x00000000	PKA Interrupt Status Register
CRYPTO_SRAM_ADDR	0x1000	W	0x00000000	SRAM Base Address

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

10.3.3 Detail Registers Description

CRYPTO_CLK_CTL

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	WO	0x0	write_enable Write enable for lower 16bits, each bit is individual 1’b0: Write access disable 1’b1: Write access enable
15:1	RO	0x0000	reserved
0	RW	0x1	auto_clkgate_en CRYPTO will gate unused Block Cipher and HASH module automatically 1'b0: Disable 1'b1: Enable

CRYPTO_RST_CTL

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:19	RO	0x0000	reserved
18:16	RW	0x0	write_enable Write enable for lower 16bits, each bit is individual 1’b0: Write access disable 1’b1: Write access enable
15:3	RO	0x0000	reserved
2	R/W SC	0x0	sw_pka_reset Software set this bit to start a reset to PKA module. After the reset is done, CRYPTO will clear this bit.
1	R/W SC	0x0	sw_rng_reset Software set this bit to start a reset to TRNG module. After the reset is done, CRYPTO will clear this bit.
0	R/W SC	0x0	sw_cc_reset Software set this bit to start a reset to Symmetric Cipher and HASH module. After the reset is done, CRYPTO will clear this bit.

NSCRYPTO_DMA_INT_EN

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	zero_len_int_en 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
5	RW	0x0	list_err_int_en 1'b0: Disable 1'b1: Enable
4	RW	0x0	src_err_int_en 1'b0: Disable 1'b1: Enable
3	RW	0x0	dst_err_int_en 1'b0: Disable 1'b1: Enable
2	RW	0x0	src_item_done_int_en 1'b0: Disable 1'b1: Enable
1	RW	0x0	dst_item_done_int_en 1'b0: Disable 1'b1: Enable
0	RW	0x0	list_done_int_en 1'b0: Disable 1'b1: Enable

SCRYPTO_DMA_INT_EN
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	lockstep_int_en 1'b0: Disable 1'b1: Enable
6	RW	0x0	zero_len_int_en 1'b0: Disable 1'b1: Enable
5	RW	0x0	list_err_int_en 1'b0: Disable 1'b1: Enable
4	RW	0x0	src_err_int_en 1'b0: Disable 1'b1: Enable
3	RW	0x0	dst_err_int_en 1'b0: Disable 1'b1: Enable
2	RW	0x0	src_item_done_int_en 1'b0: Disable 1'b1: Enable
1	RW	0x0	dst_item_done_int_en 1'b0: Disable 1'b1: Enable
0	RW	0x0	list_done_int_en 1'b0: Disable 1'b1: Enable

NSCRYPTO_DMA_INT_ST
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
6	W1C	0x0	zero_len 1'b1: Indicate that DMA has met an 0 byte source transfer length in list descriptors. After the bit is read, the application should write 1 to clear this bit for next time use 1'b0: Nothing
5	W1C	0x0	list_err 1'b1: Indicate that DMA has met an error response when transfer list descriptors. The state machine will exit current transfer and then return to IDLE state. After the bit is read, the application should write 1 to clear this bit for next time use 1'b0: Nothing
4	W1C	0x0	src_err 1'b1: Indicate that DMA has met an error response when transfer source data. The state machine will exit current transfer and then return to IDLE state. After the bit is read, the application should write 1 to clear this bit for next time use 1'b0: Nothing
3	W1C	0x0	dst_err 1'b1: Indicate that DMA has met an error response when transfer destination data. The state machine will exit current transfer and then return to IDLE state. After the bit is read, the application should write 1 to clear this bit for next time use 1'b0: Nothing
2	W1C	0x0	src_item_done 1'b1:Indicate that DMA has completed a read transfers which the current list descriptor pointed to. After the bit is read, the application should write 1 to clear this bit for next time use 1'b0: Nothing
1	W1C	0x0	dst_item_done 1'b1: Indicate that DMA has completed a write transfers which the current list descriptor pointed to. After the bit is read, the application should write 1 to clear this bit for next time use 1'b0: Nothing
0	W1C	0x0	list_done 1'b1: Indicate that DMA has completed all the transfers which the list descriptors pointed to. After the bit is read, the application should write 1 to clear this bit for next time use 1'b0: Nothing

SCRYPTO_DMA_INT_ST

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	W1C	0x0	lockstep_flag 1'b0: Nothing 1'b1: Indicate that crypto was attacked
6	RW	0x0	zero_len 1'b0: nothing 1'b1: indicate that DMA has met an 0 byte source transfer length in list descriptors. After the bit is read, the application should write 1 to clear this bit for next time use

Bit	Attr	Reset Value	Description
5	RW	0x0	list_err 1'b0: Nothing 1'b1: Indicate that DMA has met an error response when transfer list descriptors. The state machine will exit current transfer and then return to IDLE state. After the bit is read, the application should write 1 to clear this bit for next time use
4	W1C	0x0	src_err 1'b0: Nothing 1'b1: Indicate that DMA has met an error response when transfer source data. The state machine will exit current transfer and then return to IDLE state. After the bit is read, the application should write 1 to clear this bit for next time use
3	W1C	0x0	dst_err 1'b0: Nothing 1'b1: Indicate that DMA has met an error response when transfer destination data. The state machine will exit current transfer and then return to IDLE state. After the bit is read, the application should write 1 to clear this bit for next time use
2	W1C	0x0	src_item_done 1'b0: Nothing 1'b1: Indicate that DMA has completed a read transfers which the current list descriptor pointed to. After the bit is read, the application should write 1 to clear this bit for next time use
1	W1C	0x0	dst_item_done 1'b0: Nothing 1'b1: Indicate that DMA has completed a write transfers which the current list descriptor pointed to. After the bit is read, the application should write 1 to clear this bit for next time use
0	W1C	0x0	list_done 1'b0: Nothing 1'b1: Indicate that DMA has completed all the transfers which the list descriptors pointed to. After the bit is read, the application should write 1 to clear this bit for next time use

CRYPTO_DMA_CTL
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	WO	0x0	write_enable Write enable for lower 16bits, each bit is individual 1’b0: Write access disable 1’b1: Write access enable
15:2	RO	0x0000	reserved
1	R/WSC	0x0	dma_restart If DMA data for next stage is not ready, application could pause DMA by descriptor commands. DMA will stop prefetching next descriptor. The application could restart DMA by asserting this bit when DMA data for next state is ready. CRYPTO will continue with previous transfer, and clear the bit automatically.
0	R/WSC	0x0	dma_start DMA asserts the bit to start DMA transfer, then CRYPTO will clear the bit automatically.

CRYPTO_DMA_LLI_ADDR
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	dma_lli_addr When DMA_CTL start asserted, CRYPTO will read the address to get the 1'st descriptor. It should be 8-bytes align. We suggest dma_lli_addr 64-byte align for best performance consideration.

CRYPTO_DMA_ST
Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	dma_busy 1'b0: DMA idle 1'b1: DMA busy

CRYPTO_DMA_STATE
Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:4	RO	0x0	dma_lli_state For debug use only 2'b00: IDLE STATE 2'b01: FETCH STATE 2'b10: WORK STATE Others: Reserved
3:2	RO	0x0	dma_src_state For debug use only 2'b00: IDLE STATE 2'b01: LOAD STATE 2'b10: WORK STATE Others: Reserved
1:0	RO	0x0	dma_dst_state For debug use only 2'b00: IDLE STATE 2'b01: LOAD STATE 2'b10: WORK STATE Others: Reserved

CRYPTO_DMA_LLI_RADDR
Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dma_lli_raddr For debug use only It indicates the current DMA LLI read address

CRYPTO_DMA_SRC_RADDR
Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dma_src_raddr For debug use only It indicates the current DMA source read address

CRYPTO_DMA_DST_WADDR
Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	dma_dst_waddr For debug use only It indicates the current DMA destination write address

CRYPTO_DMA_ITEM_ID
Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RO	0x00	dma_item_id For debug use only It indicates the current descriptor ID

CRYPTO_FIFO_CTL
Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	WO	0x0	write_enable Write enable for lower 16bits, each bit is individual 1’b0: Write access disable 1’b1: Write access enable
15:2	RO	0x0000	reserved
1	RW	0x1	dout_byteswap 1'b0: Little endian 1'b1: Big endian
0	RW	0x1	din_byteswap 1'b0: Little endian 1'b1: Big endian

CRYPTO_BC_CTL
Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:16	WO	0x000	write_enable Write enable for lower 16bits, each bit is individual 1’b0: Write access disable 1’b1: Write access enable
15:10	RO	0x00	reserved
9:8	RW	0x0	bc_cipher_sel 2'b00: AES 2'b01: SM4 2'b10: DES 2'b11: TDES

Bit	Attr	Reset Value	Description
7:4	RW	0x0	mode For AES 4'h0: ECB 4'h1: CBC 4'h2: CTS 4'h3: CTR 4'h4: CFB 4'h5: OFB 4'h6: XTS 4'h7: CCM 4'h8: GCM 4'h9: CMAC 4'hA: CBC-MAC Others: Reserved For TDES/DES 4'h0: ECB 4'h1: CBC 4'h4: CFB 4'h5: OFB Others: Reserved
3:2	RW	0x0	key_size For AES 2'b00: 128 bit 2'b01: 192 bit 2'b10: 256 bit 2'b11: reserved For TDES/DES, it is reserved
1	RW	0x0	decrypt 1'b0: Encrypt 1'b1: Decrypt
0	RW	0x0	bc_enable 1'b0: Disable 1'b1: Enable

CRYPTO_HASH_CTL

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	WO	0x00	write_enable Write enable for lower 16bits, each bit is individual 1’b0: Write access disable 1’b1: Write access enable
15:8	RO	0x00	reserved
7:4	RW	0x0	hash_cipher_sel 4'h0: SHA-1 4'h1: MD-5 4'h2: SHA-256 4'h3: SHA-224 4'h4: SM3 4'h8: SHA-512 4'h9: SHA-384 4'hA: SHA-512/224 4'hB: SHA-512/256 Others: Reserved

Bit	Attr	Reset Value	Description
3	RW	0x0	hmac_enable CRYPTO supports HMAC-SHA1, HMAC-SHA256, HMAC_SHA512, HMAC-MD5, HMAC-SM3 1'b0: Disable 1'b1: Enable Note: If hmac_enable set '1' hash_cipher_sel must set 0x6 when chose HMAC-SM3 mode hash_cipher_sel set the corresponding value when chose other mode
2	RW	0x1	hw_pad_enable 1'b0: Disable 1'b1: Enable
1	RW	0x0	hash_src_sel 1'b0: From RX-FIFO 1'b1: From TX-FIFO
0	RW	0x0	hash_enable 1'b0: Disable 1'b1: Enable

CRYPTO_CIPHER_ST

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RO	0x0	otp_key_valid Indicate if otp_key is valid. 1'b0: Invalid 1'b1: Valid
1	RO	0x0	hash_busy 1'b0: Idle 1'b1: Busy
0	RO	0x0	block_cipher_busy 1'b0: Idle 1'b1: Busy

CRYPTO_CIPHER_STATE

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14:10	RO	0x01	hash_state For debug use only 5'h01: IDLE State 5'h02: IPAD State 5'h04: TEXT State 5'h08: OPAD State 5'h10: OPAD EXT State
9:8	RO	0x0	gcm_state For debug use only 2'b00: IDLE State 2'b01: PRE State 2'b10: NA State 2'b11: PC State

Bit	Attr	Reset Value	Description
7:6	RO	0x0	ccm_state For debug use only 2'b00: IDLE State 2'b01: PRE State 2'b10: NA State 2'b11: PC State
5:4	RO	0x0	parallel_state For debug use only 2'b00: IDLE State 2'b01: PRE State 2'b10: BULK State Others: Reserved
3:2	RO	0x0	mac_state For debug use only 2'b00: IDLE State 2'b01: PRE State 2'b10: BULK State Others: Reserved
1:0	RO	0x0	serial_state For debug use only 2'b00: IDLE State 2'b01: PRE State 2'b10: BULK State 2'b11: Reserved

CRYPTO_CHn_IV_0
Address: Operational Base + offset (0x0100+n*0x10)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_iv_0 Channel n range from 0 to 7 CHn_IV_0 address = 0x0100 + 0x10 * n For CTR Mode, IV stands for counter For XTS Mode, IV stands for tweak

CRYPTO_CHn_IV_1
Address: Operational Base + offset (0x0104+n*0x10)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_iv_1 Channel n range from 0 to 7 CHn_IV_1 address = 0x0104 + 0x10 * n For CTR Mode, IV stands for counter For XTS Mode, IV stands for tweak

CRYPTO_CHn_IV_2
Address: Operational Base + offset (0x0108+n*0x10)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_iv_2 Channel n range from 0 to 7 CHn_IV_2 address = 0x0108 + 0x10 * n For CTR Mode, IV stands for counter For XTS Mode, IV stands for tweak

CRYPTO_CHn_IV_3
Address: Operational Base + offset (0x010C+n*0x10)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_iv_3 Channel n range from 0 to 7 CHn_IV_3 address = 0x010c + 0x10 * n For CTR Mode, IV stands for counter For XTS Mode, IV stands for tweak

CRYPTO_CHn_KEY_0
Address: Operational Base + offset (0x0180+n*0x10)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_key_0 Channel n range from 0 to 7 CHn_KEY_0 address = 0x0180 + 0x10 * n

CRYPTO_CHn_KEY_1
Address: Operational Base + offset (0x0184+n*0x10)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_key_1 Channel n range from 0 to 7 CHn_KEY_1 address = 0x0184 + 0x10 * n

CRYPTO_CHn_KEY_2
Address: Operational Base + offset (0x0188+n*0x10)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_key_2 Channel n range from 0 to 7 CHn_KEY_2 address = 0x0188 + 0x10 * n

CRYPTO_CHn_KEY_3
Address: Operational Base + offset (0x018C+n*0x10)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	chn_key_3 Channel n range from 0 to 7 CHn_KEY_3 address = 0x018c + 0x10 * n

CRYPTO_CHn_PC_LEN_0
Address: Operational Base + offset (0x0280+n*0x8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_pc_len_0 Channel n range from 0 to 7 CHn_PC_LEN_0 address = 0x0280 + 0x8 * n Length in byte unit

CRYPTO_CHn_PC_LEN_1
Address: Operational Base + offset (0x0284+n*0x8)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28:0	RW	0x00000000	chn_pc_len_1 Channel n range from 0 to 7 CHn_PC_LEN_1 address = 0x0284 + 0x8 * n Length in byte unit

CRYPTO_CHn_AAD_LEN_0
Address: Operational Base + offset (0x02C0+n*0x8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	chn_aad_len_0 Channel n range from 0 to 7 CHn_AAD_LEN_0 address = 0x02c0 + 0x8 * n Length in byte unit

CRYPTO_CHn_AAD_LEN_1
Address: Operational Base + offset (0x02C4+n*0x8)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:0	RW	0x00000000	chn_aad_len_1 Channel n range from 0 to 7 CHn_AAD_LEN_1 address = 0x02c4 + 0x8 * n Length in byte unit

CRYPTO_CHn_IV_LEN_0
Address: Operational Base + offset (0x0300+n*0x4)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4:0	RW	0x00	chn_iv_len Channel n range from 0 to 7 CHn_IV_LEN_0 address = 0x0300 + 0x4 * n Length in byte unit. Up to 16 byte IV for GCM

CRYPTO_CHn_TAG_0
Address: Operational Base + offset (0x0320+n*0x10)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	chn_tag_0 Channel n range from 0 to 7 CHn_TAG_0 address = 0x0320 + 0x10 * n When the corresponding TAG_VALID is high, TAG value is valid

CRYPTO_CHn_TAG_1
Address: Operational Base + offset (0x0324+n*0x10)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	chn_tag_1 Channel n range from 0 to 7 CHn_TAG_1 address = 0x0324 + 0x10 * n When the corresponding TAG_VALID is high, TAG value is valid

CRYPTO_CHn_TAG_2
Address: Operational Base + offset (0x0328+n*0x10)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	chn_tag_2 Channel n range from 0 to 7 CHn_TAG_2 address = 0x0328 + 0x10 * n When the corresponding TAG_VALID is high, TAG value is valid

CRYPTO_CHn_TAG_3

Address: Operational Base + offset (0x032C+n*0x10)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	chn_tag_3 Channel n range from 0 to 7 CHn_TAG_3 address = 0x032c + 0x10 * n When the corresponding TAG_VALID is high, TAG value is valid

CRYPTO_HASH_DOUT_n

Address: Operational Base + offset (0x03A0+n*0x4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	hash_dout_n HASH dout n range from 0 to 15 HASH_DOUT_n address = 0x03a0 + 0x4 * n n'th output word for all hash function, in big endian

CRYPTO_TAG_VALID

Address: Operational Base + offset (0x03E0)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	W1C	0x0	ch7_tag_valid When channel 7 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit 1'b0: Channel 7 tag is invalid 1'b1: Channel 7 tag is valid
6	W1C	0x0	ch6_tag_valid When channel 6 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit 1'b0: Channel 6 tag is invalid 1'b1: Channel 6 tag is valid
5	W1C	0x0	ch5_tag_valid When channel 5 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit 1'b0: Channel 5 tag is invalid 1'b1: Channel 5 tag is valid
4	W1C	0x0	ch4_tag_valid When channel 4 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit 1'b0: Channel 4 tag is invalid 1'b1: Channel 4 tag is valid

Bit	Attr	Reset Value	Description
3	W1C	0x0	ch3_tag_valid When channel 3 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit 1'b0: Channel 3 tag is invalid 1'b1: Channel 3 tag is valid
2	W1C	0x0	ch2_tag_valid When channel 2 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit. 1'b0: Channel 2 tag is invalid 1'b1: Channel 2 tag is valid
1	W1C	0x0	ch1_tag_valid When channel 1 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit 1'b0: Channel 1 tag is invalid 1'b1: Channel 1 tag is valid
0	W1C	0x0	ch0_tag_valid When channel 0 tag calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit 1'b0: Channel 0 tag is invalid 1'b1: Channel 0 tag is valid

CRYPTO_HASH_VALID
Address: Operational Base + offset (0x03E4)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	W1C	0x0	hash_valid When HASH calculation is finished, CRYPTO will set this bit. After the bit is read by application, it should be cleared by writing 1 to this bit 1'b0: HASH_DOUT is invalid 1'b1: HASH_DOUT is valid

NSCRYPTO_RNG_CTL
Address: Operational Base + offset (0x0400)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:16	WO	0x00	write_enable Write enable for lower 16bits, each bit is individual 1’b0: Write access disable 1’b1: Write access enable

5	RO	0x0	alu_carry Carry of the last ALU operation
4	RO	0x0	div_by_zero Division by 0
3	RO	0x0	alu_mod_ovflw Modular overflow flag
2	RO	0x0	alu_out_zero ALU out is 0
1	RO	0x0	pka_busy PKA is busy
0	RO	0x1	pipe_is_busy PKA ready signal 1'b0: Pipe full 1'b1: PKA ready for new command

CRYPTO_PKA_SW_RESET

Address: Operational Base + offset (0x088C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	WO	0x0	pka_sw_reset PKA software reset the reset mechanism will take about four PKA clocks until the reset line is de-asserted.

CRYPTO_PKA_Ln
Address: Operational Base + offset (0x0890+n*0x4)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:0	RW	0x0000	pka_ln Length n range from 0 to 7 PKA_Ln address = 0x0890 + 0x4 * n PKA length n, in bit unit

CRYPTO_PKA_PIPE_RDY
Address: Operational Base + offset (0x08B0)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x1	pka_pipe_rdy PKA pipe is ready for new opcode.

CRYPTO_PKA_DONE
Address: Operational Base + offset (0x08B4)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x1	pka_done PKA operation is completed and pipe is empty.

CRYPTO_PKA_MON_SELECT
Address: Operational Base + offset (0x08B8)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	pka_mon_select PKA monitor select which PKA FSM monitor is being output.

CRYPTO_PKA_DEBUG_REG_EN
Address: Operational Base + offset (0x08BC)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	pka_debug_reg_en Enable all the debug mechanism when set.

CRYPTO_DEBUG_CNT_ADDR
Address: Operational Base + offset (0x08C0)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:0	R/W SC	0x00000	debug_cnt_addr The clock counter initial values. clock is disabled when counter expires. Triggered when pka_debug_en is set.

CRYPTO_DEBUG_EXT_ADDR
Address: Operational Base + offset (0x08C4)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	WO	0x0	debug_ext_addr Disable the debug Mechanism.

CRYPTO_PKA_DEBUG_HALT
Address: Operational Base + offset (0x08C8)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	pka_debug_halt In debug mode: PKA is in halt state.

CRYPTO_PKA_MON_READ
Address: Operational Base + offset (0x08D0)

Bit	Attr	Reset Value	Description
31:0	RO	0x0000feef	pka_mon_read This is the PKA monitor bus register output.

CRYPTO_PKA_INT_ENA
Address: Operational Base + offset (0x08D4)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	pka_int_ena 1'b0: Disable pka interrupt 1'b1: Enable pka interrupt

CRYPTO_PKA_INT_ST
Address: Operational Base + offset (0x08D8)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	W1C	0x0	pka_int_st Indicate that PKA operation completes. After the bit is read, the application should write 1 to clear this bit for next time use.

CRYPTO_SRAM_ADDR
Address: Operational Base + offset (0x1000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	sram_addr Sram address starts from 0x1000 to 0x1fff. When RAM_CTL.ram_pka_rdy == 0, application could access sram. Otherwise, application can't.

10.4 Application Note

10.4.1 Clock & Reset

There are 4 clock domains in CRYPTO. The clock and reset signals are described in the following table.

Table 10-1 CRYPTO Clock & Reset Description

Signal	Attr	Description
hclk	clock	AHB clock
aclk	clock	AXI master clock
pclk(SCRYPTO only)	clock	APB master clock
clk_core	clock	Cipher work clock

Signal	Attr	Description
clk_pka	clock	PKA work clock
clk_rng	clock	TRNG work clock
hresetn	reset	Asynchronously assert, synchronously de-assert to hclk, low active
aresetn	reset	Asynchronously assert, synchronously de-assert to aclk, low active
presetn(SCRYPTO only)	reset	Asynchronously assert, synchronously de-assert to pclk, low active
resetn_core	reset	Asynchronously assert, synchronously de-assert to clk_core, low active
resetn_pka	reset	Asynchronously assert, synchronously de-assert to clk_pka, low active
resetn_rng	reset	Asynchronously assert, synchronously de-assert to clk_rng, low active

Each function need different clocks. The applications could gate the un-used clock to save power. Please see the following table for detail information.

Table 10-2 CRYPTO Clock & Reset Description

Operation	HCLK	ACLK	CLK_CORE	CLK_PKA
AES	ON	ON	ON	OFF
DES/TDES	ON	ON	ON	OFF
SM4	ON	ON	ON	OFF
HASH/HMAC	ON	ON	ON	OFF
PKA	ON	OFF	OFF	ON

Even when CLK_CORE is on, CRYPTO is doing some cipher job. And CRYPTO could still be able to automatically gate most parts of un-used blocks to save more power, if CRYPTO_CLK_CTL. auto_clkgate_en is set to ‘1’. The default value for this bit is also ‘1’. Application could do a soft reset to a certain clock domain. Please refer to “Chapter CRU” for more details.

10.4.2 Performance

Cipher performance is shown in the following table.

Table 10-3 CRYPTO Performance Description

Algorithm	block size (Byte)	clk_core frequency (Mhz)	cycle	serial max throughput (MBps)	parallel max throughput (MBps)
DES	8	350	18	155	622
TDES	8	350	55	50	203
AES-128	16	350	12	466	1866
AES-192	16	350	14	400	1600
AES-256	16	350	16	350	1400
SM4	16	350	34	164	658
SM3	64	350	66	339	NA
SHA-1	64	350	81	276	NA

Algorithm	block size (Byte)	clk_core frequency (Mhz)	cycle	serial max throughput (MBps)	parallel max throughput (MBps)
MD5	64	350	65	344	NA
SHA-256/224	64	350	65	344	NA
SHA-512/384/ 512_224/ 512_256	128	350	81	553	NA
RSA-2048	NA	350	130K	NA	NA

There are 2 column throughput rates in the table, 1 is serial mode, the other is parallel mode. In parallel mode, there are 4 engines working at the same time. So the speed is 4 times than serial mode. Parallel mode includes ECB/CTR/XTS both encryption and decryption mode, CFB/CBC/CTS only decryption mode. Other modes are serial. HASH doesn't have parallel mode.
For RSA-2048, the time-consuming MODEXP operation needs about 130K clock cycles.

10.4.3 DMA

DMA supports Link List Item (LLI) DMA transaction.

- Each item contains 8 bytes, and start address should be 8 bytes align
- We suggest that DATA start address is 8 bytes align
- Total DATA length is byte align
- Support segmenting HASH/HMAC DATA into multi sections. We suggest that each section DATA length is a multiple of 64 bytes, except this section is the last section

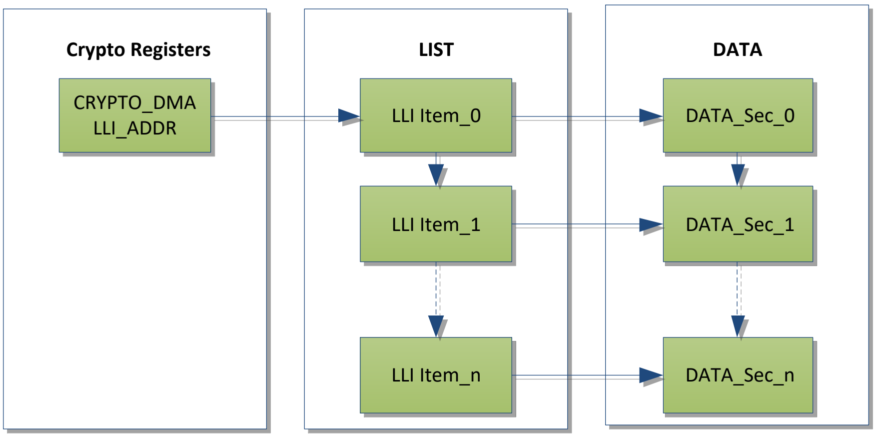

Fig. 10-2 LLI DMA Usage

As shown in the Figure above, Register CRYPTO_DMA_LLI_ADDR points to 1'st LLI item in external memory. Each LLI item contains DATA address, length, control information and next LLI item pointer, except the last LLI item. The last item doesn't have the next LLI Item pointer. After the last LLI item is finished, DMA will go to idle state.
LLI item definition is shown in the following table.

Table 10-4 LLI Item Description

offset	Def	Description
0x00	SRC_ADDRESS[31:0]	Source data start address
0x04	SRC_LENGTH[31:0]	Source data length, in byte unit
0x08	DST_ADDRESS[31:0]	Destination data start address

offset	Def	Description
0x0c	DST_LENGTH[31:0]	Destination data length, in byte unit
0x10	USER_DEFINE[31:0]	Used in cipher block
0x14	IV_OFFSET	IV offset
0x18	DMA_CTRL[31:0]	Used in DMA block
0x1c	NEXT_ADDRESS[31:0]	Next LLI item address. When DMA_CTRL.LAST = “1”, NEXT_ADDRESS is invalid

DMA_CTRL: the definition is shown in the following table.

Table 10-5 LLI Item dma_ctl Description

Bit	Def	Definition
[31:24]	ITEM_ID[7:0]	Used to identify LLI items
[23:16]	Reserved	Reserved
[15:11]	Reserved	Reserved
10	Source_item_done enable	When source data fetch is completed, CRYPTO_DMA_INT_ST.source_item_done will assert if this bit is set
9	Dst_item_done enable	When destination data fetch is completed, CRYPTO_DMA_INT_ST.dst_item_done will assert if this bit is set
8	List_done enable	When all LLI items transfer is completed, CRYPTO_DMA_INT_ST.list_done will assert if this bit is set
[7:2]	Reserved	Reserved
1	PAUSE	Indicate DMA will hold on after executes current item. DMA won’t go on unless CRYPTO_DMA_CTL.restart is configured
0	LAST	Indicate current item is the last one. After executes current item, DMA will return to IDLE state

Table 10-6 LLI Item user_define Description

Bit	Signal	Description
31:7	Reserved	Reserved
6:4	Chnl_num	Channel number, from 0 to 7
3	String_attr	Indicate current item's attribution 1: ADA; 0: PC(plaintext or ciphertext)
2	String_last	Indicate current item is the string last item
1	String_start	Indicate current item is the string first item
0	Cipher_start	Indicate current item is the cipher first item

10.4.4 Hash and cipher operation

NSCRYPTO and SCRYPTO have the same function of hash and cipher.

10.4.5 TRNG

- **How to start**

After configuring other registers, NSCRYPTO starts random number generation after configuring rng_start bit segment of register NSCRYPTO_RNG_CTL. For SCRYPTO, after other register are configured and rng_enable bit segment of register SCRYPTO_RNG_CTL is configured, SCRYPTO_RNG_START register must be configured to start random number generation.

- **First start in SCRYPTO**

SCRYPTO will automatically generate a random number after reset release. Only after the first random number generation is completed can the register be configured to generate a new random number.

- **Interrupt in SCRYPTO**

SCRYPTO will set register SCRYPTO_RNG_INTEN after generating random number. If register SCRYPTO_RNG_INTST is configured, SCRYPTO will set interrupt signal.

10.4.6 Lockstep in SCRYPTO

When SCRYPTO's SCRYPTO_LOCKSTEP_EN register is configured, SCRYPTO_LOCKSTEP_FLAG register will be set when SCRYPTO is attacked. When SCRYPTO_LOCKSTEP_FLAG register is set, only reset SCRYPTO can clear the register.

10.4.7 KEY Table in SCRYPTO

KEY Table is used to receive and temporarily store the KEY sent by KEYLAD through APB, and provide the KEY to CIPHER operation. If SCRYPTO uses the KEY in the KEY Table as the KEY of the CIPHER operation, it also needs to configure the SCRYPTO_KEY_SEL register to be the value of 0x5a5a5a5a.

10.4.8 Multi-Channel Map

There are 8-channel configurations for AES or DES/TDES operation. For different key-size, the map is different. Please find the register map in the following table.

Table 10-7 LLI Item user_define Description

Cipher sel	chnl num	key	iv(tag/...)
AES-128/ DES	0	CH0_KEY0-3/ CH0_KEY0-1	CH0_IV0-3/ CH0_IV0-1
AES-128/ DES	n	CHn_KEY0-3/ CHn_KEY0-1	CHn_IV0-3/ CHn_IV0-1
AES-128/ DES	7	CH7_KEY0-3/ CH7_KEY0-1	CH7_IV0-3/ CH7_IV0-1
AES-192/ TDES	0	CH0_KEY0-3, CH1_KEY0-1	CH0_IV0-3/ CH0_IV0-1
AES-192/ TDES	1	CH2_KEY0-3, CH3_KEY0-1	CH1_IV0-3/ CH1_IV0-1
AES-192/ TDES	2	CH4_KEY0-3, CH5_KEY0-1	CH2_IV0-3/ CH2_IV0-1
AES-192/ TDES	3	CH6_KEY0-3, CH7_KEY0-1	CH3_IV0-3/ CH3_IV0-1
AES-192/ TDES	4-7	not supported	not supported
AES-256	0	CH0_KEY0-3, CH1_KEY0-3	CH0_IV0-3/ CH0_IV0-1
AES-256	1	CH2_KEY0-3, CH3_KEY0-3	CH1_IV0-3/ CH1_IV0-1

Cipher sel	chnl num	key	iv(tag/...)
AES-256	2	CH4_KEY0-3, CH5_KEY0-3	CH2_IV0-3/ CH2_IV0-1
AES-256	3	CH6_KEY0-3, CH7_KEY0-3	CH3_IV0-3/ CH3_IV0-1
AES-256	4-7	not supported	not supported

In AES-XTS mode, there are 2 keys, and only AES-128 and AES-256 mode are. Please refer to the following table for detail information.

Table 10-8 LLI Item user_define Description

Cipher sel	chnl num	key1	key2	tweak
AES-128	0	CH0_KEY0-3	CH4_KEY0-3	CH0_IV0-3
AES-128	1	CH1_KEY0-3	CH5_KEY0-3	CH1_IV0-3
AES-128	2	CH2_KEY0-3	CH6_KEY0-3	CH2_IV0-3
AES-128	3	CH3_KEY0-3	CH7_KEY0-3	CH3_IV0-3
AES-128	4-7	not supported	not supported	not supported
AES-128	NA	not supported	not supported	not supported
AES-256	0	CH0_KEY0-3, CH1_KEY0-3	CH4_KEY0-CH5_KEY3	CH0_IV0-3
AES-256	1	CH2_KEY0-3, CH3_KEY0-3	CH6_KEY0-CH7_KEY3	CH1_IV0-3
AES-256	2-7	not supported	not supported	not supported

10.4.9 HASH Data Path

HASH and AES could run in parallel way. There are 2 paths lead to AES-HASH function. One is AES-HASH-RX mode, the other is AES-HASH-TX mode.

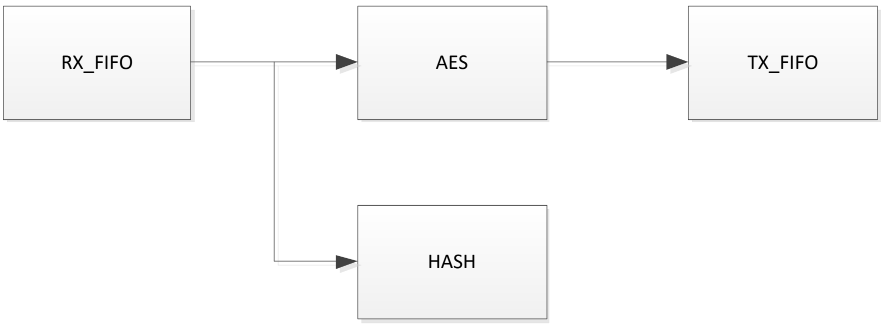

Fig. 10-3 AES-HASH-RX mode

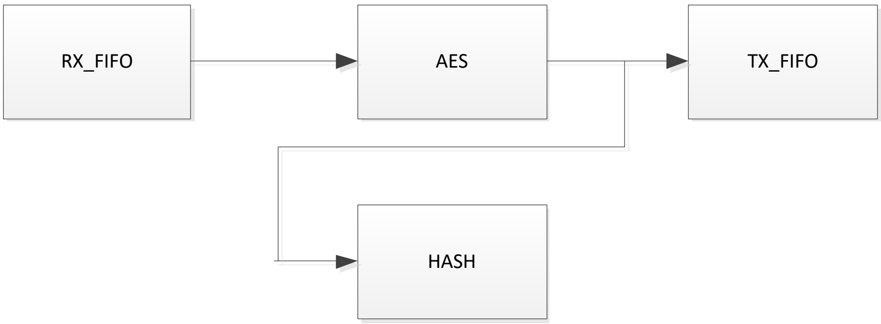

Fig. 10-4 AES-HASH-TX mode

As shown in the figures above, we could facilitate operations in some cases. For example, secure boot, we need both AES and HASH operations for the same blocks of data. The data HASH gets from RX_FIFO or TX_FIFO is byte swapped if the byte swap function is configured.

10.4.10 Program Steps

The application could succeed various CRYPTO operations if they program properly.

- Program the LLI address to DMA_LLI_ADDR
- Program KEY, IV, or other parameter if needed
- Program BC_CTL or HASH_CTL for control information
- Prepare LLI Item
- Enable interrupt, or do nothing

All these operations could be in any order

- Program DMA_CTL.start to start the operation

This step should be the last configuration step. After this register is configured, other registers should not be changed

- Wait interrupt asserted, or just poll the DMA_INT_ST bits
- Program DMA_INT_ST to clear interrupt status, and get the result

The application could also use LLI.pause when the next LLI item is not ready. After the new item is prepared, the application could program DMA_CTL.restart to continue previous operation

Chapter 11 PCIe Controller

11.1 Overview

The PCI Express (PCIe) is a high performance, general purpose I/O interconnect defined for a wide variety of future computing and communication platforms. The PCIe designed to be used as a general-purpose serial I/O interconnect in multiple market segments, including desktop, mobile, server, storage, and embedded communications. The PCIe controller implements the three PCI Express protocol layers (Transaction layer, Data Link layer, and the MAC portion of the physical layer). It also implements the application-dependent functionality of the PCI Express Transaction Layer for packet transmission, which is located between application logic and the PCI Express protocol layers.

The PCIe controller is compliant with PCI Express Specifications 1.1, 2.1, 3.0. The PCIe controller subsystem consists of 5 controllers, refer to Block Diagram for details.

PCIe controller subsystem supports the following features:

- Compatible with PCI Express Base Specification Revision 3.0
- Including 5 PCIe controllers
  - PCIe3_4L DM mode
    - Maximum payload size is 256 bytes
    - 16 ATU inbound regions, 16 ATU outbound regions
    - Up to Gen3 X4 link
    - Embedded 2-Channel DMA(2ch Read, 2ch Write) with Hardware Flow Control
    - Separate Refclk with Independent Spread Spectrum Clocking (SRIS) when working with Gen 3 PHY
  - PCIe3_2L RC mode
    - Maximum payload size is 256 bytes
    - 16 ATU inbound regions, 16 ATU outbound regions
    - Up to Gen3 X2 link
    - Separate Refclk with Independent Spread Spectrum Clocking (SRIS) when working with Gen 3 PHY
  - PCIe3_1L0/1L1/1L2 RC mode
    - Maximum payload size is 256 bytes
    - 8 ATU inbound regions, 8 ATU outbound regions
    - Up to Gen3 X1 link when connecting with Gen3 PHY, and Gen2 X1 link when connecting with Combo PIPE PHY
    - Separate Refclk with Independent Spread Spectrum Clocking (SRIS) when connecting with Gen 3 PHY
- The following optional features of the specification
  - Alternative Routing-ID Interpretation (ARI)
  - Address Translation Services (ATS) by your application
  - TLP Prefix
  - Dynamic Power Allocation (DPA)
  - L1 Substates (L1SS)
  - Resizable BAR (RBAR) with Expanded RBAR and VF Resizable BAR support
  - Separate Refclk with Independent Spread Spectrum Clocking (SRIS)
  - Gen3 Receiver Impedance
  - PCI Express Active State Power Management (ASPM)
  - PCI Express Advanced Error Reporting (AER) with Multiple Header Logging
- Support Latency Tolerance Reporting (LTR)
- Support Optimized Buffer Flush and Fill (OBFF)
- Internal Datapath Operating at 62.5 MHz, 125 MHz, 250MHz
- Advanced Power and Clock Management
- Internal Address Translation Unit
- Internal MSI-X Generation Module
- Automatic Lane Reversal
- Up-configure Support

- RAS DES (Debug, Error Injection, and Statistics)
- ECRC Generation and Checking
- Configuration Intercept Controller to allow your application to modify CFG access from wire
- Store-and-forward Queue Modes for Rx TLPs
- Configurable Filtering Rules for Posted, Non-posted, and Completion Traffic
- Configurable BAR Filtering, I/O Filtering, Configuration Filtering and Completion Lookup/Timeout
- Three Application Transmit Clients
- MSI with Per-Vector Masking (PVM), Extended message data for MSI
- MSI-X with Per-Vector Masking (PVM)

11.2 Block Diagram

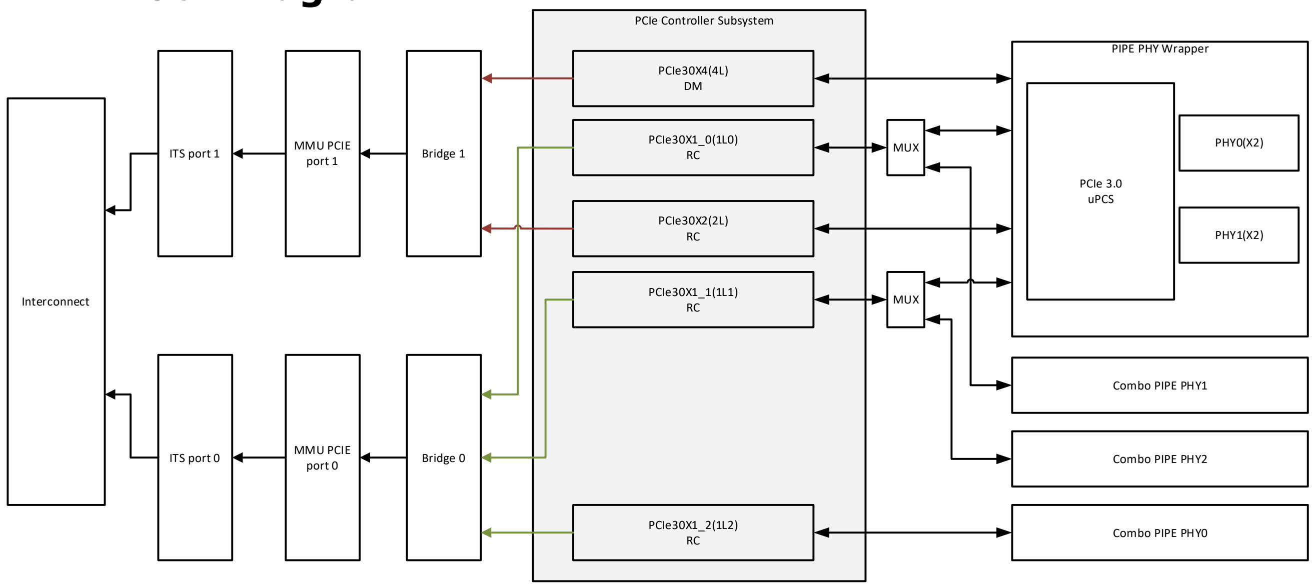

Fig. 11-1 PCIe Controller Subsystem Block Diagram

The PCIe controller subsystem consists of 5 controllers, the 4L and 2L is located in PD_PCIE, 1L0/1/2 is in PD_PHP. PD_PCIE belongs to PD_PHP, so, PD_PCIE should be power down before PD_PHP if the system wants to power PD_PHP. For detail multiplexers of the PHY subsystem, refer to Chapter Multi-PHY.

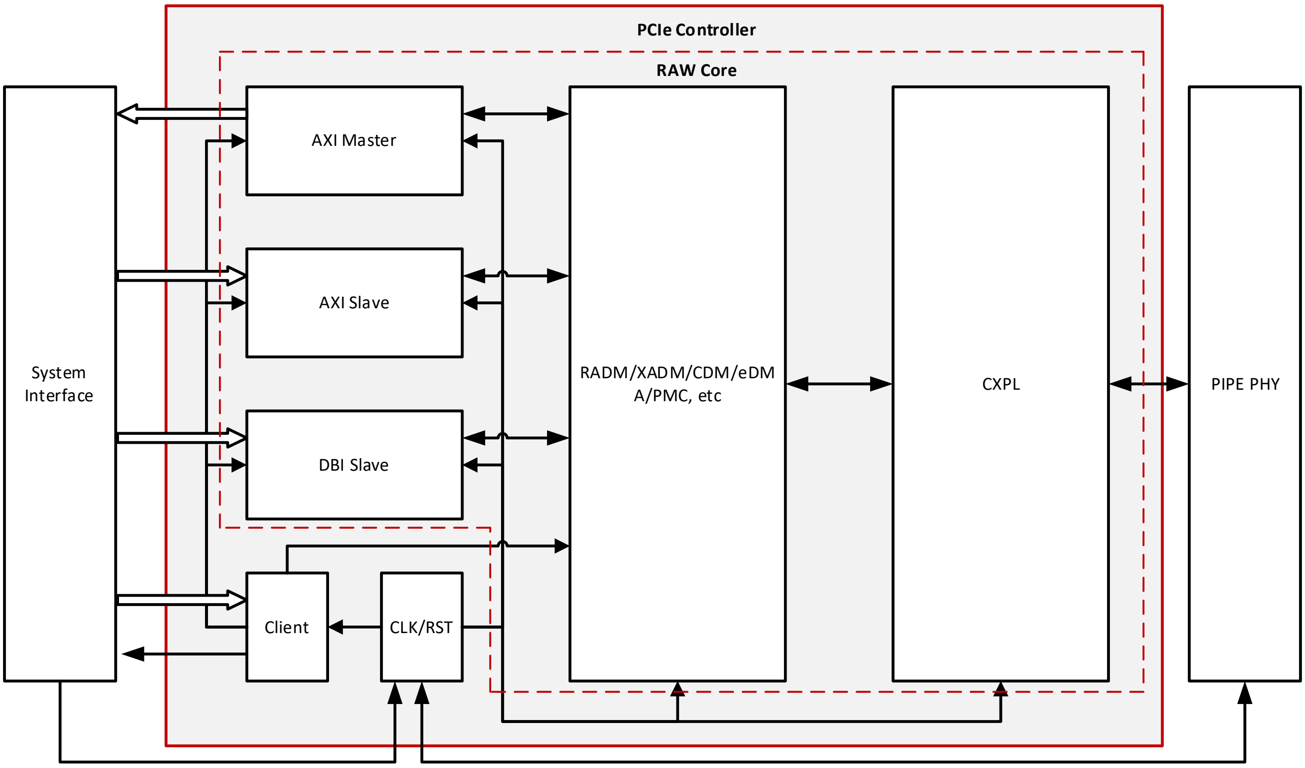

Fig. 11-2 PCIe Controller Architecture Overview

Each Controller consists of RAW core and some application glue logic, like Client and CLK/RST block. The RAW core implements of the PCIe protocol and mode-specific features, including several AXI bus interface, RADM/XADM/CDM/eDMA/PMC/CXPL.

11.3 Function Description

11.3.1 Application Interface and AXI Bridge

Application Interface comprises with four standard interfaces: one AXI master interface, two AXI slave interface and one APB interface. These interface bridging capability for directly adding a PCI Express link to an AXI system fabric.

The AXI bridge module acts as a bridge between the standard AXI interfaces and the PCIe controller native interfaces. The bridge interconnects the AXI interfaces within an AXI-embedded system with a remote PCIe link, as either a root complex port or as an endpoint port.

The AXI master interfaces enable a remote PCIe device to read and write to an AXI slave (in System Interface) connected to the AXI bridge. The AXI link slave interface enables an AXI master (in System Interface) to read and write through the AXI bridge to a remote PCIe device. The DBI slave enables an AXI master (in System Interface) to access the controller’s registers. The APB enables Application to access the Client registers.

11.3.2 Client

Client Logic Consists of some additional logic used for application to interact with PCIe Controller. For example, applications can access client registers to send/receive PCIe Message, request to enter/exit PM state, deal with interrupts, configure some basic operation mode, read some basic debug information, and so on. For more details, please refer to Client registers description and application notes for more information.

11.3.3 eDMA

The RC system CPU, or the EP application CPU, can offload the transferring of large blocks of data to the embedded DMA controller, leaving the CPU free to perform other tasks. The embedded DMA have one read channel and one write channel. It can simultaneously perform the two types of memory transactions:

- DMA write: Transfer (copy) of a block of data from local (application) memory to remote (link partner) memory.

- DMA read: Transfer (copy) of a block of data from remote (link partner) memory to local (application) memory.

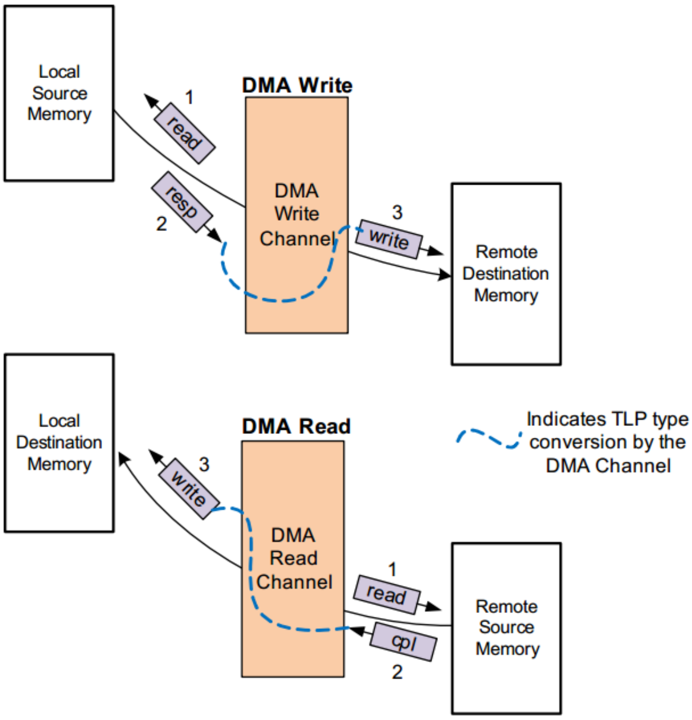

Fig. 11-3 System Level View of PCIe EDMA

Therefore, the EDMA supports full duplex operation, processing read and write transfers at the same time, and in parallel with normal (non-DMA) traffic. Upon completion of a DMA transfer or an error, the DMA optionally interrupts the local CPU or sends an interrupt MWr (Memory Write) to the remote CPU. The DMA is highly configurable and can be programed by using the local DBI AXI Slave interface.

The EDMA provides a linked list (LL) mode to efficiently move data from source to destination with minimal intervention from the local CPU. For details, please refer to DMA Registers Description and Application notes for more information.

11.3.4 CXPL

PCIe Core deal with the PCIe protocol, and consists of three main modules:

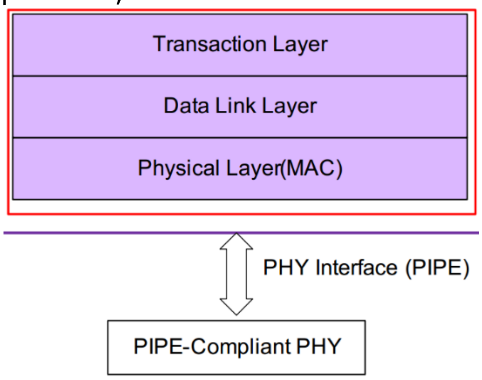

Fig. 11-4 PCIe Core Architecture Overview

The PCIe Core implements the basic functionality for the PCI Express physical, link, and transaction layers. This module implements a large part of the transaction layer logic, all of the data link layer logic, and the MAC portion of the physical layer, including the link training and status state machine (LTSSM). The Core connects to the external PHY through the standard PIPE interface.

11.3.5 PMC

PCIe Controller support PCIe ASPM, L1 Substate and PCI PM. For proper understanding of PCIe Power Management, you should be familiar with Power Management of the PCI Express Base Specification, and PCI-SIG Engineering Change Notice ECN L1 Substates with CLKREQ#. For application details, please refer to Application Notes for more information.

11.3.6 XADM

Transmit Application-Dependent Module (XADM) implements the application-specific functionality of the PCI Express transaction layer for packet transmission. Its functions include:

- TLP Arbitration
- TLP Formation
- Flow Control (FC) Credit checking

The transmit path uses a cut-through architecture. It does not implement transmit buffering/queues (other than the retry buffer). The controller maintains an internal Target Completion Lookup Table to store certain TLP header information from the Rx request

11.3.7 RADM

Receive Application-Dependent Module (RADM) implements application-specific functionality of the PCI Express transaction layer for packet reception. Its functions include:

- Sorting/filtering of received TLPs. The filtering rules and routing are configurable.
- Buffering and queuing of the received TLPs.
- Routing of received TLP to the controller's receive interfaces.

The RADM maintains a Receive Completion Lookup Table (LUT) for completion tracking and completion-timeout monitoring of Tx non-posted requests. It indicates a timeout when an expected Rx completion does not arrive within the timeout period.

11.3.8 CDM

Configuration-Dependent Module (CDM) implements:

- Standard PCI Express configuration space
- Controller-specific register space (Port Logic Registers

11.4 Register Description

PCIe Registers can be accessed by either local CPU through AXI DBI bus or remote RC device through PCIe link or both. The way through local CPU will be mentioned as 'DBI' and the way through PCIe link will be mentioned as 'wire' in this section.

Some read-only registers can be made temporarily R/W when you write 1 to the DBI_RO_WR_EN bit of the MISC_CONTROL_1_OFF register. These registers will be specifically mentioned in their description if they have this feature.

11.4.1 Internal Address Mapping

PCIe local address mapping is listed in this section.

Table 11-1 PCIe3_4L DM G3 Client and Core Register Address Mapping

Base Address	Name	Device	Address Length	Offset Address Range
0xF5000000	PCIe3_4L_DBI	Core Register	4M BYTE	0x00000 ~ 0x3fffff
0xa40000000	PCIe3_4L_DBI	Core Register	4M BYTE	0x00000 ~ 0x3fffff
0xF0000000	PCIe3_4L_S	PCIe Outbound Memory	16M BYTE	0x0000000~0xffffff
0x900000000	PCIe3_4L_S	PCIe Outbound Memory	1G BYTE	0x00000000~0x3fffffff
0xFE150000	PCIe3_4L_APB	Client Register	64K BYTE	0x0000~0xffff

Table 11-2 PCIe3_2L RC G3 Client and Core Register Address Mapping

Base Address	Name	Device	Address Length	Offset Address Range
0xF5400000	PCIe3_2L_DBI	Core Register	4M BYTE	0x00000 ~ 0x3fffff
0xa40400000	PCIe3_2L_DBI	Core Register	4M BYTE	0x00000 ~ 0x3fffff

Base Address	Name	Device	Address Length	Offset Address Range

11.4.2.2 PCIE_CLIENT Detail Registers Description

PCIE_CLIENT_GENERAL_CON

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15	RO	0x0	reserved
14	RW	0x0	mem_auto_clk_gating_disable Control the memory auto clock gating when it is inactive. 1'b0: Auto gating enable 1'b1: Auto gating disable
13	RW	0x0	link_req_rst_grt_sel Link down reset request grant control select: 1'b1: From client grf GENERAL_CON bit 3 1'b0: From pcie grf PCIE_CON0 bit 2 Reserved after r5p6 (version 50600).
12	R/W SC	0x0	app_hdr_valid Alias "app_err_report" in old client version. One-clock-cycle pulse indicating that the data app_hdr_log, app_err_bus, app_err_func_num, and app_tlp_prfx_log is valid. Set 1 to report application error to controller. It is a self-clear bit to generate a pulse to controller. Application should provide error information in VEN_ERR_INFOx registers before setting this bit.
11	RW	0x0	app_sris_mode SRIS operating mode 1'b0: non-SRIS mode 1'b1: SRIS mode
10	RW	0x0	app_dbi_ro_wr_disable DBI Read-only Write Disable 1'b0: MISC_CONTROL_1_OFF.DBI_RO_WR_EN register field is read-write. 1'b1: MISC_CONTROL_1_OFF.DBI_RO_WR_EN register field is forced to 0 and is read-only

Bit	Attr	Reset Value	Description
9	RW	0x0	tx_lane_flip_en Performs manual lane reversal for transmit lanes. For use whenautomatic lane reversal does not occur because lane 0 is not detected. In most cases, tx_lane_flip_en should be wired to a static value at thechip level. For more information, see 'Lane Reversal and Broken Lanes'. This signal is only used in Conventional PCIe mode. When in M-PCIe mode, mpcie_tx_lane_flip_en is used. 1'b0: Disable 1'b1: Enable
8	RW	0x0	rx_lane_flip_en Performs manual lane reversal for receive lanes. For use when automatic lane reversal does not occur because lane 0 is not detected. In most cases, rx_lane_flip_en should be wired to a static value at the chip level. For more information, see 'Lane Reversal and Broken Lanes'. This signal is only used in Conventional PCIe mode. When in M-PCIe mode, mpcie_rx_lane_flip_en is used. 1'b0: Disable 1'b1: Enable
7:4	RW	0x0	device_type Device/port type. Indicates the specific type of this PCI Express function. It is also used to set the 'Device/Port Type' field of the 'PCI Express Capabilities Register'. The controller uses this input to determine the operating mode of the controller at run time. Defined encodings are: 4'h0: PCI Express endpoint 4'h1: Legacy PCI Express endpoint 4'h4: Root port of PCI Express root complex
3	RW	0x0	link_req_rst_grt Link down reset request grant control. 1'b0: Disable link down reset request grant 1'b1: Enable link down reset request grant Reserved after r5p6(version 50600).
2	RW	0x0	app_ltssm_enable Driven low by your application after cold, warm, or hot reset to hold the LTSSM in the Detect state until your application is ready for the link training to begin. When your application has finished reprogramming the controller configuration registers using the DBI, it asserts app_ltssm_enable to allow the LTSSM to continue link establishment. Can also be used to delay hot resetting of the controller until you have read out any register status.
1	RW	0x0	app_req_retry_en Provides a capability to defer incoming configuration requests until initialization is complete. When app_req_retry_en is asserted, the controller completes incoming configuration requests with a configuration request retry status. Other incoming requests are not affected. When the Readiness Notification mechanism is supported, DRS messaging is blocked when app_req_retry_en=1. When app_req_retry_en=0 and app_drs_ready=1, the controller autonomously transmits a DRS message when the link transitions from DL_Down to DL_Up.

Bit	Attr	Reset Value	Description
0	R/W SC	0x0	app_init_rst Request from your application to send a hot reset to the upstream port. The hot reset request is sent when a single cycle pulse is applied to this pin. In an upstream port, you should set this input to '0'.

PCIE_CLIENT_INTR_STATUS_MSG_RX

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14	W1 C	0x0	obff_cpu_active_int Interrupt indicates that the controller received an 'CPU Active' OBFF message. 1'b0: No interrupt 1'b1: Interrupt EP only. One-clock-cycle pulse that indicates that the controller received a 'CPU Active' OBFF message. When RX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message. Only usable in an upstream port.
13	W1 C	0x0	obff_obff_int Interrupt indicates that the controller received an 'OBFF' OBFF message. 1'b0: No interrupt 1'b1: Interrupt EP only. if cfg_obff_en is not equal to 2'b11, then radm_msg_obff One-clock-cycle pulse that indicates that the controller received an 'OBFF' OBFF message. When RX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message. Only usable in an upstream port.
12	W1 C	0x0	obff_idle_int Interrupt indicates that the controller received an 'IDLE' OBFF message. 1'b0: No interrupt 1'b1: Interrupt EP only. if cfg_obff_en is not equal to 2'b11, then radm_msg_idle One-clock-cycle pulse that indicates that the controller received an 'IDLE' OBFF message. When RX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message. Only usable in an upstream port.
11	RO	0x0	reserved

Bit	Attr	Reset Value	Description
10	W1C	0x0	pm_turnoff_int Interrupt indicates that the controller received a PME Turnoff message. 1'b0: No interrupt 1'b1: Interrupt EP mode only. radm_pm_turnoff One-clock-cycle pulse that indicates that the controller received a PME Turnoff message. When RX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then no indication is given for the second message.
9	W1C	0x0	pm_to_ack_int Interrupt indicates that the controller received a PME_TO_Ack message. 1'b0: No interrupt 1'b1: Interrupt RC mode only. radm_pm_to_ackOne-clock-cycle pulse that indicates that the controller received a PME_TO_Ack message. Upstream port: Reserved.
8	W1C	0x0	pm_pme_int Interrupt indicates that the controller received a PM_PME message. 1'b0: No interrupt 1'b1: Interrupt RC mode only. radm_pm_pme One-clock-cycle pulse that indicates that the controller received a PM_PME message.
7:6	RO	0x0	reserved
5	W1C	0x0	cfg_pme_msi_int Interrupt that indicates the controller received a cfg_pme_msi pulse. 1'b0: No interrupt 1'b1: Interrupt cfg_pme_msi asserted when all of the following conditions are true: 1. MSI or MSI-X is enabled. 2. The PME Interrupt Enable bit in Root Control register is set to 1. 3. The PME Status bit in Root Status register is set to 1. The controller does not check if the associated MSI vector (asserted cfg_pcie_cap_int_msg_num) is unmasked. It is up to the application to check whether the vector is masked or unmasked.
4	RO	0x0	cfg_pme_int Asserted when all of the following conditions are true: 1. The INTx Assertion Disable bit in the Command register is 0. 2. The PME Interrupt Enable bit in the Root Control register is set to 1. 3. The PME Status bit in the Root Status register is set to 1. The cfg_pme_msi output is a pulse signal (only asserted for one clock cycle). But cfg_pme_int is a level signal; essentially an AND of the PME interrupt enable and receipt of the pm_pme message.
3	RO	0x0	reserved

Bit	Attr	Reset Value	Description
2	W1C	0x0	ltr_msg_int Interrupt that indicates the controller received a LTR message. The LTR message information is available in PL_LTR_LATENCY_OFF registers. 1'b0: No interrupt 1'b1: Interrupt radm_msg_ltr One-clock-cycle pulse that indicates that the controller received an LTR message. The controller makes the message header available the radm_msg_payload output. It is also available the app_ltr_latency output. When RX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message.
1	W1C	0x0	unlock_msg_int Interrupt indicates that the controller received an unlock message. 1'b0: No interrupt 1'b1: Interrupt radm_msg_unlock One-cycle pulse that indicates that the controller received an Unlock message. When RX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then no separate indication is given for the second message.
0	W1C	0x0	ven_msg_int Interrupt that indicates radm_vendor_msg One-cycle pulse is received. The message header is available in VEN_MSG_RX_INFO registers. 1'b0: No interrupt 1'b1: Interrupt radm_vendor_msg One-cycle pulse that indicates the controller received a vendor-defined message. The controller makes the message header available the radm_msg_payload output. When FX_TLP > 1 and when two messages of the same type are received in the same clock cycle (back-to-back), then both bits are asserted.

PCIE_CLIENT_INTR_STATUS_LEGACY

RC mode only.

PCIE_CLIENT_INTR_STATUS_ERR

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	W1C	0x0	radm_qoverflow_int Pulse radm_qoverflow indicating that one or more of the P/NP/CPL receive queues have overflowed. There is a 1-bit indication for each configured virtual channel. You can connect this output to your internal error reporting mechanism 1'b0: No interrupt 1'b1: Interrupt
11	RO	0x0	reserved
10	W1C	0x0	f_err_rx_int One-clock-cycle radm_fatal_err pulse that indicates that the controller received an ERR_FATAL message. 1'b0: No interrupt 1'b1: Interrupt RC mode only.

Bit	Attr	Reset Value	Description
9	W1C	0x0	nf_err_rx_int One-clock-cycle radm_nonfatal_err pulse that indicates that the controller received an ERR_NONFATAL message. 1'b0: No interrupt 1'b1: Interrupt RC mode only.
8	W1C	0x0	cor_err_rx_int One-clock-cycle radm_correctable_err pulse that indicates that the controller received an ERR_COR message. The controller makes the message header available the radm_msg_payload output. 1'b0: No interrupt 1'b1: Interrupt RC mode only.
7	RO	0x0	reserved
6	W1C	0x0	f_err_sent_int cfg_send_f_err indicates Sent Fatal Error. Controller has sent a message towards the Root Complex indicating that an Rx TLP that contained a fatal error, and that can not be corrected, has been received by the EndPoint. 1'b0: No interrupt 1'b1: Interrupt EP mode only.
5	W1C	0x0	nf_err_sent_int cfg_send_nf_err indicates Sent Non-Fatal Error. Controller has sent a message towards the Root Complex indicating that an Rx TLP that contained a non-fatal error, and that can not be corrected, has been received by the EndPoint. 1'b0: No interrupt 1'b1: Interrupt
4	W1C	0x0	cor_err_sent_int cfg_send_cor_err indicates sent correctable error. Controller has sent a message towards the Root Complex indicating that an Rx TLP that contained an error, and that can be corrected, has been received by the EndPoint 1'b0: No interrupt 1'b1: Interrupt
3	W1C	0x0	tx_cpl_timeout_int trgt_cpl_timeout indicates that the application has not generated a completion for an incoming request within the required time interval. Information about the timed-out completion is available the trgt_timeout_* outputs listed later. When a completion timeout occurs, the controller does not clear the corresponding entry from the completion lookup table. The default completion timeout value is approximately 10 ms. 1'b0: No interrupt 1'b1: Interrupt
2	W1C	0x0	rx_cpl_timeout_int radm_cpl_timeout indicates that the completion TLP for a request has not been received within the expected time window. 1'b0: No interrupt 1'b1: Interrupt Can find the timed-out completion information in RX_CPL_TIME_OUT_INFO register.

Bit	Attr	Reset Value	Description
1	W1C	0x0	aer_rc_err_msi The controller asserts cfg_aer_rc_err_msi for one clock cycle when all of the following conditions are true: 1. MSI or MSI-X is enabled. 2. A reported error condition causes a bit to be set in the Root Error Status register. 3. The associated error message reporting enable bit is set in the Root Error Command register. The controller does not check if the associated MSI vector (asserted cfg_aer_int_msg_num) is unmasked. It is up to the application to check whether the vector is masked or unmasked. RC mode only.
0	RO	0x0	aer_rc_err_int Asserted when a reported error condition causes a bit to be set in the Root Error Status register and the associated error message reporting enable bit is set in the Root Error Command register. cfg_aer_rc_err_int is set when the RC internally generates an error or when an error message is received by the RC. Because the RC itself generates it, this needs to be propagated up to the system software which would then need to read the error registers to see which error occurred. Note: This signal is used when MSI/MSI-X is NOT enabled; otherwise see cfg_aer_rc_err_msi. RC mode only.

PCIE_CLIENT_INTR_STATUS_MISC

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RO	0x0	ep_elbi_app_int Interrupt generated by ELBI application register access. 1'b0: No interrupt 1'b1: Interrupt
14	RO	0x0	link_eq_req_int Interrupt indicating to your application that the Link Equalization Request bit in the Link Status 2 Register has been set and the Link Equalization Request Interrupt Enable (Link Control 3 Register bit 1) is set. cfg_link_eq_req_int 1'b1: Interrupt 1'b0: No interrupt
13	W1C	0x0	rbar_update_int Indicates that a resizable BAR control register has been updated: 1 bit per Physical function. 1'b0: No interrupt 1'b1: Interrupt

Bit	Attr	Reset Value	Description
12	W1C	0x0	dpa_sub_upd_int DPA Substate-Updated Indication Signal Bus. The controller asserts "dpa_substate_update" for one core_clk cycle when the Substate Control field of the DPA Control Register has been updated with a new value for the associated function. The controller asserts it when the updated value of the Substate Control field does not match the Substate Status field of the Status Register when the Substate Control Enable bit field of the Status Register is set to "1". Note: Your application logic is required to do the following: 1. Detect the one cycle pulse on the signal for the relevant function. 2. Read the function's substate control register to determine the software's target substate (transition). 3. Read the function's transition latency value, unit, and indicator. Calculate the maximum transition latency for the substate transition. 4. Execute the substate transition and complete it within the maximum transition latency. 5. Update the substate status after completing the transition through a DBI write. The controller updates the substate status during the substate transition if the transition is from a lower power substate to a higher; the status is the higher power substate during the substate transition.
11	RO	0x0	edma_rd_int DMA read channel interrupt. Indicates that the DMA transfer has completed or that an error has occurred. This is a level interrupt. For more information, see 'Interrupts and Error Handling'. 1'b0: No interrupt 1'b1: Interrupt
10	RO	0x0	edma_wr_int DMA write channel interrupt. Indicates that the DMA transfer has completed or that an error has occurred. This is a level interrupt. For more information, see 'Interrupts and Error Handling'. 1'b0: No interrupt 1'b1: Interrupt
9	W1C	0x0	bw_mgt_msi The controller sets this pin when following conditions are true: 1. MSI or MSI-X is enabled. 2. The Link Bandwidth Management Status register (Link Control Status register bit 14) is updated 3. The Link Bandwidth Management Interrupt Enable (Link Control register bit 10) is set. reuse-pragma begin Attr Description This pin is set as a notification when the Link Bandwidth Management Status register (Link Status register bit 14) is updated and the Link Bandwidth Management Interrupt Enable (Link Control register bit 10) is set and in addition the msi or msix are enabled . This bit is not applicable to, and is reserved, for endpoint devices and upstream ports of Switches. For upstream port: Reserved. <ct:CX_IS_EP>Reserved.

Bit	Attr	Reset Value	Description
8	RO	0x0	bw_mgt_int The controller asserts cfg_bw_mgt_int when all of the following conditions are true: 1. The INTx Assertion Disable bit in the Command register is 0, and 2. The Bandwidth Management Interrupt Enable bit in the Link Control register is set to 1, and 3. The Bandwidth Management Interrupt Status bit in the Link Status register is set to 1. The cfg_bw_mgt_msi output is a pulse signal (only asserted for one clock cycle); but cfg_bw_mgt_int is a level signal. For upstream port: Reserved.
7	W1C	0x0	link_auto_bw_msi The controller sets this pin when following conditions are true: 1. MSI or MSI-X is enabled. 2. The Link Autonomous Bandwidth Status register (Link Status register bit 15) is updated. 3. The Link Autonomous Bandwidth Interrupt Enable (Link Control register bit 11) is set. The controller does not check if the associated MSI vector (asserted cfg_pcie_cap_int_msg_num) is unmasked. It is up to the application to check whether the vector is masked or unmasked. For upstream port: Reserved. <ct:CX_IS_EP>Reserved.
6	RO	0x0	link_auto_bw_int The controller asserts cfg_link_auto_bw_int when all of the following conditions are true: 1. The INTx assertion disable bit in the Command register is 0, and 2. The Link Autonomous Bandwidth Interrupt Enable bit in the Link Control register is set to 1, and 3. The Link Autonomous Bandwidth Interrupt Status bit in the Link Status register is set to 1. The cfg_link_auto_bw_msi output is a pulse signal (only asserted for one clock cycle); but cfg_link_auto_bw_int is a level signal. For upstream port: Reserved.
5	W1C	0x0	hp_msi The controller asserts hp_msi (as a one-cycle pulse) when the logical AND of the following conditions transitions from false to true: 1. MSI or MSI-X is enabled. 2. Hot-Plug interrupts are enabled in the Slot Control register. 3. Any bit in the Slot Status register transitions from 0 to 1 and the associated event notification is enabled in the Slot Control register. There is one bit of hp_int for each configured function. The controller pulses the hp_msi output only when any of the hot plug status bits change from 0 to 1 (as is hp_pme).

Bit	Attr	Reset Value	Description
4	RO	0x0	hp_int The controller asserts hp_int when all of the following conditions are true: 1. The INTx Assertion Disable bit in the Command register is 0. 2. Hot-Plug interrupts are enabled in the Slot Control register. 3. Any bit in the Slot Status register is equal to 1, and the associated event notification is enabled in the Slot Control register. There is one bit of hp_int for each configured function.
3	W1C	0x0	hp_pme_int The controller asserts hp_pme when all of the following conditions are true: 1. The PME Enable bit in the Power Management Control and Status register is set to 1. 2. Any bit in the Slot Status register transitions from 0 to 1 and the associated event notification is enabled in the Slot Control register. The controller does not check if the PM state is D1, D2, or D3hot. It is up to your application to check the value pm_dstate to make sure the device is in D1, D2, or D3hot. There is one bit of hp_pme for each configured function. The controller pulses the hp_pme output only when any hot plug status bit changes from 0 to 1 (as is hp_msi). hp_int stays asserted as long as the status bit is set. In addition, it asserts hp_pme only if PME is enabled, but it does not matter if hot-plug interrupts are enabled.
2	W1C	0x0	link_req_rst_not_int Early version of the link_req_rst_not signal. For more information, see the 'Warm and Hot Resets' section in the Architecture chapter of the Databook. smlh_req_rst_not. 1'b0: No interrupt 1'b1: Interrupt
1	W1C	0x0	dll_link_up_int Data link layer up/down indicator (rdlh_link_up): This status from the flow control initialization state machine indicates that flow control has been initiated and the Data link layer is ready to transmit and receive packets. For multi-VC designs, this signal indicates status for VC0 only. 1'b0: Link is down 1'b1: Link is up
0	W1C	0x0	phy_link_up_int PHY "smlh_link_up" Link up/down indicator. 1'b0: Link is down 1'b1: Link is up

PCIE_CLIENT_INTR_STATUS_PMC

Address: Operational Base + offset (0x0014)

PCIE_CLIENT_POWER_CON
Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15:14	RO	0x0	reserved
13	RW	0x0	clk_req_n_con Valid when clk_req_n_bypass set to 1. 1'b1: Tristate CLKREQ# 1'b0: Pull down CLKREQ#
12	RW	0x0	clk_req_n_bypass 1'b0: clk_req_n does not bypass, CLKREQ# driven by controller 1'b1: clk_req_n bypass, CLKREQ# driven by bit 13 of POWER_CON
11:10	RW	0x0	p2_cpm_disable 2'b00: When phy in P2 power state, enable clock PM for both L1 and L2 2'b01: When phy in P2 power state, enable clock PM for L2 but disable for L1 2'b10: When phy in P2 power state, disable clock PM for L2 but enable for L1 2'b11: When phy in P2 power state, disable clock PM for both L1 and L2 Reserved after r5p6(version 50600).

Bit	Attr	Reset Value	Description
9	RW	0x0	app_clk_pm_en Clock PM feature enabled by application. Used to inhibit the programming of the Clock PM in Link Control Register. For more information, see 'L1 with Clock PM (L1 with REFCLK removal/PLL Off)'.
8	RW	0x0	sys_aux_pwr_det Auxiliary Power Detected. Used to report to the host software that auxiliary power (Vaux) is present. 1'b0: Auxiliary power is not present 1'b1: Auxiliary power is present
7	RO	0x0	reserved
6	RW	0x0	app_l1sub_disable The application can set this input to 1'b1 to prevent entry to L1 Sub-states. This pin is used to gate the L1 sub-state enable bits from the L1 PM Substates Control 1 Register.
5	RW	0x0	app_xfer_pending Indicates that your application has transfers pending. 1'b1: There are transactions outside the controller that the controller needs to transmit. For EP mode, prevents generation of requests to enter L1. Triggers exit if already in L1. For RC mode, triggers exit if already in L1. 1'b0: There are no transactions outside the controller. Indicates that your application has transfers pending and prevents the controller from entering L1. If the entry into L1 is already in progress, assertion of app_xfer_pending causes an exit from L1. This is a level signal used to inform the controller about the state of external queues and pipeline stages that contain transactions to be transmitted by the controller. The controller uses this information to determine when to enter/exit L1. When this signal is asserted, it indicates that there are transactions outside the controller that the controller needs to transmit. When de-asserted, it indicates that there are no transactions outside the controller. The controller responds to an assertion on this signal as follows: 1. Upstream Ports: Prevents generation of requests to enter L1. Triggers exit if already in L1. 2. Downstream Ports: Triggers exit if already in L1. You can instruct the controller to exit L1 by asserting either or both of app_xfer_pending and app_req_exit_l1. The controller only samples app_req_exit_l1 when the controller is already in the L1 state.
4	R/W SC	0x0	app_req_exit_l1 1'b0: Self clear to generate a pulse to controller. 1'b1: Application request to Exit L1. Application request to Exit L1. Request from your application to exit L1. It is only effective when L1 is enabled.

Bit	Attr	Reset Value	Description
3	RW	0x1	app_ready_entr_l23 1'b0: Application not ready to enter L23. 1'b1: Application ready to enter L23. Application Ready to Enter L23. Indication from your application that it is ready to enter the L23 state. The app_ready_entr_l23 signal is provided for applications that must control L23 entry (in case certain tasks must be performed before going into L23). The controller delays sending PM_Enter_L23 (in response to PM_Turn_Off) until this signal becomes active. When this signal has been asserted by the application, it must be kept asserted until L2 entry has completed. Hardwire to 1 for applications that do not require this feature. Note: The controller ignores this input in RC mode.
2	R/W SC	0x0	app_req_entr_l1 Application request to Enter L1 ASPM state. 1'b0: Self clear to generate a pulse to controller 1'b1: Application request to enter L1 state Application request to Enter L1 ASPM state. The app_req_entr_l1 signal is for use by applications that need to control L1 entry instead of using the L1 entry timer as defined in the PCI Express Specification. It is only effective when L1 is enabled. The controller latches this request when in L0 or L0s; to be acted upon later. Note: The controller ignores this input in RC mode.
1	R/W SC	0x0	app_pm_xmt_pme Wake Up. If PME is enabled and PME support is configured for current PMCSR D-state asserting this signal (apps_pm_xmt_pme) causes the controller to wake from either L1 or L2 state. When the controller has transitioned back to the L0 state it transmits a PME message and set the PME_Status. Upon receiving the PME message the root complex should clear the PME_Status and change the D-state back to D0.
0	RW	0x0	app_clk_req_n Indicates that the application logic is ready to have reference clock removed. In designs which support reference clock removal through either L1 PM Sub-states or L1 CPM, the application should set this signal to 1'b1 if it supports reference clock removal. If the application does not want to remove reference clock it should set this signal to 1'b0. This signal should be asserted or de-asserted when L1 CPM or L1 Sub-states are being configured, it should not be changed dynamically during L1. Indicates that the application is ready to have reference clock removed. 1'b0: Application does not want to remove reference clock 1'b1: Application is ready to have reference clock removed

PCIE_CLIENT_POWER_STATUS

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RO	0x0	pm_clkreq_in Status of wire CLKREQ# GPIO.
27	RO	0x0	pm_clkreq_out Status of CLKREQ# output drive signal.

Bit	Attr	Reset Value	Description
26	RO	0x0	pm_wake_in Status of wire WAKE# GPIO.
25	RO	0x0	pm_wake_out The wake state of the wake_out 1'b0: Controller is not in wake process or Link already back to L0 1'b1: Controller assert WAKE# signal to request to make link back to L0 EP only.
24	RO	0x0	pm_linkst_in_l0s Power management is in L0s state. 1'b0: Power management is not in L0s. 1'b1: Power management is in L0s.
23	RO	0x0	pm_linkst_in_l2 Power management is in L2 state. 1'b0: Power management is not in L2 1'b1: Power management is in L2
22	RO	0x0	pm_linkst_in_l1 Power management is in L1 state. 1'b0: Power management is not in L1 1'b1: Power management is in L1
21	RO	0x0	pm_linkst_in_l1sub Power management is in L1 substate. Indicates when the link has entered L1 substates. It is used in (see 'Clock Generation and Gating Design Example') to ensure that the switching back of aux_clk from AUXCLK to PCLK occurs only after L1 substates have been exited. For L1.2 this signal is de-asserted at the end of the L1.2.Exit state, after the t_power_on constraint has been satisfied. External logic can use the transition high to low on this signal to initiate REFCLK restore. 1'b0: Power management is not in L1 substate 1'b1: Power management is in L1 substate
20	RO	0x0	reserved
19:17	RO	0x0	pm_l1sub_state Power management L1 sub-states FSM state. For debugging purposes, not for system operation. 3'b000: L1_U 3'b001: L1_0 3'b010: L1_0_WAIT4_ACK 3'b011: L1_0_WAIT4_CLKREQ 3'b100: L1_N_ENTRY 3'b101: L1_N 3'b110: L1_N_EXIT 3'b111: L1_N_ABORT

8:4	RO	0x00	pm_master_state Power management master FSM state. For debugging purposes, not for system operation.
3	RO	0x0	reserved
2:0	RO	0x0	pm_curnt_state Indicates the current power state. For debugging purposes, not for system operation.

PCIE_CLIENT_MSG_GEN_CON

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15	RO	0x0	reserved
14	R/W SC	0x0	obff_cpu_active_msg_req Request controller to generate a "CPU Active" OBFF message. This bit clears automatically when request has been sent. Only usable in a downstream port. When application sets OBFF Enable bit in Device Control 2 Register to choose to use OBFF message or WAKE# signaling.
13	R/W SC	0x0	obff_obff_msg_req Request controller to generate a "OBFF" OBFF message. This bit clears automatically when request has been sent. Only usable in a downstream port. When application sets OBFF Enable bit in Device Control 2 Register to choose to use OBFF message or WAKE# signaling.
12	R/W SC	0x0	obff_idle_msg_req Request controller to generate a "IDLE" OBFF message. This bit clears automatically when request has been sent. Only usable in a downstream port. When application sets OBFF Enable bit in Device Control 2 Register to choose to use OBFF message or WAKE# signaling.
11:9	RO	0x0	reserved
8	R/W SC	0x0	app_ltr_msg_req Indicates that your application is requesting to send an LTR message. Once asserted, app_ ltr_msg_req must remain asserted until the controller asserts app_ltr_msg_grant. Set to request controller to send a LTR Message. This bit clears automatically when request is granted by controller. Application should put LTR message information ready in LTR_MSG_TX_INFO register before setting this bit.
7:6	RO	0x0	reserved
5	R/W SC	0x0	app_unlock_msg Request from your application to generate an Unlock message. You must assert this signal for one clock cycle. The controller does not return an acknowledgment or grant signal. You must not pulse the same signal again, until the previous message has been transmitted.
4	R/W SC	0x0	apps_pm_xmt_turnoff Request from your application to generate a PM_Turn_Off message. You must assert this signal for one clock cycle. The controller does not return an acknowledgment or grant signal. You must not pulse the same signal again, until the previous message has been transmitted.
3:2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	legacy_int_req When legacy_int_req (sys_int) goes from low to high, the controller generates an Assert_INTx Message. When sys_int goes from high to low, the controller generates a Deassert_INTx Message. There is a separate sys_int input bit for each function in your controller configuration. The Interrupt Pin register for the corresponding function determines which INTx Message the controller generates (INTA, INTB, INTC, or INTD). Legacy and native PCIe devices capable of generating an interrupt must support both Assert_INTx/Deassert_INTx and MSI or MSI-X. sys_int is intended to generate a message that emulates the legacy PCI Interrupts.
0	R/W SC	0x0	ven_msg_req Set to request controller to send a vendor-defined Message. This bit clears automatically when request is granted by controller. Application should put vendor message information ready in VEN_MSG_TX_CFGx registers before setting this bit. Request from your application to send a vendor-defined Message. Once asserted, ven_msg_req must remain asserted until the controller asserts ven_msg_grant.

PCIE_CLIENT_MSI_GEN_CON
Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:0	R/W SC	0x00000000	msi_gen_req 32 bits write only MSI generation request signals. MSB has the highest priority and LSB has the lowest priority. Write 1 to a certain bit request the controller send a MSI interrupt. Software should use MSI capability register to access MSI mask or pending status.

PCIE_CLIENT_VEN_MSG_TX_CFG2
Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ven_msg_data_h The fourth double word of the Vendor Defined Message header. Third and fourth dwords of the Vendor Defined Message header where: 1. Bytes 8-11 (third header dword) =ven_msg_data[63:32] 2. Bytes 12-15 (fourth header dword) =ven_msg_data[31:0], where ven_msg_data[7:0] =byte 15 For more information, see the 'Endianness' advanced information chapter.

PCIE_CLIENT_LTR_MSG_TX_INFO
Address: Operational Base + offset (0x0068)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_ltr_msg_latency LTR message that your application is requesting to send. The message format is defined in the PCI Express Specification.

PCIE_CLIENT_APP_ERR_RPT_INFO0
Address: Operational Base + offset (0x006C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_hdr_log0 The header(bit 0 to bit 31) of the TLP that contained the error. The header of the TLP that contained the error indicated app_err_bus, valid when 1. app_hdr_valid is asserted. For Corrected Internal and Uncorrectable Internal errors (app_err_bus[10:9]),and receiver Overflow (app_err_bus[1]), the header information this input is not logged by the controller. 2. app_dpc_err_valid is asserted. The header of the TLP that contained the error indicated on app_dpc_err_bus. When DPC RP PIO extensions are supported, it is used to update DPC RP PIO Header Log Register.

PCIE_CLIENT_APP_ERR_RPT_INFO1
Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_hdr_log1 The header(bit 32 to bit 63) of the TLP that contained the error. The header of the TLP that contained the error indicated app_err_bus, valid when 1. app_hdr_valid is asserted. For Corrected Internal and Uncorrectable Internal errors (app_err_bus[10:9]),and receiver Overflow (app_err_bus[1]), the header information this input is not logged by the controller. 2. app_dpc_err_valid is asserted. The header of the TLP that contained the error indicated on app_dpc_err_bus. When DPC RP PIO extensions are supported, it is used to update DPC RP PIO Header Log Register.

PCIE_CLIENT_APP_ERR_RPT_INFO2
Address: Operational Base + offset (0x0074)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_hdr_log2 The header(bit 64 to bit 95) of the TLP that contained the error. The header of the TLP that contained the error indicated app_err_bus, valid when 1. app_hdr_valid is asserted. For Corrected Internal and Uncorrectable Internal errors (app_err_bus[10:9]),and receiver Overflow (app_err_bus[1]), the header information this input is not logged by the controller. 2. app_dpc_err_valid is asserted. The header of the TLP that contained the error indicated on app_dpc_err_bus. When DPC RP PIO extensions are supported, it is used to update DPC RP PIO Header Log Register.

PCIE_CLIENT_APP_ERR_RPT_INFO3
Address: Operational Base + offset (0x0078)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_hdr_log3 The header (bit 96 to bit 127) of the TLP that contained the error. The header of the TLP that contained the error indicated app_err_bus, valid when 1. app_hdr_valid is asserted. For Corrected Internal and Uncorrectable Internal errors (app_err_bus[10:9]),and receiver Overflow (app_err_bus[1]), the header information this input is not logged by the controller. 2. app_dpc_err_valid is asserted. The header of the TLP that contained the error indicated on app_dpc_err_bus. When DPC RP PIO extensions are supported, it is used to update DPC RP PIO Header Log Register.

PCIE_CLIENT_APP_ERR_RPT_INFO4
Address: Operational Base + offset (0x007C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
16	RW	0x0	app_err_advisory Indicates that your application error is an advisory error. Your application should assert app_err_advisory under either of the following conditions: 1. The controller is configured to mask completion timeout errors, your application is reporting a completion timeout error app_err_bus, and your application intends to resend the request. In such cases the error is an advisory error, as described in PCI Express Specification. When your application does not intend to resend the request, then your application must keep app_err_advisory de-asserted when reporting a completion timeout error. 2. The controller is configured to forward poisoned TLPs to your application and your application is going to treat the poisoned TLP as a normal TLP, as described in PCI Express Specification. Upon receipt of a poisoned TLP, your application must report the error app_err_bus, and either assert app_err_advisory (to indicate an advisory error) or de-assert app_err_advisory (to indicate that your application is dropping the TLP). For more information, see the PCI Express Specification to determine when an application error is an advisory error. 1'b0: Application error is not an advisory error 1'b1: Application error is an advisory error
15:13	RO	0x0	reserved
12:0	RW	0x0000	app_err_bus The type of error that application detected. The controller combines the values err_bus bits with the internally detected error signals to set the corresponding bit in the Un-correctable or Correctable Error Status Registers [0]: Malformed TLP [1]: Receiver Overflow [2]: Unexpected completion [3]: Completer abort [4]: Completion Timeout [5]: Unsupported request [6]: ECRC Check Failed [7]: Poisoned TLP received [8]: AtomicOp Egress Blocked [9]: Un-correctable Internal Error [10]: Corrected Internal Error [11]: TLP Prefix Blocked Error Status: only valid for RC and when CX_NPRFX >0 [12]: ACS Violation: only valid when CX_ACS_ENABLE =1 For more information, see 'Application Error Reporting Interface'.

PCIE_CLIENT_OBFF_WAKE_ELE_CFG

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:24	RW	0xb4	wk_min_f2f_wdt Configure the minimum falling edge to falling edge width. The minimum value Specification define is 700ns. Application set this value equals to wk_min_f2f_wdt * core_clock_period(8ns in gen1 and 4ns in gen2).

Bit	Attr	Reset Value	Description
23:16	RW	0xf0	wk_max_f2f_wdt Configure the maximum falling edge to falling edge width. The maximum value Specification define is 1000ns. Application set this value equals to wk_max_f2f_wdt * core_clock_period(8ns in gen1 and 4ns in gen2).
15:8	RW	0x50	wk_mim_pls_wdt Configure the minimum WAKE# pulse width for both active-inactive-active and inactive-active-inactive pulse. The minimum value Specification define is 300ns. Application set this value equals to wk_mim_pls_wdt * core_clock_period(8ns in gen1 and 4ns in gen2).
7:0	RW	0x64	wk_max_pls_wdt Configure the maximum WAKE# pulse width for both active-inactive-active and inactive-active-inactive pulse. The maximum value Specification define is 500ns. Application set this value equals to wk_max_pls_wdt * core_clock_period(8ns in gen1 and 4ns in gen2). Setting this value less than 50% of {wk_max_f2f_wdt * core_clock_period}.

PCIE_CLIENT_OBFF_WAKE_DEBUG
Address: Operational Base + offset (0x0084)

15:7	RO	0x000	reserved
6	RW	0x0	sd_hold_ltssm app_ras_des_sd_hold_ltssm Hold and release LTSSM. For as long as this signal is '1', the controller stays in the current LTSSM. 1'b0: Release LTSSM 1'b1: Hold LTSSM

Bit	Attr	Reset Value	Description
5	RW	0x0	dbg_pba MSIX PBA RAM Debug Mode. Use this input to activate the debug mode and allow direct read/write access to the PBA. You can also use the MSIX_RAM_CTRL_DBG_PBA field in MSIX_RAM_CTRL_OFF to activate debug mode. Debug mode turns off the PF/VF/Offset-based addressing into the RAM and maps the entire array linearly from the base address of the BAR (indicated by the BIR) in function 0. When you assert dbg_table and dbg_pba simultaneously, you can access the traffic class (TC) information bits. For more information, see the Interrupts section in the "Controller Operations" chapter of the Databook.
4	RW	0x0	dbg_table MSIX Table RAM Debug Mode. Use this input to activate the debug mode and allow direct read/write access to the Table. You can also use the MSIX_RAM_CTRL_DBG_TABLE field in MSIX_RAM_CTRL_OFF to activate debug mode. Debug mode turns off the PF/VF/Offset-based addressing into the RAM and maps the entire table linearly from the base address of the BAR (indicated by the BIR) in function 0. When you assert dbg_table and dbg_pba simultaneously, you can access the traffic class (TC) information bits. For more information, see the Interrupts section in the "Controller Operations" chapter of the Databook.
3	RO	0x0	reserved
2:0	RW	0x0	diag_ctrl_bus Diagnostic Control Bus 1. x01: Insert LCRC error by inverting the LSB of LCRC 2. x10: Insert ECRC error by inverting the LSB of ECRC 2.1 The rising edge of these two signals ([1:0]) enable the controller to assert an LCRC or ECRC to the packet that it currently being transferred. 2.2 When LCRC or ECRC error packets are transmitted by the controller, the controller asserts diag_status_bus[lcrc_err_asserted] or diag_status_bus[ecrc_err_asserted] to report that the requested action has been completed. This handshake between control and status allows your application to control a specific packet being injected with an CRC or ECRC error. 2.3 The LCRC and ECRC errors are generated by simply inverting the last bit of the LCRC or ECRC value. 3. 1xx: Select Fast Link Mode. 3.1 Sets all internal LTSSM millisecond timers to Fast Mode for speeding up simulation purposes. Forces the LTSSM training (link initialization) to use shorter timeouts and to link up faster. 3.2 The default scaling factor is 1024 for all internal timers. The default scaling factor can be changed using the DEFAULT_FAST_LINK_SCALING_FACTOR parameter or through the FAST_LINK_SCALING_FACTOR field in the TIMER_CTRL_MAX_FUNC_NUM_OFF register. 3.3 Fast Link Mode can also be activated by setting the FAST_LINK_MODE field in the PORT_LINK_CTRL_OFF register. 3.4 For more information, see the "Fast Link Simulation Mode" section in the "Integrating the Controller with the PHY or Application RTL or Verification IP" chapter of the User Guide.

0	RO	0x0	cfg_rcvr_err_sts Indication from the controller that the controller detected an Receiver Error.

PCIE_CLIENT_TLP_PRFX_LOG0
Address: Operational Base + offset (0x0380)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_tlp_prfx_log_0 End-End TLP prefixes of the TLP that contained an error. Valid when 1. app_hdr_valid is asserted. The header of the TLP that contained the error indicated on app_err_bus. For Corrected Internal and Uncorrectable Internal errors (app_err_bus[10:9]),and receiver Overflow (app_err_bus[1]), the header information this input is not logged by the controller. 2. app_dpc_err_valid is asserted. The header of the TLP that contained the error indicated on app_dpc_err_bus. When DPC RP PIO extensions are supported, it is used to update DPC RP PIO Header Log Register. Available after version 50610.

PCIE_CLIENT_TLP_PRFX_LOG1
Address: Operational Base + offset (0x0384)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_tlp_prfx_log_1 End-End TLP prefixes of the TLP that contained an error. Valid when 1. app_hdr_valid is asserted. The header of the TLP that contained the error indicated on app_err_bus. For Corrected Internal and Uncorrectable Internal errors (app_err_bus[10:9]),and receiver Overflow (app_err_bus[1]), the header information this input is not logged by the controller. 2. app_dpc_err_valid is asserted. The header of the TLP that contained the error indicated on app_dpc_err_bus. When DPC RP PIO extensions are supported, it is used to update DPC RP PIO Header Log Register. Available after version 50610.

PCIE_CLIENT_TLP_PRFX_LOG2
Address: Operational Base + offset (0x0388)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_tlp_prfx_log_2 End-End TLP prefixes of the TLP that contained an error. Valid when 1. app_hdr_valid is asserted. The header of the TLP that contained the error indicated on app_err_bus. For Corrected Internal and Uncorrectable Internal errors (app_err_bus[10:9]),and receiver Overflow (app_err_bus[1]), the header information this input is not logged by the controller. 2. app_dpc_err_valid is asserted. The header of the TLP that contained the error indicated on app_dpc_err_bus. When DPC RP PIO extensions are supported, it is used to update DPC RP PIO Header Log Register. Available after version 50610.

PCIE_CLIENT_TLP_PRFX_LOG3
Address: Operational Base + offset (0x038C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_tlp_prfx_log_3 End-End TLP prefixes of the TLP that contained an error. Valid when 1. app_hdr_valid is asserted. The header of the TLP that contained the error indicated on app_err_bus. For Corrected Internal and Uncorrectable Internal errors (app_err_bus[10:9]),and receiver Overflow (app_err_bus[1]), the header information this input is not logged by the controller. 2. app_dpc_err_valid is asserted. The header of the TLP that contained the error indicated on app_dpc_err_bus. When DPC RP PIO extensions are supported, it is used to update DPC RP PIO Header Log Register. Available after version 50610.

11.4.3.2 DSP_PCIE_TYPE1 Detail Registers Description

DSP_PCIE_TYPE1_DEV_ID_VEND_ID_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RW	0x1808	DEVICE_ID Device ID. The Device ID register identifies the particular Function. This identifier is allocated by the vendor. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x3588 Testable: unconstrained
15:0	RW	0x1d87	VENDOR_ID Vendor ID. The Vendor ID register identifies the manufacturer of the Function. Valid vendor identifiers are allocated by the PCI-SIG to ensure uniqueness. It is not permitted to populate this register with a value of FFFFh, which is an invalid value for Vendor ID. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1d87 Testable: unconstrained

DSP_PCIE_TYPE1_STATUS_COMMAND_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	W1C	0x0	DETECTED_PARITY_ERROR Detected Parity Error. The bit is set when the Poisoned TLP is received by a Function's primary side. Values: 0x1 (SET): This bit is set by a Function whenever it receives a Poisoned TLP, regardless of the state the Parity Error Response bit in the Command register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
30	W1C	0x0	SIGNALED_SYS_ERROR Signaled System Error. Values: 0x1 (SET): This bit is set when a Function sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR# Enable bit in the Command register is 1b. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
29	W1C	0x0	RCVD_MASTER_ABORT Received Master Abort. This bit is set when a Requester receives a Completion with Unsupported Request Completion status. The bit is set when the Unsupported Request is received by a Function's primary side. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
28	W1C	0x0	RCVD_TARGET_ABORT Received Target Abort. This bit is set when a Requester receives a Completion with Completer Abort Completion status. The bit is set when the Completer Abort is received by a Function's primary side. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
27	W1C	0x0	SIGNALED_TARGET_ABORT Signaled Target Abort. This bit is set when a Function completes a Posted or Non-Posted Request as a Completer Abort error. This applies to a Function when the Completer Abort was generated by its primary side. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
26:25	RO	0x0	DEV_SEL_TIMING DEVSEL Timing. This field was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires it to 00b. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
24	W1C	0x0	MASTER_DPE Master Data Parity Error. This bit is set by a Function if the Parity Error Response bit in the Command register is 1b and either of the following two conditions occurs: Port receives a Poisoned Completion going downstream Port transmits a Poisoned Request upstream If the Parity Error Response bit is 0b, this bit is never set. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23	RO	0x0	FAST_B2B_CAP Fast Back-to-Back Transactions Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0
22	RO	0x0	reserved
21	RO	0x0	FAST_66MHZ_CAP 66 MHz Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0
20	RO	0x1	CAP_LIST Capabilities List. Indicates the presence of an Extended Capability list item. Since all PCI Express device Functions are required to implement the PCI Express Capability structure, the controller hardwires this bit to 1b. Value After Reset: 0x1
19	RO	0x0	INT_STATUS Interrupt Status. INTx emulation interrupts forwarded by Functions from the secondary side are not reflected in this bit. Setting the Interrupt Disable bit has no effect on the state of this bit. For Functions that do not generate INTx interrupts, the controller hardwires this bit to 0b. Values: 0x1 (SET): Indicates that an INTx emulation interrupt is pending internally in the Function. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
18:11	RO	0x00	reserved

Bit	Attr	Reset Value	Description
10	RW	0x0	INT_EN Interrupt Disable. Controls the ability of a Function to generate INTx emulation interrupts. Note: Any INTx emulation interrupts already asserted by the Function must be deasserted when this bit is set. INTx interrupts use virtual wires that must, if asserted, be deasserted using the appropriate Deassert_INTx message(s) when this bit is set. Only the INTx virtual wire interrupt(s) associated with the Function(s) for which this bit is set are affected. For Functions that generate INTx interrupts on their own behalf, this bit is required. This bit has no effect on interrupts forwarded from the secondary side. For Functions that do not generate INTx interrupts on their own behalf this bit is optional. If this bit is not implemented, the controller hardwires it to 0b. Values: 0x1 (SET): When set, Functions are prevented from asserting INTx interrupts. Value After Reset: 0x0
9	RO	0x0	reserved
8	RW	0x0	SERREN SERR# Enable. Note: The errors are reported if enabled either through this bit or through the PCI Express specific bits in the Device Control register. In addition, this bit controls transmission by the primary interface of ERR_NONFATAL and ERR_FATAL error Messages forwarded from the secondary interface. This bit does not affect the transmission of forwarded ERR_COR messages. Values: 0x1 (SET): This bit enables reporting upstream of Non-fatal and Fatal errors detected by the Function. Value After Reset: 0x0
7	RO	0x0	IDSEL IDSEL Stepping/Wait Cycle Control. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
6	RW	0x0	PERREN Parity Error Response. This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Status register. Values: 0x1 (ENABLE): Parity Error Response enable 0x0 (DISABLE): Parity Error Response disable Value After Reset: 0x0
5	RO	0x0	VGAPS VGA Palette Snoop. This bit was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0
4	RO	0x0	MWI_EN Memory Write and Invalidate. This bit was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. For PCI Express to PCI/PCI-X Bridges, refer to the PCI Express to PCI/PCI-X Bridge Specification for requirements for this register. Value After Reset: 0x0
3	RO	0x0	SCO Special Cycle Enable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0
2	RW	0x0	BME Bus Master Enable. This bit controls forwarding of Memory or I/O requests by a port in the Upstream direction. When this bit is 0b, Memory and I/O Requests received at a Root Port must be handled as Unsupported Requests (UR) For Non-Posted Requests a Completion with UR completion status must be returned. This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O Requests is not controlled by this bit. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
1	RW	0x0	MSE Memory Space Enable. This bit controls a Function's response to Memory Space accesses received on its primary side. You cannot write to this register if your configuration has no MEM BARs; that is, the internal signal has_mem_bar =0. Note: The access attributes of this field are as follows: Wire: No access. Dbi: !has_mem_bar ? RO : RW Values: 0x1 (SET): The Function is enabled to decode the address and further process Memory Space accesses. 0x0 (CLEAR): All received Memory Space accesses are caused to be handled as Unsupported Requests. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
0	RW	0x0	IO_EN IO Space Enable. This bit controls a Function's response to I/O Space accesses received on its primary side. You cannot write to this register if your configuration has no IO BARs; that is, the internal signal has_io_bar =0. Note: The access attributes of this field are as follows: Wire: No access. Dbi: !has_io_bar ? RO : RW Values: 0x1 (SET): The Function is enabled to decode the address and further process I/O Space accesses. 0x0 (CLEAR): All received I/O accesses are caused to be handled as Unsupported Requests. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_TYPE1_CLASS_CODE_REV_ID_REG
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	BASE_CLASS_CODE Base Class Code. A code that broadly classifies the type of operation the Function performs. Encodings for base class, are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are reserved. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
23:16	RW	0x00	SUBCLASS_CODE Sub-Class Code. Specifies a base class sub-class, which identifies more specifically the operation of the Function. Encodings for sub-class are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are reserved. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
15:8	RW	0x00	PROGRAM_INTERFACE Programming Interface. This field identifies a specific register level programming interface (if any) so that device independent software can interact with the Function. Encodings for interface are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are reserved. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
7:0	RW	0x01	REVISION_ID Revision ID. The value of this field specifies a Function specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. The Revision ID should be viewed as a vendor defined extension to the Device ID. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

DSP_PCIE_TYPE1_BIST_HDR_TYPE_LAT_CACHE_LINE_SIZE_REG
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	BIST BIST. This register is used for control and status of BIST. Functions that do not support BIST must hardwire the register to 00h. A Function whose BIST is invoked must not prevent normal operation of the PCI Express Link. Bit descriptions: [31]: BIST Capable. When set, this bit indicates that the Function supports BIST. When Clear, the Function does not support BIST. [30]: Start BIST. If BIST Capable is set, set this bit to invoke BIST. The Function resets the bit when BIST is complete. Software is permitted to fail the device if this bit is not Clear (BIST is not complete) 2 seconds after it had been set. Writing this bit to 0b has no effect. The controller hardwires this bit to 0b if BIST Capable is clear. [29:28]: Reserved. [27:24]: Completion Code. This field encodes the status of the most recent test. A value of 0000b means that the Function has passed its test. Non-zero values mean the Function failed. Function-specific failure codes can be encoded in the non-zero values. This field's value is only meaningful when BIST Capable is set and Start BIST is Clear. This field must be hardwired to 0000b if BIST Capable is clear. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
23	RO	0x0	MULTI_FUNC Multi-Function Device. Except where stated otherwise, it is recommended that this bit be set if there are multiple Functions, and clear if there is only one Function. Note: This register field is sticky. Values: 0x1 (SET): Indicates that the device may contain multiple Functions, but not necessarily. Software is permitted to probe for Functions other than Function 0. 0x0 (CLEAR): Software must not probe for Functions other than Function 0 unless explicitly indicated by another mechanism, such as an ARI or SR-IOV Capability structure. Value After Reset: 0x0
22:16	RO	0x01	HEADER_TYPE Header Layout. This field identifies the layout of the second part of the predefined header. The controller uses 000 0001b encoding. The encoding 000 0010b is reserved. This encoding was originally described in the PC Card Standard Electrical Specification and is used in previous versions of the programming model. Careful consideration should be given to any attempt to re-purpose it. Value After Reset: 0x1
15:8	RO	0x00	LATENCY_MASTER_TIMER Latency Timer. This register is also referred to as Primary Latency Timer. The Latency Timer was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this register to 00h. Value After Reset: 0x0
7:0	RW	0x00	CACHE_LINE_SIZE Cache Line Size. The Cache Line Size register is programmed by the system firmware or the operating system to system cache line size. However, legacy conventional PCI software may not always be able to program this register correctly especially in the case of Hot-Plug devices. This read-write register is implemented for legacy compatibility purposes but has no effect on any PCI Express device behavior. Value After Reset: 0x0

DSP_PCIE_TYPE1_BAR0_REG
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	BAR0_START BAR0 Base Address. Memory Space: Base Address. IO Space: bits[31:2] are used to map the function into IO space/Base. Address. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R(Sticky)/W(Sticky) if enabled else R(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
3	RW	0x0	BAR0_PREFETCH BAR0 Prefetchable. Memory Space: Set to one if data is prefetchable. A Function is permitted to mark a range as prefetchable. If there are no side effects on reads, the function returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors. Bit must me clear otherwise. IO Space: Not applicable Note: The access attributes of this field are as follows: Wire: No access. DSP_PCIE_TYPE1_SEC_LAT_TIMER_SUB_BUS_SEC_BUS_PRI_BUS_REG
Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	SEC_LAT_TIMER Secondary Latency Timer. This register does not apply to PCI Express. The controller hardwires it to 00h. Value After Reset: 0x0
23:16	RW	0x00	SUB_BUS Subordinate Bus Number. The Subordinate Bus Number register is used to record the bus number of the highest numbered PCI bus segment which is behind (or subordinate to) the bridge. Configuration software programs the value in this register. The bridge uses this register in conjunction with the Secondary Bus Number register to determine when to respond to and pass on a Type 1 configuration transaction on the primary interface to the secondary interface. Value After Reset: 0x0
15:8	RW	0x00	SEC_BUS Secondary Bus Number. The Secondary Bus Number register is used to record the bus number of the PCI bus segment to which the secondary interface of the bridge is connected. Configuration software programs the value in this register. The bridge uses this register to determine when to respond to and convert a Type 1 configuration transaction on the primary interface into a Type 0 transaction on the secondary interface. Value After Reset: 0x0
7:0	RW	0x00	PRIM_BUS Primary Bus Number. This register is not used by PCI Express Functions. It is implemented for compatibility with legacy software. Value After Reset: 0x0

DSP_PCIE_TYPE1_SEC_STAT_IO_LIMIT_IO_BASE_REG

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31	W1C	0x0	SEC_STAT_DPE Detected Parity Error. This bit is set by a Function when a Poisoned TLP is received by its secondary side, regardless of the state the Parity Error Response Enable bit in the Bridge Control register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
30	W1C	0x0	SEC_STAT_RCVD_SYS_ERR Received System Error. This bit is set when the secondary side of a Function receives an ERR_FATAL or ERR_NONFATAL message. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
29	W1C	0x0	SEC_STAT_RCVD_MSTR_ABRT Received Master Abort. This bit is set when the secondary side of a Function (for requests initiated by the Type 1 header Function itself) receives a Completion with Unsupported Request Completion status. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
28	W1C	0x0	SEC_STAT_RCVD_TRGT_ABRT Received Target Abort. This bit is set when the secondary side of a Function (for requests initiated by the Type 1 header Function itself) receives a Completion with Completer Abort Completion status. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
27	W1C	0x0	SEC_STAT_SIG_TRGT_ABRT Signaled Target Abort. This bit is set when the secondary side of the Function (for Requests completed by the Type 1 header Function itself) completes a Posted or Non-Posted request as a Completer Abort error. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
26:25	RO	0x0	reserved

Bit	Attr	Reset Value	Description
24	W1C	0x0	SEC_STAT_MDPE Master Data Parity Error. This bit is set by a Function if the Parity Error Response Enable bit in the Bridge Control register is set, and either of the following two conditions occurs: Port receives a Poisoned Completion coming Upstream Port transmits a Poisoned Request Downstream If the Parity Error Response Enable bit is clear, this bit is never set. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23:16	RO	0x00	reserved
15:12	RW	0x0	IO_LIMIT I/O Limit Address. These bits correspond to the address[15:12] of IO address range. For the purpose of address decoding, the bridge assumes that the lower 12 address bits, address[11:0], of the I/O limit address (not implemented in the I/O Limit register) are FFFh. The I/O Limit register can be programmed to a smaller value than the I/O Base register, if there are no I/O addresses on the secondary side of the bridge. In this case, the bridge will not forward any I/O transactions from the primary bus to the secondary and will forward all I/O transactions from the secondary bus to the primary bus. Value After Reset: 0x0
11:9	RO	0x0	reserved

Bit	Attr	Reset Value	Description
8	RO	0x0	IO_DECODE_BIT8 I/O Addressing Encode (IO Limit Address). This bit encodes the IO addressing capability of the bridge. Note: For 16bit I/O address decoding, the bridge must still perform a full 32-bit decode of the I/O address (that is, check that Address[31:16] are 0000h). In this case, the I/O address range supported by the bridge will be restricted to the first 64 KB of I/O Space (0000 0000h to 0000 FFFFh). For 16bit I/O address decoding, the bridge assumes that the upper 16 address bits, Address[31:16], of the I/O limit address (not implemented in I/O Limit register) are zero. For 32bit I/O address decoding, and the I/O Limit Upper 16 Bits hold the upper 16 bits, corresponding to Address[31:16], of the 32-bit Limit address. In this case, system configuration software is permitted to locate the I/O address range supported by the bridge anywhere in the 4-GB I/O Space. The 4-KB alignment and granularity restrictions still apply when the bridge supports 32-bit I/O addressing. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R Values: 0x0 (_16b_SUP_IO_ADDR): The bridge supports only 16-bit I/O addressing (for ISA compatibility). 0x1 (_32b_SUP_IO_ADDR): The bridge supports 32-bit I/O addressing. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
7:4	RW	0x0	IO_BASE I/O Base Address. These bits correspond to the address[15:12] of IO address range. For the purpose of address decoding, the bridge assumes that the lower 12 address bits, address[11:0], of the I/O base address (not implemented in the I/O Base register) are zero. Value After Reset: 0x0
3:1	RO	0x0	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	IO_DECODE I/O Addressing Encode (IO Base Address). This bit encodes the IO addressing capability of the bridge. Note: For 16bit I/O address decoding, the bridge must still perform a full 32-bit decode of the I/O address (that is, check that Address[31:16] are 0000h). In this case, the I/O address range supported by the bridge will be restricted to the first 64 KB of I/O Space (0000 0000h to 0000 FFFFh). For 16bit I/O address decoding, the bridge assumes that the upper 16 address bits, Address[31:16], of the I/O limit address (not implemented in I/O Limit register) are zero. For 32bit I/O address decoding, and the I/O Limit Upper 16 Bits hold the upper 16 bits, corresponding to Address[31:16], of the 32-bit Limit address. In this case, system configuration software is permitted to locate the I/O address range supported by the bridge anywhere in the 4-GB I/O Space. The 4-KB alignment and granularity restrictions still apply when the bridge supports 32-bit I/O addressing. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Values: 0x0 (_16b_SUP_IO_ADDR): The bridge supports only 16-bit I/O addressing (for ISA compatibility). 0x1 (_32b_SUP_IO_ADDR): The bridge supports 32-bit I/O addressing. Value After Reset: 0x0 Testable: unconstrained

DSP_PCIE_TYPE1_MEM_LIMIT_MEM_BASE_REG

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:20	RW	0x000	MEM_LIMIT Memory Limit Address. These bits correspond to the upper 12 address bits, Address[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, Address[19:0], of the memory limit address (not implemented in the Memory Limit register) are F FFFFh. The Memory Limit register must be programmed to a smaller value than the Memory Base register if there is no memory-mapped address space on the secondary side of the bridge. Value After Reset: 0x0
19:16	RO	0x0	reserved

Bit	Attr	Reset Value	Description
15:4	RW	0x000	MEM_BASE Memory Base Address. These bits correspond to the upper 12 address bits, Address[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, Address[19:0], of the memory base address (not implemented in the Memory Base register) are zero. Value After Reset: 0x0
3:0	RO	0x0	reserved

DSP_PCIE_TYPE1_PREF_MEM_LIMIT_PREF_MEM_BASE_REG
Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:20	RW	0x000	PREF_MEM_LIMIT Prefetchable Memory Limit Address. If the Prefetchable Memory Limit register indicates support for 32-bit addressing, then the Prefetchable Limit Upper 32 Bits register is implemented as a read-only register that returns zero when read. If the Prefetchable Memory Limit registers indicate support for 64-bit addressing, then the Prefetchable Limit Upper 32 Bits register is implemented as a read/write register which must be initialized by configuration software. If a 64-bit prefetchable memory address range is supported, the Prefetchable Limit Upper 32 Bits register specifies the upper 32 bits, corresponding to Address[63:32], of the 64-bit limit addresses which specify the prefetchable memory address range. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
19:17	RO	0x0	reserved
16	RO	0x1	PREF_MEM_LIMIT_DECODE Prefetchable Memory Limit Decode. This bit encodes whether or not the bridge supports 64-bit addresses. Note: This bit is a copy of the PREF_MEM_DECODE bit and always reflects the current value of that bit. Values: 0x0 (SUP_32b_ADDR): Indicates that the bridge supports only 32 bit addresses. 0x1 (SUP_64b_ADDR): Indicates that the bridge supports 64 bit addresses. Prefetchable Limit Upper 32 Bits registers holds the rest of the 64-bit prefetchable limit address. Value After Reset: 0x1 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description

DSP_PCIE_TYPE1_EXP_ROM_BASE_REG

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:11	RW	0x000000	EXP_ROM_BASE_ADDRESS Expansion ROM Base Address. Upper 21 bits of the Expansion ROM base address. The number of bits (out of these 21) that a Function actually implements depends on how much address space the Function requires. The mask for this ROM BAR exists (if implemented) as a shadow register at this address. The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the second register at this address. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1) then R/W else R
10:8	RO	0x0	reserved

Bit	Attr	Reset Value	Description
7:4	RW	0x0	ROM_BAR_VALIDATION_DETAILS Expansion ROM Validation Details. The field contains optional, implementation-specific details associated with Expansion ROM Validation. If validation is in progress (Expansion ROM Validation Status is 001b), non-zero values of this field represent implementation-specific indications of the phase of the validation progress (e.g., 50% complete). The value 0000b indicates that no validation progress information is provided. If validation is completed (Expansion ROM Validation Status 010b to 111b inclusive), non-zero values in this field represent additional implementation-specific information. The value 0000b indicates that no information is provided. When validation is supported and this field is not implemented, this field must be hardwired to 0000b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1 && DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3:1	RW	0x0	ROM_BAR_VALIDATION_STATUS Expansion ROM Validation Status. When this field is non-zero, it indicates the status of hardware validation of the Expansion ROM contents. If the Function does not support validation, this field must be hardwired to 000b. It is optional whether an implementation is capable of returning Validation Status values 011b, 101b, 110b, or 111b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1 && DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (ZERO): Validation not supported. 0x1 (ONE): Validation in Progress. 0x2 (TWO): Validation Pass Valid contents, trust test was not performed. 0x3 (THREE): Validation Pass Valid and trusted contents. 0x4 (FOUR): Validation Fail Invalid contents. 0x5 (FIVE): Validation Fail Valid but untrusted contents (e.g., Out of Date, Expired or Revoked Certificate). 0x6 (SIX): Warning Pass Validation Passed with implementation-specific warning. Valid contents, trust test was not performed. 0x7 (SEVEN): Warning Pass Validation Passed with implementation-specific warning. Valid and trusted contents. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	ROM_BAR_ENABLE Expansion ROM Enable. This bit controls whether or not the Function accepts accesses to its expansion ROM. The Memory Space Enable bit in the Command register has precedence over the Expansion ROM Enable bit. A Function must claim accesses to its expansion ROM only if both the Memory Space Enable bit and the Expansion ROM Enable bit are set. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1) then R/W else R Values: 0x1 (ONE): Address decoding is enabled using the parameters in the other part of the Expansion ROM Base Address register. 0x0 (ZERO): Function's expansion ROM address space is disabled. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_TYPE1_BRIDGE_CTRL_INT_PIN_INT_LINE_REG

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved
22	RW	0x0	SBR Secondary Bus Reset. Setting this bit triggers a hot reset on the corresponding PCI Express Port. Software must ensure a minimum reset duration (Trst) as defined in the PCI Local Bus Specification. Software and systems must honor first-access-following-reset timing requirements, unless the Readiness Notifications mechanism is used or if the Immediate Readiness bit in the relevant Function's Status Register register is set. Port configuration registers must not be changed, except as required to update Port status. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
21	RO	0x0	MSTR_ABORT_MODE Master Abort Mode. This bit was originally described in the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
20	RO	0x0	VGA_16B_DEC VGA 16 bit decode. This bit only has meaning if VGA Enable bit is set. This bit enables system configuration software to select between 10-bit and 16-bit I/O address decoding for all VGA I/O register accesses that are forwarded from primary to secondary. For Functions that do not support VGA, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R Values: 0x0 (_10b_ADDR_DECODE): Execute 10-bit address decodes on VGA I/O accesses 0x1 (_16b_ADDR_DECODE): Execute 16-bit address decodes on VGA I/O accesses Value After Reset: 0x0

Bit	Attr	Reset Value	Description
19	RO	0x0	VGA_EN VGA Enable. Modifies the response by the bridge to VGA compatible addresses. If the VGA Enable bit is set, the bridge will positively decode and forward the following accesses on the primary interface to the secondary interface (and, conversely, block the forwarding of these addresses from the secondary to primary interface): Memory accesses in the range 000A 0000h to 000B FFFFh I/O addresses in the first 64 KB of the I/O address space (Address[31:16] are 0000h) where Address[9:0] are in the ranges 3B0h to 3BBh and 3C0h to 3DFh (inclusive of ISA address aliases determined by the setting of VGA 16-bit Decode) If the VGA Enable bit is set, forwarding of these accesses is independent of the I/O address range and memory address ranges defined by the I/O Base and Limit registers, the Memory Base and Limit registers, and the Prefetchable Memory Base and Limit registers of the bridge. (Forwarding of these accesses is also independent of the setting of the ISA Enable bit (in the Bridge Control register) when the VGA Enable bit is set. Forwarding of these accesses is qualified by the I/O Space Enable and Memory Space Enable bits in the Command register.) For Functions that do not support VGA, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R Values: 0x0 (NO_FRWD_VGA): Do not forward VGA compatible memory and I/O addresses from the primary to the secondary interface (addresses defined above) unless they are enabled for forwarding by the defined I/O and memory address ranges 0x1 (FRWD_VGA): Forward VGA compatible memory and I/O addresses (addresses defined above) from the primary interface to the secondary interface (if the I/O Space Enable and Memory Space Enable bits are set) independent of the I/O and memory address ranges and independent of the ISA Enable bit Value After Reset: 0x0

Bit	Attr	Reset Value	Description
18	RW	0x0	ISA_EN ISA Enable. Modifies the response by the bridge to ISA I/O addresses. This applies only to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64 KB of I/O address space (0000 0000h to 0000 FFFFh). If this bit is set, the bridge will block any forwarding from primary to secondary of I/O transactions addressing the last 768 bytes in each 1-KB block. In the opposite direction (secondary to primary), I/O transactions will be forwarded if they address the last 768 bytes in each 1-KB block. Values: 0x0 (FRWD_DSP): Forward downstream all I/O addresses in the address range defined by the I/O Base and I/O Limit registers 0x1 (FRWD_USP): Forward upstream ISA I/O addresses in the address range defined by the I/O Base and I/O Limit registers that are in the first 64 KB of PCI I/O address space (top 768 bytes of each 1-KB block. Value After Reset: 0x0
17	RW	0x0	SERR_EN SERR# Enable. This bit controls forwarding of ERR_COR, ERR_NONFATAL and ERR_FATAL from secondary to primary. Value After Reset: 0x0
16	RW	0x0	PERE Parity Error Response Enable. This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Secondary Status register. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15:8	RW	0x01	INT_PIN Interrupt PIN. The Interrupt Pin register register that identifies the legacy interrupt Message(s) the Function uses. All encodings other than the defined encodings are reserved. PCI Express defines one legacy interrupt Message for a single Function device and up to four legacy interrupt Messages for a multi-Function device. For a single Function device, only INTA may be used. Any Function on a multi-Function device can use any of the INTx Messages. If a device implements a single legacy interrupt Message, it must be INTA; if it implements two legacy interrupt Messages, they must be INTA and INTB; and so forth. For a multi-Function device, all Functions may use the same INTx Message or each may have its own (up to a maximum of four Functions) or any combination thereof. A single Function can never generate an interrupt request on more than one INTx Message. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x1 (INTA): Map to legacy interrupt Messages for INTA 0x2 (INTB): Map to legacy interrupt Messages for INTB 0x3 (INTC): Map to legacy interrupt Messages for INTC 0x4 (INTD): Map to legacy interrupt Messages for INTD 0x0 (NO_INT): Indicates that the Function uses no legacy interrupt Message(s). Value After Reset: 0x1 Testable: unconstrained
7:0	RW	0xff	INT_LINE Interrupt Line. The Interrupt Line register communicates interrupt line routing information. The register must be implemented by any Function that uses an interrupt pin. Values in this register are programmed by system software and are system architecture specific. The Function itself does not use this value; rather the value in this register is used by device drivers and operating systems. Value After Reset: 0xff

11.4.3.3 DSP_PCIE_PM Registers Summary

Name	Offset	Size	Reset Value	Description
DSP_PCIE_PM_CAP_ID_NXT_PTR_REG	0x0000	W	0x07C35001	Power Management Capabilities Register
DSP_PCIE_PM_CON_STATUS_REG	0x0004	W	0x00000008	Power Management Control and Status Register

11.4.3.4 DSP_PCIE_PM Detail Registers Description

DSP_PCIE_PM_CAP_ID_NXT_PTR_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:27	RW	0x00	PME_SUPPORT PME_Support. This 5-bit field indicates the power states in which the function may generate a PME and/or forward PME messages. A value of 0b for any bit indicates that the function is not capable of asserting PME while in that power state. bit(27) X XXX1b - PME can be generated from D0 bit(28) X XX1Xb - PME can be generated from D1 bit(29) X X1XXb - PME can be generated from D2 bit(30) X 1XXXb - PME can be generated from D3hot bit(31) 1 XXXXb - PME can be generated from D3cold Bit 31 (PME can be asserted from D3cold) represents a special case. Functions that set this bit require some sort of auxiliary power source. Implementation specific mechanisms are recommended to validate that the power source is available before setting this bit. Each bit that corresponds to a supported D-state must be set for PCI-PCI Bridge structures representing Ports on Root Complexes/Switches to indicate that the Bridge will forward PME Messages. Bit 31 must only be set if the Port is still able to forward PME Messages when main power is not available. The read value from this field is the write value && (sys_aux_pwr_det, 1'b1, D2_SUPPORT, D1_SUPPORT, 1'b1), where D1_SUPPORT and D2_SUPPORT are fields in this register. The reset value PME_SUPPORT_n && (sys_aux_pwr_det, 1'b1, D2_SUPPORT, D1_SUPPORT, 1'b1), where PME_SUPPORT_n is a configuration parameter. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1b Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
26	RW	0x1	D2_SUPPORT D2_Support. If this bit is set, this function supports the D2 Power Management state. Functions that do not support D2 must always return a value of 0b for this bit. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
25	RW	0x1	D1_SUPPORT D1_Support. If this bit is set, this function supports the D1 Power Management state. Functions that do not support D1 must always return a value of 0b for this bit. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
24:22	RW	0x7	AUX_CURR Aux_Current. This 3 bit field reports the Vaux auxiliary current requirements for the function. If this function implements the Data Register, the controller hardwires this field to 000b. If PME_Support is 0 xxxxb (PME assertion from D3cold is not supported), the controller hardwires this field to 0000b. For functions where PME_Support is 1 xxxxb (PME assertion from D3cold is supported), and which do not implement the Data field, the encodings defined in Values: apply: Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x7 (_370mA_): 375mA Vaux Max. Current Required 0x6 (_320mA_): 320mA Vaux Max. Current Required 0x5 (_270mA_): 270mA Vaux Max. Current Required 0x4 (_220mA_): 220mA Vaux Max. Current Required 0x3 (_160mA_): 160mA Vaux Max. Current Required 0x2 (_100mA_): 100mA Vaux Max. Current Required 0x1 (_055mA_): 55mA Vaux Max. Current Required 0x0 (SELF_): 0 self powered Value After Reset: 0x7 Testable: unconstrained
21	RW	0x0	DSI Device Specific Initialization. The DSI bit indicates whether special initialization of this function is required. When set, indicates that the function requires a device specific initialization sequence following a transition to the D0uninitialized state. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
20	RO	0x0	reserved

Bit	Attr	Reset Value	Description
19	RO	0x0	PME_CLK PME Clock. Does not apply to PCI Express, the controller hardwires it to 0b. Note: This register field is sticky. Value After Reset: 0x0
18:16	RW	0x3	PM_SPEC_VER Version. This field provides the Power Management specification version. The controller hardwires this field to 011b for functions compliant to PCI Express Base Specification, Revision 4.0, Version 1.0>. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x3 Testable: unconstrained
15:8	RW	0x50	PM_NEXT_POINTER Next Capability Pointer. This field provides an offset into the function's configuration space pointing to the location of next item in the capabilities list. If there are no additional items in the capabilities list, this field is set to 00h. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x50 Testable: unconstrained
7:0	RO	0x01	PM_CAP_ID Capability ID. This field returns 01h to indicate that this is the PCI Power Management Capability. Each function may have only one item in its capability list with Capability ID set to 01h. Value After Reset: 0x1

DSP_PCIE_PM_CON_STATUS_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	DATA_REG_ADD_INFO Data. This field is used to report the state dependent data requested by the Data_Select field. The value of this field is scaled by the value reported by the Data_Scale field. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
23	RO	0x0	BUS_PWR_CLK_CON_EN Bus Power/Clock Control Enable. If this field is set, Bus Power/Clock Control is Enable. Value After Reset: 0x0
22	RO	0x0	B2_B3_SUPPORT B2B3 Support for D3hot. If this field is set, B2B3 support for D3hot is available. Value After Reset: 0x0
21:16	RO	0x00	reserved
15	W1C	0x0	PME_STATUS PME_Status. This bit is set when the function normally generates a PME signal. The value of this bit is not affected by the value of the PME_En bit. If PME_Support bit 31 of the Power Management Capabilities register is clear, this bit is permitted to be hardwired to 0b. Functions that consume Aux power must preserve the value of this sticky register when Aux power is available. In such functions, this register value is not modified by Conventional Reset or FLR. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
14:13	RO	0x0	DATA_SCALE Data_Scale. This field indicates the scaling factor to be used when interpreting the value of the Data field. The value and meaning of this field varies depending on which data value has been selected by the Data_Select field. For more details, see 7.5.2.3 section of PCI Express Base Specification. Value After Reset: 0x0
12:9	RO	0x0	DATA_SELECT Data_Select. This 4-bit field is used to select which data is to be reported through the Data and Data_Scale field. If the Data field is not implemented, this field must be hardwired to 0000b. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
8	RW	0x0	PME_ENABLE PME_En. When set, the function is permitted to generate a PME. When clear, the function is not permitted to generate a PME. If PME_Support is 1 xxxxb (PME generation from D3cold) or the function consumes Aux power and Aux power is available this bit is RWS and the bit is not modified by Conventional Reset or FLR. If PME_Support is 0 xxxxb, this field is not sticky (RW). If PME_Support is 0 0000b, the controller hardwires this bit to 0b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
7:4	RO	0x0	reserved
3	RW	0x1	NO_SOFT_RST No_Soft_Reset. This bit indicates the state of the function after writing the PowerState field to transition the function from D3hot to D0. When set, this transition preserves internal function state. The function is in D0Active and no additional software intervention is required. When clear, this transition results in undefined internal function state. Regardless of this bit, functions that transition from D3hot to D0 by Fundamental Reset will return to D0Uninitialized with only PME context preserved if PME is supported and enabled. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1:0	RW	0x0	POWER_STATE PowerState. This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. You can write to this register; however, the read-back value is the actual power state, not the write value. If you attempt to write an unsupported, optional state to this field, the write operation completes normally; however, the data is discarded and no state change occurs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x0 (D0): D0 power state 0x1 (D1): D1 power state 0x2 (D2): D2 power state 0x3 (D3hot): D3hot D3hot power state Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

11.4.3.5 DSP_PCIE_MSI Registers Summary

Name	Offset	Size	Reset Value	Description
DSP_PCIE_MSI_CAP_ID_NEXT_CTRL_REG	0x0000	W	0x018A7005	MSI Capability Header and Message Control Register
DSP_PCIE_MSI_CAP_OFF_04H_REG	0x0004	W	0x00000000	Message Address Register for MSI (Offset 04h)
DSP_PCIE_MSI_CAP_OFF_08H_REG	0x0008	W	0x00000000	Message Address Register for MSI (Offset 08h)
DSP_PCIE_MSI_CAP_OFF_0CH_REG	0x000C	W	0x00000000	Message Address Register for MSI (Offset 0Ch)
DSP_PCIE_MSI_CAP_OFF_10H_REG	0x0010	W	0x00000000	Message Address Register for MSI (Offset 10h)
DSP_PCIE_MSI_CAP_OFF_14H_REG	0x0014	W	0x00000000	Message Address Register for MSI (Offset 14h)

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.3.6 DSP_PCIE_MSI Detail Registers Description

DSP_PCIE_MSI_CAP_ID_NEXT_CTRL_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved

Bit	Attr	Reset Value	Description
26	RO	0x0	PCI_MSI_EXT_DATA_EN Extended Message Data Enable. If set, the function is enabled to provide Extended Message Data. If clear, the function is not enabled to provide Extended Message Data. Note: The access attributes of this field are as follows: Wire: No access. Dbi: PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_MSI_EXT_DATA_CAP ? RW : RO Value After Reset: 0x0 Testable: writeAsRead
25	RO	0x0	PCI_MSI_EXT_DATA_CAP Extended Message Data Capable. If set, the function is capable of providing Extended Message Data. If clear, the function does not support providing Extended Message Data. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
24	RO	0x1	PCI_PVM_SUPPORT Per-Vector Masking Capable. If set, the function supports MSI Per-Vector Masking. If clear, the function does not support MSI Per-Vector Masking. This bit must be set if the function is a PF or VF within an SR-IOV Device. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
23	RO	0x1	PCI_MSI_64_BIT_ADDR_CAP 64 bit address capable. If set, the function is capable of sending a 64-bit message address. If clear, the function is not capable of sending a 64-bit message address. This bit must be set if the function is a PCI Express Endpoint. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
22:20	RW	0x0	PCI_MSI_MULTIPLE_MSG_EN Multiple Message Enable. Software writes to this field to indicate the number of allocated vectors (equal to or less than the number of requested vectors). The number of allocated vectors is aligned to a power of two. If a function requests four vectors (indicated by a Multiple Message Capable encoding of 010b), system software can allocate either four, two, or one vector by writing a 010b, 001b, or 000b to this field, respectively. When MSI is enabled, a function will be allocated at least 1 vector. All encodings other than the defined encodings are reserved. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x0 (_1_VECTOR): 1 vector allocated 0x1 (_2_VECTOR): 2 vectors allocated 0x2 (_4_VECTOR): 4 vectors allocated 0x3 (_8_VECTOR): 8 vectors allocated 0x4 (_16_VECTOR): 16 vectors allocated 0x5 (_32_VECTOR): 32 vectors allocated Value After Reset: 0x0

Bit	Attr	Reset Value	Description
19:17	RW	0x5	PCI_MSI_MULTIPLE_MSG_CAP Multiple Message Capable. System software reads this field to determine the number of requested vectors. The number of requested vectors must be aligned to a power of two (if a function requires three vectors, it requests four by initializing this field to 010b). All encodings other than the defined encodings are reserved. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (_1_VECTOR): 1 vector requested 0x1 (_2_VECTOR): 2 vectors requested 0x2 (_4_VECTOR): 4 vectors requested 0x3 (_8_VECTOR): 8 vectors requested 0x4 (_16_VECTOR): 16 vectors requested 0x5 (_32_VECTOR): 32 vectors requested Value After Reset: 0x5 Testable: unconstrained
16	RW	0x0	PCI_MSI_ENABLE MSI Enable. If set and the MSI-X Enable bit in the MSI-X Message Control register is clear, the function is permitted to use MSI to request service and is prohibited from using INTx interrupts. System configuration software sets this bit to enable MSI. A device driver is prohibited from writing this bit to mask a function's service request. For more details on control of INTx interrupts, see section 7.5.1.1 of PCI Express Base Specification. If clear, the function is prohibited from using MSI to request service. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15:8	RW	0x70	PCI_MSI_CAP_NEXT_OFFSET Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x70 Testable: unconstrained
7:0	RO	0x05	PCI_MSI_CAP_ID Capability ID. Indicates the MSI Capability structure. This field returns a Capability ID of 05h indicating that this is an MSI Capability structure. Value After Reset: 0x5

DSP_PCIE_MSI_CAP_OFF_04H_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	PCI_MSI_CAP_OFF_04H Message Address - System-specified message address. If the Message Enable bit (bit 16 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG register) is set, the contents of this field specify the DWORD-aligned address (Address[31:02]) for the MSI transaction. Address[1:0] are set to 00b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
1:0	RO	0x0	reserved

DSP_PCIE_MSI_CAP_OFF_08H_REG
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	PCI_MSI_CAP_OFF_0AH For a function that supports a 32-bit message address, this field contains Extended Message Data (System-specified message data). For the MSI Capability structures without per-vector masking, it must be implemented if the Extended Message Data Capable bit is set; otherwise, it is outside the MSI Capability structure and undefined. For the MSI Capability structures with Per-vector Masking, it must be implemented if the Extended Message Data Capable bit is set; otherwise, it is RsvdP. If the Extended Message Data Enable bit (bit 26 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the DWORD Memory Write transaction uses Extended Message Data for the upper 16 bits; otherwise, it uses 0000h for the upper 16 bits. For a function that supports a 64-bit message address, it contains upper 16 bits of the Message Upper Address. Note: The access attributes of this field are as follows: Wire: No access. Dbi: PCI_MSI_64_BIT_ADDR_CAP || `DEFAULT_EXT_MSI_DATA_CAPABLE ? R/W : R Value After Reset: 0x0 Testable: writeAsRead
15:0	RW	0x0000	PCI_MSI_CAP_OFF_08H For a function that supports a 32-bit message address, this field contains Message Data (System-specified message data). If the Message Enable bit (bit 16 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the function sends a DWORD Memory Write transaction using Message Data for the lower 16 bits. All 4 Byte Enables are set. The Multiple Message Enable field (bits 22:20 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010b indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000b, the Function is not permitted to modify the message data. For a function that supports a 64-bit message address, it contains lower 16 bits of the Message Upper Address. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0

DSP_PCIE_MSI_CAP_OFF_0CH_REG
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	PCI_MSI_CAP_OFF_0EH For a function that supports a 32-bit message address, this field contains the upper Mask Bits when the Per Vector Masking Capable bit (PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_PVM_SUPPORT) is set. For a function that supports a 64-bit message address, this field contains Message Data (System-specified message data). Note: The access attributes of this field are as follows: Wire: No access. Dbi: (!MSI_64_EN && MSI_PVM_EN_VALUE) ? RW: MSI_64_EN && DEFAULT_EXT_MSI_DATA_CAPABLE ? RW : RO Value After Reset: 0x0 Testable: writeAsRead
15:0	RW	0x0000	PCI_MSI_CAP_OFF_0CH For a function that supports a 32-bit message address, this field contains the lower Mask Bits when the Per Vector Masking Capable bit (PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_PVM_SUPPORT) is set. For a function that supports a 64-bit message address, this field contains Message Data (System-specified message data). If the Message Enable bit (bit 16 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the function sends a DWORD Memory Write transaction using Message Data for the lower 16 bits. All 4 Byte Enables are set. The Multiple Message Enable field (bits 22:20 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010b indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000b, the Function is not permitted to modify the message data. Note: The access attributes of this field are as follows: Wire: No access. Dbi: PCI_MSI_64_BIT_ADDR_CAP || MSI_PVM_EN ? R/W : R Value After Reset: 0x0 Testable: writeAsRead

DSP_PCIE_MSI_CAP_OFF_10H_REG

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	PCI_MSI_CAP_OFF_10H Used for MSI when the Per Vector Masking Capable bit (PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_PVM_SUPPORT) is set. For 32-bit contains Pending Bits. For 64-bit, contains Mask Bits. Note: The access attributes of this field are as follows: Wire: No access. Dbi: PCI_MSI_64_BIT_ADDR_CAP && MSI_PVM_EN ? R/W : R Value After Reset: 0x0 Testable: writeAsRead

DSP_PCIE_MSI_CAP_OFF_14H_REG
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	W1C	0x0	PCI_MSI_CAP_OFF_14H Pending Bits. For each pending bit that is set, the function has a pending associated message. Value After Reset: 0x0

11.4.3.7 DSP_PCIE_CAP Registers Summary

11.4.3.8 DSP_PCIE_CAP Detail Registers Description

DSP_PCIE_CAP_ID_PCIE_NEXT_CAP_PTR_PCIE_CAP_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:25	RW	0x08	PCIE_INT_MSG_NUM PCIE Interrupt Message Number. Interrupt Message Number. This field indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability structure. For MSI, the value in this field indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this field indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. If both MSI and MSI-X are implemented, they are permitted to use different vectors, though software is permitted to enable only one mechanism at a time. If MSI-X is enabled, the value in this field must indicate the vector for MSI-X. If MSI is enabled or neither is enabled, the value in this field must indicate the vector for MSI. If software enables both MSI and MSI-X at the same time, the value in this field is undefined. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x8 Testable: unconstrained

Bit	Attr	Reset Value	Description
24	RW	0x0	PCIE_SLOT_IMP Slot Implemented. When set, this bit indicates that the Link associated with this Port is connected to a slot (as compared to being connected to a system-integrated device or being disabled). This bit is valid for Downstream Ports. This bit is undefined for Upstream Ports. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
23:20	RO	0x4	PCIE_DEV_PORT_TYPE Device/Port Type. Indicates the specific type of this PCI Express function. Note: Different functions in a Multi-Function Device can generally be of different types. Defined encodings for functions that implement a Type 00h PCI Configuration Space header are: Defined encodings for functions that implement a Type 01h PCI Configuration Space header are: All other encodings are Reserved. Note: Different Endpoint types have notably different requirements in Section 1.3.2 of PCI Express Base Specification regarding I/O resources, Extended Configuration Space, and other capabilities. Values: 0x0 (PCIE_EP): PCI Express Endpoint 0x1 (PCIE_LEGACY_EP): Legacy PCI Express Endpoint 0x4 (ROOT_PORT_PCIE_RC): Root Port of PCI Express Root Complex 0x5 (USP_PCIE_SWITCH): Upstream Port of PCI Express Switch 0x6 (DSP_PCIE_SWITCH): Downstream Port of PCI Express Switch Value After Reset: 0x4 Testable: untestable Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
19:16	RO	0x2	PCIE_CAP_REG Capability Version. Indicates PCI-SIG defined PCI Express Capability structure version number. A version of the specification that changes the PCI Express Capability structure in a way that is not otherwise identifiable (for example, through a new Capability field) is permitted to increment this field. All such changes to the PCI Express Capability structure must be software-compatible. Software must check for Capability Version numbers that are greater than or equal to the highest number defined when the software is written, as functions reporting any such Capability Version numbers will contain a PCI Express Capability structure that is compatible with that piece of software. The controller hardwires this field to 2h for functions compliant to PCI Express Base Specification, Revision 4.0, Version 1.0. Note: This register field is sticky. Value After Reset: 0x2
15:8	RW	0xb0	PCIE_CAP_NEXT_PTR Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0xb0 Testable: unconstrained
7:0	RO	0x10	PCIE_CAP_ID Capability ID. Indicates the PCI Express Capability structure. This field must return a Capability ID of 10h indicating that this is a PCI Express Capability structure. Value After Reset: 0x10

DSP_PCIE_CAP_DEVICE_CAPABILITIES_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28	RW	0x0	PCIE_CAP_FLR_CAP Function Level Reset Capability. A value of 1b indicates the function supports the optional Function Level Reset mechanism described in section 6.6.2 of the PCI Express Base Specification. This bit applies to Endpoints only. For all other function types the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
27:26	RO	0x0	PCIE_CAP_CAP_SLOT_PWR_LMT_SCALE Captured Slot Power Limit Scale. Captured Slot Power Limit Scale (Upstream Ports only). Specifies the scale used for the Slot Power Limit Value. This value is set by the Set_Slot_Power_Limit Message or hardwired to 00b (for more details, see section 6.9 of PCI Express Base Specification). Values: 0x0 (_1.0X): 1.0x 0x1 (_0.1X): 0.1x 0x2 (_0.01X): 0.01x 0x3 (_0.001X): 0.001x Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
25:18	RO	0x00	PCIE_CAP_CAP_SLOT_PWR_LMT_VALUE Captured Slot Power Limit Value. Captured Slot Power Limit Value (Upstream Ports only). In combination with the Captured Slot Power Limit Scale value, specifies the upper limit on power available to the adapter. Power limit (in Watts) is calculated by multiplying the value in this field by the value in the Captured Slot Power Limit Scale field except when the Captured Slot Power Limit Scale field equals 00b (1.0x) and the Captured Slot Power Limit Value exceeds EFh, then alternative encodings are used (for more details, see section 7.5.3.9 of PCI Express Base Specification). This value is set by the Set_Slot_Power_Limit Message or hardwired to 00h (for more details, see section 6.9 of PCI Express Base Specification). Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
17:16	RO	0x0	reserved
15	RO	0x1	PCIE_CAP_ROLE_BASED_ERR_REPORT Role-Based Error Reporting. When set, this bit indicates that the function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be set by all functions conforming to the ECN, PCI Express Base Specification, Revision 1.1., or subsequent PCI Express Base Specification revisions. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
14:12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
11:9	RO	0x7	PCIE_CAP_EP_L1_ACCPT_LATENCY Endpoint L1 Acceptable Latency. This field indicates the acceptable latency that an Endpoint can withstand due to the transition from L1 state to the L0 state. It is essentially an indirect measure of the Endpoint's internal buffering. Power management software uses the reported L1 Acceptable Latency number to compare against the L1 Exit Latencies reported (see below) by all components comprising the data path from this Endpoint to the Root Complex Root Port to determine whether ASPM L1 entry can be used with no loss of performance. For functions other than Endpoints, this field is Reserved and the controller hardwires it to 000b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W (Sticky) else R(Sticky) Note: This register field is sticky. Values: 0x0 (MAX_1US): Maximum of 1 us 0x1 (MAX_2US): Maximum of 2 us 0x2 (MAX_4US): Maximum of 4 us 0x3 (MAX_8US): Maximum of 8 us 0x4 (MAX_16US): Maximum of 16 us 0x5 (MAX_32US): Maximum of 32 us 0x6 (MAX_64US): Maximum of 64 us 0x7 (NO_LIMIT): No limit Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
8:6	RW	0x7	PCIE_CAP_EP_L0S_ACCPT_LATENCY Endpoint L0s Acceptable Latency. This field indicates the acceptable total latency that an Endpoint can withstand due to the transition from L0s state to the L0 state. It is essentially an indirect measure of the Endpoint's internal buffering. Power management software uses the reported L0s Acceptable Latency number to compare against the L0s exit latencies reported by all components comprising the data path from this Endpoint to the Root Complex Root Port to determine whether ASPM L0s entry can be used with no loss of performance. For functions other than Endpoints, this field is Reserved and the controller hardwires it to 000b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (MAX_64NS): Maximum of 64 ns 0x1 (MAX_128NS): Maximum of 128 ns 0x2 (MAX_256NS): Maximum of 256 ns 0x3 (MAX_512NS): Maximum of 512 ns 0x4 (MAX_1US): Maximum of 1 us 0x5 (MAX_2US): Maximum of 2 us 0x6 (MAX_4US): Maximum of 4 us 0x7 (NO_LIMIT): No limit Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
5	RO	0x0	PCIE_CAP_EXT_TAG_SUPP Extended Tag Field Supported. This bit, in combination with the 10-Bit Tag Requester Supported bit in the Device Capabilities 2 register, indicates the maximum supported size of the Tag field as a Requester. This bit must be set if the 10-Bit Tag Requester Supported bit is set. Note: 8-bit Tag field generation must be enabled by the Extended Tag Field Enable bit in the Device Control register of the Requester Function before 8-bit Tags can be generated by the Requester. See Section 2.2.6.2 of PCI Express Base Specification for interactions with enabling the use of 10-Bit Tags. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (_5b_TAG): 5-bit Tag field supported 0x1 (_8b_TAG): 8-bit Tag field supported Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
4:3	RW	0x0	PCIE_CAP_PHANTOM_FUNC_SUPPORT Phantom Functions Supported. This field indicates the support for use of unclaimed function numbers to extend the number of outstanding transactions allowed by logically combining unclaimed function numbers (called Phantom Functions) with the Tag identifier (see Section 2.2.6.2 of PCI Express Base Specification for a description of Tag Extensions). With every Function in an ARI Device, the Phantom Functions Supported field must be set to 00b. The remainder of this field description applies only to non-ARI Multi-Function Devices. This field indicates the number of most significant bits of the Function Number portion of Requester ID that are logically combined with the Tag identifier. Note: Phantom Function support for the function must be enabled by the Phantom Functions Enable field in the Device Control register before the Function is permitted to use the Function Number field in the Requester ID for Phantom Functions. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (NO_PHNATOM_FUNC): No Function Number bits are used for Phantom Functions. Multi-Function Devices are permitted to implement up to 8 independent functions. 0x1 (MAX_1_PHANTOM_PER_FUNC): The most significant bit of the Function number in Requester ID is used for Phantom Functions; a Multi-Function Device is permitted to implement Functions 0-3. Functions 0, 1, 2, and 3 are permitted to use Function Numbers 4, 5, 6, and 7 respectively as Phantom Functions. 0x2 (MAX_3_PHANTOM_PER_FUNC): The two most significant bits of Function Number in Requester ID are used for Phantom Functions; a Multi-Function Device is permitted to implement Functions 0-1. Function 0 is permitted to use Function Numbers 2, 4, and 6 for Phantom Functions. Function 1 is permitted to use Function Numbers 3, 5, and 7 as Phantom Functions. 0x3 (SINGLE_FUNC_MAX_7_PHANTOM_FUNC): All 3 bits of Function Number in Requester ID used for Phantom Functions. The device must have a single Function 0 that is permitted to use all other Function Numbers as Phantom Functions. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
2:0	RW	0x0	PCIE_CAP_MAX_PAYLOAD_SIZE Max_Payload_Size Supported. This field indicates the maximum payload size that the function can support for TLPs. All encodings other than the defined encodings are reserved. The functions of a Multi-Function Device are permitted to report different values for this field. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (MAX_128B_SIZE): 128 bytes max payload size 0x1 (MAX_256B_SIZE): 256 bytes max payload size 0x2 (MAX_512B_SIZE): 512 bytes max payload size 0x3 (MAX_1024B_SIZE): 1024 bytes max payload size 0x4 (MAX_2048B_SIZE): 2048 bytes max payload size 0x5 (MAX_4096B_SIZE): 4096 bytes max payload size Value After Reset: 0x1 Testable: unconstrained

DSP_PCIE_CAP_DEVICE_CONTROL_DEVICE_STATUS

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21	RO	0x0	PCIE_CAP_TRANS_PENDING Transactions Pending. Endpoints: When set, this bit indicates that the function has issued Non-Posted Requests that have not been completed. A Function reports this bit cleared only when all outstanding Non-Posted Requests have completed or have been terminated by the Completion Timeout mechanism. This bit must also be cleared upon the completion of an FLR. Root and Switch Ports: The controller hardwires this bit to 0b. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
20	RO	0x0	PCIE_CAP_AUX_POWER_DETECTED AUX Power Detected. Functions that require Aux power report this bit as set if Aux power is detected by the function. This bit is derived by sampling the sys_aux_pwr_det input. Value After Reset: 0x1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
19	RW	0x0	PCIE_CAP_UNSUPPORTED_REQ_DETECTED Unsupported Request Detected. This bit indicates that the function received an Unsupported Request. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function Device, each function indicates status of errors as perceived by the respective function. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
18	W1C	0x0	PCIE_CAP_FATAL_ERR_DETECTED Fatal Error Detected. This bit indicates status of Fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For Functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
17	W1C	0x0	PCIE_CAP_NON_FATAL_ERR_DETECTED Non-Fatal Error Detected. This bit indicates status of Non-fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
16	W1C	0x0	PCIE_CAP_CORR_ERR_DETECTED Correctable Error Detected. This bit indicates status of correctable errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Correctable Error Mask register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15	RO	0x0	reserved

Bit	Attr	Reset Value	Description
14:12	RW	0x2	PCIE_CAP_MAX_READ_REQ_SIZE Max_Read_Request_Size. This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For functions that do not generate Read Requests larger than 128 bytes and functions that do not generate Read Requests on their own behalf, the controller implements this field as Read Only (RO) with a value of 000b. Values: 0x0 (MAX_128B_SIZE): 128 bytes maximum Read Request size 0x1 (MAX_256B_SIZE): 256 bytes maximum Read Request size 0x2 (MAX_512B_SIZE): 512 bytes maximum Read Request size 0x3 (MAX_1024B_SIZE): 1024 bytes maximum Read Request size 0x4 (MAX_2048B_SIZE): 2048 bytes maximum Read Request size 0x5 (MAX_4096B_SIZE): 4096 bytes maximum Read Request size 0x6 (RESERVED1): RESERVED 0x7 (RESERVED2): RESERVED Value After Reset: 0x
11	RO	0x0	PCIE_CAP_EN_NO_SNOOP Enable No Snoop. If this bit is set, the function is permitted to Set the No Snoop bit in the Requester Attributes of transactions it initiates that do not require hardware enforced cache coherency (see section 2.2.6.5 in PCI Express Base Specification). Note: Setting this bit to 1b should not cause a function to set the No Snoop attribute on all transactions that it initiates. Even when this bit is set, a function is only permitted to set the No Snoop attribute on a transaction when it can guarantee that the address of the transaction is not stored in any cache in the system. The controller hardwires this bit 0b if a function would never set the No Snoop attribute in transactions it initiates. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R Value After Reset: 0x0

Bit	Attr	Reset Value	Description
10	RW	0x0	PCIE_CAP_AUX_POWER_PM_EN Aux Power PM Enable. This bit is derived by sampling the sys_aux_pwr_det input. When set this bit, enables a function to draw Aux power independent of PME Aux power. Functions that require Aux power on legacy operating systems should continue to indicate PME Aux power requirements. Aux power is allocated as requested in the Aux_Current field of the Power Management Capabilities register (PMC), independent of the PME_En bit in the Power Management Control/Status register (PMCSR). For Multi-Function devices, a component is allowed to draw Aux power if at least one of the functions has this bit set. Note: Functions that consume Aux power must preserve the value of this sticky register when Aux power is available. In such functions, this bit is not modified by Conventional Reset. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
9	RO	0x0	PCIE_CAP_PHANTOM_FUNC_EN Phantom Functions Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, If this bit is set, it enables a function to use unclaimed functions as Phantom functions to extend the number of outstanding transaction identifiers If this bit is clear, the function is not allowed to use Phantom functions For more details, see section 2.2.6.2 of PCI Express Base Specification. Software should not change the value of this bit while the function has outstanding Non-Posted Requests; otherwise, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_PHANTOM_FUNC_SUPPORT ? RW : RO Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
8	RO	0x0	PCIE_CAP_EXT_TAG_EN Extended Tag Field Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, If the Extended Tag Field Enable bit is set, the function is permitted to use an 8-bit Tag field as a Requester If the Extended Tag Field Enable bit is clear, the Function is restricted to a 5-bit Tag field See section 2.2.6.2 of PCI Express Base Specification for required behavior when the 10-Bit Tag Requester Enable bit is set. If software changes the value of the Extended Tag Field Enable bit while the function has outstanding Non-Posted Requests, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_EXT_TAG_SUPP ? RW : RO Value After Reset: 0x1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
7:5	RW	0x0	PCIE_CAP_MAX_PAYLOAD_SIZE_CS Max_Payload_Size. This field sets maximum TLP payload size for the Function. As a Receiver, the Function must handle TLPs as large as the set value. As a Transmitter, the Function must not generate TLPs exceeding the set value. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported field (PCIE_CAP_MAX_PAYLOAD_SIZE) in the Device Capabilities (DEVICE_CAPABILITIES_REG) register (for more details, see section 7.5.3.3 of PCI Express Base Specification). This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For Functions that support only the 128-byte max payload size, the controller hardwires this field to 000b. System software is not required to program the same value for this field for all the Functions of a Multi-Function device (for more details, see section 2.2.2 of PCI Express Base Specification). For ARI Devices, Max_Payload_Size is determined solely by the setting in Function0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x0 (MAX_128B_SIZE): 128 bytes maximum Read Request size 0x1 (MAX_256B_SIZE): 256 bytes maximum Read Request size 0x2 (MAX_512B_SIZE): 512 bytes maximum Read Request size 0x3 (MAX_1024B_SIZE): 1024 bytes maximum Read Request size 0x4 (MAX_2048B_SIZE): 2048 bytes maximum Read Request size 0x5 (MAX_4096B_SIZE): 4096 bytes maximum Read Request size 0x6 (RESERVED1): RESERVED 0x7 (RESERVED2): RESERVED Value After Reset: 0x0

Bit	Attr	Reset Value	Description
4	RW	0x1	PCIE_CAP_EN_REL_ORDER Enable Relaxed Ordering. If this bit is set, the function is permitted to set the Relaxed Ordering bit in the Attributes field of transactions it initiates that do not require strong write ordering (for more details, see section 2.2.6.4 and section 2.4 of PCI Express Base Specification). For a function that never sets the Relaxed Ordering attribute in transactions it initiates as a Requester, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1
3	RW	0x0	PCIE_CAP_UNSUPPORT_REQ_REP_EN Unsupported Request Reporting Enable. This bit, in conjunction with other bits, controls the signaling of Unsupported Request Errors by sending error Messages (for more details, see section 6.2.5 and section 6.2.6 of PCI Express Base Specification). For a Multi-Function Device, this bit controls error reporting for each Function from point-of-view of the respective Function. Value After Reset: 0x0
2	RW	0x0	PCIE_CAP_FATAL_ERR_REPORT_EN Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_FATAL Messages (for more details, see section 6.2.5 and section 6.2.6 of of PCI Express Base Specification). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of Fatal errors is internal to the root. No external ERR_FATAL Message is generated. Value After Reset: 0x0
1	RW	0x0	PCIE_CAP_NON_FATAL_ERR_REPORT_EN Non-Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_NONFATAL Messages (for more details, see section 6.2.5 and Section 6.2.6 of PCI Express Base Specification). For a Multi-Function Device, this bit controls error reporting for each function from point-of-view of the respective Function. For a Root Port, the reporting of Non-fatal errors is internal to the root. No external ERR_NONFATAL Message is generated. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	PCIE_CAP_CORR_ERR_REPORT_EN Correctable Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_COR Messages (for more details, see section 6.2.5, section 6.2.6, and section 6.2.10.2 of PCI Express Base Specification). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of correctable errors is internal to the root. No external ERR_COR Message is generated. Value After Reset: 0x0

DSP_PCIE_CAP_LINK_CAPABILITIES_REG
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	PCIE_CAP_PORT_NUM Port Number. This field indicates the PCI Express Port number for the given PCI Express Link. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
23	RO	0x0	reserved
22	RW	0x1	PCIE_CAP_ASPM_OPT_COMPLIANCE ASPM Optionality Compliance. For a description of this standard PCIe register field, see the PCI Express Specification. Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
21	RW	0x1	PCIE_CAP_LINK_BW_NOT_CAP ASPM Optionality Compliance. This field must be set to 1b in all functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
20	RO	0x1	PCIE_CAP_DLL_ACTIVE_REP_CAP Data Link Layer Link Active Reporting Capable. For a Downstream Port, the controller hardwires this bit to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine. For a hot-plug capable Downstream Port (as indicated by the Hot-Plug Capable bit of the Slot Capabilities register) or a Downstream Port that supports Link speeds greater than 5.0 GT/s, the controller hardwires this bit to 1b. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b. Value After Reset: 0x1
19	RW	0x0	PCIE_CAP_SURPRISE_DOWN_ERR_REP_CAP Surprise Down Error Reporting Capable. For a Downstream Port, this bit must be set if the component supports the optional capability of detecting and reporting a Surprise Down error condition. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
18	RO	0x0	PCIE_CAP_CLOCK_POWER_MAN Clock Power Management. For Upstream Ports, a value of 1b in this bit indicates that the component tolerates the removal of any reference clock(s) via the "clock request" (CLKREQ#) mechanism when the Link is in the L1 and L2/L3 Ready Link states. A value of 0b indicates the component does not have this capability and that reference clock(s) must not be removed in these Link states. L1 PM Substates defines other semantics for the CLKREQ# signal, which are managed independently of Clock Power Management. This Capability is applicable only in form factors that support "clock request" (CLKREQ#) capability. For a Multi-Function device associated with an Upstream Port, each Function indicates its capability independently. Power Management configuration software must only permit reference clock removal if all functions of the Multi-Function device indicate a 1b in this bit. For ARI Devices, all Functions must indicate the same value in this bit. For Downstream Ports, the controller hardwires this bit to 0b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
17:15	RW	0x4	PCIE_CAP_L1_EXIT_LATENCY L1 Exit Latency. This field indicates the L1 exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from ASPM L1 to L0. If ASPM L1 is not supported, the value is undefined. Note: Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: CX_NFTS !=CX_COMM_NFTS DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (LESS_THAN_1US): Less than 1us 0x1 (_1US_TO_2US): 1 us to less than 2 us 0x2 (_2US_TO_4US): 2 us to less than 4 us 0x3 (_4US_TO_8US): 4 us to less than 8 us 0x4 (_8US_TO_16US): 8 us to less than 16 us 0x5 (_16US_TO_32US): 16 us to less than 32 us 0x6 (_32US_TO_64US): 32 us to 64 us 0x7 (GREATER_THAN_64US): More than 64 us Value After Reset: 0x4 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
14:12	RW	0x6	PCIE_CAP_L0S_EXIT_LATENCY L0s Exit Latency. This field indicates the L0s exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from L0s to L0. If L0s is not supported, the value is undefined; however, see the Implementation Note "Potential Issues With Legacy Software When L0s is Not Supported" in section 5.4.1.1 of PCI Express Base Specification for the recommended value. Note: Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: CX_NFTS !=CX_COMM_NFTS DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (LESS_THAN_64NS): Less than 64 ns 0x1 (_64NS_TO_128NS): 64 ns to less than 128 ns 0x2 (_128NS_TO_256NS): 128 ns to less than 256 ns 0x3 (_256NS_TO_512NS): 256 ns to less than 512 ns 0x4 (_512NS_TO_1US): 512 ns to less than 1 us 0x5 (_1US_TO_2US): 1 us to less than 2 us 0x6 (_2US_TO_4US): 2 us to 4 us 0x7 (GREATER_THAN_4US): More than 4 us Value After Reset: 0x6 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
11:10	RW	0x3	PCIE_CAP_ACTIVE_STATE_LINK_PM_SUPPORT Active State Power Management (ASPM) Support. This field indicates the level of ASPM supported on the given PCI Express Link. For more details on ASPM support requirements, see section 5.4.1 of PCI Express Base Specification. Multi-Function devices associated with an Upstream Port must report the same value in this field for all functions. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (NO_ASPM_SUP): No ASPM Support 0x1 (L0S_SUP): L0s Supported 0x2 (L1_SUP): L1 Supported 0x3 (L0S_L1_SUP): L0s and L1 Supported Value After Reset: 0x2 Testable: unconstrained

Bit	Attr	Reset Value	Description
9:4	RW	0x04	PCIE_CAP_MAX_LINK_WIDTH Maximum Link Width. This field indicates the maximum Link width (xN - corresponding to N Lanes) implemented by the component. This value is permitted to exceed the number of Lanes routed to the slot (Downstream Port), adapter connector (Upstream Port), or in the case of component-to-component connections, the actual wired connection width. All encodings other than the defined encodings are reserved. Multi-Function devices associated with an Upstream Port must report the same value in this field for all functions. In M-PCIe mode, the reset and dynamic values of this field are calculated by the controller. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. DSP_PCIE_CAP_LINK_CONTROL_LINK_STATUS_REG
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31	W1C	0x0	PCIE_CAP_LINK_AUTO_BW_STATUS Link Autonomous Bandwidth Status. This bit is set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. Value After Reset: 0x0 Reset Mask: 0x0

Bit	Attr	Reset Value	Description
30	W1C	0x0	PCIE_CAP_LINK_BW_MAN_STATUS Link Bandwidth Management Status. This bit is set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: A Link retraining has completed following a write of 1b to the Retrain Link bit. Note: This bit is set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. The default value of this bit is 0b. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
29	RO	0x0	PCIE_CAP_DLL_ACTIVE Data Link Layer Link Active. This bit indicates the status of the Data Link Control and Management State Machine. It returns a 1b to indicate the DL_Active state, 0b otherwise. This bit must be implemented if the Data Link Layer Link Active Reporting Capable bit is 1b. Otherwise, the controller hardwires it to 0b. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
28	RW	0x1	PCIE_CAP_SLOT_CLK_CONFIG Slot Clock Configuration. This bit indicates that the component uses the same physical reference clock that the platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference clock on the connector, this bit must be clear. For a Multi-Function Device, each Function must report the same value for this bit. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x1 Testable: unconstrained
27	RO	0x0	PCIE_CAP_LINK_TRAINING Link Training. This read-only bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state, or that 1b was written to the Retrain Link bit but Link training has not yet begun. Hardware clears this bit when the LTSSM exits the Configuration/Recovery state. This bit is not applicable and Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches, and the controller hardwires it to 0b. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
26	RO	0x0	reserved

Bit	Attr	Reset Value	Description
25:20	RO	0x00	PCIE_CAP_NEGO_LINK_WIDTH Negotiated Link Width. This field indicates the negotiated width of the given PCI Express Link. All encodings other than the defined encodings are reserved. The value in this field is undefined when the Link is not up. Values: 0x1 (X1): x1 0x2 (X2): x2 0x4 (X4): x4 0x8 (X8): x8 0xc (X12): x12 0x10 (X16): x16 0x20 (X32): x32 Value After Reset: 0x1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
19:16	RO	0x0	PCIE_CAP_LINK_SPEED Current Link Speed. This field indicates the negotiated Link speed of the given PCI Express Link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. All encodings other than the defined encodings are reserved. The value in this field is undefined when the Link is not up. Values: 0x1 (SUP_LINK_SPEED_FIELD_BIT_0): Supported Link Speeds Vector field bit 0 0x2 (SUP_LINK_SPEED_FIELD_BIT_1): Supported Link Speeds Vector field bit 1 0x3 (SUP_LINK_SPEED_FIELD_BIT_2): Supported Link Speeds Vector field bit 2 0x4 (SUP_LINK_SPEED_FIELD_BIT_3): Supported Link Speeds Vector field bit 3 0x5 (SUP_LINK_SPEED_FIELD_BIT_4): Supported Link Speeds Vector field bit 4 0x6 (SUP_LINK_SPEED_FIELD_BIT_5): Supported Link Speeds Vector field bit 5 0x7 (SUP_LINK_SPEED_FIELD_BIT_6): Supported Link Speeds Vector field bit 6 Value After Reset: 0x1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
15:14	RW	0x0	PCIE_CAP_DRS_SIGNALING_CONTROL DRS Signaling Control. Indicates the mechanism used to report reception of a DRS message. Must be implemented for Downstream Ports with the DRS Supported bit Set in the Link Capabilities 2 Register. Encodings are: If DRS Supported is set, receiving a DRS Message will set DRS Message Received in the Link Status 2 Register but will otherwise have no effect If the DRS Message Received bit in the Link Status 2 Register transitions from 0 to 1, and either MSI or MSI-X is enabled, an MSI or MSI-X interrupt is generated using the vector in Interrupt Message Number (section 7.5.3.2) If the DRS Message Received bit in the Link Status 2 Register transitions from 0 to 1, the Port must send an FRS Message Upstream with the FRS Reason field set to DRS Message Received. Behavior is undefined if this field is set to 10b and the FRS Supported bit in the Device Capabilities 2 Register is Clear. Behavior is undefined if this field is set to 11b. For Downstream Ports with the DRS Supported bit clear in the Link Capabilities 2 register, the controller hardwires this field to 00b. This field is Reserved for Upstream Ports. Note: The access attributes of this field are as follows: Wire: No access. Dbi: LINK_CAPABILITIES2_REG.DRS_SUPPORTED ? RW : RO Values: 0x0 (DRS_NOT_REPORTED): DRS not Reported 0x1 (DRS_INTRRUPT_EN): DRS Interrupt Enabled 0x2 (FRS_EN): DRS to FRS Signaling Enabled Value After Reset: 0x0 Testable: writeAsRead
13:12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
11	RW	0x0	PCIE_CAP_LINK_AUTO_BW_INT_EN Link Autonomous Bandwidth Management Interrupt Enable. When set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been set. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. When set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been set. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_LINK_BW_NOT_CAP ? RW : RO Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
9	RW	0x0	PCIE_CAP_HW_AUTO_WIDTH_DISABLE Hardware Autonomous Width Disable. When set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RW, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. For components that do not implement the ability autonomously to change Link width, the ciontroller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0

Bit	Attr	Reset Value	Description
8	RW	0x0	PCIE_CAP_EN_CLK_POWER_MAN Enable Clock Power Management. Applicable only for Upstream Ports and with form factors that support a "Clock Request" (CLKREQ#) mechanism, this bit operates as follows: For a non-ARI Multi-Function Device, power-management-configuration software must only Set this bit if all Functions of the Multi-Function Device indicate a 1b in the Clock Power Management bit of the Link Capabilities register. The component is permitted to use the CLKREQ# signal to power manage Link clock only if this bit is Set for all Functions. For ARI Devices, Clock Power Management is enabled solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. The CLKREQ# signal may also be controlled via the L1 PM Substates mechanism. Such control is not affected by the setting of this bit. For Downstream Ports and components that do not support Clock Power Management (as indicated by a 0b value in the Clock Power Management bit of the Link Capabilities register), the controller hardwires this bit to 0b. The write value is gated with the PCIE_CAP_CLOCK_POWER_MAN field in LINK_CAPABILITIES_REG. Note: The access attributes of this field are as follows: Wire: No access. Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_CLOCK_POWER_MAN ? RWS : ROS Note: This register field is sticky. Values: 0x0 (PM_DISABLE_LOW_CLKREQ): Clock power management is disabled and device must hold CLKREQ# signal low. 0x1 (CLKREQ_IN_USE): When this bit is set, the device is permitted to use CLKREQ# signal to power manage Link clock according to protocol defined in appropriate form factor specification. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
7	RW	0x0	PCIE_CAP_EXTENDED_SYNCH Extended Synch. When set, this bit forces the transmission of additional Ordered Sets when exiting the L0s state (see section 4.2.4.5 of PCI Express Base Specification) and when in the Recovery state (see section 4.2.6.4.1 of PCI Express Base Specification). This mode provides external devices (for example, logic analyzers) monitoring the Link time to achieve bit and Symbol lock before the Link enters the L0 state and resumes communication. For Multi-Function devices if any function has this bit set, then the component must transmit the additional Ordered Sets when exiting L0s or when in Recovery. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
6	RW	0x0	PCIE_CAP_COMMON_CLK_CONFIG Common Clock Configuration. When set, this bit indicates that this component and the component at the opposite end of this Link are operating with a distributed common reference clock. A value of 0b indicates that this component and the component at the opposite end of this Link are operating with asynchronous reference clock. For non-ARI Multi-Function Devices, software must program the same value for this bit in all Functions. If not all Functions are Set, then the component must as a whole assume that its reference clock is not common with the Upstream component. For ARI Devices, Common Clock Configuration is determined solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Components utilize this common clock configuration information to report the correct L0s and L1 Exit Latencies. After changing the value in this bit in both components on a Link, software must trigger the Link to retrain by writing a 1b to the Retrain Link bit of the Downstream Port. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
5	RW	0x0	PCIE_CAP_RETRAIN_LINK Retrain Link. A write of 1b to this bit initiates Link retraining by directing the Physical Layer LTSSM to the Recovery state. If the LTSSM is already in Recovery or Configuration, re-entering Recovery is permitted but not required. If the Port is in DPC when a write of 1b to this bit occurs, the result is undefined. Reads of this bit always return 0b. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress. This bit is not applicable and is Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. This bit always returns 0b when read. Note: The access attributes of this field are as follows: Wire: No access. Dbi: see description Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
4	RW	0x0	PCIE_CAP_LINK_DISABLE Link Disable. This bit disables the Link by directing the LTSSM to the Disabled state when set; this bit is Reserved on Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. Writes to this bit are immediately reflected in the value read from the bit, regardless of actual Link state. After clearing this bit, software must honor timing requirements defined in Section 6.6.1 with respect to the first Configuration Read following a Conventional Reset. In a DSP that supports crosslink, the controller gates the write value with the CROSS_LINK_EN field in PORT_LINK_CTRL_OFF. Note: The access attributes of this field are as follows: Wire: No access. Dbi: CX_CROSSLINK_ENABLE=1 && PORT_LINK_CTRL_OFF.CROSS_LINK_EN=1||CX_CROSSLINK_ENABLE=0 && dsp=1? RW : RO Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	PCIE_CAP_RCB Read Completion Boundary (RCB). Root Ports: Indicates the RCB value for the Root Port. Refer to section 2.3.1.1 of PCI Express Base Specification for the definition of the parameter RCB. The controller hardwires this bit for a Root Port and returns its RCB support capabilities. Endpoints and Bridges: Optionally set by configuration software to indicate the RCB value of the Root Port Upstream from the Endpoint or Bridge. Refer to Section 2.3.1.1 of PCI Express Base Specification for the definition of the parameter RCB is same as Root Port. Configuration software must only set this bit if the Root Port Upstream from the Endpoint or Bridge reports an RCB value of 128 bytes (a value of 1b in the Read Completion Boundary bit). For functions that do not implement this feature, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Values: 0x0 (_64B): 64 byte 0x1 (_128B): 128 byte Value After Reset: 0x0 Testable: unconstrained
2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1:0	RW	0x0	PCIE_CAP_ACTIVE_STATE_LINK_PM_CONTROL Active State Power Management (ASPM) Control. This field controls the level of ASPM enabled on the given PCI Express Link. See section 5.4.1.3 of PCI Express Base Specification for requirements on when and how to enable ASPM. Note: "L0s Entry Enabled" enables the Transmitter to enter L0s. If L0s is supported, the Receiver must be capable of entering L0s even when the Transmitter is disabled from entering L0s (00b or 10b). ASPM L1 must be enabled by software in the Upstream component on a Link prior to enabling ASPM L1 in the Downstream component on that Link. When disabling ASPM L1, software must disable ASPM L1 in the Downstream component on a Link prior to disabling ASPM L1 in the Upstream component on that Link. ASPM L1 must only be enabled on the Downstream component if both components on a Link support ASPM L1. For Multi-Function Devices (including ARI Devices), it is recommended that software program the same value for this field in all Functions. For non-ARI Multi-Function Devices, only capabilities enabled in all Functions are enabled for the component as a whole. For ARI Devices, ASPM Control is determined solely by the setting in Function0, regardless of Function 0's D-state. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Software must not enable L0s in either direction on a given Link unless components on both sides of the Link each support L0s; otherwise, the result is undefined. Values: 0x0 (DISABLED): Disabled 0x1 (L0S_ENTRY_EN): L0s Entry Enabled 0x2 (L1_ENTRY_En): L1 Entry Enabled 0x3 (L0S_L1_ENTRY_EN): L0s and L1 Entry Enabled Value After Reset: 0x0

DSP_PCIE_CAP_SLOT_CAPABILITIES_REG
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:19	RW	0x0000	PCIE_CAP_PHY_SLOT_NUM Physical Slot Number. This field indicates the physical slot number attached to this Port. This field must be hardware initialized to a value that assigns a slot number that is unique within the chassis, regardless of the form factor associated with the slot. This field must be initialized to zero for Ports connected to devices that are either integrated on the system board or integrated within the same silicon as the Switch device or Root Port. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
18	RW	0x0	PCIE_CAP_NO_CMD_CPL_SUPPORT No Command Completed Support. When set, this bit indicates that this slot does not generate software notification when an issued command is completed by the Hot-Plug Controller. This bit is only permitted to be set if the hot-plug capable Port is able to accept writes to all fields of the Slot Control register without delay between successive writes. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
17	RW	0x0	PCIE_CAP_ELECTROMECH_INTERLOCK Electromechanical Interlock Present. When set, this bit indicates that an Electromechanical Interlock is implemented on the chassis for this slot. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
16:15	RW	0x0	PCIE_CAP_SLOT_POWER_LIMIT_SCALE Slot Power Limit Scale. Specifies the scale used for the Slot Power Limit Value (for more details, see Section 6.9 of PCI Express Base Specification). This register must be implemented if the Slot Implemented bit is set. Writes to this register also cause the Port to send the Set_Slot_Power_Limit Message. The default value prior to hardware/firmware initialization is 00b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Values: 0x0 (_1.0X): 1.0x 0x1 (_0.1X): 0.1x 0x2 (_0.01X): 0.01x 0x3 (_0.001X): 0.001x Value After Reset: 0x0 Testable: unconstrained
14:7	RW	0x00	PCIE_CAP_SLOT_POWER_LIMIT_VALUE Slot Power Limit Value. In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by the slot (for more detais, see Section 6.9 of PCI Express Base Specification) or by other means to the adapter. Power limit (in Watts) is calculated by multiplying the value in this field by the value in the Slot Power Limit Scale field except when the Slot Power Limit Scale field equals 00b (1.0x) and Slot Power Limit Value exceeds EFh, the alternative encodings defined in Values: are used. Value F3h to FFh are Reserved for Slot Power Limit values above 300 W. This register must be implemented if the Slot Implemented bit is set. Writes to this register also cause the Port to send the Set_Slot_Power_Limit Message. The default value prior to hardware/firmware initialization is 0000 0000b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Values: 0xf0 (_250W_LIMIT): 250 W Slot Power Limit 0xf1 (_275W_LIMIT): 275 W Slot Power Limit 0xf2 (_300W_LIMIT): 300 W Slot Power Limit Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
6	RW	0x0	PCIE_CAP_HOT_PLUG_CAPABLE Hot-Plug Capable. When set, this bit indicates that this slot is capable of supporting hot-plug operations. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
5	RW	0x0	PCIE_CAP_HOT_PLUG_SURPRISE Hot-Plug Surprise. When set, this bit indicates that an adapter present in this slot might be removed from the system without any prior notification. This is a form factor specific capability. This bit is an indication to the operating system to allow for such removal without impacting continued software operation. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
4	RW	0x0	PCIE_CAP_POWER_INDICATOR Power Indicator Present. When set, this bit indicates that a Power Indicator is electrically controlled by the chassis for this slot. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
3	RW	0x0	PCIE_CAP_ATTENTION_INDICATOR Attention Indicator Present. When set, this bit indicates that an Attention Indicator is electrically controlled by the chassis. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
2	RW	0x0	PCIE_CAP_MRL_SENSOR MRL Sensor Present. When set, this bit indicates that an MRL Sensor is implemented on the chassis for this slot. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
1	RW	0x0	PCIE_CAP_POWER_CONTROLLER Power Controller Present. When set, this bit indicates that a software programmable Power Controller is implemented for this slot/adapter (depending on form factor). Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
0	RW	0x0	PCIE_CAP_ATTENTION_INDICATOR_BUTTON Attention Button Present. When set, this bit indicates that an Attention Button for this slot is electrically controlled by the chassis. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained

DSP_PCIE_CAP_SLOT_CONTROL_SLOT_STATUS

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	W1C	0x0	PCIE_CAP_DLL_STATE_CHANGED Data Link Layer State Changed. This bit is set when the value reported in the Data Link Layer Link Active bit of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read the Data Link Layer Link Active bit of the Link Status register to determine if the Link is active before initiating configuration cycles to the hot plugged device. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
23	RO	0x0	PCIE_CAP_ELECTROMECH_INTERLOCK_STATUS Electromechanical Interlock Status. If an Electromechanical Interlock is implemented, this bit indicates the status of the Electromechanical Interlock. Values: 0x0 (DISENGAGED): Electromechanical Interlock Disengaged 0x1 (ENGAGED): Electromechanical Interlock Engaged Value After Reset: 0x0
22	RO	0x0	PCIE_CAP_PRESENCE_DETECT_STATE Presence Detect State. This bit indicates the presence of an adapter in the slot, reflected by the logical "OR" of the Physical Layer in-band presence detect mechanism and, if present, any out-of-band presence detect mechanism defined for the slot's corresponding form factor. Note that the in-band presence detect mechanism requires that power be applied to an adapter for its presence to be detected. Consequently, form factors that require a power controller for hot-plug must implement a physical pin presence detect mechanism. This bit must be implemented on all Downstream Ports that implement slots. For Downstream Ports not connected to slots (where the Slot Implemented bit of the PCI Express Capabilities register is 0b), the controller hardwires this bit to 1b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R Values: 0x0 (EMPTY_SLOT): Slot Empty 0x1 (ADAPTER_PRESENT_IN_SLOT): Adapter Present in slot Value After Reset: 0x1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
21	RO	0x0	PCIE_CAP_MRL_SENSOR_STATE MRL Sensor State. This bit reports the status of the MRL sensor if implemented. Encodings are define as above. Values: 0x0 (MRL_CLOSED): MRL Closed 0x1 (MRL_OPEN): MRL Open Value After Reset: 0x0

Bit	Attr	Reset Value	Description
20	W1C	0x0	PCIE_CAP_CMD_CPLD Command Completed. If Command Completed notification is supported (if the No Command Completed Support bit in the Slot Capabilities register is 0b), this bit is set when a hot-plug command has completed and the Hot-Plug Controller is ready to accept a subsequent command. The Command Completed status bit is set as an indication to host software that the Hot-Plug Controller has processed the previous command and is ready to receive the next command; it provides no guarantee that the action corresponding to the command is complete. If Command Completed notification is not supported, the controller hardwires this bit to 0b. Value After Reset: 0x0
19	W1C	0x0	PCIE_CAP_PRESENCE_DETECTED_CHANGED Presence Detect Changed. This bit is set when the value reported in the Presence Detect State bit is changed. Value After Reset: 0x0
18	W1C	0x0	PCIE_CAP_MRL_SENSOR_CHANGED MRL Sensor Changed. If an MRL sensor is implemented, this bit is set when a MRL Sensor state change is detected. If an MRL sensor is not implemented, this bit must not be set. Value After Reset: 0x0
17	W1C	0x0	PCIE_CAP_POWER_FAULT_DETECTED Power Fault Detected. If a Power Controller that supports power fault detection is implemented, this bit issSet when the Power Controller detects a power fault at this slot. Note: Depending on hardware capability, it is possible that a power fault can be detected at any time, independent of the Power Controller Control setting or the occupancy of the slot. If power fault detection is not supported, this bit must not be set. Value After Reset: 0x0
16	W1C	0x0	PCIE_CAP_ATTENTION_BUTTON_PRESSED Attention Button Pressed. If an Attention Button is implemented, this bit is set when the attention button is pressed. If an Attention Button is not supported, this bit must not be set. Value After Reset: 0x0
15:13	RO	0x0	reserved
12	RW	0x0	PCIE_CAP_DLL_STATE_CHANGED_EN Data Link Layer State Changed Enable. If the Data Link Layer Link Active Reporting capability is 1b, this bit enables software notification when Data Link Layer Link Active bit is changed. If the Data Link Layer Link Active Reporting Capable bit is 0b, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
11	WO	0x0	PCIE_CAP_ELECTROMECH_INTERLOCK_CTRL Electromechanical Interlock Control. If an Electromechanical Interlock is implemented, a write of 1b to this bit causes the state of the interlock to toggle. A write of 0b to this bit has no effect. A read of this bit always returns a 0b. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
10	RW	0x0	PCIE_CAP_POWER_CONTROLLER_CTRL Power Controller Control. If a Power Controller is implemented, this bit when written sets the power state of the slot per the defined encodings. Reads of this bit must reflect the value from the latest write, even if the corresponding hot-plug command is not complete, unless software issues a write, if required to, without waiting for the previous command to complete in which case the read value is undefined. Note: In some cases the power controller may autonomously remove slot power or not respond to a power-up request based on a detected fault condition, independent of the Power Controller Control setting. If the Power Controller Present bit in the Slot Capabilities register is clear, then writes to this bit have no effect and the read value of this bit is undefined. Values: 0x0 (PWR_ON): Power On 0x1 (PWR_OFF): Power Off Value After Reset: 0x0
9:8	RW	0x3	PCIE_CAP_POWER_INDICATOR_CTRL Power Indicator Control. If a Power Indicator is implemented, writes to this field set the Power Indicator to the written state. Reads of this field must reflect the value from the latest write, even if the corresponding hot-plug command is not complete, unless software issues a write without waiting, if required to, for the previous command to complete in which case the read value is undefined. Note: The default value of this field must be one of the non-Reserved values. If the Power Indicator Present bit in the Slot Capabilities register is 0b, this bit is permitted to be read-only with a value of 00b. Values: 0x0 (RESERVED): Reserved 0x1 (ON): On 0x2 (BLINK): Blink 0x3 (OFF): Off Value After Reset: 0x3

Bit	Attr	Reset Value	Description
7:6	RW	0x3	PCIE_CAP_ATTENTION_INDICATOR_CTRL Attention Indicator Control. If an Attention Indicator is implemented, writes to this field set the Attention Indicator to the written state. Reads of this field must reflect the value from the latest write, even if the corresponding hot-plug command is not complete, unless software issues a write without waiting, if required to, for the previous command to complete in which case the read value is undefined. Note: The default value of this field must be one of the non-Reserved values. If the Attention Indicator Present bit in the Slot Capabilities register is 0b, this bit is permitted to be read-only with a value of 00b. Values: 0x0 (RESERVED): Reserved 0x1 (ON): On 0x2 (BLINK): Blink 0x3 (OFF): Off Value After Reset: 0x3
5	RW	0x0	PCIE_CAP_HOT_PLUG_INT_EN Hot-Plug Interrupt Enable. When set, this bit enables generation of an interrupt on enabled hot-plug events. If the Hot Plug Capable bit in the Slot Capabilities register is clear, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0
4	RW	0x0	PCIE_CAP_CMD_CPL_INT_EN Command Completed Interrupt Enable. If Command Completed notification is supported (if the No Command Completed Support bit in the Slot Capabilities register is 0b), when set, this bit enables software notification when a hot-plug command is completed by the Hot-Plug Controller. If Command Completed notification is not supported, the controller hardwires this bit must to 0b. Write value is gated with PCIE_CAP_NO_CMD_CPL_SUPPORT field in SLOT_CAPABILITIES_REG. Note: The access attributes of this field are as follows: Wire: No access. Dbi: SLOT_CAPABILITIES_REG.PCIE_CAP_NO_CMD_CPL_SUPPORT ? RO : RW Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	PCIE_CAP_PRESENCE_DETECT_CHANGE_EN Presence Detect Changed Enable. When set, this bit enables software notification on a presence detect changed event (for more details, see Section 6.7.3 of PCI Express Base Specification). If the Hot-Plug Capable bit in the Slot Capabilities register is 0b, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0
2	RW	0x0	PCIE_CAP_MRL_SENSOR_CHANGED_EN MRL Sensor Changed Enable. When set, this bit enables software notification on a MRL sensor changed event (for more details, see Section 6.7.3 of PCI Express Base Specification). If the MRL Sensor Present bit in the Slot Capabilities register is Clear, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0
1	RW	0x0	PCIE_CAP_POWER_FAULT_DETECTED_EN Power Fault Detected Enable. When set, this bit enables software notification on a power fault event (for more details, see Section 6.7.3 of PCI Express Base Specification). If a Power Controller that supports power fault detection is not implemented, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0
0	RW	0x0	PCIE_CAP_ATTENTION_BUTTON_PRESSED_EN Attention Button Pressed Enable. When set to 1b, this bit enables software notification on an attention button pressed event (for more details, see Section 6.7.3 of PCI Express Base Specification). If the Attention Button Present bit in the Slot Capabilities register is 0b, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0

DSP_PCIE_CAP_ROOT_CONTROL_ROOT_CAPABILITIES_REG

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x1	PCIE_CAP_CRS_SW_VISIBILITY CRS Software Visibility Capable. When set, this bit indicates that the Root Port is capable of returning Configuration Request Retry Status (CRS) Completion Status to software (for more details, see section 2.3.1 of PCI Express Base Specification). Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W (Sticky) else R (Sticky) Note: This register field is sticky. 23:22	RW	0x1	PCIE_CAP2_CFG_MAX_END2END_TLP_PRFXS Max End-End TLP Prefixes. Indicates the maximum number of End-End TLP Prefixes supported by this Function. For more details, see Section 2.2.10.2 of PCI Express Base Specification. If End-End TLP Prefix Supported is clear, this field is RsvdP. Different Root Ports that have the End-End TLP Prefix Supported bit set are permitted to report different values for this field. For Switches where End-End TLP Prefix Supported is set, this field must be 00b indicating support for up to four End-End TLP Prefixes. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x1 (ONE_END_END_TLP_PREFIX): 1 End-End TLP Prefix 0x2 (TWO_END_END_TLP_PREFIX): 2 End-End TLP Prefixes 0x3 (THREE_END_END_TLP_PREFIX): 3 End-End TLP Prefixes 0x0 (FOUR_END_END_TLP_PREFIX): 4 End-End TLP Prefixes Value After Reset: 0x1 Testable: unconstrained
21	RW	0x1	PCIE_CAP2_CFG_END2END_TLP_PRFX_SUPPORT End-End TLP Prefix Supported. Indicates whether End-End TLP Prefix support is offered by a Function. Values are: All Ports of a Switch must have the same value for this bit. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (NO_SUP): No Support 0x1 (SUP): Support is provided to receive TLPs containing End-End TLP Prefixes. Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
20	RW	0x1	PCIE_CAP2_CFG_EXTND_FMT_SUPPOR Extended Fmt Field Supported. If set, the Function supports the 3-bit definition of the Fmt field. If clear, the Function supports a 2-bit definition of the Fmt field. For more details, see section 2.2 of PCI Express Base Specification. Must be set for Functions that support End-End TLP Prefixes. All Functions in an Upstream Port must have the same value for this bit. Each Downstream Port of a component may have a different value for this bit. It is strongly recommended that Functions support the 3-bit definition of the Fmt field. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
19:18	RO	0x3	PCIE_CAP_OBFF_SUPPORT OBFF Supported. This field indicates if OBFF is supported and, if so, what signaling mechanism is used. The value reported in this field must indicate support for WAKE# signaling only if: for a Downstream Port, driving the WAKE# signal for OBFF is supported and the connector or component connected Downstream is known to receive that same WAKE# signal for an Upstream Port, receiving the WAKE# signal for OBFF is supported and, if the component is on an add-in-card, that the component is connected to the WAKE# signal on theconnector. Root Ports, Switch Ports, and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this field. For Bridges and Ports that do not implement this capability, the controller hardwires this field to 00b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Note: This register field is sticky. Values: 0x0 (NOT_SUP): OBFF Not Supported 0x1 (SUP_USING_MSG): OBFF supported using Message signaling only 0x2 (SUP_USING_WAKE): OBFF supported using WAKE# signaling only 0x3 (SUP_USING_MSG_AND_WAKE): OBFF supported using WAKE# and Message signaling Value After Reset: 0x3 Testable: unconstrained
17	RO	0x0	PCIE_CAP2_10_BIT_TAG_REQ_SUPPORT 10-Bit Tag Requester Supported. If this bit is set, the Function supports 10-Bit Tag Requester capability; otherwise, the Function does not. This bit must not be set if the 10-Bit Tag Completer Supported bit is clear. Note: 10-Bit Tag field generation must be enabled by the 10-Bit Tag Requester Enable bit in the Device Control 2 register of the Requester Function before 10-Bit Tags can be generated by the Requester. For more details, see section 2.2.6.2. of PCI Express Base Specification. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
16	RO	0x0	PCIE_CAP2_10_BIT_TAG_COMP_SUPPORT 10-Bit Tag Completer Supported. If this bit is set, the Function supports 10-Bit Tag Completer capability; otherwise, the Function does not. For more details, see section 2.2.6.2. of PCI Express Base Specification. Value After Reset: 0x0
15:14	RO	0x0	PCIE_CAP2_LN_SYS_CLS LN System CLS. Applicable only to Root Ports and RCRBs; must be 00b for all other Function types. This field indicates if the Root Port or RCRB supports LN protocol as an LN Completer, and if so, what cacheline size is in effect. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x0 (LN_COMPLETER_NO_SUP): LN Completer either not supported or not in effect 0x1 (LN_COMPLETER_64B_CACHE): LN Completer with 64-byte cachelines in effect 0x2 (LN_COMPLETER_128B_CACHE): LN Completer with 128-byte cachelines in effect Value After Reset: 0x0
13	RO	0x0	PCIE_CAP_TPH_CMPLT_SUPPORT_1 TPH Completer Supported Bit 1. Value After Reset: 0x0
12	RO	0x0	PCIE_CAP_TPH_CMPLT_SUPPORT_0 TPH Completer Supported Bit 0. Value of this bit along with TPH Completer Supported Bit 1 indicates Completer support for TPH or Extended TPH. Applicable only to Root Ports and Endpoints. For all other Functions, this field is Reserved. For more details, see section 6.17 of PCI Express Base Specification. Values: 0x0 (TPH_EXT_TPH_CMPL_NOT_SUP_OR_RSVD): TPH and Extended TPH Completer not supported (if TPH Completer Supported Bit is 0) or Reserved ((if TPH Completer Supported Bit is 1). 0x1 (TPH_SUP_EXT_TPH_NOT_SUP_OR_BOTH_SUPP): TPH Completer supported; Extended TPH Completer not supported(if TPH Completer Supported Bit is 0) or Both TPH and Extended TPH Completer supported ((if TPH Completer Supported Bit is 1). Value After Reset: 0x0

Bit	Attr	Reset Value	Description
11	RW	0x1	PCIE_CAP_LTR_SUPP LTR Mechanism Supported. A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism. Root Ports, Switches and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this bit. For Bridges and other Functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
10	RO	0x0	PCIE_CAP_NO_RO_EN_PR2PR_PAR No RO-enabled PR-PR Passing. If this bit is set, the routing element never carries out the passing permitted by Table 2-39 of PCI Express Base Specification entry A2b that is associated with the Relaxed Ordering Attribute field being Set. This bit applies only for Switches and RCs that support peer-to-peer traffic between Root Ports. This bit applies only to Posted Requests being forwarded through the Switch or RC and does not apply to traffic originating or terminating within the Switch or RC itself. All Ports on a Switch or RC must report the same value for this bit. For all other functions, this bit must be 0b. Value After Reset: 0x1
9	RO	0x0	PCIE_CAP_128_CAS_CPL_SUPP 128-bit CAS Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. This bit must be set to 1b if the Function supports this optional capability. For more details, see section 6.15 of PCI Express Base Specification. Value After Reset: 0x0
8	RO	0x0	PCIE_CAP_64_ATOMIC_CPL_SUPP 64-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more details on additional RC requirements, see section 6.15.3.1 of PCI Express Base Specification. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
7	RO	0x0	PCIE_CAP_32_ATOMIC_CPL_SUPP 32-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more details on additional RC requirements, see section 6.15.3.1 of PCI Express Base Specification. Value After Reset: 0x0
6	RO	0x0	PCIE_CAP_ATOMIC_ROUTING_SUPP AtomicOp Routing Supported. Applicable only to Switch Upstream Ports, Switch Downstream Ports, and Root Ports; must be 0b for other Function types. This bit must be set to 1b if the Port supports this optional capability. For more details, see section 6.15 of PCI Express Base Specification. Value After Reset: 0x0
5	RO	0x1	PCIE_CAP_ARI_FORWARD_SUPPORT ARI Forwarding Supported. Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. For more details, see section 6.13 of PCI Express Base Specification. Value After Reset: 0x1
4	RO	0x1	PCIE_CAP_CPL_TIMEOUT_DISABLE_SUPPORT Completion Timeout Disable Supported. A value of 1b indicates support for the Completion Timeout Disable mechanism. The Completion Timeout Disable mechanism is required for Endpoints that issue Requests on their own behalf and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. This mechanism is optional for Root Ports. For all other Functions this field is Reserved and the controller hardwires this bit to 0b. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
3:0	RO	0x0	PCIE_CAP_CPL_TIMEOUT_RANGE Completion Timeout Ranges Supported. This field indicates device Function support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue Requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. For all other Functions this field is Reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50 us to 10 ms Range B: 10 ms to 250 ms Range C: 250 ms to 4 s Range D: 4 s to 64 s Bits are set according to the list below to show timeout value ranges supported. All encodings other than the defined encodings are reserved. It is strongly recommended that the Completion Timeout mechanism not expire in less than 10 ms. Values: 0x0 (NOT_SUP): Completion Timeout programming not supported, the Function must implement a timeout value in the range 50 us to 50 ms. 0x1 (RANGE_A): Range A 0x2 (RANGE_B): Range B 0x3 (RANGE_A_B): Ranges A and B 0x6 (RANGE_B_C): Ranges B and C 0x7 (RANGE_A_B_C): Ranges A, B, and C 0xe (RANGE_B_C_D): Ranges B, C, and D 0xf (RANGE_A_B_C_D): Ranges A, B, C, and D Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15	RW	0x0	PCIE_CTRL2_CFG_END2END_TLP_PFX_BLCK End-End TLP Prefix Blocking. Controls whether the routing function is permitted to forward TLPs containing an End-End TLP Prefix. This bit affects TLPs that exit the Switch/Root Complex using the associated Port. It does not affect TLPs forwarded internally within the Switch/Root Complex. It does not affect TLPs that enter through the associated Port, that originate in the associated Port or originate in a Root Complex Integrated Device integrated with the associated Port. Blocked TLPs are reported by the TLP Prefix Blocked Error. This bit is hardwired to 1b in Root Ports that support End-End TLP Prefixes but do not support forwarding of End-End TLP Prefixes. This bit is applicable to Root Ports and Switch Ports where the End-End TLP Prefix Supported bit is set. This bit is not applicable and is RsvdP in all other cases. Note: The access attributes of this field are as follows: Wire: No access. Dbi: DEVICE_CAPABILITIES2_REG.PCIE_CAP2_CFG_END2END_TLP_PRFX_SUPPORT ? RW : RO Values: 0x0 (FORWARDING_EN): Forwarding Enabled, Function is permitted to send TLPs with End-End TLP Prefixes. 0x1 (FORWARDING_BL): Forwarding Blocked, Function is not permitted to send TLPs with End-End TLP Prefixes. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
14:13	RW	0x0	PCIE_CAP_OBFF_EN OBFF Enable. This field enables the OBFF mechanism and selects the signaling method. For more details on these encodings, see section 6.19 of PCI Express Base Specification. This field is required for all Ports that support the OBFF Capability. For a Multi-Function Device associated with an Upstream Port of a Device that implements OBFF, the field in Function 0 is of type RW, and only Function 0 controls the Component's behavior. In all other Functions of that Device, this field is of type RsvdP. Ports that do not implement OBFF are permitted to hardwire this field to 00b Note: RW for function #0 and RsdvP for all other functions. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (pf=0 && DEVICE_CAPABILITIES2_REG.PCIE_CAP_OBFF_SUPPORT) then R/W else R Values: 0x0 (DISABLED): Disabled 0x1 (EN_USING_MSG_SIG_A): Enabled using Message signaling [Variation A] 0x2 (EN_USING_MSG_SIG_B): Enabled using Message signaling [Variation B] 0x3 (EN_USING_WAKE_SIG): Enabled using WAKE# signaling Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
6	RO	0x0	PCIE_CAP_SEL_DEEMPHASIS Selectable De-emphasis. When the Link is operating at 5.0 GT/s speed, this bit is used to control the transmit de-emphasis of the link in specific situations. For more details, see section 4.2.6 of PCI Express Base Specification. When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. This bit is not applicable and Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (_3_5_DB): -3.5 dB 0x0 (_6_DB): -6 dB Value After Reset: 0x0 Testable: unconstrained
5	RW	0x0	PCIE_CAP_HW_AUTO_SPEED_DISABLE Hardware Autonomous Speed Disable. When set, this bit disables hardware from changing the Link speed for device-specific reasons other than attempting to correct unreliable Link operation by reducing Link speed. Initial transition to the highest supported common link speed is not blocked by this bit. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
4	RW	0x0	PCIE_CAP_ENTER_COMPLIANCE Enter Compliance. Software is permitted to force a Link to enter Compliance mode (at the speed indicated in the Target Link Speed field and the de-emphasis/preset level indicated by the Compliance Preset/De-emphasis field) by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3:0	RW	0x3	PCIE_CAP_TARGET_LINK_SPEED Target Link Speed. For Downstream Ports, this field sets an upper limit on Link operational speed by restricting the values advertised by the Upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All encodings other than the defined encodings are reserved. If a value is written to this field that does not correspond to a supported speed (as indicated by the Supported Link Speeds Vector), the result is undefined. If either of the Enter Compliance or Enter Modified Compliance bits are implemented, then this field must also be implemented. The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode. For Upstream Ports, if the Enter Compliance bit is Clear, this field is permitted to have no effect. For a Multi-Function Device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Components that support only the 2.5 GT/s speed are permitted to hardwire this field to 0000b. In M-PCIe mode, the contents of this field are derived from other registers. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (SUP_LINK_SPEED_VECTOR_BIT_0): Supported Link Speeds Vector field bit 0 0x2 (SUP_LINK_SPEED_VECTOR_BIT_1): Supported Link Speeds Vector field bit 1 0x3 (SUP_LINK_SPEED_VECTOR_BIT_2): Supported Link Speeds Vector field bit 2 0x4 (SUP_LINK_SPEED_VECTOR_BIT_3): Supported Link Speeds Vector field bit 3 0x5 (SUP_LINK_SPEED_VECTOR_BIT_4): Supported Link Speeds Vector field bit 4 0x6 (SUP_LINK_SPEED_VECTOR_BIT_5): Supported Link Speeds Vector field bit 5 0x7 (SUP_LINK_SPEED_VECTOR_BIT_6): Supported Link Speeds Vector field bit 6 Value After Reset: 0x3 Testable: unconstrained

11.4.3.9 DSP_PCIE_MSIX Registers Summary

Name	Offset	Size	Reset Value	Description
DSP_PCIE_MSIX_CAP_ID_NEXT_CTRL_REG	0x0000	W	0x003F0011	MSI-X Capability ID, Next Pointer, Control Registers
DSP_PCIE_MSIX_TABLE_OFFSET_REG	0x0004	W	0x00020004	MSI-X Table Offset and BIR Register
DSP_PCIE_MSIX_PBA_OFFSET_REG	0x0008	W	0x00028004	MSI-X PBA Offset and BIR Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.3.10 DSP_PCIE_MSIX Detail Registers Description

DSP_PCIE_MSIX_CAP_ID_NEXT_CTRL_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RW	0x0	PCI_MSIX_ENABLE MSI-X Enable. If Set and the MSI Enable bit in the MSI Message Control Register for MSI is Clear, the Function is permitted to use MSI-X to request service and is prohibited from using INTx interrupts (if implemented). System configuration software Sets this bit to enable MSI-X. A device driver is prohibited from writing this bit to mask a Function's service request. If Clear, the Function is prohibited from using MSI-X to request service. Value After Reset: 0x0
30	RW	0x0	PCI_MSIX_FUNCTION_MASK Function Mask. If Set, all of the vectors associated with the Function are masked, regardless of their per-vector Mask bit values. If Clear, each vector's Mask bit determines whether the vector is masked or not. Setting or Clearing the MSI-X Function Mask bit has no effect on the value of the per-vector Mask bits. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
29:27	RO	0x0	reserved

Bit	Attr	Reset Value	Description
26:16	RW	0x03f	PCI_MSIX_TABLE_SIZE MSI-X Table Size. System software reads this field to determine the MSI-X Table Size N, which is encoded as N-1. For example, a returned value of 000 0000 0011b indicates a table size of 4. SRIOV Note: All VFs in a single PF have the same value for "MSI-X Table Size" (PCI_MSIX_TABLE_SIZE field in SHADOW_PCI_MSIX_CAP_ID_NEXT_CTRL_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_TABLE_SIZE field in the PF PCI_MSIX_CAP_ID_NEXT_CTRL_REG register. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x7f Testable: unconstrained
15:8	RW	0x00	PCI_MSIX_CAP_NEXT_OFFSET MSI-X Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
7:0	RO	0x11	PCI_MSIX_CAP_ID MSI-X Capability ID. This field indicates the MSI-X Capability structure. This field must return a Capability ID of 11h indicating that this is an MSI-X Capability structure. Value After Reset: 0x11

DSP_PCIE_MSIX_TABLE_OFFSET_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:3	RW	0x00004000	PCI_MSIX_TABLE_OFFSET MSI-X Table Offset. Used as an offset from the address contained by one of the Function's Base Address Registers to point to the base of the MSI-X Table. The lower 3 Table BIR bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. SRIOV Note: All VFs in a single PF have the same value for "MSI-X Table Offset" (PCI_MSIX_TABLE_OFFSET field in SHADOW_MSIX_TABLE_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_TABLE_OFFSET field in the PF MSIX_TABLE_OFFSET_REG register. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x4000 Testable: unconstrained

Bit	Attr	Reset Value	Description
2:0	RW	0x4	PCI_MSIX_BIR MSI-X Table BAR Indicator Register Field. This field indicates which one of a Function's Base Address Registers , located beginning at 10h in Configuration Space, or entry in the Enhanced Allocation capability with a matching BEI , is used to map the Function's MSI-X Table into Memory Space. All encodings other than the defined encodings are reserved. For a 64-bit Base Address Register , the Table BIR indicates the lower DWORD. For Functions with Type 1 Configuration Space headers, BIR values 2 through 5 are also Reserved. SRIOV Note: All VFs in a single PF have the same value for "MSI-X Table BAR Indicator Register" (PCI_MSIX_BIR field in SHADOW_MSIX_TABLE_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_BIR field in the PF MSIX_TABLE_OFFSET_REG register. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (BAR_10): Base Address Register 10h 0x1 (BAR_14): Base Address Register 14h 0x2 (BAR_18): Base Address Register 18h 0x3 (BAR_1C): Base Address Register 1Ch 0x4 (BAR_20): Base Address Register 20h 0x5 (BAR_24): Base Address Register 24h Value After Reset: 0x4 Testable: unconstrained

DSP_PCIE_MSIX_PBA_OFFSET_REG
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:3	RW	0x00005000	PCI_MSIX_PBA_OFFSET MSI-X PBA Offset. Used as an offset from the address contained by one of the Function's Base Address Registers to point to the base of the MSI-X PBA. The lower 3 PBA BIR bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. SRIOV Note: All VFs in a single PF have the same value for "MSI-X PBA Offset" (PCI_MSIX_PBA_OFFSET field in SHADOW_MSIX_PBA_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_PBA_OFFSET field in the PF MSIX_PBA_OFFSET_REG register. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x5000 Testable: unconstrained
2:0	RW	0x4	PCI_MSIX_PBA_BIR MSI-X PBA BIR. This field indicates which one of a Function's Base Address Registers , located beginning at 10h in Configuration Space, or entry in the Enhanced Allocation capability with a matching BEI, is used to map the Function's MSI-X PBA into Memory Space. The PBA BIR value definitions are identical to those for the Table BIR . SRIOV Note: All VFs in a single PF have the same value for "MSI-X PBA BIR" (PCI_MSIX_PBA_BIR field in SHADOW_MSIX_PBA_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_PBA_BIR field in the PF MSIX_PBA_OFFSET_REG register. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x4 Testable: unconstrained

11.4.3.11 DSP_PCIE_AER Registers Summary

Name	Offset	Size	Reset Value	Description
DSP_PCIE_AER_EXT_CAP_HDR_OFF	0x0000	W	0x14820001	Advanced Error Reporting Extended Capability Header

DSP_PCIE_AER_HDR_LOG_3_OFF	0x0028	W	0x00000000	Header Log Register 3
DSP_PCIE_AER_ROOT_ERR_CMD_OFF	0x002C	W	0x00000000	Root Error Command Register. Exits only in RC mode
DSP_PCIE_AER_ROOT_ERR_STATUS_OFF	0x0030	W	0x48000000	Root Error Status Register. Exists only in RC mode
DSP_PCIE_AER_ERR_SRC_ID_OFF	0x0034	W	0x00000000	Error Source Identification Register.Exists only in RC mode
DSP_PCIE_AER_TLP_PREFIX_LOG_1_OFF	0x0038	W	0x00000000	TLP Prefix Log Register 1
DSP_PCIE_AER_TLP_PREFIX_LOG_2_OFF	0x003C	W	0x00000000	TLP Prefix Log Register 2
DSP_PCIE_AER_TLP_PREFIX_LOG_3_OFF	0x0040	W	0x00000000	TLP Prefix Log Register 3
DSP_PCIE_AER_TLP_PREFIX_LOG_4_OFF	0x0044	W	0x00000000	TLP Prefix Log Register 4

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.3.12 DSP_PCIE_AER Detail Registers Description

DSP_PCIE_AER_EXT_CAP_HDR_OFF

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x148	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x148 Testable: unconstrained
19:16	RW	0x2	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field must be 2h if the End-End TLP Prefix Supported bit is set and must be 1h or 2h otherwise. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x2 Testable: unconstrained
15:0	RW	0x0001	CAP_ID AER Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. The Extended Capability ID for the Advanced Error Reporting Capability is 0001h. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

DSP_PCIE_AER_UNCORR_ERR_STATUS_OFF

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23	W1C	0x0	TLP_PRFX_BLOCKED_ERR_STATUS TLP Prefix Blocked Error Status. Status bit for TLP Prefix Blocked Error. Note: Not supported. Note: This register field is sticky. Value After Reset: 0x0
22	W1C	0x0	INTERNAL_ERR_STATUS Unsupported Request Error Status. This field represents status of Unsupported Request Error. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

6	RW	0x0	BAD_TLP_MASK Bad TLP Mask. Masking bit for Bad TLP. Note: This register field is sticky. Value After Reset: 0x0
5:1	RO	0x00	reserved
0	RW	0x0	RX_ERR_MASK Receiver Error Mask (Optional). Masking bit for Receiver Error. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_AER_ADV_ERR_CAP_CTRL_OFF

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	CTO_PRFX_HDR_LOG_CAP TLP Prefix Log Present. If Set, this bit indicates that the Function records the prefix/header of Request TLPs that experience a Completion Timeout error. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
11	RW	0x0	TLP_PRFX_LOG_PRESENT Completion Timeout Prefix/Header Log Capable. If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined. Default value of this bit is 0. This bit is RsvdP if the End-End TLP Prefix Supported bit is Clear. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
10	RO	0x0	MULTIPLE_HEADER_EN Multiple Header Recording Enable. When Set, this bit enables the Function to record more than one error header. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. Default value of this bit is 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R (sticky) Note: This register field is sticky. Value After Reset: 0x0
9	RO	0x0	MULTIPLE_HEADER_CAP Multiple Header Recording Capable. If Set, this bit indicates that the Function is capable of recording more than one error header. Note: This register field is sticky. Value After Reset: 0x0
8	RW	0x0	ECRC_CHECK_EN ECRC Check Enable. When Set, ECRC checking is enabled. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. Default value of this bit is 0b. Note: This register field is sticky. Value After Reset: 0x0
7	RO	0x1	ECRC_CHECK_CAP ECRC Check Capable. If Set, this bit indicates that the Function is capable of checking ECRC. Note: This register field is sticky. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
6	RW	0x0	ECRC_GEN_EN ECRC Generation Enable. When Set, ECRC generation is enabled. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. Default value of this bit is 0b. Note: This register field is sticky. Value After Reset: 0x0
5	RO	0x1	ECRC_GEN_CAP ECRC Generation Capable. If Set, this bit indicates that the Function is capable of generating ECRC. Note: This register field is sticky. Value After Reset: 0x1
4:0	RO	0x00	FIRST_ERR_POINTER First Error Pointer. The First Error Pointer is a field that identifies the bit position of the first error reported in the Uncorrectable Error Status register. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_AER_HDR_LOG_0_OFF
Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	FIRST_DWORD_FOURTH_BYTE Byte 3 of Header log register of First 32-bit Data Word. This field represents fourth byte of First DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
23:16	RO	0x00	FIRST_DWORD_THIRD_BYTE Byte 2 of Header log register of First 32-bit Data Word. This field represents third byte of First DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15:8	RO	0x00	FIRST_DWORD_SECOND_BYTE Byte 1 of Header log register of First 32-bit Data Word. This field represents second byte of First DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7:0	RO	0x00	FIRST_DWORD_FIRST_BYTE Byte 0 of Header log register of First 32-bit Data Word. This field represents first byte of First DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_AER_HDR_LOG_1_OFF
Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	SECOND_DWORD_FOURTH_BYTE Byte 3 of Header log register of Second 32-bit Data Word. This field represents fourth byte of Second DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
23:16	RO	0x00	SECOND_DWORD_THIRD_BYTE Byte 2 of Header log register of Second 32-bit Data Word. This field represents third byte of Second DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15:8	RO	0x00	SECOND_DWORD_SECOND_BYTE Byte 1 of Header log register of Second 32-bit Data Word. This field represents second byte of Second DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: tru
7:0	RO	0x00	SECOND_DWORD_FIRST_BYTE Byte 0 of Header log register of Second 32-bit Data Word. This field represents first byte of Second DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_AER_HDR_LOG_2_OFF
Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description

Bit	Attr	Reset Value	Description
23:16	RO	0x00	THIRD_DWORD_THIRD_BYTE Byte 2 of Header log register of Third 32-bit Data Word. This field represents third byte of Third DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15:8	RO	0x00	THIRD_DWORD_SECOND_BYTE Byte 1 of Header log register of Third 32-bit Data Word. This field represents second byte of Third DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7:0	RO	0x00	THIRD_DWORD_FIRST_BYTE Byte 0 of Header log register of Third 32-bit Data Word. This field represents first byte of Third DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_AER_HDR_LOG_3_OFF

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	FOURTH_DWORD_FOURTH_BYTE Byte 3 of Header log register of Fourth 32-bit Data Word. This field represents fourth byte of Fourth DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
23:16	RO	0x00	FOURTH_DWORD_THIRD_BYTE Byte 2 of Header log register of Fourth 32-bit Data Word. This field represents third byte of Fourth DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15:8	RO	0x00	FOURTH_DWORD_SECOND_BYTE Byte 1 of Header log register of Fourth 32-bit Data Word. This field represents second byte of Fourth DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7:0	RO	0x00	FOURTH_DWORD_FIRST_BYTE Byte 0 of Header log register of Fourth 32-bit Data Word. This field represents first byte of Fourth DW of Header. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_AER_ROOT_ERR_CMD_OFF
Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RW	0x0	FATAL_ERR_REPORTING_EN Fatal Error Reporting Enable. When Set, this bit enables the generation of an interrupt when a Fatal error is reported by any of the Functions in the Hierarchy Domain associated with this Root Port. Root Complex Event Collectors provide support for the above described functionality for RCiEPs. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
1	RW	0x0	NON_FATAL_ERR_REPORTING_EN Non-Fatal Error Reporting Enable. When Set, this bit enables the generation of an interrupt when a Non-fatal error is reported by any of the Functions in the Hierarchy Domain associated with this Root Port. Root Complex Event Collectors provide support for the above described functionality for RCiEPs. Value After Reset: 0x0
0	RW	0x0	CORR_ERR_REPORTING_EN Correctable Error Reporting Enable. When Set, this bit enables the generation of an interrupt when a correctable error is reported by any of the Functions in the Hierarchy Domain associated with this Root Port. Root Complex Event Collectors provide support for the above described functionality for RCiEPs (Root Complex integrated Endpoint). Value After Reset: 0x0

DSP_PCIE_AER_ROOT_ERR_STATUS_OFF

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:27	RO	0x09	ADV_ERR_INT_MSG_NUM Advanced Error Interrupt Message Number. This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability. For MSI, the value in this register indicates the offset between the base Message Data and the interrupt message that is generated. For MSI-X, the value in this register indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. If MSI-X is enabled, the value in this register must indicate the vector for MSI-X. If MSI is enabled or neither is enabled, the value in this register must indicate the vector for MSI. If software enables both MSI and MSI-X at the same time, the value in this register is undefined. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x9 Testable: unconstrained
26:7	RO	0x00000	reserved

Bit	Attr	Reset Value	Description
6	W1C	0x0	FATAL_ERR_MSG_RX One or more Fatal Error Messages Received. Set when one or more Fatal Uncorrectable error Messages have been received. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5	W1C	0x0	NON_FATAL_ERR_MSG_RX One or more Non-Fatal Error Messages Received. Set when one or more Non-Fatal Uncorrectable error Messages have been received. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
4	W1C	0x0	FIRST_UNCORR_FATAL First Uncorrectable Error is Fatal. Set when the first Uncorrectable error Message received is for a Fatal error. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
3	W1C	0x0	MUL_ERR_FATAL_NON_FATAL_RX Multiple Fatal or Non-Fatal Errors Received. Set when either a Fatal or a Non-fatal error is received and ERR_FATAL_NON_FATAL_RX is already Set. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
2	W1C	0x0	ERR_FATAL_NON_FATAL_RX Fatal or Non-Fatal Error Received. Set when either a Fatal or a Non-fatal error Message is received and this bit is not already Set. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
1	W1C	0x0	MUL_ERR_COR_RX Multiple Correctable Errors Received. Set when a Correctable error Message is received and ERR_COR_RX is already Set. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
0	W1C	0x0	ERR_COR_RX Correctable Error Received. Set when a Correctable error Message is received and this bit is not already Set. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_AER_ERR_SRC_ID_OFF
Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	ERR_FATAL_NON_FATAL_SOURCE_ID Source of Fatal/Non-Fatal Error. Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message when the ERR_FATAL/NONFATAL Received bit is not already set. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
15:0	RO	0x0000	ERR_COR_SOURCE_ID Source of Correctable Error. Loaded with the Requester ID indicated in the received ERR_COR Message when the ERR_COR Received bit is not already set. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_AER_TLP_PREFIX_LOG_1_OFF
Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	CFG_TLP_PFX_LOG_1_FOURTH_BYTE Byte 3 of Error TLP Prefix Log 1. For a description of this standard PCIe register field, see the PCI Express Specification.
23:16	RO	0x00	CFG_TLP_PFX_LOG_1_THIRD_BYTE Byte 2 Error TLP Prefix Log 1. For a description of this standard PCIe register field, see the PCI Express Specification.
15:8	RO	0x00	CFG_TLP_PFX_LOG_1_SECOND_BYTE Byte 1 Error TLP Prefix Log 1. For a description of this standard PCIe register field, see the PCI Express Specification.
7:0	RO	0x00	CFG_TLP_PFX_LOG_1_FIRST_BYTE Byte 0 Error TLP Prefix Log 1. For a description of this standard PCIe register field, see the PCI Express Specification.

DSP_PCIE_AER_TLP_PREFIX_LOG_2_OFF
Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	CFG_TLP_PFX_LOG_2_FOURTH_BYTE Byte 3 Error TLP Prefix Log 2. For a description of this standard PCIe register field, see the PCI Express Specification.
23:16	RO	0x00	CFG_TLP_PFX_LOG_2_THIRD_BYTE Byte 2 Error TLP Prefix Log 2. For a description of this standard PCIe register field, see the PCI Express Specification.
15:8	RO	0x00	CFG_TLP_PFX_LOG_2_SECOND_BYTE Byte 1 Error TLP Prefix Log 2. For a description of this standard PCIe register field, see the PCI Express Specification.
7:0	RO	0x00	CFG_TLP_PFX_LOG_2_FIRST_BYTE Byte 0 Error TLP Prefix Log 2. For a description of this standard PCIe register field, see the PCI Express Specification.

DSP_PCIE_AER_TLP_PREFIX_LOG_3_OFF
Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:24	WO	0x00	CFG_TLP_PFX_LOG_3_FOURTH_BYTE Byte 3 Error TLP Prefix Log 3. For a description of this standard PCIe register field, see the PCI Express Specification.
23:16	RO	0x00	CFG_TLP_PFX_LOG_3_THIRD_BYTE Byte 2 Error TLP Prefix Log 3. For a description of this standard PCIe register field, see the PCI Express Specification.

Bit	Attr	Reset Value	Description

31:24	RO	0x00	CFG_TLP_PFX_LOG_4_FOURTH_BYTE Byte 3 Error TLP Prefix Log 4. For a description of this standard PCIe register field, see the PCI Express Specification.
23:16	RO	0x00	CFG_TLP_PFX_LOG_4_THIRD_BYTE Byte 2 Error TLP Prefix Log 4. For a description of this standard PCIe register field, see the PCI Express Specification.
15:8	RO	0x00	CFG_TLP_PFX_LOG_4_SECOND_BYTE Byte 1 Error TLP Prefix Log 4. For a description of this standard PCIe register field, see the PCI Express Specification.
7:0	RO	0x00	CFG_TLP_PFX_LOG_4_FIRST_BYTE Byte 0 Error TLP Prefix Log 4. For a description of this standard PCIe register field, see the PCI Express Specification.

11.4.3.13 DSP_PCIE_SPCIE Registers Summary

Name	Offset	Size	Reset Value	Description
DSP_PCIE_SPCIE_CAP_HEADER_REG	0x0000	W	0x19010019	SPCIE Capability Header
DSP_PCIE_SPCIE_LINK_CONTROL3_REG	0x0004	W	0x00000000	Link Control 3 Register
DSP_PCIE_SPCIE_LANE_ERR_STATUS_REG	0x0008	W	0x00000000	Lane Error Status Register
DSP_PCIE_SPCIE_CAP_OFF_0CH_REG	0x000C	W	0x0F7F7F7F	Lane Equalization Control Register for lanes 1 and 0
DSP_PCIE_SPCIE_CAP_OFF_10H_REG	0x0010	W	0x7F7F7F7F	Lane Equalization Control Register for lanes 3 and 2

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.3.14 DSP_PCIE_SPCIE Detail Registers Description

DSP_PCIE_SPCIE_CAP_HEADER_REG
Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x190	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xfff (MAX_VAL): Max value. Value After Reset: 0x190 Testable: unconstrained
19:16	RW	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
15:0	RW	0x0019	EXTENDED_CAP_ID Secondary PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffff (MAX_VAL): Max value Value After Reset: 0x19 Testable: unconstrained

DSP_PCIE_SPCIE_LINK_CONTROL3_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RO	0x0	EQ_REQ_INT_EN Link Equalization Request Interrupt Enable. This bit is RW for Downstream Ports and for Upstream Ports when Crosslink Supported is 1b. This bit is not applicable and is RsvdP for Upstream Ports when the Crosslink Supported bit is 0b. If the Port does not support 8.0 GT/s, this bit is permitted to be hardwired to 0b by the controller. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x0 (CLEAR): Clear 0x1 (SET): When Set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request 8.0 GT/s bit, the Link Equalization Request 16.0 GT/s bit, or the Link Equalization Request 32.0 GT/s bit has been set. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RO	0x0	PERFORM_EQ Perform Equalization. This bit is RW for Downstream Ports and for Upstream Ports when Crosslink Supported is 1b. This bit is not applicable and is RsvdP for Upstream Ports when the Crosslink Supported bit is 0b. If the Port does not support 8.0 GT/s, this bit is permitted to be hardwired to 0b by the controller. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x0 (CLEAR): Clear 0x1 (SET): When this bit is 1b and a 1b is written to the Retrain Link bit with the Target Link Speed field set to 8.0 GT/s or higher, the Downstream Port must perform Link Equalization. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

DSP_PCIE_SPCIE_LANE_ERR_STATUS_REG
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	W1C	0x0	LANE_ERR_STATUS Lane Error Status Bits per Lane. Each bit indicates if the corresponding Lane detected a Lane-based error. A value of 1b indicates that a Lane based-error was detected on the corresponding Lane Number. For Ports that are narrower than 32 Lanes, the unused upper bits [31: Maximum Link Width] are RsvdZ. For Ports that do not support 8.0 GT/s and do not set these bits based on 8b/10b errors , this field is permitted to be hardwired to 0 by the controller. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_SPCIE_CAP_OFF_0CH_REG
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved

Bit	Attr	Reset Value	Description
30:28	RW	0x0	USP_RX_PRESET_HINT1 Upstream Port 8.0 GT/s Receiver Preset Hint 1. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Receiver preset hint 1 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. Case C: When Operating port is Upstream port and Crosslink Supported bit is 1, Field is not used or affected by the current Link Equalization. Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. For case A and C, Field is HwInit. For case B, Field is RO. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
27:24	RW	0xf	USP_TX_PRESET1 Upstream Port 8.0 GT/s Transmitter Preset 1. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Transmitter preset 1 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. Case C: When Operating port is Upstream port and Crosslink Supported bit is 1, Field is not used or affected by the current Link Equalization. Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. For case A and C, Field is HwInit. For case B, Field is RO. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: 0xf Testable: unconstrained
23	RO	0x0	reserved
22:20	RW	0x7	DSP_RX_PRESET_HINT1 Downstream Port 8.0 GT/s Receiver Preset Hint 1. Receiver preset hint 1 value that may be used as a suggested setting for 8.0 GT/s receiver equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
19:16	RW	0xf	DSP_TX_PRESET1 Downstream Port 8.0 GT/s Transmitter Preset 1. Transmitter preset 1 value used for 8.0 GT/s equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: 0xf Testable: unconstraine
15	RO	0x0	reserved
14:12	RW	0x7	USP_RX_PRESET_HINT0 Upstream Port 8.0 GT/s Receiver Preset Hint 0. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Receiver preset hint 0 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. Case C: When Operating port is Upstream port and Crosslink Supported bit is 1, Field is not used or affected by the current Link Equalization. Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. For case A and C, Field is HwInit. For case B, Field is RO. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
11:8	RW	0xf	USP_TX_PRESET0 Upstream Port 8.0 GT/s Transmitter Preset 0. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Transmitter preset 0 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. Case C: When Operating port is Upstream port and Crosslink Supported bit is 1, Field is not used or affected by the current Link Equalization. Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. For case A and C, Field is HwInit. For case B, Field is RO. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: 0xf Testable: unconstrained
7	RO	0x0	reserved
6:4	RW	0x7	DSP_RX_PRESET_HINT0 Downstream Port 8.0 GT/s Receiver Preset Hint 0. Receiver preset hint 0 value that may be used as a suggested setting for 8.0 GT/s receiver equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Value After Reset: 0x7 Testable: unconstrained

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.3.16 DSP_PCIE_L1SUB Detail Registers Description

DSP_PCIE_L1SUB_CAP_HEADER_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x1d0	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h, if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b although software must mask them to allow for future uses of these bits. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1d0 Testable: unconstrained

Bit	Attr	Reset Value	Description
19:16	RW	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field is depends on version of the specification. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
15:0	RW	0x001e	EXTENDED_CAP_ID L1SUB Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Extended Capability ID for L1 PM Substates is 001Eh. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1e Testable: unconstrained

DSP_PCIE_L1SUB_CAPABILITY_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:19	RW	0x05	PWR_ON_VALUE_SUPPORT Port T Power On Value. Along with the Port T_POWER_ON_SCALE field in the L1 PM Substates Capabilities register sets the time (in us) that this Port requires the port on the opposite side of Link to wait in L1.2.Exit after sampling CLKREQ# asserted before actively driving the interface. The value of Port T_POWER_ON is calculated by multiplying the value in this field by the scale value in the Port T_POWER_ON_SCALE field in the L1 PM Substates Capabilities register. Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: No access. Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT||L1SUB_CAPABILITY_REG.L1_2_PCIPM_SUPPORT ? RWS : RSVDP Value After Reset: 0x5 Testable: writeAsRead

Bit	Attr	Reset Value	Description
18	RO	0x0	reserved
17:16	RW	0x0	PWR_ON_SCALE_SUPPORT Port T Power On Scale. Specifies the scale used for the Port T_POWER_ON_VALUE field in the L1 PM Substates Capabilities register. Range of values are given below. Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: No access. Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT||L1SUB_CAPABILITY_REG.L1_2_PCIPM_SUPPORT ? RWS : RSVDP Values: 0x0 (_2us): Scale is 2us 0x1 (_10us): Scale is 10us 0x2 (_100us): Scale is 100us 0x3 (Reserved): Reserved Value After Reset: 0x0 Testable: writeAsRead
15:8	RW	0x0a	COMM_MODE_SUPPORT Port Common Mode Restore Time. Time (in us) required for this Port to re-establish common mode. Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: No access. Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT||L1SUB_CAPABILITY_REG.L1_2_PCIPM_SUPPORT ? RWS : RSVDP Value After Reset: 0xa Testable: writeAsRead
7:5	RO	0x0	reserved
4	RW	0x1	L1_PMSUB_SUPPORT L1 PM Substates ECN Supported. When Set this field indicates that this Port supports L1 PM Substates. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Value After Reset: 0x1

Bit	Attr	Reset Value	Description
3	RW	0x1	L1_1_ASPM_SUPPORT ASPM L11 Supported. When Set this field indicates that ASPM L1.1 is supported. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Value After Reset: 0x1
2	RW	0x1	L1_2_ASPM_SUPPORT ASPM L12 Supported. When Set this field indicates that ASPM L1.2 is supported. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Value After Reset: 0x1
1	RW	0x1	L1_1_PCIPM_SUPPORT PCI-PM L11 Supported. When Set this field indicates that PCI-PM L1.1 is supported, and must be Set by all Ports implementing L1 PM Substates. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Value After Reset: 0x1
0	RW	0x1	L1_2_PCIPM_SUPPORT PCI-PM L12 Supported. When Set this field indicates that PCI-PM L1.2 is supported. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Value After Reset: 0x1

DSP_PCIE_L1SUB_CONTROL1_REG
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:29	RW	0x0	L1_2_TH_SCA LTR L12 Threshold Scale. This field provides a scale for the value contained within the LTR_L1.2_THRESHOLD_Value. Hardware operation is undefined if software writes a Not-Permitted value to this field. Required for all Ports Ports for which the ASPM L12 Supported bit is Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: No access. Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT ? RW : RSVDP Value After Reset: 0x0 Testable: writeAsRead
28:26	RO	0x0	reserved
25:16	RW	0x000	L1_2_TH_VAL LTR L12 Threshold Value. Along with the LTR_L1.2_THRESHOLD_Scale, this field indicates the LTR threshold used to determine if entry into L1 results in L1.1 (if enabled) or L1.2 (if enabled). Required for all Ports for which the ASPM L12 Supported bit is Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: No access. Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT ? RW : RSVDP Value After Reset: 0x0 Testable: writeAsRead
15:8	RW	0x0a	T_COMMON_MODE Common Mode Restore Time. Sets value of TCOMMONMODE (in us), which must be used by the Downstream Ports for timing the re-establishment of common mode. This field is of type RsvdP for Upstream Ports. Note: The access attributes of this field are as follows: Wire: No access. Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT||L1SUB_CAPABILITY_REG.L1_2_PCIPM_SUPPORT ? RW : RSVDP Value After Reset: 0xa Testable: writeAsRead
7:4	RO	0x0	reserved

Bit	Attr	Reset Value	Description
3	RW	0x0	L1_1_ASPM_EN ASPM L11 Enable. When Set this field, enables ASPM L1.1. For Ports for which the ASPM L1.1 Supported bit is clear, this bit is permitted to be hardwired to 0. Required for both Upstream and Downstream Ports. For compatibility with possible future extensions, software must not enable L1 PM Substates unless the L1 PM Substates Supported field in the L1 PM Substates Capabilities Register is Set. Value After Reset: 0x0
2	RW	0x0	L1_2_ASPM_EN ASPM L12 Enable. When Set this field, enables ASPM L1.2. For Ports for which the ASPM L1.2 Supported bit is clear, this bit is permitted to be hardwired to 0. Required for both Upstream and Downstream Ports. For compatibility with possible future extensions, software must not enable L1 PM Substates unless the L1 PM Substates Supported field in the L1 PM Substates Capabilities Register is Set. Value After Reset: 0x0
1	RW	0x0	L1_1_PCIPM_EN PCI-PM L11 Enable. When Set this field, enables PCI-PM L1.1. Required for both Upstream and Downstream Ports. For compatibility with possible future extensions, software must not enable L1 PM Substates unless the L1 PM Substates Supported field in the L1 PM Substates Capabilities Register is Set. Value After Reset: 0x0
0	RW	0x0	L1_2_PCIPM_EN PCI-PM L12 Enable. When Set this field, enables PCI-PM L1.2. For Ports for which the PCI-PM L1.2 Supported bit is clear, this bit is permitted to be hardwired to 0. Required for both Upstream and Downstream Ports. For compatibility with possible future extensions, software must not enable L1 PM Substates unless the L1 PM Substates Supported field in the L1 PM Substates Capabilities Register is Set. Value After Reset: 0x0

DSP_PCIE_L1SUB_CONTROL2_REG

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:3	RW	0x05	T_POWER_ON_VALUE T Power On Value. Along with the T_POWER_ON_SCALE sets the minimum amount of time (in us) that the Port must wait in L1.2.Exit after sampling CLKREQ# asserted before actively driving the interface. T_POWER_ON is calculated by multiplying the value in this field by the value in the T_POWER_ON_SCALE field. Required for all Ports that support L1.2, otherwise this field is of type RsvdP.This field must only be modified when the ASPM L1.2 Enable and PCI-PM L1.2 Enable bits are both Clear. The Port behavior is undefined if this field is modified when either the ASPM L1.2 Enable and/or PCI-PM L1.2 Enable bit(s) are set. Note: The access attributes of this field are as follows: Wire: No access. Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT||L1SUB_CAPABILITY_REG.L1_2_PCIPM_SUPPORT ? 11.4.3.18 DSP_PCIE_RAS_DES Detail Registers Description

DSP_PCIE_RAS_DES_CAP_HEADER_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x2a0	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xfff (MAX_VAL): Max value Value After Reset: 0x2d0 Testable: writeAsRead
19:16	RW	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Value of this field is depends on the version of the specification. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x1 Testable: writeAsRead

Bit	Attr	Reset Value	Description
15:0	RW	0x000b	EXTENDED_CAP_ID PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Extended Capability ID for the Vendor-Specific Extended Capability is 000Bh. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffff (MAX_VAL): Max value Value After Reset: 0xb Testable: writeAsRead

DSP_PCIE_RAS_DES_VENDOR_SPECIFIC_HEADER_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:20	RO	0x100	VSEC_LENGTH VSEC Length. This field indicates the number of bytes in the entire VSEC structure, including the Vendor-Specific Extended Capability Header, the Vendor-Specific Header, and the vendor-specific registers. Values: 0x0 (MIN_VAL): Min value 0xfff (MAX_VAL): Max value Value After Reset: 0x100
19:16	RO	0x4	VSEC_REV VSEC Rev. This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x4
15:0	RO	0x0002	VSEC_ID VSEC ID. This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field. Values: 0x0 (MIN_VAL): Min value 0xffff (MAX_VAL): Max value Value After Reset: 0x2

DSP_PCIE_RAS_DES_EVENT_COUNTER_CONTROL_REG

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	EVENT_COUNTER_EVENT_SELECT Event Counter Data Select. This field in conjunction with the EVENT_COUNTER_LANE_SELECT field indexes the Event Counter data returned by the EVENT_COUNTER_DATA_REG register. 27-24: Group number(4-bit: 0..0x7) 23-16: Event number(8-bit: 0..0x13) within the Group .. For detailed definitions of Group number and Event number, see the RAS DES chapter in the Databook. Note: This register field is sticky. Values: 0x0 (EBUF_OVERFLOW): Ebuf Overflow 0x1 (EBUF_UNDERRUN): Ebuf Underrun 0x700 (TX_MEM_WRITE): Tx Memory Write 0x713 (RX_MSG_TLP): Rx Message TLP Value After Reset: 0x0 Testable: writeAsRead
15:12	RO	0x0	reserved
11:8	RW	0x0	EVENT_COUNTER_LANE_SELECT Event Counter Lane Select. This field in conjunction with EVENT_COUNTER_EVENT_SELECT indexes the Event Counter data returned by the EVENT_COUNTER_DATA_REG register. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Lane0 0xf (MAX_VAL): Lane15 Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
7	RO	0x0	EVENT_COUNTER_STATUS Event Counter Status. This register returns the current value of the Event Counter selected by the following fields: EVENT_COUNTER_EVENT_SELECT EVENT_COUNTER_LANE_SELECT Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): Set Value After Reset: 0x0 Testable: writeAsRead Volatile: true
6:5	RO	0x0	reserved
4:2	WO	0x0	EVENT_COUNTER_ENABLE Event Counter Enable. Enables/disables the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. By default, all event counters are disabled. You can enable/disable a specific Event Counter by writing the 'per event off' or 'per event on' codes. You can enable/disable all event counters by writing the 'all on' or 'all off' codes. The read value is always '0'. For other values no change. Values: 0x1 (PER_EVENT_OFF): per event off 0x3 (PER_EVENT_ON): per event on 0x5 (ALL_OFF): all off 0x7 (ALL_ON): all on Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
1:0	WO	0x0	EVENT_COUNTER_CLEAR Event Counter Clear. Clears the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. You can clear the value of a specific Event Counter by writing the 'per clear' code and you can clear all event counters at once by writing the 'all clear' code. The read value is always '0'. Other values are reserved. Values: 0x0 (NO_CHANGE): no change 0x1 (PER_CLEAR): per clear 0x2 (NO_CHANGE_2): no change 0x3 (ALL_CLEAR): all clear Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_EVENT_COUNTER_DATA_REG
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	EVENT_COUNTER_DATA Event Counter Data. This register returns the data selected by the following fields: EVENT_COUNTER_EVENT_SELECT in EVENT_COUNTER_CONTROL_REG Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_TIME_BASED_ANALYSIS_CONTROL_REG
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	TIME_BASED_REPORT_SELECT Time-based Report Select. Selects what type of data is measured for the selected duration (TIME_BASED_DURATION_SELECT), and returned in TIME_BASED_ANALYSIS_DATA. Each type of data is measured using one of three types of units: Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. Total time in ps is [Value of TIME_BASED_ANALYSIS_DATA returned when TIME_BASED_REPORT_SELECT=0x00] * TIME_BASED_ANALYSIS_DATA. Values 0-4 and 7-8 correspond to Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. Aux_clk Cycles. Total time in ps is [Period of platform specific clock] * TIME_BASED_ANALYSIS_DATA. Values 5, 6, and 9 correspond to aux_clk Cycles. Core_clk Cycles for 20GT/s, 25GT/s (CCIX ESM data rate). Total time in ps is [Value of TIME_BASED_ANALYSIS_DATA returned when TIME_BASED_REPORT_SELECT=0x10] * TIME_BASED_ANALYSIS_DATA. Values 10-14 and 17-18 correspond to Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. Data Bytes. Actual amount of bytes is 16 * TIME_BASED_ANALYSIS_DATA. Values 20-23 correspond to data bytes. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x0 (ONE_CYCLE): Duration of 1 cycle 0x1 (TX_L0S): TxL0s 0x2 (RX_L0S): RxL0s 0x3 (L0): L0 0x4 (L1): L1 0x7 (CFG_RCVRY): Configuration/Recovery 0x8 (TX_RX_L0S): TxL0s and RxL0s 0x5 (L1_1): L1.1 0x6 (L1_2): L1.2 0x9 (L1_AUX): L1 aux 0x10 (_1_CYCLE): Duration of 1 cycle 0x11 (TX_L0S_): TxL0s 0x12 (RX_L0S_): RxL0s 0x13 (L0_): L0 0x14 (L1_): L1 0x17 (CFG_RCVRY_): Configuration/Recovery 0x18 (TX_RX_L0S_): TxL0s and RxL0s 0x20 (TX_PCIE_TLP): Tx PCIe TLP data payload Bytes 0x21 (RX_PCIE_TLP): Rx PCIe TLP data payload Bytes 0x22 (TX_CCIX_TLP): Tx CCIX TLP data payload Bytes 0x23 (RX_CCIX_TLP): Rx CCIX TLP data payload Bytes Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
23:16	RO	0x00	reserved
15:8	RW	0x00	TIME_BASED_DURATION_SELECT Time-based Duration Select. Selects the duration of time-based analysis. When "manual control" is selected and TIMER_START is set to '1', this analysis never stops until TIMER_STOP is set to '0'. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x0 (MANUAL): Manual control 0x1 (_1_MS): 1ms 0x2 (_2_MS): 10ms 0x3 (_100_MS): 100ms 0x4 (_1_S): 1s 0x5 (_2_S): 2s 0x6 (_4_S): 4s 0xff (_4_US): 4us (Debug purpose) Value After Reset: 0x1 Testable: writeAsRead
7:1	RO	0x00	reserved
0	RW	0x0	TIMER_START Timer Start. This bit will be cleared automatically when the measurement is finished. Note: The app_ras_des_tba_ctrl input also sets the contents of this field and controls the measurement start/stop. Note: This register field is sticky. Values: 0x1 (START_RESTART): Start/Restart 0x0 (STOP): Stop Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_TIME_BASED_ANALYSIS_DATA_REG
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	TIME_BASED_ANALYSIS_DATA Time Based Analysis Data. This register returns the data selected by the TIME_BASED_REPORT_SELECT field in TIME_BASED_ANALYSIS_CONTROL_REG. The results are cleared when next measurement starts. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0 Testable: untestable Volatile: true

DSP_PCIE_RAS_DES_TIME_BASED_ANALYSIS_DATA_63_32_REG

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	TIME_BASED_ANALYSIS_DATA_63_32 Upper 32 bits of Time Based Analysis Data. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_EINJ_ENABLE_REG

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
6	RW	0x0	ERROR_INJECTION6_ENABLE Error Injection6 Enable (Specific TLP Error). Enables insertion of errors into the packets that you select. You can set this bit to '1' when you have disabled RAS datapath protection (DP) by setting CX_RASDP = CX_RASDP_RAM_PROT =0. You can set this bit to '1' when you have disabled the address translation by setting ADDR_TRANSLATION_SUPPORT_EN=0. For more details, see the EINJ6_COMPARE_*_REG/EINJ6_CHANGE_*_REG/EINJ6_TLP_REG registers. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5	RW	0x0	ERROR_INJECTION5_ENABLE Error Injection5 Enable (TLP Duplicate/Nullify Error). Enables insertion of duplicate/nullified TLPs. For more details, see the EINJ5_SP_TLP_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
4	RW	0x0	ERROR_INJECTION4_ENABLE Error Injection4 Enable (FC Credit Update Error). Enables insertion of errors into UpdateFCs. For more details, see the EINJ4_FC_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
3	RW	0x0	ERROR_INJECTION3_ENABLE Error Injection3 Enable (Symbol DataK Mask Error or Sync Header Error). Enables DataK masking of special symbols or the breaking of the sync header. For more details, see the EINJ3_SYMBOL_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2	RW	0x0	ERROR_INJECTION2_ENABLE Error Injection2 Enable (DLLP Error). Enables insertion of DLLP errors. For more details, see the EINJ2_DLLP_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
1	RW	0x0	ERROR_INJECTION1_ENABLE Error Injection1 Enable (Sequence Number Error). Enables insertion of errors into sequence numbers. For more details, see the EINJ1_SEQNUM_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
0	RW	0x0	ERROR_INJECTION0_ENABLE Error Injection0 Enable (CRC Error). Enables insertion of errors into various CRC. For more details, see the EINJ0_CRC_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_EINJ0_CRC_REG

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved

Bit	Attr	Reset Value	Description
11:8	RW	0x0	EINJ0_CRC_TYPE Error injection type. Selects the type of CRC error to be inserted. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x0 (TLP_LCRC_ERR): (TX Path) New TLP's LCRC error injection 0x1 (_16b_CRC_ERR_ACK_NAK_DLLP): (TX Path) 16bCRC error injection of ACK/NAK DLLP 0x2 (_16b_CRC_ERR_UPD_FC): (TX Path) 16bCRC error injection of Update-FC DLLP 0x3 (TLP_ECRC_ERR): (TX Path) New TLP's ECRC error injection 0x4 (FCRC_ERR_TLP): (TX Path) TLP's FCRC error injection (128b/130b) 0x5 (PARITY_TSOS_ERR): (TX Path) Parity error of TSOS (128b/130b) 0x6 (PARITY_SKPOS_ERR): (TX Path) Parity error of SKPOS (128b/130b) 0x8 (LCRC_ERR): (RX Path) LCRC error injection 0xb (ECRC_ERR): (RX Path) ECRC error injection Value After Reset: 0x0 Testable: writeAsRead
7:0	RW	0x00	EINJ0_COUNT Error injection count. Indicates the number of errors. This register is decremented when the errors have been inserted. If the counter value is 0x01 and error is inserted, ERROR_INJECTION0_ENABLE in EINJ_ENABLE_REG returns 0b. If the counter value is 0x00 and ERROR_INJECTION0_ENABLE=1, the errors are inserted until ERROR_INJECTION0_ENABLE is set to '0'. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_EINJ1_SEQNUM_REG

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28:16	RW	0x0000	EINJ1_BAD_SEQNUM Bad sequence number. Indicates the value to add/subtract from the naturally-assigned sequence numbers. This value is represented by two's complement. For example: Set Type, SEQ# and Count EINJ1_SEQNUM_TYPE =0 (Insert errors into new TLPs) EINJ1_BAD_SEQNUM =0x1FFD (represents -3) EINJ1_COUNT =1 Enable Error Injection ERROR_INJECTION1_ENABLE =1 Send a TLP From the Core's Application Interface Assume SEQ#5 is given to the TLP. The SEQ# is Changed to #2 by the Error Injection Function in Layer2. 5 + (-3) = 2 The TLP with SEQ#2 is Transmitted to PCIe Link. Note: This register field is sticky. Values: 0xfff (MAX_VAL): +4095 0x1001 (MIN_VAL): -4095 Value After Reset: 0x0 Testable: writeAsRead
15:9	RO	0x00	reserved
8	RW	0x0	EINJ1_SEQNUM_TYPE Sequence number type. Selects the type of sequence number. Note: This register field is sticky. Values: 0x0 (TLP_ERR): Insertion of New TLP's SEQ# error 0x1 (ACK_NAK_DLLP_ERR): Insertion of ACK/NAK DLLP's SEQ# Error Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
7:0	RW	0x00	EINJ1_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. If the counter value is 0x01 and error is inserted, ERROR_INJECTION1_ENABLE in EINJ_ENABLE_REG returns '0'. If the counter value is 0x00 and ERROR_INJECTION1_ENABLE=1, the errors are inserted until ERROR_INJECTION1_ENABLE is set to '0'. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_EINJ2_DLLP_REG

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9:8	RW	0x0	EINJ2_DLLP_TYPE DLLP Type. Selects the type of DLLP errors to be inserted. Note: This register field is sticky. Values: 0x0 (ACK_NACK_DLLP): ACK/NAK DLLP's transmission block 0x1 (UPD_FC_DLLP): Update FC DLLP's transmission block 0x2 (NAK_DLLP): Always Transmission for NAK DLLP 0x3 (RSVD): Reserved Value After Reset: 0x0 Testable: writeAsRead
7:0	RW	0x00	EINJ2_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. If the counter value is 0x01 and the error is inserted, ERROR_INJECTION2_ENABLE in EINJ_ENABLE_REG returns '0'. If the counter value is 0x00 and ERROR_INJECTION2_ENABLE =1, the errors are inserted until ERROR_INJECTION2_ENABLE is set to '0'. This register is affected only when EINJ2_DLLP_TYPE =2'10b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_EINJ3_SYMBOL_REG

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:8	RW	0x0	EINJ3_SYMBOL_TYPE Error Type. 8b/10b encoding - Mask K symbol. It is not supported to insert errors into the first ordered-set after exiting from TxElecIdle when CX_FREQ_STEP_EN has been enabled. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x0 (RSVD_OR_INVRT_SYNC_HDR): Invert sync header for 128b/130b encoding or this field is reserved for 8b/10b encoding. 0x1 (COM_PAD_TS1): COM/PAD(TS1 Order set) 0x2 (COM_PAD_TS2): COM/PAD(TS2 Order set) 0x3 (COM_FTS): COM/FTS(FTS Order set) 0x4 (COM_IDL): COM/IDL(E-Idle Order set) 0x5 (END_EDB): END/EDB Symbol 0x6 (STP_SDP): STP/SDP Symbol 0x7 (COM_SKP): COM/SKP(SKP Order set) Value After Reset: 0x0 Testable: writeAsRead
7:0	RW	0x00	EINJ3_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. If the counter value is 0x01 and error is inserted, ERROR_INJECTION3_ENABLE in EINJ_ENABLE_REG returns '0'. If the counter value is 0x00 and ERROR_INJECTION3_ENABLE =1, the errors are inserted until ERROR_INJECTION3_ENABLE is set to '0'. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_EINJ4_FC_REG

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28:16	RW	0x0000	EINJ4_BAD_UPDFC_VALUE Bad update-FC credit value. Indicates the value to add/subtract from the UpdateFC credit. This value is represented by two's complement. Note: This register field is sticky. Values: 0xfff (MAX_VAL): +4095 0x1001 (MIN_VAL): -4095 Value After Reset: 0x0 Testable: writeAsRead
15	RO	0x0	reserved
14:12	RW	0x0	EINJ4_VC_NUMBER VC Number. Indicates target VC Number. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min Value 0x7 (MAX_VAL): Min Value Value After Reset: 0x0 Testable: writeAsRead
11	RO	0x0	reserved
10:8	RW	0x0	EINJ4_UPDFC_TYPE Update-FC type. Selects the credit type. Note: This register field is sticky. Values: 0x0 (POSTED_TLP_HDR): Posted TLP Header Credit value control 0x1 (NON_POSTED_TLP_HDR): Non-Posted TLP Header Credit value control 0x2 (CMPL_TLP_HDR): Completion TLP Header Credit value control 0x3 (RSERVED): Reserved 0x4 (POSTED_TLP_DATA): Posted TLP Data Credit value control 0x5 (NON_POSTED_TLP_DATA): Non-Posted TLP Data Credit value control 0x6 (CMPL_TLP_DATA): Completion TLP Data Credit value control 0x7 (RSVD): Reserved Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
7:0	RW	0x00	EINJ4_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. If the counter value is 0x01 and error is inserted, ERROR_INJECTION4_ENABLE in EINJ_ENABLE_REG returns '0'. If the counter value is 0x00 and ERROR_INJECTION4_ENABLE =1, the errors are inserted until ERROR_INJECTION4_ENABLE is set to '0'. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_EINJ5_SP_TLP_REG
Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	EINJ5_SPECIFIED_TLP Specified TLP. Selects the specified TLP to be inserted. Note: This register field is sticky. Values: 0x0 (DUPLICATE_DLLP): Generates duplicate TLPs by handling ACK DLLP as NAK DLLP. 0x1 (NULLIFIED_TLP): Generates Nullified TLP (Original TLP will be stored in retry buffer). Value After Reset: 0x0 Testable: writeAsRead
7:0	RW	0x00	EINJ5_COUNT Error injection count. Indicates the number of errors. This register is decremented as the errors are being inserted. If the counter value is 0x01 and error is inserted, ERROR_INJECTION5_ENABLE in EINJ_ENABLE_REG returns '0'. If the counter value is 0x00 and ERROR_INJECTION5_ENABLE =1, the errors are inserted until ERROR_INJECTION5_ENABLE is set to '0'. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_EINJ6_COMPARE_POINT_H0_REG
Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	EINJ6_COMPARE_POINT_H0 Packet Compare Point: 1st DWORD. Specifies which Tx TLP header DWORD#0 bits to compare with the corresponding bits in the Packet Compare Value registers (EINJ6_COMPARE_VALUE*). When all specified bits (in the Tx TLP header and EINJ6_COMPARE_VALUE*) match, the controller inserts errors into the TLP. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead

DSP_PCIE_RAS_DES_EINJ6_COMPARE_POINT_H1_REG
Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	EINJ6_COMPARE_POINT_H1 Packet Compare Point: 2nd DWORD. Specifies which Tx TLP header DWORD#0 bits to compare with the corresponding bits in the Packet Compare Value registers (EINJ6_COMPARE_VALUE*). When all specified bits (in the Tx TLP header and EINJ6_COMPARE_VALUE*) match, the controller inserts errors into the TLP. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead

DSP_PCIE_RAS_DES_EINJ6_COMPARE_POINT_H2_REG
Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	EINJ6_COMPARE_POINT_H2 Packet Compare Point: 3rd DWORD. Specifies which Tx TLP header DWORD#0 bits to compare with the corresponding bits in the Packet Compare Value registers (EINJ6_COMPARE_VALUE*). When all specified bits (in the Tx TLP header and EINJ6_COMPARE_VALUE*) match, the controller inserts errors into the TLP. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead

Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	EINJ6_CHANGE_VALUE_H3 Packet Change Value: 4th DWORD. Specifies replacement values for the Tx TLP header DWORD#0 bits defined in the Packet Change Point registers (EINJ6_CHANGE_POINT*). Only applies when the EINJ6_INVERTED_CONTROL field in EINJ6_TLP_REG is '0'. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead

DSP_PCIE_RAS_DES_EINJ6_TLP_REG

Address: Operational Base + offset (0x008C)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:9	RW	0x0	EINJ6_PACKET_TYPE Packet type. Selects the TLP packets to inject errors into. All encodings other than the specified encodings are reserved. Note: This register field is sticky. Values: 0x0 (HEADER): TLP Header 0x1 (TLP_FIRST_4_DW): TLP Prefix 1st 4-DWORDs 0x2 (TLP_SECOND_DW): TLP Prefix 2nd -DWORDs Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
8	RW	0x0	EINJ6_INVERTED_CONTROL Inverted Error Injection Control. Encodded vlues given as above. Note: This register field is sticky. Values: 0x0 (REPLACE): EINJ6_CHANGE_VALUE_H[0/1/2/3] is used to replace bits specified by EINJ6_CHANGE_POINT_H[0/1/2/3]. 0x1 (IGNORE): EINJ6_CHANGE_VALUE_H[0/1/2/3] is ignored and inverts bits specified by EINJ6_CHANGE_POINT_H[0/1/2/3]. Value After Reset: 0x0 Testable: writeAsRead
7:0	RW	0x00	EINJ6_COUNT Error Injection Count. Indicates the number of errors to insert. This counter is decremented while errors are been inserted. If the counter value is 0x01 and error is inserted, ERROR_INJECTION6_ENABLE in EINJ_ENABLE_REG returns '0'. If the counter value is 0x00 and ERROR_INJECTION6_ENABLE=1, errors are inserted until ERROR_INJECTION6_ENABLE is set to '0'. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_SD_CONTROL1_REG

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:22	RW	0x0	LOW_POWER_INTERVAL Low Power Entry Interval Time. Interval Time that the controller starts monitoring RXELECIDLE signal after L0s/L1/L2 entry. You should set the value according to the latency from receiving EIOS to, RXELECIDLE assertion at the PHY. Note: This register field is sticky. Values: 0x0 (_40NS): 40ns 0x1 (_160NS): 160ns 0x2 (_320NS): 320ns 0x3 (_640NS): 640ns Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
21:20	RW	0x0	TX_EIOS_NUM Number of Tx EIOS. This register sets the number of transmit EIOS for L0s/L1 entry and Disable/Loopback/Hot-reset exit. The controller selects the greater value between this register and the value defined by the PCI-SIG specification. Note: This register field is sticky. Values: 0x0 (G2_2_EIOS_OTHER_SPEED_1_EIOS): (2.5GT/s, 8.0GT/s or higher) 1 or (5.0GT/s) 2 0x1 (G2_8_EIOS_OTHER_SPEED_4_EIOS): (2.5GT/s, 8.0GT/s or higher) 4 or (5.0GT/s) 8 0x2 (G2_16_EIOS_OTHER_SPEED_8_EIOS): (2.5GT/s, 8.0GT/s or higher) 8 or (5.0GT/s) 16 0x3 (G2_32_EIOS_OTHER_SPEED_16_EIOS): (2.5GT/s, 8.0GT/s or higher) 16 or (5.0GT/s) 32 Value After Reset: 0x0 Testable: writeAsRead
19:17	RO	0x0	reserved
16	RW	0x0	FORCE_DETECT_LANE_EN Force Detect Lane Enable. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): When this bit is set, the controller ignores receiver detection from PHY during LTSSM Detect state and uses FORCE_DETECT_LANE. Value After Reset: 0x0 Testable: writeAsRead
15:0	RW	0x0000	FORCE_DETECT_LANE Force Detect Lane. When the FORCE_DETECT_LANE_EN field is set, the controller ignores receiver detection from PHY during LTSSM Detect state and uses this value instead. Value represents lane number. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Lane0 0xf (MAX_VAL): Lane15 Value After Reset: 0x0 Testable: writeAsRead

DSP_PCIE_RAS_DES_SD_CONTROL2_REG

Address: Operational Base + offset (0x00A4)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	FRAMING_ERR_RECOVERY_DISABLE Framing Error Recovery Disable. This bit disables a transition to Recovery state when a Framing Error is occurred. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead
15:11	RO	0x00	reserved
10	RW	0x0	DIRECT_LPBKSLV_TO_EXIT Direct Loopback Slave To Exit. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): When this bit is set and the LTSSM is in Loopback Slave Active State, the LTSSM transitions to Loopback Slave Exit state. Value After Reset: 0x0 Testable: writeAsRead
9	RW	0x0	DIRECT_POLCOMP_TO_DETECT Direct Polling.Compliance to Detect. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): When this bit is set and the LTSSM is in Polling Compliance State, the LTSSM transitions to Detect state. Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
8	RW	0x0	DIRECT_RECIDLE_TO_CONFIG Direct Recovery.Idle to Configuration. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): When this bit is set and the LTSSM is in Recovery Idle State, the LTSSM transitions to Configuration state. Value After Reset: 0x0 Testable: writeAsRead
7:3	RO	0x00	reserved
2	RW	0x0	NOACK_FORCE_LINKDOWN Force LinkDown. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): When this bit is set and the controller detects REPLY_NUM rolling over 4 times, the LTSSM transitions to Detect State. Value After Reset: 0x0 Testable: writeAsRead
1	WO	0x0	RECOVERY_REQUEST Recovery Request. Values: 0x0 (CLEAR): Clear 0x1 (SET): When this bit is set to '1' in L0 or L0s, the LTSSM starts transitioning to Recovery State. This request does not cause a speed change or re-equalization. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	HOLD_LTSSM Hold and Release LTSSM. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): As long as this field is '1', the controller stays in the current LTSSM. Value After Reset: 0x0 Testable: writeAsRead

27	RO	0x0	FC_INIT2 FC_INIT2. Indicates the controller is in FC_INIT2(VC0) state. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
26	RO	0x0	FC_INIT1 FC_INIT1. Indicates the controller is in FC_INIT1(VC0) state. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
25:24	RO	0x0	DLCMSM DLCMSM. Indicates the current DLCMSM. Note: This register field is sticky. Values: 0x0 (DL_INACTIVE): DL_INACTIVE 0x1 (DL_FC_INIT): DL_FC_INIT 0x3 (DL_ACTIVE): DL_ACTIVE Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23:12	RO	0xfff	RX_ACK_SEQ_NO Tx Ack Sequence Number. Indicates ACKD_SEQ which is updated by receiving ACK/NAK DLLP. Note: This register field is sticky. Value After Reset: 0xfff Testable: writeAsRead Volatile: true
11:0	RO	0x000	TX_TLP_SEQ_NO Tx Tlp Sequence Number. Indicates next transmit sequence number for transmit TLP. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_SD_STATUS_L3FC_REG
Address: Operational Base + offset (0x00C0)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	CREDIT_DATA1 Credit Data1. Current FC credit data selected by the CREDIT_SEL_VC, CREDIT_SEL_CREDIT_TYPE, CREDIT_SEL_TLP_TYPE, and CREDIT_SEL_HD viewport-select fields. Rx: Credit Allocated Value Tx: Credit Limit Value. This value is valid when DLCMSM=0x3(DL_ACTIVE). Note: This register field is sticky. Value After Reset: 0x0 Testable: untestable Volatile: true
19:8	RO	0x000	CREDIT_DATA0 Credit Data0. Current FC credit data selected by the CREDIT_SEL_VC, CREDIT_SEL_CREDIT_TYPE, CREDIT_SEL_TLP_TYPE, and CREDIT_SEL_HD viewport-select fields. Rx: Credit Received Value Tx: Credit Consumed Value Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7	RO	0x0	reserved
6	RW	0x0	CREDIT_SEL_HD Credit Select(HeaderData). This field in conjunction with the CREDIT_SEL_VC, CREDIT_SEL_CREDIT_TYPE, and CREDIT_SEL_TLP_TYPE viewport-select fields determines that data that is returned by the CREDIT_DATA0 and CREDIT_DATA1 data fields. Note: This register field is sticky. Values: 0x0 (HEADER_CREDIT): Header Credit 0x1 (DATA_CREDIT): Data Credit Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
5:4	RW	0x0	CREDIT_SEL_TLP_TYPE Credit Select(TLP Type). This field in conjunction with the CREDIT_SEL_VC, CREDIT_SEL_CREDIT_TYPE, and CREDIT_SEL_HD viewport-select fields determines that data that is returned by the CREDIT_DATA0 and CREDIT_DATA1 data fields. Note: This register field is sticky. Values: 0x0 (POSTED): Posted 0x1 (NON_POSTED): Non-Posted 0x2 (COMPLETION): Completion Value After Reset: 0x0 Testable: writeAsRead
3	RW	0x0	CREDIT_SEL_CREDIT_TYPE Credit Select(Credit Type). This field in conjunction with the CREDIT_SEL_VC, CREDIT_SEL_TLP_TYPE, and CREDIT_SEL_HD viewport-select fields determines that data that is returned by the CREDIT_DATA0 and CREDIT_DATA1 data fields. Note: This register field is sticky. Values: 0x0 (RX): Rx 0x1 (TX): Tx Value After Reset: 0x0 Testable: writeAsRead
2:0	RW	0x0	CREDIT_SEL_VC Credit Select(VC). This field in conjunction with the CREDIT_SEL_CREDIT_TYPE, CREDIT_SEL_TLP_TYPE, and CREDIT_SEL_HD viewport-select fields determines that data that is returned by the CREDIT_DATA0 and CREDIT_DATA1 data fields. Note: This register field is sticky. Values: 0x0 (MIN_VAL): VC0 0x7 (MAX_VAL): VC7 Value After Reset: 0x0

DSP_PCIE_RAS_DES_SD_STATUS_L3_REG

Address: Operational Base + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7	RW	0x0	MFTLP_STATUS Malformed TLP Status. Indicates malformed TLP has occurred. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
6:0	RO	0x00	MFTLP_POINTER First Malformed TLP Error Pointer. Indicates the element of the received first malformed TLP. This pointer is validated by MFTLP_STATUS. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x1 (ATMC_OP_ALIGN): AtomicOp address alignment 0x2 (ATMC_OP_OPERAND): AtomicOp operand 0x3 (ATMC_OP_BYTE_EN): AtomicOp byte enable 0x4 (TLP_LENGTH_MISMATCH): TLP length miss match 0x5 (MAX_PAYLOAD_SIZE): Max payload size 0x6 (TLP_WITHOUT_TC0): Message TLP without TC0 0x7 (INVALID_TC): Invalid TC 0x8 (UNXPCTD_ROUTE_BIT_MSG_TLP): Unexpected route bit in Message TLP 0x9 (UNXPCTD_CRS_STATUS_CMPL_TLP): Unexpected CRS status in Completion TLP 0xa (BYTE_ENABLE): Byte enable 0xb (MEM_ADDR_4KB_BOUNDARY): Memory Address 4KB boundary 0xc (TLP_PREFIX_RULES): TLP prefix rules 0xd (TRANSLATION_RULES): Translation request rules 0xe (INVALID_TLP_TYPE): Invalid TLP type 0xf (CMPL_RULES): Completion rules 0x7f (APPLICATION): Application Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_SD_EQ_CONTROL1_REG
Address: Operational Base + offset (0x00D0)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	FOM_TARGET FOM Target. Indicates figure of merit target criteria value of EQ Master(DSP in EQ Phase3/USP in EQ Phase2). This field is only valid when GEN3_EQ_FB_MODE is 0001b(Figure Of Merit). Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead
23	RW	0x0	FOM_TARGET_ENABLE FOM Target Enable. Enables the FOM_TARGET fields. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead
22:18	RO	0x00	reserved
17:16	RW	0x0	EVAL_INTERVAL_TIME Eval Interval Time. Indicates interval time of RxEqEval assertion. This field is used for EQ Master(DSP in EQ Phase3/USP in EQ Phase2). Note: This register field is sticky. Values: 0x0 (_500NS): 500ns 0x1 (_1US): 1us 0x2 (_2US): 2us 0x3 (_4US): 4us Value After Reset: 0x0 Testable: writeAsRead
15:10	RO	0x00	reserved

Bit	Attr	Reset Value	Description
9:8	RW	0x0	EXT_EQ_TIMEOUT Extends EQ Phase2/3 Timeout. This field is used when the LTSSM is in Recovery.EQ2/3. When this field is set, the value of EQ2/3 timeout is extended. Note: This register field is sticky. Values: 0x0 (_24MS_OR_32MS): [EQ Master(DSP in EQ Phase3/USP in EQ Phase2)] 24ms (default) or [EQ Slave(DSP in EQ Phase2/USP in EQ Phase3)] 32ms (default) 0x1 (_48MS_OR_56MS): [EQ Master(DSP in EQ Phase3/USP in EQ Phase2)] 48ms (x2) or [EQ Slave(DSP in EQ Phase2/USP in EQ Phase3)] 56ms (32ms+24ms) 0x2 (_240MS_OR_248MS): [EQ Master(DSP in EQ Phase3/USP in EQ Phase2)] 240ms (x10) or [EQ Slave(DSP in EQ Phase2/USP in EQ Phase3)] 248ms (32ms +9*24ms) 0x3 (NO_TIMEOUT): [EQ Master(DSP in EQ Phase3/USP in EQ Phase2)] No timeout or [EQ Slave(DSP in EQ Phase2/USP in EQ Phase3)] No timeout Value After Reset: 0x0 Testable: writeAsRead
7:5	RO	0x0	reserved
4	RW	0x0	EQ_RATE_SEL EQ Status Rate Select. Setting this field in conjunction with the EQ_LANE_SEL field determines the per-lane Silicon Debug EQ Status data returned by the SD_EQ_CONTROL[2/3] and SD_EQ_STATUS[1/2/3] viewport registers. Note: This register field is sticky. Values: 0x0 (_8GT): 8.0GT/s Speed (include ESM data rate) 0x1 (_16GT): 16.0GT/s Speed (include ESM data rate) 0x2 (_32GT): 32.0GT/s Speed Value After Reset: 0x0 Testable: writeAsRea

Bit	Attr	Reset Value	Description
3:0	RW	0x0	EQ_LANE_SEL EQ Status Lane Select. Setting this field in conjunction with the EQ_RATE_SEL field determines the per-lane Silicon Debug EQ Status data returned by the SD_EQ_CONTROL[2/3] and SD_EQ_STATUS[1/2/3] viewport registers. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Lane0 0xf (MAX_VAL): Lane15 Value After Reset: 0x0 Testable: writeAsRead

DSP_PCIE_RAS_DES_SD_EQ_CONTROL2_REG
Address: Operational Base + offset (0x00D4)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30	RW	0x0	FORCE_LOCAL_TX_PRESET_ENABLE Force Local Transmitter Preset Enable. Enables the FORCE_LOCAL_TX_PRESET field. If select rate in the EQ_RATE_SEL field is 32.0GT/s Speed, this feature is not available. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
29	RW	0x0	FORCE_LOCAL_RX_HINT_ENABLE Force Local Receiver Preset Hint Enable. Enables the FORCE_LOCAL_RX_HINT field. If select rate in the EQ_RATE_SEL field is other than 8.0GT/s Speed, this feature is not available. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
28	RW	0x0	FORCE_LOCAL_TX_COEF_ENABLE Force Local Transmitter Coefficient Enable. Enables the following fields: FORCE_LOCAL_TX_PRE_CURSOR FORCE_LOCAL_TX_CURSOR FORCE_LOCAL_TX_POST_CURSOR Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
27:24	RW	0x0	FORCE_LOCAL_TX_PRESET Force Local Transmitter Preset. Indicates initial preset value of USP in EQ Slave(EQ Phase2) instead of receiving EQ TS2. If select rate in the EQ_RATE_SEL field is 32.0GT/s Speed, this feature is not available. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23:21	RO	0x0	reserved
20:18	RW	0x0	FORCE_LOCAL_RX_HINT Force Local Receiver Preset Hint. Indicates the RxPresetHint value of EQ Slave(DSP in EQ Phase2/USP in EQ Phase3), instead of received or set value. If select rate in the EQ_RATE_SEL field is other than 8.0GT/s Speed, this feature is not available. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
17:12	RW	0x00	FORCE_LOCAL_TX_POST_CURSOR Force Local Transmitter Post-Cursor. Indicates the coefficient value of EQ Slave(DSP in EQ Phase2/USP in EQ Phase3), instead of the value instructed from link partner. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
11:6	RW	0x00	FORCE_LOCAL_TX_CURSOR Force Local Transmitter Cursor. Indicates the coefficient value of EQ Slave(DSP in EQ Phase2/USP in EQ Phase3), instead of the value instructed from link partner. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5:0	RW	0x00	FORCE_LOCAL_TX_PRE_CURSOR Force Local Transmitter Pre-cursor. Indicates the coefficient value of EQ Slave(DSP in EQ Phase2/USP in EQ Phase3), instead of the value instructed from link partner. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_SD_EQ_CONTROL3_REG
Address: Operational Base + offset (0x00D8)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RW	0x0	FORCE_REMOTE_TX_COEF_ENABLE Force Remote Transmitter Coefficient Enable. Enables the following fields: FORCE_REMOTE_TX_PRE_CURSOR FORCE_REMOTE_TX_CURSOR FORCE_REMOTE_TX_POST_CURSOR This function can only be used when GEN3_EQ_FB_MODE = 0000b(Direction Change) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
27:18	RO	0x000	reserved

Bit	Attr	Reset Value	Description
17:12	RW	0x00	FORCE_REMOTE_TX_POST_CURSOR Force Remote Transmitter Post-Cursor. Indicates the coefficient value of EQ Master(DSP in EQ Phase3/USP in EQ Phase2), instead of the value instructed from local phy in dirchange mode. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
11:6	RW	0x00	FORCE_REMOTE_TX_CURSOR Force Remote Transmitter Cursor. Indicates the coefficient value of EQ Master(DSP in EQ Phase3/USP in EQ Phase2), instead of the value instructed from local phy in dirchange mode. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5:0	RW	0x00	FORCE_REMOTE_TX_PRE_CURSOR Force Remote Transmitter Pre-Cursor. Indicates the coefficient value of EQ Master(DSP in EQ Phase3/USP in EQ Phase2), instead of the value instructed from local phy in dirchange mode. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_SD_EQ_STATUS1_REG

Address: Operational Base + offset (0x00E0)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7	RO	0x0	EQ_REJECT_EVENT EQ Reject Event. Indicates that the controller receives two consecutive TS1 OS w/Reject=1b during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
6	RO	0x0	EQ_RULEC_VIOLATION EQ Rule C Violation. Indicates that coefficients rule C violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rule C correspond to the rules c) from section "Rules for Transmitter Coefficents" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5	RO	0x0	EQ_RULEB_VIOLATION EQ Rule B Violation. Indicates that coefficients rule B violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rules B correspond to the rules b) from section "Rules for Transmitter Coefficents" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
4	RO	0x0	EQ_RULEA_VIOLATION EQ Rule A Violation. Indicates that coefficients rule A violation is detected in the values provided by PHY using direction change method during EQ Master phase(DSP in EQ Phase3/USP in EQ Phase2). The coefficients rules A correspond to the rules a) from section "Rules for Transmitter Coefficents" in the PCI Express Base Specification. This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
3	RO	0x0	reserved
2:1	RO	0x0	EQ_CONVERGENCE_INFO EQ Convergence Info. Indicates equalization convergence information. This bit is automatically cleared when the controller starts EQ Master phase again. Note: This register field is sticky. Values: 0x0 (EQ_NOT_ATTEMPTED): Equalization is not attempted 0x1 (EQ_SUCCESSFUL): Equalization finished successfully 0x2 (EQ_UNSUCCESSFUL): Equalization finished unsuccessfully 0x3 (RSVD): Reserved Value After Reset: 0x0 Testable: writeAsRead Volatile: true
0	RO	0x0	EQ_SEQUENCE EQ Sequence. Indicates that the controller is starting the equalization sequence. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_SD_EQ_STATUS2_REG
Address: Operational Base + offset (0x00E4)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	EQ_LOCAL_FOM_VALUE EQ Local Figure of Merit. Indicates Local maximum Figure of Merit value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23:21	RO	0x0	reserved
20:18	RO	0x0	EQ_LOCAL_RX_HINT EQ Local Receiver Preset Hint. Indicates Local Receiver Preset Hint value. If select rate in the EQ_RATE_SEL field is other than 8.0GT/s Speed, this feature is not available. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
17:12	RO	0x00	EQ_LOCAL_POST_CURSOR EQ Local Post-Cursor. Indicates Local post cursor coefficient value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
11:6	RO	0x00	EQ_LOCAL_CURSOR EQ Local Cursor. Indicates Local cursor coefficient value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
5:0	RO	0x00	EQ_LOCAL_PRE_CURSOR EQ Local Pre-Cursor. Indicates Local pre cursor coefficient value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_RAS_DES_SD_EQ_STATUS3_REG

Address: Operational Base + offset (0x00E8)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:24	RO	0x00	EQ_REMOTE_FS EQ Remote FS. Indicates Remote FS value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23:18	RO	0x00	EQ_REMOTE_LF EQ Remote LF. Indicates Remote LF value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
17:12	RO	0x00	EQ_REMOTE_POST_CURSOR EQ Remote Post-Cursor. Indicates Remote post cursor coefficient value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
11:6	RO	0x00	EQ_REMOTE_CURSOR EQ Remote Cursor. Indicates Remote cursor coefficient value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5:0	RO	0x00	EQ_REMOTE_PRE_CURSOR EQ Remote Pre-Cursor. Indicates Remote pre cursor coefficient value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

11.4.3.19 DSP_PCIE_VSECDMA Registers Summary

Name	Offset	Size	Reset Value	Description
DSP_PCIE_VSECDMA_EXT_CAP_HDR_OFF	0x0000	W	0x0001000B	PCIe Extended Capability ID, Capability Version, and Next Capability Offset Register
DSP_PCIE_VSECDMA_VENDOR_SPECIFIC_HDR_OFF	0x0004	W	0x01800006	Vendor Specific Header Register
DSP_PCIE_VSECDMA_DEVICE_INFORMATION_OFF	0x0008	W	0x00A80401	DMA and related AXI Bridge Implementation Information
DSP_PCIE_VSECDMA_NUM_CHAN_OFF	0x000C	W	0x00020002	Number of Implemented Channels Register
DSP_PCIE_VSECDMA_UNROLL_ADDR_OFFSET_LOW_OFF	0x0010	W	0x00000000	DMA Register Map Start Address Offset Low Register
DSP_PCIE_VSECDMA_UNROLL_ADDR_OFFSET_HIGH_OFF	0x0014	W	0x00000000	DMA Register Map Start Address Offset High Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.3.20 DSP_PCIE_VSECDMA Detail Registers Description

DSP_PCIE_VSECDMA_EXT_CAP_HDR_OFF

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x000	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b although software must mask them to allow for future uses of these bits. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead
19:16	RW	0x1	CAP Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. A version of the specification that changes the Extended Capability in a way that is not otherwise identifiable (that is, through a new Capability field) is permitted to increment this field. All such changes to the Capability structure must be software-compatible. Software must check for Capability Version numbers that are greater than or equal to the highest number defined when the software is written, as Functions reporting any such Capability Version numbers will contain a Capability structure that is compatible with that piece of software. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: writeAsRead

Bit	Attr	Reset Value	Description
15:0	RW	0x000b	ID PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0xb Testable: writeAsRead

DSP_PCIE_VSECDMA_VENDOR_SPECIFIC_HDR_OFF

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:20	RO	0x018	VSEC_LENGTH VSEC Length. This field indicates the number of bytes in the entire VSEC structure, including the Vendor-Specific Extended Capability Header, the Vendor-Specific Header, and the vendor-specific registers. Value After Reset: 0x18
19:16	RO	0x0	VSEC_REV VSEC Rev. This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field. Value After Reset: 0x0
15:0	RO	0x0006	VSEC_ID VSEC ID. This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field. Value After Reset: 0x6

DSP_PCIE_VSECDMA_DEVICE_INFORMATION_OFF

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26	RO	0x0	MASTER_PAGE_BOUNDARY_POINTER_WIDTH This field provides address page boundary information. It reports the value of CC_MSTR_PAGE_BOUNDARY_PW configuration parameter. Value After Reset: 0xd

Bit	Attr	Reset Value	Description
25:23	RO	0x1	MASTER_BURST_LENGTH Reports the CC_MSTR_BURST_LEN configuration parameter. Values: 0x0 (MSTR_BRSTLEN_8): 8 bits 0x1 (MSTR_BRSTLEN_16): 16 bits 0x2 (MSTR_BRSTLEN_32): 32 bits 0x3 (MSTR_BRSTLEN_64): 64 bits 0x4 (MSTR_BRSTLEN_128): 128 bits 0x5 (MSTR_BRSTLEN_256): 256 bits Value After Reset: 0x1
22:20	RO	0x2	MASTER_BUS_WIDTH This field provides information regarding the AXI master data bus width. It reports the value of MASTER_BUS_DATA_WIDTH configuration parameter. Values: 0x0 (MSTR_BUSWD_32): 32 bits 0x1 (MSTR_BUSWD_64): 64 bits 0x2 (MSTR_BUSWD_128): 128 bits 0x3 (MSTR_BUSWD_256): 256 bits 0x4 (MSTR_BUSWD_512): 512 bits Value After Reset: 0x2
19	RO	0x1	AXI This field provides information about AXI interface usage. It reports the value of AXI_POPULATED configuration parameter. Value After Reset: 0x1
18:16	RO	0x0	CHANNEL_SEPARATION If the MAP_FORMAT is set to HDMA_NATIVE, this field specifies the read write channel address separation. Other values are reserved. Values: 0x0 (CHSEP_256): 256 separated 0x1 (CHSEP_512): 512 separated 0x2 (CHSEP_1K): 1k separated 0x3 (CHSEP_2K): 2k separated 0x4 (CHSEP_4K): 4k separated 0x5 (CHSEP_8K): 8k separated 0x6 (CHSEP_16K): 16k separated 0x7 (CHSEP_32K): 32k separated Value After Reset: 0x0
15:11	RO	0x00	PFN Physical Function Number. This field provides information regarding the DMA register and physical function mapping. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
10:8	RO	0x4	BARN Bar Number. This field provides information regarding the DMA register and BAR number mapping. Value After Reset: 0x4
7:3	RO	0x00	reserved
2:0	RO	0x1	MAP_FORMAT Defines the register map format and features to be one of the following values: Other values are reserved. Values: 0x0 (EDMA_LEGACY_PL): Legacy DMA register map accessed by the port-logic registers 0x1 (EDMA_LEGACY_UNROLL): Legacy DMA register map, mapped to a PF/BAR 0x5 (HDMA_COMPATIBILITY_MODE): HDMA compatibility mode (CC_LEGACY_DMA_MAP =1) register map, mapped to a PF/BAR 0x7 (HDMA_NATIVE): HDMA native (CC_LEGACY_DMA_MAP =0) register map, mapped to a PF/BAR Value After Reset: 0x1

DSP_PCIE_VSECDMA_NUM_CHAN_OFF

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:16	RO	0x002	NUM_DMA_RD_CHAN This field provides information regarding the number of implemented read channels. It reports the value of CC_NUM_DMA_RD_CHAN parameter. Value After Reset: 0x2
15:10	RO	0x00	reserved
9:0	RO	0x002	NUM_DMA_WR_CHAN This field provides information regarding the number of implemented write channels. It reports the value of CC_NUM_DMA_WR_CHAN parameter. Value After Reset: 0x2

DSP_PCIE_VSECDMA_UNROLL_ADDR_OFFSET_LOW_OFF

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	UNROLL_ADDR_OFFSET_LOW BAR address offset, 32-bit LSB. Value After Reset: 0x0

DSP_PCIE_VSECDMA_UNROLL_ADDR_OFFSET_HIGH_OFF

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	UNROLL_ADDR_OFFSET_HIGH BAR address offset, 32-bit MSB. Value After Reset: 0x0

11.4.3.21 DSP_PCIE_PL Registers Summary

Name	Offset	Size	Reset Value	Description
DSP_PCIE_PL_ACK_LATENCY_TIMER_OFF	0x0000	W	0x0C23040B	Ack Latency Timer and Replay Timer Register
DSP_PCIE_PL_VENDOR_SPEC_DLLP_OFF	0x0004	W	0xFFFFFFFF	Vendor Specific DLLP Register

11.4.3.22 DSP_PCIE_PL Detail Registers Description

DSP_PCIE_PL_ACK_LATENCY_TIMER_OFF

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RW	0x0c23	REPLAY_TIME_LIMIT Replay Timer Limit. The replay timer expires when it reaches this limit. The controller initiates a replay upon reception of a NAK or when the replay timer expires. For more details, see "Transmit Replay" in the Databook. You can modify the effective timer limit through the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-4, 3-5, and 3-6 of the PCI Express Base Specification. If there is a change in the payload size or link speed, the controller overrides any value that you have written to this register field, and resets the field back to the specification-defined value. The controller does not change the value in the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. Value After Reset: 0xc23 Testable: untestable Volatile: true

Bit	Attr	Reset Value	Description
15:0	RW	0x040b	ROUND_TRIP_LATENCY_TIME_LIMIT Ack Latency Timer Limit. The Ack latency timer expires when it reaches this limit. For more details, see "ACK/NAK Scheduling" in the Databook. You can modify the effective timer limit through the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-7, 3-8, and 3-9 of the PCI Express Base Specification. The limit must reflect the round trip latency from requester to completer. If there is a change in the payload size or link width, the controller overrides any value that you have written to this register field, and resets the field back to the specification-defined value. The controller does not change the value in the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. Value After Reset: 0x40b Testable: untestable Volatile: true

DSP_PCIE_PL_VENDOR_SPEC_DLLP_OFF
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	VENDOR_SPEC_DLLP Vendor Specific DLLP Register. You can use this register to send a specific PCI Express DLLP. Your application can write 8-bit DLLP Type and 24-bit Payload data into this register, and set the VENDOR_SPECIFIC_DLLP_REQ field of the PORT_LINK_CTRL_OFF, to send the DLLP. Bits[7:0]: DLLP Type Bits[31:8]: Vendor Defined Payload (24 bits) Note: This register field is sticky. Values: 0x0 (ZERO): Zero value 0xffffffff (MAX): Max value Value After Reset: 0xffffffff

DSP_PCIE_PL_PORT_FORCE_OFF
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23	RW	0x1	DO_DESKEW_FOR_SRIS Use the transitions from TS2 to Logical Idle Symbol, SKP OS to Logical Idle Symbol, EIEOS to Logical Idle Symbol, and FTS Sequence to SKP OS to do deskew instead of using received SKP OS or TS1 to TS2 transition if DO_DESKEW_FOR_SRIS is set to '1'. Note: This register field is sticky. Value After Reset: 0x1
22	RW	0x0	SUPPORT_PART_LANES_RXEI_EXIT Support LTSSM transition from Polling.Active to Polling.Config based on Rx 8 TSs on any lanes which are Rx EI exit too from base spec after 24ms timeout. This prevents some lanes detected but not Rx EI exit and LTSSM cannot move to Polling.Config. You must set the parameter CX_AUTO_LANE_FLIP_CTRL_EN true for the auto lanes reversal. Note: This register field is sticky. Values: 0x1 (SUPPORT): Any lanes receives 8 consecutive TS OSs, LTSSM moves from Polling.Active to Polling.Config. If all lanes do not receive 8 consecutive TS OSs and any predetermined lanes are still on Rx ElecIdle, LTSSM moves from Polling.Active to Polling.Compliance. 0x0 (UNSUPPORT): Any lanes receives 8 consecutive TS OS and all predetermined lanes have Rx ElecIdle exit, LTSSM moves from Polling.Active to Polling.Config. This is legacy mode from Base Spec. Any predetermined lanes are still on Rx ElecIdle, LTSSM moves from Polling.Active to Polling.Compliance. Value After Reset: 0x0
21:16	RW	0x00	LINK_STATE Forced LTSSM State. The LTSSM state that the controller is forced to when you set the FORCE_EN bit (Force Link). LTSSM state encoding is defined by the lts_state variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15	WO	0x0	FORCE_EN Force Link. The controller supports a testing and debug capability to allow your software to force the LTSSM state machine into a specific state, and to force the controller to transmit a specific Link Command. Asserting this bit triggers the following actions: Forces the LTSSM to the state specified by the Forced LTSSM State field. Forces the controller to transmit the command specified by the Forced Link Command field. This is a self-clearing register field. Reading from this register field always returns a '0'. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
14:12	RO	0x0	reserved
11:8	RW	0x0	FORCED_LTSSM Forced Link Command. The link command that the controller is forced to transmit when you set FORCE_EN bit (Force Link). Link command encoding is defined by the ltssm_cmd variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky. Value After Reset: 0x0
7:0	RW	0x04	LINK_NUM Link Number. Not used for endpoint. Note: This register field is sticky. Value After Reset: 0x4

DSP_PCIE_PL_ACK_F_ASPM_CTRL_OFF

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved

Bit	Attr	Reset Value	Description
30	RW	0x0	ENTER_ASPM ASPM L1 Entry Control. Note: This register field is sticky. Values: 0x1 (IDLE_TO_L1): Controller enters ASPM L1 after a period in which it has been idle. 0x0 (L0S_TO_L1): Controller enters ASPM L1 only after idle period during which both receive and transmit are in L0s. Value After Reset: 0x0
29:27	RW	0x3	L1_ENTRANCE_LATENCY L1 Entrance Latency. Note: Programming this timer with a value greater that 32us has no effect unless extended sync is used, or all of the credits are infinite. Note: This register field is sticky. Values: 0x0 (_1_US): 1 us 0x1 (_2_US): 2 us 0x2 (_4_US): 4 us 0x3 (_8_US): 8 us 0x4 (_16_US): 16 us 0x5 (_32_US): 32 us 0x6 (_64_US): 64Us 0x7 (_64US_): 64 us Value After Reset: 0x3
26:24	RW	0x3	L0S_ENTRANCE_LATENCY L0s Entrance Latency. Note: This register field is sticky. Values: 0x0 (_1_US): 1 us 0x1 (_2_US): 2 us 0x2 (_3_US): 3 us 0x3 (_4_US): 4 us 0x4 (_5_US): 5 us 0x5 (_6_US): 6 us 0x6 (_7_US): 7 US 0x7 (_7US_): 7 us Value After Reset: 0x3

Bit	Attr	Reset Value	Description
23:16	RO	0xd2	COMMON_CLK_N_FTS Common Clock N_FTS. This is the N_FTS when common clock is used. The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. This field is only writable (sticky) when all of the following configuration parameter equations are true: CX_NFTS !=CX_COMM_NFTS DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Note: The access attributes of this field are as follows: Wire: No access. Dbi: R Values: 0x0 (ZERO): The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. 0xff (MAX_VAL): The maximum number of FTS ordered-sets that a component can request is 255. Value After Reset: 0xd2
15:8	RW	0xd2	ACK_N_FTS The number of Fast Training Sequence(N_FTS) ordered sets to be transmitted when transitioning from L0s to L0. Note: This register field is sticky. Values: 0x0 (ZERO): The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. 0xff (MAX_VAL): The maximum number of FTS ordered-sets that a component can request is 255. Value After Reset: 0xd2

Bit	Attr	Reset Value	Description
7:0	RW	0x00	ACK_FREQ Ack Frequency. The controller accumulates the number of pending ACKs specified here (up to 255) before scheduling an ACK DLLP. 0: Indicates that this Ack Frequency Counter feature is turned off. The controller generates a low-priority ACK request for every TLP that it receives. The controller waits until the ACK Latency Timer expires, then converts the current low-priority ACK request to a high-priority ACK request and schedules the DLLP for transmission to the remote link partner. 1-255: Indicates that the controller will schedule a high-priority ACK after receiving this number of TLPs. It might schedule the ACK before receiving this number of TLPs if the ACK Latency Timer expires, but never later. For a typical system, you do not have to modify the default setting. For more details, see "ACK/NAK Scheduling" in the Databook. Note: This register field is sticky. Values: 0x0 (MIN_VAL): The value '0' indicates that this Ack Frequency Counter feature is turned off. 0xff (MAX_VAL): Any value between 1 and 255 indicates that the controller will schedule a high-priority ACK after receiving the specified number of TLPs. Value After Reset: 0x0

DSP_PCIE_PL_PORT_LINK_CTRL_OFF

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	TRANSMIT_LANE_REVERSALE_ENABLE TRANSMIT_LANE_REVERSALE_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
26	RW	0x0	EXTENDED_SYNCH EXTENDED_SYNCH is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
25	RW	0x0	CORRUPT_LCRC_ENABLE CORRUPT_LCRC_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
24	RW	0x0	BEACON_ENABLE BEACON_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
23:22	RO	0x0	reserved
21:16	RW	0x03	LINK_CAPABLE Link Mode Enable. Sets the number of lanes in the link that you want to connect to the link partner. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Predetermined Number of Lanes" field of the "Link Width and Speed Change Control Register". For more information, see "How to Tie Off Unused Lanes". For information on upsizing and downsizing the link width, see "Link Establishment". Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (X1): x1 0x3 (X2): x2 0x7 (X4): x4 0xf (X8): x8 0x1f (X16): x16 0x3f (X32): x32 (not supported) Value After Reset: 0x7 Testable: unconstrained
15:12	RO	0x0	reserved
11:8	RW	0x1	LINK_RATE LINK_RATE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
7	RW	0x0	FAST_LINK_MODE Fast Link Mode. Sets all internal LTSSM millisecond timers to Fast Mode for speeding up simulation. Forces the LTSSM training (link initialization) to use shorter time-outs and to link up faster. The default scaling factor can be changed using the DEFAULT_FAST_LINK_SCALING_FACTOR parameter or through the FAST_LINK_SCALING_FACTOR field in the TIMER_CTRL_MAX_FUNC_NUM_OFF register. Fast Link Mode can also be activated by setting the diag_ctrl_bus[2] pin to '1'. For more details, see the "Fast Link Simulation Mode" section in the "Integrating the Controller with the PHY or Application RTL or Verification IP" chapter of the User Guide. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
6	RW	0x0	LINK_DISABLE LINK_DISABLE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
5	RW	0x1	DLL_LINK_EN DLL Link Enable. Note: This register field is sticky. Values: 0x1 (ENABLE): Enables link initialization. 0x0 (DISABLE): The controller does not transmit InitFC DLLPs and does not establish a link. Value After Reset: 0x1
4	RO	0x0	reserved
3	RW	0x0	RESET_ASSERT Reset Assert. Triggers a recovery and forces the LTSSM to the hot reset state (downstream port only). Note: This register field is sticky. Values: 0x1 (SET): Set 0x0 (CLEAR): Clear Value After Reset: 0x0

Bit	Attr	Reset Value	Description
2	RW	0x0	LOOPBACK_ENABLE Loopback Enable. Turns on loopback. For more details, see "Loopback" in the Databook. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
1	RW	0x0	SCRAMBLE_DISABLE Scramble Disable. Turns off data scrambling. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
0	W1C	0x0	VENDOR_SPECIFIC_DLLP_REQ Vendor Specific DLLP Request. Reading from this self-clearing register field always returns a '0'. Values: 0x1 (SET): When software writes a '1' to this bit, the controller transmits the DLLP contained in the VENDOR_SPEC_DLLP field of VENDOR_SPEC_DLLP_OFF 0x0 (CLEAR): This is a self clearing register Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_PL_LANE_SKEW_OFF
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31	RW	0x0	DISABLE_LANE_TO_LANE_DESKEW Disable Lane-to-Lane Deskew. Causes the controller to disable the internal Lane-to-Lane deskew logic. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
30:27	RW	0x1	IMPLEMENT_NUM_LANES Implementation-specific Number of Lanes. Set the implementation-specific number of lanes. The number of lanes to be used when in Loopback Master. The number of lanes programmed must be equal to or less than the valid number of lanes set in LINK_CAPABLE field. You must configure this field before initiating Loopback by writing in the LOOPBACK_ENABLE field. The controller will transition from Loopback.Entry to Loopback.Active after receiving two consecutive TS1 Ordered Sets with the Loopback bit asserted on the implementation specific number of lanes configured in this field. Note: This register field is sticky. Values: 0x0 (_1_LANE): 1 lane 0x1 (_2_LANE): 2 lanes 0x3 (_4_LANE): 4 lanes 0x7 (_8_LANE): 8 lanes 0xf (_16_LANE): 16 lanes Value After Reset: 0x3
26	RW	0x0	ELASTIC_BUFFER_MODE Selects Elasticity Buffer operating mode: Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (HALF_FULL): Nominal Half Full Buffer mode 0x1 (EMPTY): Nominal Empty Buffer Mode Value After Reset: 0x1

Bit	Attr	Reset Value	Description
25	RW	0x0	ACK_NAK_DISABLE Ack/Nak Disable. Prevents the controller from sending ACK and NAK DLLPs. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
24	RW	0x0	FLOW_CTRL_DISABLE Flow Control Disable. Prevents the controller from sending FC DLLPs. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
23:0	RW	0x000000	INSERT_LANE_SKEW INSERT_LANE_SKEW is an internally reserved field. Do not use. Note: This register field is sticky. Values: 0x0 (MIN): Zero value 0xff (MAX): Max value Value After Reset: 0x0

DSP_PCIE_PL_TIMER_CTRL_MAX_FUNC_NUM_OFF

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:29	RW	0x0	FAST_LINK_SCALING_FACTOR Fast Link Timer Scaling Factor. Sets the scaling factor of LTSSM timer when FAST_LINK_MODE field in PORT_LINK_CTRL_OFF is set to '1'. Default is set by the hidden configuration parameter DEFAULT_FAST_LINK_SCALING_FACTOR which defaults to '0'. Note: This register field is sticky. Values: 0x0 (SF_1024): Scaling Factor is 1024 (1ms is 1us). When the LTSSM is in Config or L12 Entry State, 1ms timer is 2us, 2ms timer is 4us and 3ms timer is 6us. 0x1 (SF_256): Scaling Factor is 256 (1ms is 4us) 0x2 (SF_64): Scaling Factor is 64 (1ms is 16us) 0x3 (SF_16): Scaling Factor is 16 (1ms is 64us) Value After Reset: 0x2

Bit	Attr	Reset Value	Description
28:24	RW	0x00	UPDATE_FREQ_TIMER UPDATE_FREQ_TIMER is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
23:19	RW	0x00	TIMER_MOD_ACK_NAK Ack Latency Timer Modifier. Increases the timer value for the Ack latency timer in increments of 64 clock cycles. A value of '0' represents no modification to the timer value. For more details, see the ROUND_TRIP_LATENCY_TIME_LIMIT field of the ACK_LATENCY_TIMER_OFF register. Note: This register field is sticky. Value After Reset: 0x0
18:14	RW	0x00	TIMER_MOD_REPLAY_TIMER Replay Timer Limit Modifier. Increases the time-out value for the replay timer in increments of 64 clock cycles at Gen1 or Gen2 speed, and in increments of 256 clock cycles at Gen3 speed. A value of '0' represents no modification to the timer limit. For more details, see the REPLAY_TIME_LIMIT field of the ACK_LATENCY_TIMER_OFF register. At Gen3 speed, the controller automatically changes the value of this field to DEFAULT_GEN3_REPLAY_ADJ. Note: This register field is sticky. Value After Reset: 0xa Testable: writeAsRead Reset Mask: 0x0 Volatile: true
13:8	RO	0x00	reserved
7:0	RW	0x00	MAX_FUNC_NUM Maximum function number that can be used in a request. Configuration requests targeted at function numbers above this value are returned with UR (unsupported request). Note: This register field is sticky. Values: 0x0 (MIN): Zero value 0xff (MAX): Max value Value After Reset: 0x0

DSP_PCIE_PL_SYMBOL_TIMER_FILTER_1_OFF
Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31	RW	0x0	CX_FLT_MASK_RC_CFG_DISCARD CX_FLT_MASK_RC_CFG_DISCARD 0: For RADM RC filter to not allow CFG transaction being received 1: For RADM RC filter to allow CFG transaction being received
30	RW	0x0	CX_FLT_MASK_RC_IO_DISCARD CX_FLT_MASK_RC_IO_DISCARD 0: For RADM RC filter to not allow IO transaction being received 1: For RADM RC filter to allow IO transaction being received
29	RW	0x0	CX_FLT_MASK_MSG_DROP CX_FLT_MASK_MSG_DROP 0: Drop MSG TLP (except for Vendor MSG). Send decoded message on the SII. 1: Do not Drop MSG (except for Vendor MSG). Send message TLPs to your application on TRGT1 and send decoded message on the SII. The default for this bit is the inverse of FLT_DROP_MSG. That is, if FLT_DROP_MSG =1, then the default of this bit is '0' (drop message TLPs). This bit only controls message TLPs other than Vendor MSGs. Vendor MSGs are controlled by Filter Mask Register 2, bits [1:0]. The controller never passes ATS Invalidate messages to the SII interface regardless of this filter rule setting. The controller passes all ATS Invalidate messages to TRGT1 (or AXI bridge master), as they are too big for the SII.
28	RW	0x0	CX_FLT_MASK_CPL_ECRC_DISCARD CX_FLT_MASK_CPL_ECRC_DISCARD Only used when completion queue is advertised with infinite credits and is in store-and-forward mode. 0: Discard completions with ECRC errors 1: Allow completions with ECRC errors to be passed up Reserved field for SW.
27	RW	0x0	CX_FLT_MASK_ECRC_DISCARD CX_FLT_MASK_ECRC_DISCARD 0: Discard TLPs with ECRC errors 1: Allow TLPs with ECRC errors to be passed up
26	RW	0x0	CX_FLT_MASK_CPL_LEN_MATCH CX_FLT_MASK_CPL_LEN_MATCH 0: Enforce length match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err 1: Mask length match for completions
25	RW	0x0	CX_FLT_MASK_CPL_ATTR_MATCH CX_FLT_MASK_CPL_ATTR_MATCH 0: Enforce attribute match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask attribute match for completions

Bit	Attr	Reset Value	Description
24	RW	0x0	CX_FLT_MASK_CPL_TC_MATCH CX_FLT_MASK_CPL_TC_MATCH 0: Enforce Traffic Class match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Traffic Class match for completions
23	RW	0x0	CX_FLT_MASK_CPL_FUNC_MATCH CX_FLT_MASK_CPL_FUNC_MATCH 0: Enforce function match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask function match for completions
22	RW	0x0	CX_FLT_MASK_CPL_REQID_MATCH CX_FLT_MASK_CPL_REQID_MATCH 0: Enforce Req. Id match for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Req. Id match for completions
21	RW	0x0	CX_FLT_MASK_CPL_TAGERR_MATCH CX_FLT_MASK_CPL_TAGERR_MATCH 0: Enforce Tag Error Rules for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Tag Error Rules for completions
20	RW	0x0	CX_FLT_MASK_LOCKED_RD_AS_UR CX_FLT_MASK_LOCKED_RD_AS_UR 0: Treat locked Read TLPs as UR for EP; Supported for RC 1: Treat locked Read TLPs as Supported for EP; UR for RC
19	RW	0x0	CX_FLT_MASK_CFG_TYPE1_REQ_AS_UR CX_FLT_MASK_CFG_TYPE1_REQ_AS_UR 0: Treat CFG type1 TLPs as UR for EP; Supported for RC 1: Treat CFG type1 TLPs as Supported for EP; UR for RC When CX_SRIOV_ENABLE is set then this bit is set to allow the filter to process Type 1 Config requests if the EP consumes more than one bus number.
18	RW	0x0	CX_FLT_MASK_UR_OUTSIDE_BAR CX_FLT_MASK_UR_OUTSIDE_BAR 0: Treat out-of-bar TLPs as UR 1: Do not treat out-of-bar TLPs as UR
17	RW	0x0	CX_FLT_MASK_UR_POIS CX_FLT_MASK_UR_POIS 0: Treat poisoned request TLPs as UR 1: Do not treat poisoned request TLPs as UR The native controller always passes poisoned completions to your application except when you are using the DMA read channel.

Bit	Attr	Reset Value	Description
16	RW	0x0	CX_FLT_MASK_UR_FUNC_MISMATCH CX_FLT_MASK_UR_FUNC_MISMATCH 0: Treat Function MisMatched TLPs as UR 1: Do not treat Function MisMatched TLPs as UR Note: This register field is sticky. Value After Reset: 0x0
15	RW	0x0	DISABLE_FC_WD_TIMER Disable FC Watchdog Timer. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
14:11	RW	0x0	EIDLE_TIMER EIDLE_TIMER is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
10:0	RW	0x140	SKP_INT_VAL SKP Interval Value. The number of symbol times to wait between transmitting SKP ordered sets. The controller waits the number of symbol times in this register plus 1, between transmitting SKP ordered sets. Your application must program this register accordingly. For example, if 1536 were programmed into this register (in a 250 MHz controller), then the controller actually transmits SKP ordered sets once every 1537 symbol times. The value programmed to this register is actually clock ticks and not symbol times. In a 125 MHz controller, programming the value programmed to this register should be scaled down by a factor of 2 (because one clock tick =two symbol times in this case). Note: This value is not used at Gen3 speed; the skip interval is hardcoded to 370 blocks. Note: This register field is sticky. Value After Reset: 0x140

Bit	Attr	Reset Value	Description
24	RW	0x0	LANE_UNDER_TEST The Lane Under Test is the lane for Forced Lane Flip or for Loopback Eq. Only one lane is configured each time. The default of this field is the CX_DEFAULT_LANE_UNDER_TEST configuration parameter. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Zero 0x1 (MAX_VAL): CX_NL Value After Reset: 0x0
23	RW	0x0	SELECTABLE_DEEMPH_BIT_MUX The selectable deemphasis bit (Symbol 4 bit 6) of the transmitted TS2 Ordered Sets for DSP in Recovery.RcvrCfg state is muxed between the Selectable De-emphasis field in the Link Control 2 register and the value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP. Note: This register field is sticky. Values: 0x0 (FROM_LINK_CTRL_2_REG): The value from the Selectable De-emphasis field in the Link Control 2 register 0x1 (REQUESTED_BY_USP): The value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP Value After Reset: 0x0
22	RW	0x0	SELECT_DEEMPH_VAR_MUX The select_deemphasis variable for DSP on entry to Recovery.RcvrCfg state is muxed between the Selectable De-emphasis field in the Link Control 2 register and the value requested by the Upstream Port in the eight consecutive TS1 Ordered Sets it received. Note: This register field is sticky. Values: 0x0 (REQUESTED_BY_USP): The value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP 0x1 (FROM_LINK_CTRL_2_REG): The value from the Selectable De-emphasis field in the Link Control 2 register Value After Reset: 0x0

Bit	Attr	Reset Value	Description
21	RW	0x0	GEN1_EI_INFERENCE Electrical Idle Inference Mode at Gen1 Rate. Programmable mode to determine inferred electrical idle (EI) in Recovery.Speed or Loopback.Active (as slave) state at Gen1 speed by looking for a '1' value on RxElecIdle instead of looking for a '0' on RxValid. If the PHY fails to deassert the RxValid signal in Recovery.Speed or Loopback.Active (because of corrupted EIOS for example), then EI cannot be inferred successfully in the controller by just detecting the condition RxValid=0. Note: This register field is sticky. Values: 0x0 (RXELECIDLE_TO_INFER): Use RxElecIdle signal to infer Electrical Idle 0x1 (RXVALID_TO_INFER): Use RxValid signal to infer Electrical Idle Value After Reset: 0x0
20	RW	0x0	SEL_DEEMPHASIS Used to set the de-emphasis level for upstream ports. This bit selects the level of de-emphasis the link operates at. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (N_6DB): -6 dB 0x1 (N_3_5DB): -3.5 dB Value After Reset: 0x0
19	RW	0x0	CONFIG_TX_COMP_RX Config Tx Compliance Receive Bit. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (SET): When set to 1, signals LTSSM to transmit TS ordered sets with the compliance receive bit assert (equal to '1'). 0x0 (CLEAR): Clear Value After Reset: 0x0

Bit	Attr	Reset Value	Description
18	RW	0x0	CONFIG_PHY_TX_CHANGE Config PHY Tx Swing. Controls the PHY transmitter voltage swing level. The controller drives the mac_phy_txswing output from this register bit field. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (FULL_SWING): Full Swing 0x1 (LOW_SWING): Low Swing Value After Reset: 0x0
17	RW	0x0	DIRECT_SPEED_CHANGE Directed Speed Change. When the speed change occurs, the controller will clear the contents of this field; and a read to this field by your software will return a '0'. To manually initiate the speed change: Write to LINK_CONTROL2_LINK_STATUS2_REG.PCIE_CAP_TARGET_LINK_SPEED in the local device Deassert this field Assert this field If you set the default of this field using the DEFAULT_GEN2_SPEED_CHANGE configuration parameter to '1', then the speed change is initiated automatically after link up, and the controller clears the contents of this field. If you want to prevent this automatic speed change, then write a lower speed value to the Target Link Speed field of the Link Control 2 register (LINK_CONTROL2_LINK_STATUS2_OFF.PCIE_CAP_TARGET_LINK_SPEED) through the DBI before link up. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x1 (SET): Writing '1' to this field instructs the LTSSM to initiate a speed change to Gen2 or Gen3 after the link is initialized at Gen1 speed. 0x0 (CLEAR): Clear Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
16	RW	0x1	AUTO_LANE_FLIP_CTRL_EN Enable Auto flipping of the lanes. You must set the CX_AUTO_LANE_FLIP_CTRL_EN configuration parameter to include the hardware for this feature in the controller. For more details, see the 'Lane Reversal' appendix in the Databook. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x1 Testable: unconstrained
15:13	RW	0x0	PRE_DET_LANE Predetermined Lane for Auto Flip. This field defines which physical lane is connected to logical Lane0 by the flip operation performed in Detect. This field is used to restrict the receiver detect procedure to a particular lane when the default detect and polling procedure performed on all lanes cannot be successful. A notable example of when it is useful to program this field to a value different from the default, is when a lane is asymmetrically broken, that is, it is detected in Detect LTSSM state but it cannot exit Electrical Idle in Polling LTSSM state. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (LANE0): Connect logical Lane0 to physical lane 0 or CX_NL-1 or CX_NL/2-1 or CX_NL/4-1 or CX_NL/8-1, depending on which lane is detected 0x1 (LANE1): Connect logical Lane0 to physical lane 1 0x2 (LANE3): Connect logical Lane0 to physical lane 3 0x3 (LANE7): connect logical lane0 to physical lane 7 0x4 (LANE15): Connect logical Lane0 to physical lane 15 Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
12:8	RW	0x02	NUM_OF_LANES Predetermined Number of Lanes. Defines the number of lanes which are connected and not bad. Used to limit the effective link width to ignore 'broken" or "unused" lanes that detect a receiver. Indicates the number of lanes to check for exit from Electrical Idle in Polling.Active and L2.Idle. It is possible that the LTSSM might detect a receiver on a bad or broken lane during the Detect Substate. However, it is also possible that such a lane might also fail to exit Electrical Idle and therefore prevent a valid link from being configured. This value is referred to as the "Predetermined Number of Lanes" in section 4.2.6.2.1 of the PCI Express Base Specification. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Link Mode Enable" field of PORT_LINK_CTRL_OFF. The value in this register is normally the same as the encoded value in PORT_LINK_CTRL_OFF. If you find that one of your used lanes is bad then you must reduce the value in this register. For more information, see "How to Tie Off Unused Lanes" in the Databook. For information on upsizing and downsizing the link width, see "Link Establishment" in the Databook. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (_1_LANE): 1 lane 0x2 (_2_LANE): 2 lanes 0x3 (_3_LANE): 3 lanes Value After Reset: 0x4 Testable: unconstrained
7:0	RW	0xd2	FAST_TRAINING_SEQ Sets the Number of Fast Training Sequences (N_FTS) that the controller advertises as its N_FTS during Gen2 or Gen3 link training. This value is used to inform the link partner about the PHY's ability to recover synchronization after a low power state. The number should be provided by the PHY vendor. Do not set N_FTS to zero; doing so can cause the LTSSM to go into the recovery state when exiting from L0s. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0xd2

DSP_PCIE_PL_PHY_STATUS_OFF
Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	PHY_STATUS PHY Status. Data received directly from the phy_cfg_status bus. These is a GPIO register reflecting the values on the static phy_cfg_status input signals. The usage is left completely to the user and does not in any way influence controller functionality. You can use it for any static sideband status signalling requirements that you have for your PHY. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Zero value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

DSP_PCIE_PL_PHY_CONTROL_OFF
Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000001	PHY_CONTROL PHY Control. Data sent directly to the cfg_phy_control bus. This is a GPIO register driving the values on the static cfg_phy_control output signals, and does not in any way influence controller functionality. It can be used for any static sideband control signaling requirements that you have for your PHY. Usage of this register and the associated GPIO bus is RESERVED when the controller is connected to a Synopsys PHY. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Zero value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x1

DSP_PCIE_PL_TRGT_MAP_CTRL_OFF
Address: Operational Base + offset (0x011C)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved

Bit	Attr	Reset Value	Description
20:16	RW	0x00	TARGET_MAP_INDEX The number of the PF Function on which the Target Values are set. This register does not respect the Byte Enable setting, any write will affect all register bits. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15:7	RO	0x000	reserved
6	RW	0x1	TARGET_MAP_ROM Target Value for the ROM page of the PF Function selected by the index number. This register does not respect the Byte Enable setting, any write will affect all register bits. Value After Reset: 0x1 Testable: writeAsRead Volatile: true
5:0	RW	0x07	TARGET_MAP_PF Target Values for each BAR on the PF Function selected by the index number. This register does not respect the Byte Enable setting, any write will affect all register bits. Value After Reset: 0x2f Testable: writeAsRead Volatile: true

DSP_PCIE_PL_CLOCK_GATING_CTRL_OFF

Address: Operational Base + offset (0x018C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
1	RW	0x1	AXI_CLK_GATING_EN AXI Clock Gating Enable. This register enables the AXI Bridge to autonomously enable and disable the AXI Master clock, the AXI Slave clock and the AXI DBI slave clock. The DWC_pcie_clk_rst.v module provides the gated clock, mstr_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, mstr_aclk_active, is asserted. For the AXI Slave this module provides the gated clock, slv_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, slv_aclk_active, is asserted. If the AXI DBI Slave is enabled (DBI_4SLAVE_POPULATED=1) the module provides the gated clock, dbi_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, dbi_aclk_active, is asserted. The controller de-asserts the clock enable signals when the respective AXI Master/Slave interfaces are idle. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable (default) Value After Reset: 0x1
0	RW	0x1	RADM_CLK_GATING_EN RADM Clock Gating Enable. This register, if set, enables the RADM to autonomously enable and disable its clock. The DWC_pcie_clk_rst.v module provides the gated clock, radm_clk_g, to the RADM and is enabled when the controllers clock enable signal, en_radm_clk_g, is asserted. The RADM clock is a gated version of the controller clock, core_clk. The controller de-asserts en_radm_clk_g when there is no Rx traffic, Rx queues and pre/post-queue pipelines are empty, RADM completion LUT is empty, and there are no FLR actions pending. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable (default) Value After Reset: 0x1

DSP_PCIE_PL_GEN3_RELATED_OFF

Address: Operational Base + offset (0x0190)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

23	RW	0x0	GEN3_EQ_INVREQ_EVAL_DIFF_DISABLE Eq InvalidRequest and RxEqEval Different Time Assertion Disable. Disable the assertion of Eq InvalidRequest and RxEqEval at different time. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
22:19	RO	0x0	reserved
18	RW	0x0	GEN3_DC_BALANCE_DISABLE DC Balance Disable. Disable DC Balance feature. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0
17	RW	0x0	GEN3_DLLP_XMT_DELAY_DISABLE DLLP Transmission Delay Disable. Disable delay transmission of DLLPs before equalization. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
16	RW	0x0	GEN3_EQUALIZATION_DISABLE Equalization Disable. Disable equalization feature. This bit cannot be changed once the LTSSM starts link training. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
15:14	RO	0x0	reserved

Bit	Attr	Reset Value	Description
13	RW	0x0	RXEQ_RGRDLESS_RXTS When set to '1', the controller as Gen3 EQ master asserts RxEqEval to instruct the PHY to do Rx adaptation and evaluation after a 500ns timeout from a new preset request. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: The access attributes of this field are as follows: Wire: No access. Dbi: see description Note: This register field is sticky. Values: 0x0 (ASSERT_1US): mac_phy_rxeqeval asserts after 1us and 2 TS1 received from remote partner. 0x1 (ASSERT_500NS): mac_phy_rxeqeval asserts after 500ns regardless of TS's received or not. Value After Reset: 0x1 Testable: writeAsRead
12	RW	0x0	RXEQ_PH01_EN Rx Equalization Phase 0/Phase 1 Hold Enable. When this bit is set the upstream port holds phase 0 (the downstream port holds phase 1) for 10ms. Holding phase 0 or phase 1 can be used to allow sufficient time for Rx Equalization to be performed by the PHY. This bit is used during Virtex-7 Gen3 equalization. The programmable bits [RXEQ_PH01_EN, EQ_PHASE_2_3] can be used to obtain the following variations of the equalization procedure: Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: The access attributes of this field are as follows: Wire: No access. Dbi: see description Note: This register field is sticky. Values: 0x0 (TX_EQ_23): Tx equalization only in phase 2/3 0x1 (NO_TX_EQ_NO_RX_EQ): No Tx equalization Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
11	RW	0x0	EQ_REDO Equalization Redo Disable. Disable autonomous mechanism for requesting to redo the equalization process. The received presets or coefficients mismatch in Recovery.RcvrLock after Recovery EQ phases causes the EQ redo requests. If the EQ redo is infinite or you do not want eq requests and redo, setting this bit to 1 will stop the EQ requests and EQ redo so that the link can go ahead to L0 state for packet trasmissions. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
10	RW	0x0	EQ_EIEOS_CNT Equalization EIEOS Count Reset Disable. Disable requesting reset of EIEOS count during equalization. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Values: 0x1 (DISABLE): Disable Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
9	RW	0x0	EQ_PHASE_2_3 Equalization Phase 2 and Phase 3 Disable. This applies to downstream ports only. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: The access attributes of this field are as follows: Wire: No access. Dbi: see description Note: This register field is sticky. Values: 0x1 (TX_EQ_23_RX_EQ_PH01): No Rx equalization 0x0 (NO_TX_EQ_RX_EQ_PH01): Rx equalization in phase 0/1 Value After Reset: 0x0 Testable: writeAsRead
8	RW	0x0	DISABLE_SCRAMBLER_GEN_3 Disable Scrambler for Gen3 and Gen4 Data Rate. The Gen3 and Gen4 scrambler/descrambler within the controller needs to be disabled when the scrambling function is implemented outside of the controller (for example within the PHY). Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0
7:2	RO	0x00	reserved
1	RW	0x0	NO_SEED_VALUE_CHANGE If this bit is set to 1, the seed value of LFSR for scrambler at Gen3 rate does not change after LinkUp = 1. This bit takes effect only when CX_AUTO_LANE_FLIP_CTRL_EN is supported. This feature requires both sides of the link support it. Note: this register is shared for Gen3 and Gen4/Gen5 data rates. Note: This register field is sticky. Values: 0x1 (NO_CHANGE): Not Change Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	GEN3_ZRXDC_NONCOMPL Gen3 Receiver Impedance ZRX-DC Not Compliant. Receivers that operate at 8.0 GT/s with an impedance other than the range defined by the ZRX-DC parameter for 2.5 GT/s (40-60 Ohms) must meet additional behavior requirements in the following LTSSM states: Polling, Rx_L0s, L1, L2, and Disabled. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rates. Note: This register field is sticky. Values: 0x0 (RCVR_COMPLIES): The receiver complies with the ZRX-DC parameter for 2.5 GT/s when operating at 8 GT/s or higher. 0x1 (RCVR_NOT_COMPLIES): The receiver does not comply with the ZRX-DC parameter for 2.5 GT/s when operating at 8 GT/s or higher. Value After Reset: 0x1

DSP_PCIE_PL_GEN3_EQ_CONTROL_OFF

5	RW	0x1	GEN3_EQ_EVAL_2MS_DISABLE Phase2_3 2 ms Timeout Disable. Determine behavior in Phase2 for USP (Phase3 if DSP) when the PHY does not respond within 2ms to the assertion of RxEqEval. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (ABORT_CURRENT_EVA): Abort the current evaluation, stop any attempt to modify the remote transmitter settings, Phase2 is terminated by the 24ms timeout 0x1 (IGNORE_2MS_TIMEOUT): Ignore the 2ms timeout and continue as normal. This is used to support PHYs that require more than 2ms to respond to the assertion of RxEqEval. Value After Reset: 0x1 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
4	RW	0x0	GEN3_EQ_PHASE23_EXIT_MODE Behavior After 24 ms Timeout (when optimal settings are not found). For a USP: Determine next LTSSM state from Phase2 after 24ms Timeout 0: Recovery.Speed 1: Recovery.Equalization.Phase3 When optimal settings are not found then: Equalization Phase 2 Successful status bit is not set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 0 Equalization Phase 2 Successful status bit is set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 1 Equalization Phase 2 Complete status bit is set in the "Link Status Register 2" For a DSP: Determine next LTSSM state from Phase3 after 24ms Timeout 0: Recovery.Speed 1: Recovery.Equalization.RcvrLock When optimal settings are not found then: Equalization Phase 3 Successful status bit is not set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 0 Equalization Phase 3 Successful status bit is set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 1 Equalization Phase 3 Complete status bit is set in the "Link Status Register 2" Note: GEN3_EQ_PHASE23_EXIT_MODE = 1 affects Direction Change feed back mode. EQ requests for Figure Of Merit mode complete before 24 ms timeout. Please see GEN3_EQ_PSET_REQ_VEC Register for more. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (RCVRY_SPEED): Recovery.Speed 0x1 (RCVRY_EQ): USP: Recovery.Equalization.Phase3; DSP: Recovery.Equalization.RcvrLock Value After Reset: 0x1

Bit	Attr	Reset Value	Description
3:0	RW	0x1	GEN3_EQ_FB_MODE Feedback Mode. Other values are reserved. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is a shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (DIR_CHG): Direction Change 0x1 (FOM): Figure Of Merit Value After Reset: 0x1 Testable: writeAsRead Volatile: true

DSP_PCIE_PL_GEN3_EQ_FB_MODE_DIR_CHANGE_OFF

Address: Operational Base + offset (0x01AC)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:14	RW	0x0	GEN3_EQ_FMDC_MAX_POST_CUSROR_DELTA Convergence Window Aperture for C+1. Post-cursor coefficients maximum delta within the convergence window depth. Allowed range: 0,1,2,..15. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
13:10	RW	0x0	GEN3_EQ_FMDC_MAX_PRE_CUSROR_DELTA Convergence Window Aperture for C-1. Pre-cursor coefficients maximum delta within the convergence window depth. Allowed range: 0,1,2,..15. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x0 Testable: unconstrained
9:5	RW	0x02	GEN3_EQ_FMDC_N_EVALS Convergence Window Depth. Number of consecutive evaluations considered in Phase 2/3 when determining if optimal coefficients have been found. Allowed range: 0,1,2,..16 up to a maximum of CX_GEN3_EQ_COEFQ_DEPTH. When set to 0, EQ Master is performed without sending any requests to the remote partner in Phase 2 for USP and Phase 3 for DSP. Therefore, the remote partner will not change its transmitter coefficients and will move to the next state. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. 31:23	RO	0x000	reserved
22	RW	0x0	PORT_LOGIC_WR_DISABLE Disable port logic register write from wire side. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
21	RW	0x0	P2P_ERR_RPT_CTRL Determines whether to enable Peer to Peer (P2P) error reporting. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable P2P error reporting 0x1 (ENABLE): Enable P2P error reporting Value After Reset: 0x0
20	RW	0x0	P2P_TRACK_CPL_TO_REG Determines whether to track completion of transmitted Non-Posted TLPs in P2P mode. Note: This register field is sticky. Values: 0x0 (DO_NOT_TRACk): Do not track completion 0x1 (TRACK): Track completion Value After Reset: 0x0
19:18	RW	0x0	TARGET_ABOVE_CONFIG_LIMIT_REG Configuration requests with an address greater than CONFIG_LIMIT_REG are directed to either ELBI or TRGT1 interface based on the setting of this field. This field can have the following values: Note: This register field is sticky. Values: 0x1 (ELBI): ELBI 0x2 (TRGT1): TRGT1 Value After Reset: 0x1
17:8	RW	0x37f	CONFIG_LIMIT_REG Configuration requests are directed either to CDM or ELBI/RTRGT1 based on the value of this field. Configuration requests with an address less CONFIG_LIMIT_REG are directed to the CDM Configuration requests with an address greater than CONFIG_LIMIT_REG are directed to either ELBI or TRGT1 interface based on the setting of TARGET_ABOVE_CONFIG_LIMIT_REG field. Your application must set a proper value for this field based on your extended configuration registers. For more details, see the "CDM/ELBI Register Space Access Through CFG Request" in "Register Module, LBC, and DBI" section in the "Controller Operations" chapter of the Databook. Note: This register field is sticky. Value After Reset: 0x37f

Bit	Attr	Reset Value	Description
7	RW	0x0	CFG_TLP_BYPASS_EN_REG Setting of this field defines how to decide the destination of Configuration requests. Note: When app_req_retry_en is asserted, the setting of this field is ignored. Note: This register field is sticky. Values: 0x1 (ONE): Configuration TLPs are routed according to the setting of TARGET_ABOVE_CONFIG_LIMIT_REG, regardless the value of CONFIG_LIMIT_REG. 0x0 (ZERO): Configuration TLPs are routed according to the setting of TARGET_ABOVE_CONFIG_LIMIT_REG, depending on the setting of CONFIG_LIMIT_REG. Refer to the definition of CONFIG_LIMIT_REG for details. Value After Reset: 0x0
6	RW	0x1	CPLQ_MNG_EN This field enables the Completion Queue Management feature. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x1
5	RW	0x0	ARI_DEVICE_NUMBER When ARI is enabled, this field enables use of the device ID. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0
4	RW	0x0	DISABLE_AUTO_LTR_CLR_MSG Disable the autonomous generation of LTR clear message in upstream port. This field can have the following values: For more details, see "Latency Tolerance Reporting (LTR) Message Generation [EP Mode]" in "Message Generation" section of the "Controller Operations" chapter of the Databook. Note: This register field is sticky. Values: 0x0 (ALLOW): Allow the autonomous generation of LTR clear message. 0x1 (DISABLE): Disable the autonomous generation of LTR clear message. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
3	RW	0x0	SIMPLIFIED_REPLAY_TIMER Enables Simplified Replay Timer (Gen4). For more details, see "Transmit Replay" in "Transmit TLP Processing" section in the "Controller Operations" chapter of the Databook. Simplified Replay Timer can have the following Values: A value from 24,000 to 31,000 Symbol Times when Extended Synch is 0b. A value from 80,000 to 100,000 Symbol Times when Extended Synch is 1b. The Simplified Replay Timer value must not be changed while the link is in use. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0
2	RW	0x0	UR_CA_MASK_4_TRGT1 When this field is set to '1', the controller suppresses error logging, error message generation, and CPL generation for non-posted requests TLPs (with UR filtering status) forwarded to your application (that is, when DEFAULT_TARGET =1). For more details, see "Advanced Error Handling For Received TLPs" chapter of the Databook. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): Set Value After Reset: 0x0
1	RW	0x0	DEFAULT_TARGET Default target for an IO or MEM request with UR/CA/CRS received. Based on the value of this field the controller either drops or forwards these requests to your application. For more details, see "ECRC Handling" and "Request TLP Routing Rules" in "Receive Routing" section of the "Controller Operations" chapter of the Databook. Note: This register field is sticky. Values: 0x0 (DROP_IO_MEM_REQ): The controller drops all incoming I/O or MEM requests (after corresponding error reporting). A completion with UR status is generated for non-posted requests. 0x1 (FWD_IO_MEM_UR_CA_CRS): The controller forwards all incoming I/O or MEM requests with UR/CA/CRS status to your application. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	DBI_RO_WR_EN Write to RO Registers Using DBI. For more details, see "Writing to Read-Only Registers" in "Register Module, LBC, and DBI" section in the "Controller Operations" chapter of the Databook. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): Your application can write to some RO and HwInit register fields through the DBI when you set this field to '1'. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_PL_MULTI_LANE_CONTROL_OFF
Address: Operational Base + offset (0x01C0)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x1	UPCONFIGURE_SUPPORT Upconfigure Support. The controller sends this value as the Link Upconfigure Capability in TS2 Ordered Sets in Configuration.Complete state. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
6	RW	0x0	DIRECT_LINK_WIDTH_CHANGE Directed Link Width Change. If the upconfigure_capable variable is '1' and the PCIE_CAP_HW_AUTO_WIDTH_DISABLE bit in LINK_CONTROL_LINK_STATUS_REG is '0', the controller starts upconfigure or autonomous width downsizing (to the TARGET_LINK_WIDTH value) in the Configuration state. If TARGET_LINK_WIDTH value is 0x0, the controller does not start upconfigure or autonomous width downsizing in the Configuration state. The controller self-clears this field when the controller accepts this request. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x0 (CLEAR): Clear 0x1 (SET): The controller always moves to Configuration state through Recovery state when this bit is set to '1'. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5:0	RW	0x00	TARGET_LINK_WIDTH Target Link Width. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x0 (NOT_START): Controller does not start upconfigure or autonomous width downsizing in the Configuration state. 0x1 (X1): x1 0x2 (X2): x2 0x4 (X4): x4 0x8 (X8): x8 0x10 (X16): x16 0x20 (X32): x32 Value After Reset: 0x0

DSP_PCIE_PL_PHY_INTEROP_CTRL_OFF

Address: Operational Base + offset (0x01C4)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
17:12	RW	0x1e	PHY_RST_TIMER Decide how many aux clock cycles the PHY reset lasts (0 to 63 aux clock cycles). Note: This register field is sticky. Values: 0x0 (MIN_VAL): Zero value 0x3f (MAX_VAL): Max value Value After Reset: 0x1e
11	RO	0x0	reserved
10	RW	0x0	L1_CLK_SEL L1 Clock control bit. This field is reserved for internal use. You should not write to this field and change the default unless specifically instructed by Synopsys support. Note: This register field is sticky. Values: 0x1 (NO_REQ): Controller does not request aux_clk switch and core_clk gating in L1. 0x0 (CAN_REQ): Controller requests aux_clk switch and core_clk gating in L1. Value After Reset: 0x0
9	RW	0x0	L1_NOWAIT_P1 L1 entry control bit. This field is reserved for internal use. You should not write to this field and change the default unless specifically instructed by Synopsys support. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (NO_WAIT_FOR_ACK): Controller does not wait for PHY to acknowledge transition to P1 before entering L1. 0x0 (WAIT_FOR_ACK): Controller waits for the PHY to acknowledge transition to P1 before entering L1. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
8	RW	0x0	L1SUB_EXIT_MODE L1 Exit Control Using phy_mac_pclkack_n. This field is reserved for internal use. You should not write to this field and change the default unless specifically instructed by Synopsys support. If PCLK as PHY input is selected, you should not write to this field and change the default value since PCLK as PHY input doesn't support any value other than the default. Note: This register field is sticky. Values: 0x1 (NO_WAIT_FOR_PCLKACK): Controller exits L1 without waiting for the PHY to assert phy_mac_pclkack_n. 0x0 (WAIT_FOR_PCLKACK): Controller waits for the PHY to assert phy_mac_pclkack_n before exiting L1. Value After Reset: 0x0
7	RO	0x0	reserved
6:0	RW	0x44	RXSTANDBY_CONTROL Rxstandby Control. Bits 0..5 determine if the controller asserts the RxStandby signal (mac_phy_rxstandby) in the indicated condition. Bit 6 enables the controller to perform the RxStandby/RxStandbyStatus handshake. This field is reserved for internal use. You should not write to this field and change the default unless specifically instructed by Synopsys support. [0]: Rx EIOS and subsequent T TX-IDLE-MIN [1]: Rate Change [2]: Inactive lane for upconfigure/downconfigure [3]: PowerDown=P1orP2 [4]: RxL0s.Idle [5]: EI Infer in L0 [6]: Execute RxStandby/RxStandbyStatus Handshake Note: This register field is sticky. Value After Reset: 0x44

DSP_PCIE_PL_TRGT_CPL_LUT_DELETE_ENTRY_OFF
Address: Operational Base + offset (0x01C8)

Bit	Attr	Reset Value	Description
31	RW	0x0	DELETE_EN This is a one-shot bit. This is a self-clearing register field. Reading from this register field always returns a '0'. Values: 0x0 (CLEAR): Clear 0x1 (SET): A '1' write to this bit triggers the deletion of the target completion LUT entry that is specified in the LOOK_UP_ID field. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
30:0	RW	0x00000000	LOOK_UP_ID This number selects one entry to delete of the TRGT_CPL_LUT. Value After Reset: 0x0

DSP_PCIE_PL_LINK_FLUSH_CONTROL_OFF
Address: Operational Base + offset (0x01CC)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	AUTO_FLUSH_EN Enables automatic flushing of pending requests before sending the reset request to the application logic to reset the PCIe controller and the AXI Bridge. The flushing process is initiated if any of the following events occur: Hot reset request. A downstream port (DSP) can "hot reset" an upstream port (USP) by sending two consecutive TS1 ordered sets with the hot reset bit asserted. Warm (Soft) reset request. Generated when exiting from D3 to D0 and cfg_pm_no_soft_rst=0. Link down reset request. A high to low transition on smlh_req_rst_not indicates the link has gone down and the controller is requesting a reset. If you disable automatic flushing, your application is responsible for resetting the PCIe controller and the AXI Bridge. For more details see "Warm and Hot Resets" section in the Architecture chapter of the Databook. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x1

DSP_PCIE_PL_AMBA_ERROR_RESPONSE_DEFAULT_OFF
Address: Operational Base + offset (0x01D0)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:10	RW	0x27	AMBA_ERROR_RESPONSE_MAP AXI Slave Response Error Map. Allows you to selectively map the errors received from the PCIe completion (for non-posted requests) to the AXI slave responses, slv_rresp or slv_bresp. The recommended setting is SLVERR. CRS is always mapped to OKAY. [0] 0: UR (unsupported request) -> DECERR 1: UR (unsupported request) -> SLVERR [1] 0: CRS (configuration retry status) -> DECERR 1: CRS (configuration retry status) -> SLVERR [2] 0: CA (completer abort) -> DECERR 1: CA (completer abort) -> SLVERR [3]: RESERVED (0x0) [4]: RESERVED (0x0) [5] 0: Completion Timeout -> DECERR 1: Completion Timeout -> SLVERR. The AXI bridge internally drops (processes internally but not passed to your application) a completion that has been marked by the Rx filter as UC or MLF, and does not pass its status directly down to the slave interface. It waits for a timeout and then signals "Completion Timeout" to the slave interface. The controller sets the AXI slave read databus to 0xFFFF for all error responses. Note: This register field is sticky. Value After Reset: 0x27
9:5	RO	0x00	reserved
4:3	RW	0x0	AMBA_ERROR_RESPONSE_CRS CRS Slave Error Response Mapping. Determines the AXI slave response for CRS completions. For more details see "Error Handling" in the AXI chapter of the Databook. Note: This register field is sticky. Values: 0x0 (OK_): OKAY 0x1 (OK_CRS_CMPL): OKAY with all FFFF_FFFF data for all CRS completions 0x2 (OK_READ_REQ): OKAY with FFFF_0001 data for CRS completions to vendor ID read requests, OKAY with FFFF_FFFF data for all other CRS completions 0x3 (SLVERR_DECERR): SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Value After Reset: 0x0

Bit	Attr	Reset Value	Description
2	RW	0x0	AMBA_ERROR_RESPONSE_VENDORID Vendor ID Non-existent Slave Error Response Mapping. Determines the AXI slave response for errors on reads to non-existent Vendor ID register. For more details see "Error Handling" in the AXI chapter of the Databook. Note: This register field is sticky. Values: 0x0 (_OK_): OKAY (with FFFF data). 0x1 (_ERR_): SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Value After Reset: 0x0
1	RO	0x0	reserved
0	RW	0x0	AMBA_ERROR_RESPONSE_GLOBAL Global Slave Error Response Mapping. Determines the AXI slave response for all error scenarios on non-posted requests. For more details see "Error Handling" in the AXI chapter of the Databook. The error response mapping is not applicable to Non-existent Vendor ID register reads. Note: This register field is sticky. Values: 0x0 (OK_): OKAY (with FFFF data for non-posted requests) 0x1 (ERR_): SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Value After Reset: 0x0

DSP_PCIE_PL_AMBA_LINK_TIMEOUT_OFF

Address: Operational Base + offset (0x01D4)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	LINK_TIMEOUT_ENABLE_DEFAULT Disable Flush. Note: This register field is sticky. Values: 0x0 (ENABLE): Enable 0x1 (DISABLE): You can disable the flush feature by setting this field to '1'. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
7:0	RW	0x32	LINK_TIMEOUT_PERIOD_DEFAULT Timeout Value (ms). The timer will timeout and then flush the bridge TX request queues after this amount of time. The timer counts when there are pending outbound AXI slave interface requests and the PCIe TX link is not transmitting any of these requests. The timer is clocked by core_clk. Note: This register field is sticky. Value After Reset: 0x32

DSP_PCIE_PL_AMBA_ORDERING_CTRL_OFF

Address: Operational Base + offset (0x01D8)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	AX_MSTR_ZEROLREAD_FW AXI Master Zero Length Read Forward to the application. The DW PCIe controller AXI bridge is able to terminate in order with the Posted transactions the zero length read, implementing the PCIe express flush semantics of the Posted transactions. Values: 0x0 (_0_LN_RD_TERMINATE): The zero length Read is terminated at the DW PCIe AXI bridge master 0x1 (_0_LN_RD_FWD): The zero length Read is forward to the application. Value After Reset: 0x0
6:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4:3	RW	0x0	AX_MSTR_ORDR_P_EVENT_SEL AXI Master Posted Ordering Event Selector. This field selects how the master interface determines when a P write is completed when enforcing the PCIe ordering rule, "NP must not pass P" at the AXI Master Interface. The AXI protocol does not support ordering between channels. Therefore, NP reads can pass P on your AXI bus fabric. This can result in an ordering violation when the read overtakes a P that is going to the same address. Therefore, the bridge master does not issue any NP requests until all outstanding P writes reach their destination. It does this by waiting for the all of the write responses on the B channel. This can affect the performance of the master read channel. For scenarios where the interconnect serializes the AXI master "AW", "W" and "AR" channels,you can increase the performance by reducing the need to wait until the complete Posted transaction has effectively reached the application slave. Note: This setting will not affect: MSI interrupt catcher and P data ordering. This is always driven by the B'last event. DMA read engine TLP ordering. This is always driven by the B'last event. NP write transactions which are always serialized with P write transactions. Values: 0x0 (B): B'last event: wait for the all of the write responses on the B channel thereby ensuring that the complete Posted transaction has effectively reached the application slave (default). 0x1 (AW): AW'last event: wait until the complete Posted transaction has left the AXI address channel at the bridge master. 0x2 (W): W'last event: wait until the complete Posted transaction has left the AXI data channel at the bridge master. 0x3 (RSVD): Reserved Value After Reset: 0x0
2	RO	0x0	reserved
1	RW	0x0	AX_SNP_EN AXI Serialize Non-Posted Requests Enable. This field enables the AXI Bridge to serialize same ID Non-Posted Read/Write Requests on the wire. Serialization implies one outstanding same ID NP Read or Write on the wire and used to avoid AXI RAR and WAW hazards at the remote link partner. For more details, see the "Optional Serialization of AXI Slave Non-posted Requests" section in the AXI chapter of the Databook. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0
0	RO	0x0	reserved

DSP_PCIE_PL_COHERENCY_CONTROL_1_OFF
Address: Operational Base + offset (0x01E0)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	CFG_MEMTYPE_BOUNDARY_LOW_ADDR Boundary Lower Address For Memory Type. Bits [31:0] of dword-aligned address of the boundary for Memory type. The two lower address LSBs are '00'. Addresses up to but not including this value are in the lower address space region; addresses equal or greater than this value are in the upper address space region. 0	RW	0x0	MSIX_RAM_CTRL_TABLE_DS MSIX Table RAM Deep Sleep. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): Set this bit to drive the cfg_msix_table_ds output to signal your external logic to place the MSIX Table RAM in Deep Sleep low-power mode. Value After Reset: 0x0

DSP_PCIE_PL_DTIM_CTRL0_OFF

Address: Operational Base + offset (0x03B0)

Bit	Attr	Reset Value	Description
31	RW	0x0	DTIM_CTRL0_IREQ_SW_FLUSH_EN Invalidate Request Software Flush Enable. If set enables software to flush pending DTI-ATS invalidate requests from the invalidate request queue. Software forces the flush by writing to the DTIM_CTRL1.INV_REQ_FLUSH_SID register. The flushing mechansim enables software to remove invalidate requests from the request queue in response to a UR from an Endpoint function. Prior to removing unsupported invalidate requests software should disable the hardware invalidate request timer (DTIM_CTRL0.IREQ_TMR_EN=0). To continue monitoring outstanding invalidate requests enable the timer once again. The timer restarts from its programmed timeout value (DTIM_CTRL5.IREQ_TMR_TRGT_TO). Note: Software initiated flushing does not result in a sync or timeout error. Note: This register field is sticky. Value After Reset: 0x0
30	RW	0x0	DTIM_CTRL0_IREQ_TMR_EN Invalidate Request Timer Enable. If set enables the DTIM to flush timed out DTI-ATS invalidate requests from the invalidate request queue. The invalidate request timer times each invalidation request sent on the wire. If disabled the responsibilty to flush the request is passed to software. Software writes to the DTIM_CTRL1.INV_REQ_FLUSH_SID register field to flush all pending requests associated with the particular Stream ID (SID). Subsequent received PCIe invalidate completions, associated with the particular SID, are treated as unexpected completions (completion received but no request pending). Timed out invalidate requests result in a sync error response to an outstanding sync request. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
29	RW	0x0	DTIM_CTRL0_IREQ_BYTE_ORDER Invalidate Request Byte Order. In normal operation PCIe data bytes are transmitted in little endian format, that is, PCIe data byte 0 is the first byte transmitted on the wire. The format of the DTI-ATS untranslated address and the PCIe untranslated address embedded in the two DWORD data field of the invalidate request message is defined in big endian format, that is, PCIe byte 0 contains the most significant byte of the address, byte 7. To align the DTI-ATS data byte order to PCIe data byte order the bytes are reversed. To be robust against misinterpretation of the byte order software can reverse the bytes by setting this bit. Note: This register field is sticky. Values: 0x0 (LITTLE_ENDIAN): DTI-ATS Invalidate Request data bytes are transmitted in little endian format. 0x1 (BIG_ENDIAN): DTI-ATS Invalidate Request data bytes are transmitted in big endian format. Value After Reset: 0x0
28	RW	0x0	DTIM_CTRL0_TRESP_BYTE_ORDER Translation Response Byte Order. In normal operation PCIe data bytes are transmitted in little endian format, that is, PCIe data byte 0 is the first byte transmitted on the wire. The format of the DTI-ATS translated address and the PCIe translated address embedded in the two DWORD data field of the translation completion is defined in big endian format, that is, PCIe byte 0 contains the most significant byte of the address, byte 7. To align the DTI-ATS data byte order to PCIe data byte order the bytes are reversed. To be robust against misinterpretation of the byte order software can reverse the bytes by setting this bit. Note: This register field is sticky. Values: 0x0 (LITTLE_ENDIAN): DTI-ATS Translation Response data bytes are transmitted in little endian format. 0x1 (BIG_ENDIAN): DTI-ATS Translation Response data bytes are transmitted in big endian format. Value After Reset: 0x0
27:24	RO	0x0	reserved

Bit	Attr	Reset Value	Description
23:16	RW	0x1f	DTIM_CTRL0_TOK_TRANS_REQ Number of Translation Request Tokens Requested. Its default value is configured by the visible parameter, CC_DTIM_NUM_TRANS_TOKENS_REQUESTED. Software can overide this value at initialization time. The number of tokens requested is equal to TOK_TRANS_REQ + 1 (1 to 256). Note: This register field is sticky. Value After Reset: 0x1f
15:0	RW	0xffff	DTIM_CTRL0_ROOT_PORT_ID Root Port ID. Its default value is configured by the visible parameter, CC_ROOT_PORT_ID. Software can overide this value at initialization time. Note: This register field is sticky. Value After Reset: 0xffff

DSP_PCIE_PL_DTIM_CTRL1_OFF

Address: Operational Base + offset (0x03B4)

Bit	Attr	Reset Value	Description
31	RW	0x0	DTIM_CTRL1_FLUSH_IREQ_GLOB Flush Invalidate Requests Global. Flushes all outstanding DTI-ATS invalidate requests. The flush is triggered when a 32-bit write to the DTIM_CTRL1 register is performed and FLUSH_IREQ_GLOB =1. Forcing the errored sync ack avoids deadlocking the SMMU in scenarios where the Endpoint function fails to complete the outstanding invalidate requests. In normal operation invalidate requests are flushed by hardware when the per Stream ID invalidate request timer expires. This field is primarily a test feature enabling software to force the sync ack to a pending sync request without having to wait for hardware to time out and flush all prior invalidate requests. Flushing outstanding DTI-ATS invalidate requests does not result in a timeout or a sync error (sync ack with its ERROR =1) if a sync request is outstanding. PCIe invalidate completions received after the flush sequence is complete are discarded and treated as unexpected completions (completion received but no request pending). If enabled, software is notified if unexpected completions are received. This field is valid if DTIM_CTRL0.FLUSH_CTRL_SW_EN is set. Note: This register field is sticky. Value After Reset: 0x0
30:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	DTIM_CTRL1_FLUSH_IREQ_SID Flush Invalidate Request Stream ID. Flushes all pending DTI-ATS invalidate requests, associated with a particuar Stream ID (SID/BDF), from the invalidate request queue. The flush is triggered when a 32-bit write to the DTIM_CTRL1 register is performed and FLUSH_IREQ_GLOB=0. FLUSH_IREQ_SID specifies the flushed Stream ID. This flushing mechanism enables software to remove invalidate requests from the request queue in response to a ERR_NONFATAL message from an Endpoint function. Software flushing of invalidate requests prior to a hardware invalidate request timeout does not result in a timeout error or a sync error (sync ack with its ERROR=1) if a sync request is outstanding. PCIe invalidate completions received with the flushed Stream ID are discarded and treated as unexpected completions (completion received but no request pending). If enabled, software is notified if unexpected completions are received. This field is valid if DTIM_CTRL0.FLUSH_CTRL_SW_EN is set. Note: This register field is sticky. Value After Reset: 0x0

0	RW	0x0	DTIM_MSI_DATA_MSI_DATA MSI Data. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_PL_DTIM_ERR_LOG0_OFF
Address: Operational Base + offset (0x03E8)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	DTIM_ERR_LOG0_ERR_IREQ_OPCODE Invalidate Request Illegal Op Code. This field contains the DTI-ATS Invalidate Request "Operation" field and is set when an illegal invalidate request opcode is detected by the DTI Master. These bits are set by hardware and cleared by software (DTIM_INT_CLR.ERR_IREQ_OPERTN_INT_CLR=1) Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23:21	RO	0x0	reserved

Bit	Attr	Reset Value	Description
20:16	RO	0x00	DTIM_ERR_LOG0_ERR_IREQ_TO_ITAG Invalidate Request Timeout ITAG. This field contains the itag associated with the first timed out DTI-ATS invalidate request. These bits are set by hardware and cleared by software (DTIM_INT_CLR.ERR_IREQ_TO_INT_CLR=1) Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15:0	RO	0x0000	DTIM_ERR_LOG0_ERR_IREQ_TO_SID_LWR Invalidate Request Timeout Target SID/BDF. This field contains the target Stream/Device ID associated with the first timed out DTI-ATS invalidate request. These bits are set by hardware and cleared by software (DTIM_INT_CLR.ERR_IREQ_TO_INT_CLR=1) Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_PL_DTIM_ERR_LOG1_OFF
Address: Operational Base + offset (0x03EC)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:16	RO	0x00	DTIM_ERR_LOG1_ERR_ICPL_UC_ITAG Unexpected Invalidate Completion ITAG. This field contains the PCIe invalidate completion itag associated with the first unexpected completion. A completion is unexpected if a completion is received from the Endpoint with a corresponding outstanding PCIe invalidate request. These bits are set by hardware and cleared by software (DTIM_INT_CLR.ERR_ICPL_UC_INT_CLR=1) Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
15:0	RO	0x0000	DTIM_ERR_LOG1_ERR_ICPL_UC_REQ_ID Unexpected Invalidate Completion Requester ID. This field contains the PCIe invalidate completion Requester ID associated with the first unexpected completion. A completion is unexpected if a completion is received from the Endpoint with a corresponding outstanding PCIe invalidate request. These bits are set by hardware and cleared by software (DTIM_INT_CLR.ERR_ICPL_UC_INT_CLR=1) Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_PL_DTIM_ERR_LOG2_OFF
Address: Operational Base + offset (0x03F0)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	DTIM_ERR_LOG2_ERR_TRESP_UR_TID Unexpected Translation Response ID. This field contains the DTI-ATS translation response translation ID associated with the first unexpeted translation response. A translation response is unexpected when a response is received without a corresponding outstanding translation request. These bits are set by hardware and cleared by software (DTIM_INT_CLR.ERR_TRESP_UID_INT_CLR=1) Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_PL_DTIM_DIAG_OFF
Address: Operational Base + offset (0x03FC)

Bit	Attr	Reset Value	Description
31	RO	0x0	DTIM_DIAG_SUP_PRI Indicates of DTI-ATS Page Request/Responses are supported by the SMMU. The field corresponds to the SUP_PRI field of the DTI_ATS_CONDIS_ACK message. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
30:25	RO	0x00	reserved

Bit	Attr	Reset Value	Description
24	RO	0x0	DTIM_DIAG_VERSION Acknowledged DTI-ATS Protocol Version. The field corresponds to the VERSION field of the DTI_ATS_CONDIS_ACK message. 0000: DTI-ATSv1 Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23:20	RO	0x0	DTIM_DIAG_OAS Maximum address size permitted for translated addresses. The field corresponds to the OAS field of the DTI_ATS_CONDIS_ACK message. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
19:16	RO	0x0	reserved
15:8	RO	0x00	DTIM_DIAG_TOK_TREQ_GNT This field indicates the number of pre-allocated tokens for translation requests that have been granted by the SMMU. The number of translation tokens granted is equal to the value of this field plus one. The field corresponds to the TOK_TRANS_GNT field of the DTI_ATS_CONDIS_ACK message. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6	RO	0x0	DTIM_DIAG_IREQ_FLUSH_SID_LWR_Q_EMPTY Invalidation Request Flush SID Lower Queue Empty Flag. If set, this bit indicates that all outstanding invalidate requests associated with the flushed Endpoint function, DTIM_CTRL1.IREQ_FLUSH_SID_LWR, have been flushed from the invalidate request queue. The flag is set when the software initiated flush sequence completes. If subsequent in-flight invalidate requests are received post the flush sequence then this flag will be cleared. Further flushing of the invalidate request queue is required in this case. Note: It is expected the SMMU stops sending invalidate requests to the DTIM prior to triggering the flush sequence. At some point all in-flight invalidate requests associated with the Endpoint function will be flushed. Value After Reset: 0x1 Testable: writeAsRead Volatile: true
5	RO	0x0	DTIM_DIAG_IREQ_FLUSH_DONE Invalidate Request Flush Done. Invalidate Request Flush Done. If set this bit indicates that the software initiated invalidate request queue flush sequence has completed. The flag is initially cleared by hardware when the flush sequence is initially triggerred by a write to the DTIM_CTRL1 register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
4	RO	0x1	DTIM_DIAG_IREQ_ORDRQ_EMPTY Invalidation Request Order Q Empty Flag. If set this bit indicates the DTI-ATS invalidate request queue is empty, that is, all invalidate requests have received a completion or invalidate request have not be sent to the DTIM or sent to the DTIM but discarded (broadcast DTI-ATS invalidate requests). Value After Reset: 0x1 Testable: writeAsRead Volatile: true
3:2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1:0	RO	0x0	DTIM_DIAG_CONDIS_STATE Connect/Disconnect FSM state. The field corresponds to the current state of the Connect/Disconnect FSM. The following encoding applies: Other value are reserved. Values: 0x0 (DISCONNECTED): DISCONNECTED 0x1 (REQ_CONNECT): REQ_CONNECT 0x2 (CONNECTED): CONNECTED 0x3 (REQ_DISCONNECT): REQ_DISCONNED Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_PL_PL_APP_BUS_DEV_NUM_STATUS_OFF

DSP_PCIE_PL_AUX_CLK_FREQ_OFF

Address: Operational Base + offset (0x0440)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
9:0	RW	0x018	AUX_CLK_FREQ The aux_clk frequency in MHz. This value is used to provide a 1 us reference for counting time during low-power states with aux_clk when the PHY has removed the pipe_clk. Frequencies lower than 1 MHz are possible but with a loss of accuracy in the time counted. If the actual frequency (f) of aux_clk does not exactly match the programmed frequency (f_prog), then there is an error in the time counted by the controller that can be expressed in percentage as: err% = (f_prog/f-1)*100. For example if f=2.5 MHz and f_prog=3 MHz, then err% =(3/2.5-1)*100 =20%, meaning that the time counted by the controller on aux_clk will be 20% greater than the time in us programmed in the corresponding time register (for example T_POWER_ON). Note: This register field is sticky. Value After Reset: 0x18

DSP_PCIE_PL_L1_SUBSTATES_OFF
Address: Operational Base + offset (0x0444)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	L1SUB_LOW_POWER_CLOCK_SWITCH_MODE If the bit is set to 1'b1 the controller will delay the switching of aux_clk to the slow platform clock until it detects that the link partner has de-asserted CLKREQ#. Note: This register field is sticky. Values: 0x0 (CLEAR): The reference clock may be gated off when CLKREQ# is de-asserted. 0x1 (SET): The reference clock shall be kept running regardless of the CLKREQ# setting. Value After Reset: 0x0
7:6	RW	0x3	L1SUB_T_PCLKACK Max delay (in 1us units) between a MAC request to remove the clock on mac_phy_pclkreq_n and a PHY response on phy_mac_pclkack_n. If the PHY does not respond within this time the request is aborted. Range is 1..4 Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0x3 (MAX_VAL): Max value Value After Reset: 0x3

Bit	Attr	Reset Value	Description
5:2	RW	0x4	L1SUB_T_L1_2 Duration (in 1us units) of L1.2. Range is 1..16. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x4
1:0	RW	0x2	L1SUB_T_POWER_OFF Duration (in 1us units) of L1.2.Entry. Range is 1..4. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0x3 (MAX_VAL): Max value Value After Reset: 0x2

DSP_PCIE_PL_POWERDOWN_CTRL_STATUS_OFF

Address: Operational Base + offset (0x0448)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	RW	0x0	POWERDOWN_PHY_POWERDOWN This field represents the Powerdown value that has been acknowledged by the PHY. It is updated with the value of Powerdown driven by the controller, when the PHY has returned the Phystatus acknowledgment for the Powerdown transition. Value After Reset: 0x2 Testable: writeAsRead Volatile: true
7:4	RW	0x2	POWERDOWN_MAC_POWERDOWN This field represents the Powerdown value driven by the controller to the PHY. Value After Reset: 0x2 Testable: writeAsRead Volatile: true
3:2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	POWERDOWN_VMAIN_ACK Set this bit to 1 if you do not want to perform the handshake with the power-switch after PERST# assertion. By default the controller will perform the handshake with the power-switch if L1 power gating is enabled Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): If you do not want to perform the handshake with the power-switch after PERST# assertion. Value After Reset: 0x0
0	WO	0x0	POWERDOWN_FORCE This field is a one shot field. This field could be used for debug purposes in event that the P2 Powerdown transition does not complete. It will allow the controller to proceed with the transition to the P1 Powerdown state. This field always reads back as 1'b0. Values: 0x0 (CLEAR): Clear 0x1 (SET): Writing a value of 1 to this field causes the controller to complete the P2 Powerdown handshake regardless of whether the PHY has returned Phystatus. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_PL_PIPE_RELATED_OFF

Address: Operational Base + offset (0x0490)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	PIPE_GARBAGE_DATA_MODE PIPE Garbage Data Mode. RxValid is deasserted a valid RxStartBlock is received at 128b/130b encoding a valid COM symbol is received at 8b/10b encoding Note: This register field is sticky. Values: 0x0 (COMPLIANT_MODE): PIPE Spec compliant mode: The MAC discards any symbols received after the electrical idle ordered-set until RxValid is deasserted. 0x1 (PHY_SUP_MODE): Special PHY Support mode: The MAC discards any symbols received after the electrical idle ordered-set until when any of the following three conditions are true: Value After Reset: 0x0
7:0	RO	0x00	reserved

11.4.3.26 DSP_PCIE_IATU Detail Registers Description

DSP_PCIE_IATU_REGION_CTRL_1_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved

Bit	Attr	Reset Value	Description
22:20	RW	0x0	CTRL_1_FUNC_NUM Function Number. When the address of an outbound TLP is matched to this region and the FUNC_BYPASS field in the "iATU Region Control 2 Register" is '0', then the function number used in generating the function part of the requester ID (RID) field of the TLP is taken from this 5-bit register. The value in this register must be 0x0 unless multifunction operation in the controller is enabled (CX_NFUNC > 1). When you are using the AXI Bridge, then this field is swapped before AXI decomposition occurs so that the correct "Max_Read_Request_Size" and "Max_Payload_Size" values are used. Note: This register field is sticky. Value After Reset: 0x0
19:18	RO	0x0	reserved
17:16	RW	0x0	AT AT. When the address of an outbound TLP is matched to this region, then the AT field of the TLP is changed to the value in this register. Only valid when the ATS_ENABLE configuration parameter is '1'. Note: This register field is sticky. Value After Reset: 0x0
15:14	RO	0x0	reserved
13	RW	0x0	INCREASE_REGION_SIZE Increase the maximum ATU Region size. When set, the maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky. Values: 0x1 (ENABLE): Maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE 0x0 (DISABLE): Maximum ATU Region size is 4 GB (default) Value After Reset: 0x0
12:11	RO	0x0	reserved
10:9	RW	0x0	ATTR When the address of an outbound TLP is matched to this region, then the ATTR field of the TLP is changed to the value in this register. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
8	RW	0x0	TD This is a reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
7:5	RW	0x0	TC When the address of an outbound TLP is matched to this region, then the TC field of the TLP is changed to the value in this register. Note: This register field is sticky. Value After Reset: 0x0
4:0	RW	0x00	TYPE When the address of an outbound TLP is matched to this region, then the TYPE field of the TLP is changed to the value in this register. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_REGION_CTRL_2_OFF_OUTBOUND_i
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	REGION_EN Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky. Value After Reset: 0x0
30	RO	0x0	reserved
29	RW	0x0	INVERT_MODE Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0

Bit	Attr	Reset Value	Description
28	RW	0x0	CFG_SHIFT_MODE CFG Shift Mode. The iATU uses bits [27:12] of the untranslated address (on the XALI0/1/2 interface or AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 3.1 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space. Note: This register field is sticky. Value After Reset: 0x0
27	RW	0x0	DMA_BYPASS DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. Note: This field is reserved for the SW product. You must set it to '0'. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
26:24	RO	0x0	reserved
23	RW	0x0	HEADER_SUBSTITUTE_EN Header Substitute Enable. When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. Encodings are as above. Note: This register field is sticky. Values: 0x1 (FILL_BYTES): LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. 0x0 (FORM_ADDR): LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register forms the new address of the translated region. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
22	RW	0x0	INHIBIT_PAYLOAD Inhibit TLP Payload Data for TLP's in Matched Region; assign iATU region to be TLP without data. When enabled and region address is matched, the iATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs such as slv_wstrb. Encoding are define as above. Note: This register field is sticky. Values: 0x1 (NO_SUPPORT_FOR_DATA_TLP): Fmt[1] =0 so that only TLP type without data is sent. For example, a Msg instead of MsgD will be sent. 0x0 (SUPPORT_DATA_TLP): Fmt[1] =0/1 so that TLPs with or without data can be sent. Value After Reset: 0x0
21	RO	0x0	reserved
20	RW	0x0	SNP TLP Header Fields Translation Bypass. In this mode header fields of the translated TLP is taken from your application transmit interface or, if AMBA is configured, from the AMBA sideband bus (slv_awmisc_info) and not from the corresponding fields of the IATU_REGION_CTRL_1_OFF_OUTBOUND_i or IATU_REGION_CTRL_2_OFF_OUTBOUND_i registers. The header fields are TC PH TH ST AT Attr (IDO, RO and NS). Note: This register field is sticky. Value After Reset: 0x0
19	RW	0x0	FUNC_BYPASS Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "iATU Region Control 1 Register" or the VF_NUMBER field of the "iATU Control 3 Register." Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
18:17	RO	0x0	reserved

Bit	Attr	Reset Value	Description
16	RW	0x0	TAG_SUBSTITUTE_EN TAG Substitute Enable. When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. Note (CX_TPH_ENABLE=1): TAG substitution for MWr will not occur because this field (byte 6) in the TLP header is the ST field. ST substitution can still take place using the MSG_CODE field in IATU_REGION_CTRL_2_OFF_OUTBOUND_i. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
15:8	RW	0x00	TAG TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set. Note: This register field is sticky. Value After Reset: 0x0
7:0	RW	0x00	MSG_CODE MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register. Memory TLPs: (ST: Steering Tag). When the ST field of an outbound TLP is matched to this region, and the translated TLP TYPE field targets memory space; then the ST field of the TLP is changed to the value in this register. Only Valid when the CX_TPH_ENABLE configuration parameter is 1. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_LWR_BASE_ADDR_OFF_OUTBOUND_i
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LWR_BASE_RW Forms bits [31:n] of the start address of the address region to be translated. n is log2(CX_ATU_MIN_REGION_SIZE) Note: This register field is sticky. Value After Reset: 0x0
15:0	RO	0x0000	LWR_BASE_HW Forms bits [n-1:0] of the start address of the address region to be translated. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. n is log2(CX_ATU_MIN_REGION_SIZE) Value After Reset: 0x0

DSP_PCIE_IATU_UPPER_BASE_ADDR_OFF_OUTBOUND_i
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	UPPER_BASE_RW Forms bits [63:32] of the start (and end) address of the address region to be translated. In systems with a 32-bit address space, this register is not used and therefore writing to this register has no effect. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_LIMIT_ADDR_OFF_OUTBOUND_i
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	LIMIT_ADDR_RW Forms upper bits of the end address of the address region to be translated. Note: This register field is sticky. Value After Reset: 0x0
15:4	RO	0xfff	LIMIT_ADDR_HW Forms lower bits of the end address of the address region to be translated. The end address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always all ones. A write to this location is ignored by the PCIe controller. Note: This register field is sticky. Value After Reset: 0xfff

Bit	Attr	Reset Value	Description
3:0	RO	0x0	CBUF_INCR Circular Buffer. Note: This register field is sticky. Value After Reset: 0xf

DSP_PCIE_IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LWR_TARGET_RW_OUTBOUND When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_ is '0' (normal operation): LWR_TARGET_RW[31:n] forms MSB's of the Lower Target part of the new address of the translated region; LWR_TARGET_RW[n-1:0] are not used. (The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so the lower bits of the start address of the new address of the translated region (bits n-1:0) are always '0'). n is log2(CX_ATU_MIN_REGION_SIZE). When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_i is '1': LWR_TARGET_RW[31:0] forms bytes 8-11 (for 3 dword header) or bytes 12-15 (for 4 dword header) of the outbound TLP header. Usage scenarios include the transmission of Vendor Defined Messages where the controller determines the content of bytes 12 to 15 of the TLP header. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_UPPER_TARGET_ADDR_OFF_OUTBOUND_i
Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	UPPER_TARGET_RW Forms bits [63:32] of the start address (Upper Target part) of the new address of the translated region. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_UPPR_LIMIT_ADDR_OFF_OUTBOUND_i
Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	UPPR_LIMIT_ADDR_HW Forms MSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_OUTBOUND_i is '1'. These bits are always '0'. Value After Reset: 0x0
0	RW	0x0	UPPR_LIMIT_ADDR_RW Forms the LSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_OUTBOUND_i is '1' Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_REGION_CTRL_1_OFF_INBOUND_i

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved
22:20	RW	0x0	CTRL_1_FUNC_NUM Function Number. MEM-I/O: When the Address and BAR matching logic in the controller indicate that a MEM-I/O transaction matches a BAR in the function corresponding to this value, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Region Control 2 Register" is set. CFG0/CFG1: When the destination function number as specified in the routing ID of the TLP header matches the function, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Region Control 2 Register" is set. Note: This register field is sticky. Value After Reset: 0x0
19:18	RO	0x0	reserved
17:16	RW	0x0	AT When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "AT Match Enable" bit of the "iATU Region Control 2 Register" is set. Only valid when the ATS_ENABLE configuration parameter is '1'. Note: This register field is sticky. Value After Reset: 0x0
15:14	RO	0x0	reserved

Bit	Attr	Reset Value	Description
13	RW	0x0	INCREASE_REGION_SIZE Increase the maximum ATU Region size. When set, the maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky. Values: 0x1 (ENABLE): Maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE 0x0 (DISABLE): Maximum ATU Region size is 4 GB (default) Value After Reset: 0x0
12:11	RO	0x0	reserved
10:9	RW	0x0	ATTR When the ATTR field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "iATU Region Control 2 Register" is set. Note: This register field is sticky. Value After Reset: 0x0
8	RW	0x0	TD When the TD field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TD Match Enable" bit of the "iATU Region Control 2 Register" is set. Note: This register field is sticky. Value After Reset: 0x0
7:5	RW	0x0	TC When the TC field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TC Match Enable" bit of the "iATU Region Control 2 Register" is set. Note: This register field is sticky. Value After Reset: 0x0
4:0	RW	0x00	TYPE When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_REGION_CTRL_2_OFF_INBOUND_i
Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31	RW	0x0	REGION_EN Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
30	RW	0x0	MATCH_MODE Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM-I/O TLPs, this field is interpreted as follows: -0: Address Match Mode. The iATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. -1: BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: -0: Routing ID Match Mode. The iATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the iATU region for matching to proceed. -1: Accept Mode. The iATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: -0: Address Match Mode. The iATU treats the third dword and fourth dword of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers. -1: Vendor ID Match Mode. This mode is relevant for ID-routed Vendor Defined Messages. The iATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third dword of the TLP header, but matches against the Vendor ID in bits [15:0] of the third dword of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth dword of the TLP header. - If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN = 1 AND MSG_TYPE_MATCH_MODE =1, then Match Mode is ignored. Note: This register field is sticky. Values: 0x0 (ZERO): The interpretation is dependent on TLP type, that is, MEM/IO, CFG0, or MSG/MSGD TLPs. 0x1 (ONE): The interpretation is dependent on TLP type, that is, MEM/IO, CFG0, or MSG/MSGD TLPs. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
29	RW	0x0	INVERT_MODE Invert Mode Enable. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). When set all regions of that type must use address match mode. Note: This register field is sticky. Values: 0x1 (ENABLE): Invert Mode Enable 0x0 (DISABLE): Invert Mode Disable Value After Reset: 0x0
28	RW	0x0	CFG_SHIFT_MODE CFG Shift Enable. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address. Note: This register field is sticky. Values: 0x1 (ENABLE): CFG Shift Enable 0x0 (DISABLE): CFG Shift Disable Value After Reset: 0x0
27	RW	0x0	FUZZY_TYPE_MATCH_CODE Fuzzy Type Match Enable. When enabled, the iATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. MWr, MRd, and MRdLk TLPs are seen as identical The Routing field of Msg/MsgD TLPs is ignored FetchAdd, Swap, and CAS are seen as identical. For example, CFG0 in the TYPE field in the "iATU Region Control 1 Register" matches against an inbound CfgRd0, CfgRd1, CfgWr0, or CfgWr1 TLP. Note: This register field is sticky. Values: 0x1 (ENABLE): Fuzzy Type Match Enable 0x0 (DISABLE): Fuzzy Type Match Disable Value After Reset: 0x0
26	RO	0x0	reserved

Bit	Attr	Reset Value	Description
25:24	RW	0x0	RESPONSE_CODE Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled. Note: This register field is sticky. Values: 0x0 (NORMAL_RADM): Normal RADM filter response is used. 0x1 (UNSUP_REQ): Unsupported request (UR) 0x2 (COMPL_ABORT): Completer abort (CA) 0x3 (NOT_USED): Not used / undefined / reserved Value After Reset: 0x0
23	RW	0x0	SINGLE_ADDR_LOC_TRANS_EN Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the iATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs when the AXI bridge is enabled. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
22	RO	0x0	reserved
21	RW	0x0	MSG_CODE_MATCH_EN Message Code Match Enable (Msg TLPS). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "iATU Region Control 2 Register") occurs (in MSG transactions) for address translation to proceed. ST Match Enable (Mem TLPs). Ensures that a successful ST TLP field comparison match (see ST field of the "iATU Region Control 2 Register") occurs (in MEM transactions) for address translation to proceed. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. Note: This register field is sticky. Values: 0x1 (ENABLE): Message Code Match Enable (for Msg TLPS) or ST Match Enable (for Mem TLPs) 0x0 (DISABLE): Virtual Function Number Match Disable Value After Reset: 0x0
20	RO	0x0	reserved

Bit	Attr	Reset Value	Description
19	RW	0x0	FUNC_NUM_MATCH_EN Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "iATU Region Control 1 Register") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed. Note: This register field is sticky. Values: 0x1 (ENABLE): Function Number Match Enable 0x0 (DISABLE): Function Number Match Disable Value After Reset: 0x0
18	RO	0x0	reserved
17	RW	0x0	AT_MATCH_EN AT Match Enable. Ensures that a successful AT TLP field comparison match (see AT field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Only valid when the ATS_ENABLE configuration parameter is '1'. Note: This register field is sticky. Values: 0x1 (ENABLE): AT Match Enable 0x0 (DISABLE): AT Match Disable Value After Reset: 0x0
16	RW	0x0	ATTR_MATCH_EN ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky. Values: 0x1 (ENABLE): ATTR Match Enable 0x0 (DISABLE): ATTR Match Disable Value After Reset: 0x0
15	RW	0x0	TD_MATCH_EN TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky. Values: 0x1 (ENABLE): TD Match Enable 0x0 (DISABLE): TD Match Disable Value After Reset: 0x0

Bit	Attr	Reset Value	Description
14	RW	0x0	TC_MATCH_EN TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky. Values: 0x1 (ENABLE): TC Match Enable 0x0 (DISABLE): TC Match Disable Value After Reset: 0x0
13	RW	0x0	MSG_TYPE_MATCH_MODE Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the IATU_REGION_CTRL_1_VIEWPORT_OFF_INBOUND_i register (TYPE[4:3]=2'b10) will be translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM or ATS messages when AXI bridge is configured on client interface. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
12:11	RO	0x0	reserved

Bit	Attr	Reset Value	Description
10:8	RW	0x0	BAR_NUM BAR Number. When the BAR number of an inbound MEM or IO TLP " that is matched by the normal internal BAR address matching mechanism " is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "iATU Region Control 2 Register" is set. IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR. Note: This register field is sticky. Values: 0x0 (BAR0): BAR0 0x1 (BAR1): BAR1 0x2 (BAR2): BAR2 0x3 (BAR3): BAR3 0x4 (BAR4): BAR4 0x5 (BAR5): BAR5 0x6 (ROM): ROM 0x7 (RSVD): reserved Value After Reset: 0x0
7:0	RW	0x00	MSG_CODE MSG TLPs: (Message Code). When the TYPE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Message Code Match Enable" bit of the "iATU Region Control 2 Register" is set. Memory TLPs: (ST: Steering Tag). When the ST field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "ST Match Enable" bit of the "iATU Region Control 2 Register" is set. The setting is independent of the setting of the TH field. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_LWR_BASE_ADDR_OFF_INBOUND_i
Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LWR_BASE_RW Forms bits [31:n] of the start address of the address region to be translated. n is log2(CX_ATU_MIN_REGION_SIZE) Note: This register field is sticky. Value After Reset: 0x0
15:0	RO	0x0000	LWR_BASE_HW Forms bits [n-1:0] of the start address of the address region to be translated. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. n is log2(CX_ATU_MIN_REGION_SIZE) Value After Reset: 0x0

DSP_PCIE_IATU_UPPER_BASE_ADDR_OFF_INBOUND_i
Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	UPPER_BASE_RW Forms bits [63:32] of the start (and end) address of the address region to be translated. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_LIMIT_ADDR_OFF_INBOUND_i
Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LIMIT_ADDR_RW Forms upper bits of the end address of the address region to be translated. When SINGLE_ADDR_LOC_TRANS_EN = 1, MSG_TYPE_MATCH_MODE = 1, and CBUF_INCR > 0 then this field forms the upper bits of the limit address for the circular buffer. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15:4	RO	0xfff	LIMIT_ADDR_HW Forms lower bits of the end address of the address region to be translated. The end address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always all ones. When SINGLE_ADDR_LOC_TRANS_EN = 1, MSG_TYPE_MATCH_MODE = 1, and CBUF_INCR > 0 then this field forms lower bits of the limit address for the circular buffer. A write to this location is ignored by the PCIe controller. Note: This register field is sticky. Value After Reset: 0xfff
3:0	RW	0x0	CBUF_INCR Circular Buffer Increment. When CX_ATU_SLOC_CBUF = 0, then this field is Read-only and forms the lowest bits of the end address of the address region to be translated. When CX_ATU_SLOC_CBUF = 1, then this field is R/W and forms the upper bits of the Circular Buffer Increment size (CBUF_INCR) field for Single Location Address translation. The increment value (in bytes) is decoded as follows: 0000b: 0 (Default; legacy Single Address Location mode) 0001b: 4 0010b: 8 0011b: 16 0100b: 32 0101b: 64 0110b: 128 0111b: 256 1000b: 512 1001b: 1024 1010b: 2048 1011b: 4096 1100b: 8192 1101b: rsvd. 1110b: rsvd. 1111b: rsvd. Note: A write to any bit in the CBUF_INCR field resets the circular buffer pointer ? that is, the next matched received Message will be translated to the start address of the Circular Buffer. This field must be written to AFTER the target and limit registers have been updated. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R (sticky) Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_LWR_TARGET_ADDR_OFF_INBOUND_i
Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LWR_TARGET_RW Forms MSB's of the Lower Target part of the new address of the translated region. These bits are always '0'. Field size depends on log2(CX_ATU_MIN_REGION_SIZE) in address match mode. Field size depends on log2(BAR_MASK+1) in BAR match mode. Note: This register field is sticky. Value After Reset: 0x0
15:0	RO	0x0000	LWR_TARGET_HW Forms the LSB's of the Lower Target part of the new address of the translated region. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary (in address match mode); and to the Bar size boundary (in BAR match mode) so that these bits are always '0'. If the BAR is smaller than the iATU region size, then the iATU target address must align to the iATU region size; otherwise it must align to the BAR size. A write to this location is ignored by the PCIe controller. Field size depends on log2(CX_ATU_MIN_REGION_SIZE) in address match mode. Field size depends on log2(BAR_MASK+1) in BAR match mode. Value After Reset: 0x0

DSP_PCIE_IATU_UPPER_TARGET_ADDR_OFF_INBOUND_i

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	UPPER_TARGET_RW Forms bits [63:32] of the start address (Upper Target part) of the new address of the translated region. In systems with a 32-bit address space, this register is not used and therefore writing to this register has no effect. Note: This register field is sticky. Value After Reset: 0x0

DSP_PCIE_IATU_UPPR_LIMIT_ADDR_OFF_INBOUND_i

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	UPPR_LIMIT_ADDR_HW Forms MSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_INBOUND_i is '1'. These bits are always '0'. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	UPPR_LIMIT_ADDR_RW Forms the LSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_INBOUND_i is '1' Note: This register field is sticky. Value After Reset: 0x0

11.4.3.27 DSP_PCIE_DMA Registers Summary

Name	Offset	Size	Reset Value	Description
DSP_PCIE_DMA_CTRL_DATA_ARB_PRIOR_OFF	0x0000	W	0x00000688	DMA Arbitration Scheme for TRGT1 Interface
DSP_PCIE_DMA_CTRL_OFF	0x0008	W	0x00020002	DMA Number of Channels Register
DSP_PCIE_DMA_WRITE_ENGINE_EN_OFF	0x000C	W	0x00000000	DMA Write Engine Enable Register
DSP_PCIE_DMA_WRITE_DOORBELL_OFF	0x0010	W	0x00000000	DMA Write Doorbell Register
DSP_PCIE_DMA_WRITE_CHANNEL_ARB_WEIGHT_LOW_OFF	0x0018	W	0x00008421	DMA Write Engine Channel Arbitration Weight Low Register
DSP_PCIE_DMA_WRITE_CHANNEL_ARB_WEIGHT_HIGH_OFF	0x001C	W	0x00000000	DMA Write Engine Channel Arbitration Weight High Register
DSP_PCIE_DMA_READ_ENGINE_EN_OFF	0x002C	W	0x00000000	DMA Read Engine Enable Register
DSP_PCIE_DMA_READ_DOORBELL_OFF	0x0030	W	0x00000000	DMA Read Doorbell Register
DSP_PCIE_DMA_READ_CHANNEL_ARB_WEIGHT_LOW_OFF	0x0038	W	0x00008421	DMA Read Engine Channel Arbitration Weight Low Register
DSP_PCIE_DMA_READ_CHANNEL_ARB_WEIGHT_HIGH_OFF	0x003C	W	0x00008421	DMA Read Engine Channel Arbitration Weight High Register
DSP_PCIE_DMA_WRITE_INT_STATUS_OFF	0x004C	W	0x00000000	DMA Write Interrupt Status Register
DSP_PCIE_DMA_WRITE_INT_MASK_OFF	0x0054	W	0x00030003	DMA Write Interrupt Mask Register
DSP_PCIE_DMA_WRITE_INT_CLEAR_OFF	0x0058	W	0x00000000	DMA Write Interrupt Clear Register
DSP_PCIE_DMA_WRITE_ERR_STATUS_OFF	0x005C	W	0x00000000	DMA Write Error Status Register
DSP_PCIE_DMA_WRITE_DONE_IMWR_LOW_OFF	0x0060	W	0x00000000	DMA Write Done IMWr Address Low Register
DSP_PCIE_DMA_WRITE_DONE_IMWR_HIGH_OFF	0x0064	W	0x00000000	DMA Write Done IMWr Interrupt Address High Register
DSP_PCIE_DMA_WRITE_ABORT_IMWR_LOW_OFF	0x0068	W	0x00000000	DMA Write Abort IMWr Address Low Register
DSP_PCIE_DMA_WRITE_ABORT_IMWR_HIGH_OFF	0x006C	W	0x00000000	DMA Write Abort IMWr Address High Register

Name	Offset	Size	Reset Value	Description
DSP_PCIE_DMA_WRITE_CH01_IMWR_DATA_OFF	0x0070	W	0x00000000	DMA Write Channel 1 and 0 IMWr Data Register
DSP_PCIE_DMA_WRITE_CH23_IMWR_DATA_OFF	0x0074	W	0x00000000	DMA Write Channel 3 and 2 IMWr Data Register
DSP_PCIE_DMA_WRITE_CH45_IMWR_DATA_OFF	0x0078	W	0x00000000	DMA Write Channel 5 and 4 IMWr Data Register
DSP_PCIE_DMA_WRITE_CH67_IMWR_DATA_OFF	0x007C	W	0x00000000	DMA Write Channel 7 and 6 IMWr Data Register
DSP_PCIE_DMA_WRITE_LINKED_LIST_ERR_EN_OFF	0x0090	W	0x00000000	DMA Write Linked List Error Enable Register
DSP_PCIE_DMA_READ_INT_STATUS_OFF	0x00A0	W	0x00000000	DMA Read Interrupt Status Register
DSP_PCIE_DMA_READ_INT_MASK_OFF	0x00A8	W	0x00030003	DMA Read Interrupt Mask Register
DSP_PCIE_DMA_READ_INT_CLEAR_OFF	0x00AC	W	0x00000000	DMA Read Interrupt Clear Register
DSP_PCIE_DMA_READ_ERR_STATUS_LOW_OFF	0x00B4	W	0x00000000	DMA Read Error Status Low Register
DSP_PCIE_DMA_READ_ERR_STATUS_HIGH_OFF	0x00B8	W	0x00000000	DMA Read Error Status High Register
DSP_PCIE_DMA_READ_LINKED_LIST_ERR_EN_OFF	0x00C4	W	0x00000000	DMA Read Linked List Error Enable Register
DSP_PCIE_DMA_READ_DONE_IMWR_LOW_OFF	0x00CC	W	0x00000000	DMA Read Done IMWr Address Low Register
DSP_PCIE_DMA_READ_DONE_IMWR_HIGH_OFF	0x00D0	W	0x00000000	DMA Read Done IMWr Address High Register
DSP_PCIE_DMA_READ_ABORT_IMWR_LOW_OFF	0x00D4	W	0x00000000	DMA Read Abort IMWr Address Low Register
DSP_PCIE_DMA_READ_ABORT_IMWR_HIGH_OFF	0x00D8	W	0x00000000	DMA Read Abort IMWr Address High Register
DSP_PCIE_DMA_READ_CH01_IMWR_DATA_OFF	0x00DC	W	0x00000000	DMA Read Channel 1 and 0 IMWr Data Register
DSP_PCIE_DMA_READ_CH23_IMWR_DATA_OFF	0x00E0	W	0x00000000	DMA Read Channel 3 and 2 IMWr Data Register
DSP_PCIE_DMA_READ_CH45_IMWR_DATA_OFF	0x00E4	W	0x00000000	DMA Read Channel 5 and 4 IMWr Data Register
DSP_PCIE_DMA_READ_CH67_IMWR_DATA_OFF	0x00E8	W	0x00000000	DMA Read Channel 7 and 6 IMWr Data Register
DSP_PCIE_DMA_WRITE_ENGINE_HSHAKE_CNT_LOW_OFF	0x0108	W	0x00000000	DMA Write Engine Handshake Counter Channel 0/1/2/3 Register
DSP_PCIE_DMA_WRITE_ENGINE_HSHAKE_CNT_HIGH_OFF	0x010C	W	0x00000000	DMA Write Engine Handshake Counter Channel 4/5/6/7 Register
DSP_PCIE_DMA_READ_ENGINE_HSHAKE_CNT_LOW_OFF	0x0118	W	0x00000000	DMA Read Engine Handshake Counter Channel 0/1/2/3 Register
DSP_PCIE_DMA_READ_ENGINE_HSHAKE_CNT_HIGH_OFF	0x011C	W	0x00000000	DMA Read Engine Handshake Counter Channel 4/5/6/7 Register
DSP_PCIE_DMA_WRITE_CHi_PWR_EN_OFF	0x0128	W	0x00000000	DMA Write Channel 0 Power Enable Register (for i = 0; i <= 7)

Name	Offset	Size	Reset Value	Description
DSP_PCIE_DMA_READ_CHi_PWR_EN_OFF	0x0168	W	0x00000000	DMA Read Channel 0 Power Enable Register (for i = 0; i <= 7)
DSP_PCIE_DMA_CH_CONTROL1_OFF_WRCH_i	0x0200	W	0x00000000	DMA Write Channel Control 1 Register (for i = 0; i <= 1)
DSP_PCIE_DMA_TRANSFER_SIZE_OFF_WRCH_i	0x0208	W	0x00000000	DMA Write Transfer Size Register
DSP_PCIE_DMA_SAR_LOW_OFF_WRCH_i	0x020C	W	0x00000000	DMA Write SAR Low Register
DSP_PCIE_DMA_SAR_HIGH_OFF_WRCH_i	0x0210	W	0x00000000	DMA Write SAR High Register (for i = 0; i <= 1)
DSP_PCIE_DMA_DAR_LOW_OFF_WRCH_i	0x0214	W	0x00000000	DMA Write DAR Low Register (for i = 0; i <= 1)
DSP_PCIE_DMA_DAR_HIGH_OFF_WRCH_i	0x0218	W	0x00000000	DMA Write DAR High Register (for i = 0; i <= 1)
DSP_PCIE_DMA_LLP_LOW_OFF_WRCH_i	0x021C	W	0x00000000	DMA Write Linked List Pointer Low Register (for i = 0; i <= 1)
DSP_PCIE_DMA_LLP_HIGH_OFF_WRCH_i	0x0220	W	0x00000000	DMA Write Linked List Pointer High Register (for i = 0; i <= 1)
DSP_PCIE_DMA_CH_CONTROL1_OFF_RDCH_i	0x0300	W	0x00000000	DMA Read Channel Control 1 Register (for i = 0; i <= 1)
DSP_PCIE_DMA_TRANSFER_SIZE_OFF_RDCH_i	0x0308	W	0x00000000	DMA Read Transfer Size Register (for i = 0; i <= 1)
DSP_PCIE_DMA_SAR_LOW_OFF_RDCH_i	0x030C	W	0x00000000	DMA Read SAR Low Register (for i = 0; i <= 1)
DSP_PCIE_DMA_SAR_HIGH_OFF_RDCH_i	0x0310	W	0x00000000	DMA Read SAR High Register (for i = 0; i <= 1)
DSP_PCIE_DMA_DAR_LOW_OFF_RDCH_i	0x0314	W	0x00000000	DMA Read DAR Low Register (for i = 0; i <= 1)
DSP_PCIE_DMA_DAR_HIGH_OFF_RDCH_i	0x0318	W	0x00000000	DMA Read DAR High Register (for i = 0; i <= 1)
DSP_PCIE_DMA_LLP_LOW_OFF_RDCH_i	0x031C	W	0x00000000	DMA Read Linked List Pointer Low Register (for i = 0; i <= 1)
DSP_PCIE_DMA_LLP_HIGH_OFF_RDCH_i	0x0320	W	0x00000000	DMA Read Linked List Pointer High Register (for i = 0; i <= 1)

11.4.3.28 DSP_PCIE_DMA Detail Registers Description

DSP_PCIE_DMA_CTRL_DATA_ARB_PRIOR_OFF

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RO	0x0	VERSION Reports the version of Register Map of eDMA. Value After Reset: 0x0
11:9	RW	0x3	RDBUFF_TRGT_WEIGHT DMA Read Channel MWr Requests. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x3

Bit	Attr	Reset Value	Description
8:6	RW	0x2	RD_CTRL_TRGT_WEIGHT DMA Read Channel MRd Requests (for LL element/descriptor access). Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x2
5:3	RW	0x1	WR_CTRL_TRGT_WEIGHT DMA Write Channel MRd Requests (for DMA data requests and LL element/descriptor access). Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1
2:0	RW	0x0	RTRGT1_WEIGHT Non-DMA Rx Requests. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0

DSP_PCIE_DMA_CTRL_OFF

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RW	0x0	DIS_C2W_CACHE_RD Disable DMA Read Channel's "completion to memory write" context cache pre-fetch function. Note: For internal debugging only. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
24	RW	0x0	DIS_C2W_CACHE_WR Disable DMA Write Channel's "completion to memory write" context cache pre-fetch function. Note: For internal debugging only. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
23:20	RO	0x0	reserved

Bit	Attr	Reset Value	Description
19:16	RO	0x2	NUM_DMA_RD_CHAN Number of Read Channels. You can read this register to determine the number of read channels configured. Value After Reset: 0x2
15:4	RO	0x000	reserved
3:0	RO	0x2	NUM_DMA_WR_CHAN Number of Write Channels. You can read this register to determine the number of write channels configured. Value After Reset: 0x2

DSP_PCIE_DMA_WRITE_ENGINE_EN_OFF
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH7 Enable Handshake for DMA Write Engine Channel 7. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
22	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH6 Enable Handshake for DMA Write Engine Channel 5. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
21	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH5 Enable Handshake for DMA Write Engine Channel 5. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
20	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH4 Enable Handshake for DMA Write Engine Channel 4. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0

Bit	Attr	Reset Value	Description
19	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH3 Enable Handshake for DMA Write Engine Channel 3. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
18	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH2 Enable Handshake for DMA Write Engine Channel 2. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
17	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH1 Enable Handshake for DMA Write Engine Channel 1. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
16	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH0 Enable Handshake for DMA Write Engine Channel 0. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
15:1	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	DMA_WRITE_ENGINE DMA Write Engine Enable. For normal operation, you must initially set this bit to '1', before any other software setup action. You do not need to toggle or rewrite to this bit during normal operation. You should set this bit to '0' when you want to "Soft Reset" the DMA controller write logic. There are three possible reasons for resetting the DMA controller write logic: The "Abort Interrupt Status" bit is set in the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF), and any of the bits in the DMA Write Error Status Register (DMA_WRITE_ERR_STATUS_OFF) are set. Resetting the DMA controller write logic re-initializes the control logic, ensuring that the next DMA write transfer is executed successfully. You have executed the procedure outlined in "Stop Bit", after which, the "Abort Interrupt Status" bit is set and the Channel Status(CS) field of the DMA Write Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_i) is set to "Stopped". Resetting the DMA controller write logic re-initializes the control logic ensuring that the next DMA write transfer is executed successfully. During software development, when you incorrectly program the DMA write engine. To "Soft Reset" the DMA controller write logic, you must: De-assert the DMA write engine enable bit. Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA write engine enable bit returns a '0'. Assert the DMA write engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA write transfer does not start until you write to the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF). Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable (Soft Reset) Value After Reset: 0x0 Testable: untestable Volatile: true

DSP_PCIE_DMA_WRITE_DOORBELL_OFF
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31	RW	0x0	WR_STOP Stop. Set in conjunction with the Doorbell Number field. The DMA write channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the DMA Write Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_0) to ensure that the write channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)". Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
30:3	RO	0x0000000	reserved
2:0	RW	0x0	WR_DOORBELL_NUM Doorbell Number. You must write the channel number to this register to start the DMA write transfer for that channel. The DMA detects a write to this register field even if the value of this field does not change. You do not need to toggle or write any other value to this register to start a new transfer. The range of this field is 0x0 to 0x7, where 0x0 corresponds to channel 0. Note: A write to this field triggers the controller to exit L1 substates. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: tru

DSP_PCIE_DMA_WRITE_CHANNEL_ARB_WEIGHT_LOW_OFF

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved

Bit	Attr	Reset Value	Description
19:15	RW	0x01	WRITE_CHANNEL3_WEIGHT Channel 3 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1
14:10	RW	0x01	WRITE_CHANNEL2_WEIGHT Channel 2 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1
9:5	RW	0x01	WRITE_CHANNEL1_WEIGHT Channel 1 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1
4:0	RW	0x01	WRITE_CHANNEL0_WEIGHT Channel 0 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1

DSP_PCIE_DMA_WRITE_CHANNEL_ARB_WEIGHT_HIGH_OFF

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved

Bit	Attr	Reset Value	Description
19:15	RW	0x00	WRITE_CHANNEL7_WEIGHT Channel 7 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1
14:10	RW	0x00	WRITE_CHANNEL6_WEIGHT Channel 6 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1
9:5	RW	0x00	WRITE_CHANNEL5_WEIGHT Channel 5 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1
4:0	RW	0x00	WRITE_CHANNEL4_WEIGHT Channel 4 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x1

DSP_PCIE_DMA_READ_ENGINE_EN_OFF

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH7 Enable Handshake for DMA Read Engine Channel 7. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
22	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH6 Enable Handshake for DMA Read Engine Channel 6. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
21	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH5 Enable Handshake for DMA Read Engine Channel 5. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
20	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH4 Enable Handshake for DMA Read Engine Channel 4. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
19	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH3 Enable Handshake for DMA Read Engine Channel 3. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
18	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH2 Enable Handshake for DMA Read Engine Channel 2. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0

Bit	Attr	Reset Value	Description
17	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH1 Enable Handshake for DMA Read Engine Channel 1. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
16	RW	0x0	DMA_READ_ENGINE_EN_HSHAKE_CH0 Enable Handshake for DMA Read Engine Channel 0. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
15:1	RO	0x0000	reserved
0	RW	0x0	DMA_READ_ENGINE DMA Read Engine Enable. 1: Enable 0: Disable (Soft Reset) For normal operation, you must initially set this bit to "1", before any other software setup actions. You do not need to toggle or rewrite to this bit during normal operation. You should set this field to "0" when you want to "Soft Reset" the DMA controller read logic. There are three possible reasons for resetting the DMA controller read logic: The "Abort Interrupt Status" bit is set (in the "DMA Read Interrupt Status Register" (DMA_READ_INT_STATUS_OFF), and any of the bits in the "DMA Read Error Status Low Register" (DMA_READ_ERR_STATUS_LOW_OFF) is set. Resetting the DMA controller read logic re-initializes the control logic, ensuring that the next DMA read transfer is executed successfully. You have executed the procedure outlined in "Stop Bit", after which, the "Abort Interrupt Status" bit is set and the channel Status field (CS) of the DMA read "DMA Channel Control 1 Register " (DMA_CH_CONTROL1_OFF_WRCH_0) is set to "Stopped". Resetting the DMA controller read logic re-initializes the control logic ensuring that the next DMA read transfer is executed successfully. During software development, when you incorrectly program the DMA read engine. To "Soft Reset" the DMA controller read logic, you must: De-assert the DMA read engine enable bit. Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA read engine enable bit returns a "0". Assert the DMA read engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA read transfer does not start until you write to the "DMA Read Doorbell Register" (DMA_READ_DOORBELL_OFF). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

DSP_PCIE_DMA_READ_DOORBELL_OFF
Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31	RW	0x0	RD_STOP Stop. Set in conjunction with the Doorbell Number field. The DMA read channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the DMA Channel Control 1 Register (DMA_CH_CONTROL1_OFF_RDCH_i) to ensure that the read channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)". Note: The access attributes of this field are as follows: Wire: No access. Address: Operational Base + offset (0x00E4)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	RD_CHANNEL_5_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 5. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	RD_CHANNEL_4_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 4. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0

DSP_PCIE_DMA_READ_CH67_IMWR_DATA_OFF

Address: Operational Base + offset (0x00E8)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	RD_CHANNEL_7_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 7. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0
15:0	RW	0x0000	RD_CHANNEL_6_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 6. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0

DSP_PCIE_DMA_WRITE_ENGINE_HSHAKE_CNT_LOW_OFF

Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:24	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH3 DMA handshake counter for DMA Write Engine Channel 3. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
23:21	RO	0x0	reserved
20:16	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH2 DMA handshake counter for DMA Write Engine Channel 2. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
15:13	RO	0x0	reserved

Bit	Attr	Reset Value	Description
12:8	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH1 DMA handshake counter for DMA Write Engine Channel 1. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
7:5	RO	0x0	reserved
4:0	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH0 DMA handshake counter for DMA Write Engine Channel 0. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0

DSP_PCIE_DMA_WRITE_ENGINE_HSHAKE_CNT_HIGH_OFF

Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:24	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH7 DMA handshake counter for DMA Write Engine Channel 7. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
23:21	RO	0x0	reserved
20:16	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH6 DMA handshake counter for DMA Write Engine Channel 6. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
15:13	RO	0x0	reserved
12:8	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH5 DMA handshake counter for DMA Write Engine Channel 5. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
7:5	RO	0x0	reserved
4:0	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH4 DMA handshake counter for DMA Write Engine Channel 4. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0

DSP_PCIE_DMA_READ_ENGINE_HSHAKE_CNT_LOW_OFF

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28:24	RO	0x00	DMA_READ_ENGINE_HSHAKE_CNT_CH3 DMA handshake counter for DMA Read Engine Channel 3. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
23:21	RO	0x0	reserved
20:16	RO	0x00	DMA_READ_ENGINE_HSHAKE_CNT_CH2 DMA handshake counter for DMA Read Engine Channel 2. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
15:13	RO	0x0	reserved
12:8	RO	0x00	DMA_READ_ENGINE_HSHAKE_CNT_CH1 DMA handshake counter for DMA Read Engine Channel 1. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
7:5	RO	0x0	reserved
4:0	RO	0x00	DMA_READ_ENGINE_HSHAKE_CNT_CH0 DMA handshake counter for DMA Read Engine Channel 0. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0

DSP_PCIE_DMA_READ_ENGINE_HSHAKE_CNT_HIGH_OFF

Address: Operational Base + offset (0x011C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:24	RO	0x00	DMA_READ_ENGINE_HSHAKE_CNT_CH7 DMA handshake counter for DMA Read Engine Channel 7. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
23:21	RO	0x0	reserved
20:16	RO	0x00	DMA_READ_ENGINE_HSHAKE_CNT_CH6 DMA handshake counter for DMA Read Engine Channel 6. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
15:13	RO	0x0	reserved
12:8	RO	0x00	DMA_READ_ENGINE_HSHAKE_CNT_CH5 DMA handshake counter for DMA Read Engine Channel 5. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
7:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4:0	RO	0x00	DMA_READ_ENGINE_HSHAKE_CNT_CH4 DMA handshake counter for DMA Read Engine Channel 4. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0

DSP_PCIE_DMA_WRITE_CHi_PWR_EN_OFF
Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	DMA_WRITE_CH0_PWR_EN DMA Write Channel 0 Power enable/disable. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0

DSP_PCIE_DMA_READ_CHi_PWR_EN_OFF
Address: Operational Base + offset (0x0168)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	DMA_READ_CH0_PWR_EN DMA Read Channel 0 Power enable/disable. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0

DSP_PCIE_DMA_CH_CONTROL1_OFF_WRCH_i
Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	DMA_AT Address Translation TLP Header Bit (AT). The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
29:27	RW	0x0	DMA_TC Traffic Class TLP Header Bit (TC). The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
26	RO	0x0	reserved
25	RW	0x0	DMA_RO Relaxed Ordering TLP Header Bit (RO). DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
24	RW	0x0	DMA_NS_SRC Source No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
23	RW	0x0	DMA_NS_DST Destination No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
22	RW	0x0	DMA_MEM_TYPE Master AXI ACE-Lite Cache Coherency Control. This field sets the DMA channel memory type of the address space of the data transfer as follows: For more details, see "ACE-Lite Features and Limitations" section of the Databook. Irrespective of the value of this field, Linked list descriptor requests have this attribute set to 0x1. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x0 (PERIPHERAL): peripheral type 0x1 (MEM_TYPE): memory type Value After Reset: 0x0 Testable: writeAsRead Volatile: true
21:17	RO	0x00	reserved
16:12	RW	0x00	DMA_FUNC_NUM Function Number (FN). The controller uses this field when generating the requester ID for the MRd/MWr DMA TLP. When you have enabled SR-IOV, then this field is ignored if you have set the VFE field in the "DMA Write Channel Control 2 Register" (DMA_CH_CONTROL2_OFF_WRCH_0). Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
11:10	RO	0x0	reserved

Bit	Attr	Reset Value	Description
9	RW	0x0	LLE Linked List Enable (LLE). Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x1 (ENABLE): Enable linked list operation 0x0 (DISABLE): Disable linked list operation Value After Reset: 0x0 Testable: writeAsRead Volatile: true
8	RW	0x0	CCS Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6:5	RO	0x0	CS Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: Values: 0x0 (RESERVED): Reserved 0x1 (RUNNING): This channel is active and transferring data 0x2 (HALTED): An error condition has been detected, and the DMA has stopped this channel 0x3 (STOPPED): The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF) Value After Reset: 0x0 Testable: writeAsRead Volatile: true
4	RW	0x0	RIE Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	LIE Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2	RW	0x0	LLP Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (non-contiguous) element. The DMA loads this field with the LLP of the linked list element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
1	RW	0x0	TCB Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	CB Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_TRANSFER_SIZE_OFF_WRCH_i
Address: Operational Base + offset (0x0208)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_TRANSFER_SIZE DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA write channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_SAR_LOW_OFF_WRCH_i
Address: Operational Base + offset (0x020C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_LOW Source Address Register (lower 32 bits). Indicates the next address to be read from. The DMA increments the SAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The SAR is the address of the remote memory. DMA Write: The SAR is the address of the local memory. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_SAR_HIGH_OFF_WRCH_i
Address: Operational Base + offset (0x0210)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_HIGH Source Address Register (higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_DAR_LOW_OFF_WRCH_i
Address: Operational Base + offset (0x0214)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_LOW Destination Address Register (lower 32 bits). Indicates the next address to be written to. The DMA increments the DAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The DAR is the address of the local memory. DMA Write: The DAR is the address of the remote memory. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_DAR_HIGH_OFF_WRCH_i
Address: Operational Base + offset (0x0218)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_HIGH Destination Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: tru

DSP_PCIE_DMA_LLP_LOW_OFF_WRCH_i
Address: Operational Base + offset (0x021C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_LOW Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list after the previous element is consumed. When the current element is a data element; this field is incremented by 6 DWORDS. When the current element is a link element; this field is overwritten by the LL Element Pointer of the element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_LLP_HIGH_OFF_WRCH_i
Address: Operational Base + offset (0x0220)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_HIGH Higher 32 bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list as elements are consumed. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_CH_CONTROL1_OFF_RDCH_i
Address: Operational Base + offset (0x0300)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	DMA_AT Address Translation TLP Header Bit (AT). The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
29:27	RW	0x0	DMA_TC Traffic Class TLP Header Bit (TC). The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
26	RO	0x0	reserved
25	RW	0x0	DMA_RO Relaxed Ordering TLP Header Bit (RO) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
24	RW	0x0	DMA_NS_SRC Source No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23	RW	0x0	DMA_NS_DST Destination No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
22	RW	0x0	DMA_MEM_TYPE Master AXI ACE-Lite Cache Coherency Control. This field sets the DMA channel memory type of the address space of the data transfer as follows: For more details, see "ACE-Lite Features and Limitations" section of the Databook. Irrespective of the value of this field, Linked list descriptor requests have this attribute set to 0x1. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x0 (PERIPHERAL): peripheral 0x1 (MEM_TYPE): main memory Value After Reset: 0x0 Testable: writeAsRead Volatile: true
21:17	RO	0x00	reserved

Bit	Attr	Reset Value	Description
16:12	RW	0x00	DMA_FUNC_NUM Function Number (FN). The controller uses this field when generating the requester ID for the MRd/MWr DMA TLP. When you have enabled SR-IOV, then this field is ignored if you have set the VFE field in the DMA Read Channel Control 2 Register (DMA_CH_CONTROL2_OFF_RDCH_0). Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
11:10	RO	0x0	reserved
9	RW	0x0	LLE Linked List Enable (LLE). Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Values: 0x1 (ENABLE): Enable linked list operation 0x0 (DISABLE): Disable linked list operation Value After Reset: 0x0 Testable: writeAsRead Volatile: true
8	RW	0x0	CCS Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6:5	RO	0x0	CS Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: Values: 0x0 (RSVD): Reserved 0x1 (RUN): Running. This channel is active and transferring data. 0x2 (HALT): Halted. An error condition has been detected, and the DMA has stopped this channel. 0x3 (STOP): Stopped. The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the DMA Read Doorbell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF). Value After Reset: 0x0 Testable: writeAsRead Volatile: true
4	RW	0x0	RIE Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	LIE Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2	RW	0x0	LLP Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (non-contiguous) element. The DMA loads this field with the LLP of the linked list element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
1	RW	0x0	TCB Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

Bit	Attr	Reset Value	Description
0	RW	0x0	CB Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_TRANSFER_SIZE_OFF_RDCH_i
Address: Operational Base + offset (0x0308)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_TRANSFER_SIZE DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA read channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_SAR_LOW_OFF_RDCH_i
Address: Operational Base + offset (0x030C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_LOW Source Address Register (Lower 32 bits). Indicates the next address to be read from. The DMA increments the SAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The SAR is the address of the remote memory. DMA Read: The SAR is the address of the local memory. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_SAR_HIGH_OFF_RDCH_i

Address: Operational Base + offset (0x0310)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_HIGH Source Address Register (higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_DAR_LOW_OFF_RDCH_i

Address: Operational Base + offset (0x0314)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_LOW Destination Address Register (Lower 32 bits). Indicates the next address to be written to. The DMA increments the DAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The DAR is the address of the local memory. DMA Read: The DAR is the address of the remote memory. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_DAR_HIGH_OFF_RDCH_i
Address: Operational Base + offset (0x0318)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_HIGH Destination Address Register (higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_LLP_LOW_OFF_RDCH_i
Address: Operational Base + offset (0x031C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_LOW Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list after the previous element is consumed. When the current element is a data element; this field is incremented by 6 DWORDS. When the current element is a link element; this field is overwritten by the LL Element Pointer of the element. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

DSP_PCIE_DMA_LLP_HIGH_OFF_RDCH_i
Address: Operational Base + offset (0x0320)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_HIGH Higher 32 bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list as elements are consumed. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

11.4.4 Upstream Port Register

11.4.4.1 USP_PCIE_TYPE0 Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_TYPE0_DEVICE_ID_VENDOR_ID_REG	0x0000	W	0x35881D87	Device ID and Vendor ID Register
USP_PCIE_TYPE0_STATUS_COMMAND_REG	0x0004	W	0x00100000	Status and Command Register
USP_PCIE_TYPE0_CLASS_CODE_REVISION_ID	0x0008	W	0x00000001	Class Code and Revision ID Register
USP_PCIE_TYPE0_BIST_HEADER_TYPE_LATENCY_CACHE_LINE_SIZE_REG	0x000C	W	0x00000000	BIST, Header Type, Latency Timer, and Cache Line Size Register
USP_PCIE_TYPE0_BAR0_REG	0x0010	W	0x00000000	BAR0 Register

Name	Offset	Size	Reset Value	Description
USP_PCIE_TYPE0_BAR1_REG	0x0014	W	0x00000000	BAR1 Register
USP_PCIE_TYPE0_BAR2_REG	0x0018	W	0x00000000	BAR2 Register
USP_PCIE_TYPE0_BAR3_REG	0x001C	W	0x00000000	BAR3 Register
USP_PCIE_TYPE0_BAR4_REG	0x0020	W	0x00000000	BAR4 Register
USP_PCIE_TYPE0_BAR5_REG	0x0024	W	0x00000000	BAR5 Register
USP_PCIE_TYPE0_CARDBUS_CIS_PTR_REG	0x0028	W	0x00000000	CardBus CIS Pointer Register
USP_PCIE_TYPE0_SUBSYSTEM_ID_SUBSYSTEM_VENDOR_ID_REG	0x002C	W	0x00000000	Subsystem ID and Subsystem Vendor ID Register
USP_PCIE_TYPE0_EXP_ROM_BASE_ADDR_REG	0x0030	W	0x00000000	Expansion ROM BAR Register
USP_PCIE_TYPE0_PCI_CAP_PTR_REG	0x0034	W	0x00000040	Capabilities Pointer Register
USP_PCIE_TYPE0_MAX_LATENCY_MIN_GRANT_INTERRUPT_PIN_INTERRUPT_LIN	0x003C	W	0x000001FF	Max_Lat, Min_Gnt, Interrupt Pin, and Interrupt Line Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.2 USP_PCIE_TYPE0 Detail Registers Description

USP_PCIE_TYPE0_DEVICE_ID_VENDOR_ID_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RW	0x3588	PCI_TYPE0_DEVICE_ID Device ID. The Device ID register identifies the particular Function. This identifier is allocated by the vendor. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
15:0	RW	0x1d87	PCI_TYPE0_VENDOR_ID Vendor ID. The Vendor ID register identifies the manufacturer of the Function. Valid vendor identifiers are allocated by the PCI-SIG to ensure uniqueness. It is not permitted to populate this register with a value of FFFFh, which is an invalid value for Vendor ID. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

USP_PCIE_TYPE0_STATUS_COMMAND_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	W1C	0x0	DETECTED_PARITY_ERR Detected Parity Error. Values: 0x1 (SET): This bit is set by a Function whenever it receives a Poisoned TLP, regardless of the state the Parity Error Response bit in the Command register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
30	W1C	0x0	SIGNALED_SYS_ERR Signaled System Error. Values: 0x1 (SET): This bit is set when a Function sends an ERR_FATAL or ERR_NONFATAL message, and the SERR# Enable bit in the Command register is 1b. For Functions that do not send ERR_FATAL or ERR_NONFATAL messages, the controller hardwires this bit to 0b. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
29	W1C	0x0	RCVD_MASTER_ABORT Received Master Abort. Values: 0x1 (SET): This bit is set when a Requester receives a Completion with Unsupported Request Completion Status. For Functions that do not make Non-Posted Requests on their own behalf, the controller hardwires this bit to 0b. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
28	W1C	0x0	RCVD_TARGET_ABORT Received Target Abort. Values: 0x1 (SET): This bit is set when a Requester receives a Completion with Completer Abort Completion Status. For Functions that do not make Non-Posted Requests on their own behalf, the controller hardwires this bit to 0b. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
27	W1C	0x0	SIGNALED_TARGET_ABORT Signaled Target Abort. Values: 0x1 (SET): This bit is set when a Function completes a Posted or Non-Posted Request as a Completer Abort error. The controller hardwires this bit to 0b for Functions that do not signal Completer Abort. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
26:25	RO	0x0	DEV_SEL_TIMING DEVSEL Timing. This field was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this field to 00b.
24	W1C	0x0	MASTER_DPE Master Data Parity Error. This bit is set by a Function if the Parity Error Response bit in the Command register is 1b and either of the following two conditions occurs: Function receives a Poisoned Completion Function transmits a Poisoned Request If the Parity Error Response bit is 0b, this bit is never set. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23	RO	0x0	FAST_B2B_CAP Fast Back to Back Transaction Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x
22	RO	0x0	reserved

Bit	Attr	Reset Value	Description
21	RO	0x0	FAST_66MHZ_CAP 66MHz Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0
20	RO	0x1	CAP_LIST Capabilities List. Indicates the presence of an Extended Capability list item. Since all PCI Express device Functions are required to implement the PCI Express Capability structure, the controller hardwires this bit to 1b. Value After Reset: 0x1
19	RO	0x0	INT_STATUS Emulation interrupt pending. When set, indicates that an INTx emulation interrupt is pending internally in the Function. Setting the Interrupt Disable bit has no effect on the state of this bit. For Functions that do not generate INTx interrupts, the controller hardwires this bit to 0b. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
18:11	RO	0x00	reserved
10	RW	0x0	PCI_TYPE0_INT_EN Interrupt Disable. Controls the ability of a Function to generate INTx emulation interrupts. When set, Functions are prevented from asserting INTx interrupts. Note: Any INTx emulation interrupts already asserted by the Function must be de-asserted when this bit is Set. INTx interrupts use virtual wires that must, if asserted, be de-asserted using the appropriate Deassert_INTx message(s) when this bit is set. Only the INTx virtual wire interrupt(s) associated with the Function(s) for which this bit is set are affected. For functions that generate INTx interrupts, this bit is required. For functions that do not generate INTx interrupts, this bit is optional. Value After Reset: 0x0
9	RO	0x0	reserved

Bit	Attr	Reset Value	Description
8	RW	0x0	PCI_TYPE0_SERREN SERR# Enable. When set, this bit enables reporting upstream of Non-fatal and Fatal errors detected by the Function. Note: The errors are reported if enabled either through this bit or through the PCI Express specific bits in the Device Control register. Value After Reset: 0x0
7	RO	0x0	PCI_TYPE_IDSEL_STEPPING IDSEL Stepping/Wait Cycle Control. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0
6	RW	0x0	PCI_TYPE0_PARITY_ERR_EN Parity Error Response. This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Status register. Value After Reset: 0x0
5	RO	0x0	PCI_TYPE_VGA_PALETTE_SNOOP VGA Palette Snoop. This bit was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge architecture specification. Its functionality does not apply to PCI Express, the controller hardwires this bit to 0b. Value After Reset: 0x0
4	RO	0x0	PCI_TYPE_MWI_ENABLE Memory Write and Invalidate. This bit was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge architecture specification. Its functionality does not apply to PCI Express, the controller hardwires this bit to 0b. Value After Reset: 0x0
3	RO	0x0	PCI_TYPE0_SPECIAL_CYCLE_OPERATION Special Cycle Enable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
2	RW	0x0	PCI_TYPE0_BUS_MASTER_EN Bus Master Enable. Controls the ability of a Function to issue Memory and I/O Read/Write requests. When this bit is set, the Function is allowed to issue Memory or I/O Requests. When this bit is clear, the Function is not allowed to issue any Memory or I/O Requests. Requests other than Memory or I/O Requests are not controlled by this bit. Note: MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
1	RW	0x0	PCI_TYPE0_MEM_SPACE_EN Memory Space Enable. Controls a Function's response to Memory Space accesses. When this bit is set, the Function is enabled to decode the address and further process Memory Space accesses. When this bit is clear, all received Memory Space accesses are caused to be handled as Unsupported Requests. For a Function does not support Memory Space accesses, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: !has_mem_bar ? RO : RW Dbi: !has_mem_bar ? RO : RW Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	PCI_TYPE0_IO_EN IO Space Enable. Controls a Function's response to I/O Space accesses. When this bit is set, the Function is enabled to decode the address and further process I/O Space accesses. When this bit is clear, all received I/O accesses are caused to be handled as Unsupported Requests. For a Function that does not support I/O Space accesses, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: !has_io_bar ? RO : RW Dbi: !has_io_bar ? RO : RW Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_TYPE0_CLASS_CODE_REVISION_ID

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	BASE_CLASS_CODE Base Class Code. A code that broadly classifies the type of operation the Function performs. Encodings for base class, are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are Reserved. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
23:16	RW	0x00	SUBCLASS_CODE Sub-Class Code. Specifies a base class sub-class, which identifies more specifically the operation of the Function. Encodings for sub-class are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are Reserved. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
15:8	RW	0x00	PROGRAM_INTERFACE Programming Interface. This field identifies a specific register-level programming interface (if any) so that device independent software can interact with the Function. Encodings for interface are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are Reserved. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
7:0	RW	0x01	REVISION_ID Revision ID. The value in this register specifies a Function specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. The Revision ID should be viewed as a vendor defined extension to the Device ID. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

USP_PCIE_TYPE0_BIST_HEADER_TYPE_LATENCY_CACHE_LINE_SIZE_REG
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	BIST BIST. This register is used for control and status of BIST. For Functions that do not support BIST the controller hardwires the register to 00h. A Function whose BIST is invoked must not prevent normal operation of the PCI Express Link. Bit descriptions: [31]: BIST Capable. When Set, this bit indicates that the Function supports BIST. When Clear, the Function does not support BIST. [30]: Start BIST. If BIST Capable is Set, Set this bit to invoke BIST. The Function resets the bit when BIST is complete. Software is permitted to fail the device if this bit is not Clear (BIST is not complete) 2 seconds after it had been Set. Writing this bit to 0b has no effect. This bit must be hardwired to 0b if BIST Capable is Clear. [29:28]: Reserved. [27:24]: Completion Code. This field encodes the status of the most recent test. A value of 0000b means that the Function has passed its test. Non-zero values mean the Function failed. Function-specific failure codes can be encoded in the non-zero values. This field's value is only meaningful when BIST Capable is Set and Start BIST is Clear. This field must be hardwired to 0000b if BIST Capable is clear. Value After Reset: 0x0
23	RW	0x0	MULTI_FUNC Multi-Function Device. Except where stated otherwise, it is recommended that this bit be set if there are multiple Functions, and clear if there is only one Function. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): Indicates that the Device may contain multiple Functions, but not necessarily. Software is permitted to probe for Functions other than Function 0 0x0 (CLEAR): Software must not probe for Functions other than Function 0 unless explicitly indicated by another mechanism, such as an ARI or SR-IOV Capability structure. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
22:16	RO	0x00	HEADER_TYPE Header Layout. This field identifies the layout of the second part of the predefined header. The controller uses 000 0000b encoding. Value After Reset: 0x0
15:8	RO	0x00	LATENCY_MASTER_TIMER Latency Timer. The Latency Timer was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this register to 00h. Value After Reset: 0x0
7:0	RW	0x00	CACHE_LINE_SIZE Cache Line Size. The Cache Line Size register is programmed by the system firmware or the operating system to system cache line size. However, legacy conventional PCI software may not always be able to program this register correctly especially in the case of Hot-Plug devices. This read-write register is implemented for legacy compatibility purposes but has no effect on any PCI Express device behavior. Value After Reset: 0x0

USP_PCIE_TYPE0_BAR0_REG

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	BAR0_START BAR0 Base Address. Memory Space: Base Address. IO Space: bits[31:2] are used to map the function into IO space/Base. Address. Note: The access attributes of this field are as follows: Wire: R(Sticky)/W(Sticky) if enabled else R(Sticky) Dbi: R(Sticky)/W(Sticky) if enabled else R(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	BAR0_PREFETCH BAR0 Prefetchable. Memory Space: Set to one if data is prefetchable. A Function is permitted to mark a range as prefetchable. If there are no side effects on reads, the function returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors. Bit must me clear otherwise. IO Space: Not applicable Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2:1	RW	0x0	BAR0_TYPE BAR0 Type. Memory Space: Base Address registers that map into Memory Space can be 32 bits or 64 bits wide (to support mapping into a 64-bit address space). The encodings defined in Values: apply. IO Space: Bit 1 is reserved and must return 0b on reads. Bits[31:2] are used to map the function into IO space. The encodings defined in Values: do not apply. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Values: 0x0 (BAR_32): Base register is 32 bits wide and can be mapped anywhere in the 32 address bit Memory Space. 0x1 (RSVD_1): Reserved. 0x2 (BAR_64): Base register is 64 bits wide and can be mapped anywhere in the 64 address bit Memory Space. 0x3 (RSVD_2): Reserved. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	BAR0_MEM_IO BAR0 Memory Space Indicator. This bit is used to determine whether the register maps into Memory or I/O Space. Base Address registers that map to Memory Space must return a 0b. Base Address registers that map to I/O Space must return a 1b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_TYPE0_BAR1_REG

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	BAR1_START BAR1 Base Address. Memory Space: Base Address. IO Space: bits[31:2] are used to map the function into IO space/Base. Address. Note: The access attributes of this field are as follows: Wire: R(Sticky)/W(Sticky) if enabled else R(Sticky) Dbi: R(Sticky)/W(Sticky) if enabled else R(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	BAR1_PREFETCH BAR1 Prefetchable. Memory Space: Set to one if data is prefetchable. A Function is permitted to mark a range as prefetchable. If there are no side effects on reads, the function returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors. Bit must me clear otherwise. IO Space: Not applicable Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2:1	RW	0x0	BAR1_TYPE BAR1 Type. Memory Space: Base Address registers that map into Memory Space can be 32 bits or 64 bits wide (to support mapping into a 64-bit address space). The encodings defined in Values: apply. IO Space: Bit 1 is reserved and must return 0b on reads. Bits[31:2] are used to map the function into IO space. The encodings defined in Values: do not apply. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Values: 0x0 (BAR_32): Base register is 32 bits wide and can be mapped anywhere in the 32 address bit Memory Space. 0x1 (RSVD_1): Reserved. 0x2 (BAR_64): Base register is 64 bits wide and can be mapped anywhere in the 64 address bit Memory Space. 0x3 (RSVD_2): Reserved. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	BAR1_MEM_IO BAR1 Memory Space Indicator. This bit is used to determine whether the register maps into Memory or I/O Space. Base Address registers that map to Memory Space must return a 0b. Base Address registers that map to I/O Space must return a 1b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_TYPE0_BAR2_REG

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	BAR2_START BAR2 Base Address. Memory Space: Base Address. IO Space: bits[31:2] are used to map the function into IO space/Base. Address. Note: The access attributes of this field are as follows: Wire: R(Sticky)/W(Sticky) if enabled else R(Sticky) Dbi: R(Sticky)/W(Sticky) if enabled else R(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	BAR2_PREFETCH BAR2 Prefetchable. Memory Space: Set to one if data is prefetchable. A Function is permitted to mark a range as prefetchable. If there are no side effects on reads, the function returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors. Bit must me clear otherwise. IO Space: Not applicable Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2:1	RW	0x0	BAR2_TYPE BAR2 Type. Memory Space: Base Address registers that map into Memory Space can be 32 bits or 64 bits wide (to support mapping into a 64-bit address space). The encodings defined in Values: apply. IO Space: Bit 1 is reserved and must return 0b on reads. Bits[31:2] are used to map the function into IO space. The encodings defined in Values: do not apply. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Values: 0x0 (BAR_32): Base register is 32 bits wide and can be mapped anywhere in the 32 address bit Memory Space. 0x1 (RSVD_1): Reserved. 0x2 (BAR_64): Base register is 64 bits wide and can be mapped anywhere in the 64 address bit Memory Space. 0x3 (RSVD_2): Reserved. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	BAR2_MEM_IO BAR2 Memory Space Indicator. This bit is used to determine whether the register maps into Memory or I/O Space. Base Address registers that map to Memory Space must return a 0b. Base Address registers that map to I/O Space must return a 1b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_TYPE0_BAR3_REG
Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:4	RW	0x0000000	BAR3_START BAR3 Base Address. Memory Space: Base Address. IO Space: bits[31:2] are used to map the function into IO space/Base. Address. Note: The access attributes of this field are as follows: Wire: R(Sticky)/W(Sticky) if enabled else R(Sticky) Dbi: R(Sticky)/W(Sticky) if enabled else R(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	BAR3_PREFETCH BAR3 Prefetchable. Memory Space: Set to one if data is prefetchable. A Function is permitted to mark a range as prefetchable. If there are no side effects on reads, the function returns all bytes on reads regardless of the byte enables, and host bridges can merge processor writes into this range without causing errors. Bit must me clear otherwise. IO Space: Not applicable Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2:1	RW	0x0	BAR3_TYPE BAR3 Type. Memory Space: Base Address registers that map into Memory Space can be 32 bits or 64 bits wide (to support mapping into a 64-bit address space). The encodings defined in Values: apply. IO Space: Bit 1 is reserved and must return 0b on reads. Bits[31:2] are used to map the function into IO space. The encodings defined in Values: do not apply. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Values: 0x0 (BAR_32): Base register is 32 bits wide and can be mapped anywhere in the 32 address bit Memory Space. 0x1 (RSVD_1): Reserved. 0x2 (BAR_64): Base register is 64 bits wide and can be mapped anywhere in the 64 address bit Memory Space. 0x3 (RSVD_2): Reserved. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	BAR3_MEM_IO BAR3 Memory Space Indicator. This bit is used to determine whether the register maps into Memory or I/O Space. Base Address registers that map to Memory Space must return a 0b. Base Address registers that map to I/O Space must return a 1b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (BAR_ENABLED == 1) then (if [DBI_RO_WR_EN == 1] then R(Sticky)/W(Sticky) else R(Sticky)) else RO(Sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_TYPE0_BAR4_REG

USP_PCIE_TYPE0_CARDBUS_CIS_PTR_REG
Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	CARDBUS_CIS_POINTER CardBus CIS Pointer. Its functionality does not apply to PCI Express. It must be hardwired to 0000 0000h. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained

USP_PCIE_TYPE0_SUBSYSTEM_ID_SUBSYSTEM_VENDOR_ID_REG
Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	SUBSYS_DEV_ID Subsystem ID. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	SUBSYS_VENDOR_ID Subsystem Vendor ID. Subsystem Vendor IDs can be obtained from the PCI SIG and are used to identify the vendor of the add-in card or subsystem. Values for the Subsystem ID are vendor-specific. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained

USP_PCIE_TYPE0_EXP_ROM_BASE_ADDR_REG

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:11	RW	0x000000	EXP_ROM_BASE_ADDRESS Expansion ROM Base Address. Upper 21 bits of the Expansion ROM base address. The number of bits (out of these 21) that a Function actually implements depends on how much address space the Function requires. Note: The access attributes of this field are as follows: Wire: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1) then R/W else R Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1) then R/W else R Value After Reset: 0x0 Testable: writeAsRead Volatile: true
10:5	RO	0x00	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	ROM_BAR_VALIDATION_DETAILS Expansion ROM Validation Details. The field contains optional, implementation-specific details associated with Expansion ROM Validation. If validation is in progress (Expansion ROM Validation Status is 001b), non-zero values of this field represent implementation-specific indications of the phase of the validation progress (for example, 50% complete). The value 0000b indicates that no validation progress information is provided. If validation is completed (Expansion ROM Validation Status 010b to 111b inclusive), non-zero values in this field represent additional implementation-specific information. The value 0000b indicates that no information is provided. When validation is supported and this field is not implemented, this field must be hardwired to 0000b. Note: The access attributes of this field are as follows: Wire: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1) then R/W else R Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1 && DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3:1	RW	0x0	ROM_BAR_VALIDATION_STATUS Expansion ROM Validation Status. When this field is non-zero, it indicates the status of hardware validation of the Expansion ROM contents. If the Function does not support validation, this field must be hardwired to 000b. It is optional whether an implementation is capable of returning Validation Status values 011b, 101b, 110b, or 111b. Note: The access attributes of this field are as follows: Wire: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1) then R/W else R Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1 && DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (ZERO): Validation not supported. 0x1 (ONE): Validation in Progress. 0x2 (TWO): Validation Pass Valid contents, trust test was not performed. 0x3 (THREE): Validation Pass Valid and trusted contents. 0x4 (FOUR): Validation Fail Invalid contents. 0x5 (FIVE): Validation Fail Valid but untrusted contents (e.g., Out of Date, Expired or Revoked Certificate). 0x6 (SIX): Warning Pass Validation Passed with implementation-specific warning. Valid contents, trust test was not performed. 0x7 (SEVEN): Warning Pass Validation Passed with implementation-specific warning. Valid and trusted contents. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RO	0x0	ROM_BAR_ENABLE Expansion ROM Enable. This bit controls whether or not the Function accepts accesses to its expansion ROM. The Memory Space Enable bit in the Command register has precedence over the Expansion ROM Enable bit. A Function must claim accesses to its expansion ROM only if both the Memory Space Enable bit and the Expansion ROM Enable bit are set. Note: The access attributes of this field are as follows: Wire: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1) then R/W else R Dbi: if (EXP_ROM_BAR_MASK_REG.ROM_BAR_ENABLED == 1) then R/W else R Values: 0x1 (ONE): When the bit is 1b, address decoding is enabled using the parameters in the other part of the Expansion ROM Base Address register. 0x0 (ZERO): When this bit is 0b, the Function's expansion ROM address space is disabled. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_TYPE0_PCI_CAP_PTR_REG
Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x40	CAP_POINTER Capabilities Pointer. This register points to a valid capability structure. Either this structure is the PCI Express Capability structure, or a subsequent list item points to the PCI Express Capability structure. The bottom two bits are reserved, the controller sets it to 00b. Software must mask these bits off before using this register as a pointer in Configuration Space to the first entry of a linked list of new capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x40 Testable: unconstrained

USP_PCIE_TYPE0_MAX_LATENCY_MIN_GRANT_INTERRUPT_PIN_INTERRUPT_LIN
Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:8	RW	0x01	INT_PIN Interrupt Pin. The Interrupt Pin register identifies the legacy interrupt Message(s) the Function uses. All encodings other than the defined encodings are reserved. PCI Express defines one legacy interrupt Message for a single Function device and up to four legacy interrupt Messages for a multi-Function device. For a single Function device, only INTA may be used. Any Function on a multi-Function device can use any of the INTx Messages. If a device implements a single legacy interrupt Message, it must be INTA; if it implements two legacy interrupt Messages, they must be INTA and INTB; and so forth. For a multi-Function device, all Functions may use the same INTx Message or each may have its own (up to a maximum of four Functions) or any combination thereof. A single Function can never generate an interrupt request on more than one INTx Message. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x1 (INTA): Map to legacy interrupt Messages for INTA 0x2 (INTB): Map to legacy interrupt Messages for INTB 0x3 (INTC): Map to legacy interrupt Messages for INTC 0x4 (INTD): Map to legacy interrupt Messages for INTD 0x0 (NO_INT): Indicates that the Function uses no legacy interrupt Message(s). Value After Reset: 0x1 Testable: unconstrained
7:0	RW	0xff	INT_LINE Interrupt Line. The Interrupt Line register communicates interrupt line routing information. The register must be implemented by any Function that uses an interrupt pin. Values in this register are programmed by system software and are system architecture specific. The Function itself does not use this value; rather the value in this register is used by device drivers and operating systems. Value After Reset: 0xff

11.4.4.3 USP_PCIE_PM Registers Summary

Name	Offset	Size	Reset Value	Description

11.4.4.4 USP_PCIE_PM Detail Registers Description

USP_PCIE_PM_CAP_ID_NXT_PTR_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:27	RW	0x00	PME_SUPPORT PME_Support. This 5-bit field indicates the power states in which the function may generate a PME and/or forward PME messages. A value of 0b for any bit indicates that the function is not capable of asserting PME while in that power state. bit(27) X XXX1b - PME can be generated from D0 bit(28) X XX1Xb - PME can be generated from D1 bit(29) X X1XXb - PME can be generated from D2 bit(30) X 1XXXb - PME can be generated from D3hot bit(31) 1 XXXXb - PME can be generated from D3cold Bit 31 (PME can be asserted from D3cold) represents a special case. Functions that set this bit require some sort of auxiliary power source. Implementation specific mechanisms are recommended to validate that the power source is available before setting this bit. Each bit that corresponds to a supported D-state must be set for PCI-PCI Bridge structures representing Ports on Root Complexes/Switches to indicate that the Bridge will forward PME Messages. Bit 31 must only be set if the Port is still able to forward PME Messages when main power is not available. The read value from this field is the write value && (sys_aux_pwr_det, 1'b1, D2_SUPPORT, D1_SUPPORT, 1'b1), where D1_SUPPORT and D2_SUPPORT are fields in this register. The reset value PME_SUPPORT_n && (sys_aux_pwr_det, 1'b1, D2_SUPPORT, D1_SUPPORT, 1'b1), where PME_SUPPORT_n is a configuration parameter. Note: The access attributes of this field are as follows: Wire: R Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1b Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
26	RW	0x1	D2_SUPPORT D2_Support. If this bit is set, this function supports the D2 Power Management state. Functions that do not support D2 must always return a value of 0b for this bit. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
25	RW	0x1	D1_SUPPORT D1_Support. If this bit is set, this function supports the D1 Power Management state. Functions that do not support D1 must always return a value of 0b for this bit. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
24:22	RW	0x7	AUX_CURR Aux_Current. This 3 bit field reports the Vaux auxiliary current requirements for the function. If this function implements the Data Register, the controller hardwires this field to 000b. If PME_Support is 0 xxxxb (PME assertion from D3cold is not supported), the controller hardwires this field to 0000b. For functions where PME_Support is 1 xxxxb (PME assertion from D3cold is supported), and which do not implement the Data field, the encodings defined in Values: apply: Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x7 (_370mA_): 375mA Vaux Max. Current Required 0x6 (_320mA_): 320mA Vaux Max. Current Required 0x5 (_270mA_): 270mA Vaux Max. Current Required 0x4 (_220mA_): 220mA Vaux Max. Current Required 0x3 (_160mA_): 160mA Vaux Max. Current Required 0x2 (_100mA_): 100mA Vaux Max. Current Required 0x1 (_055mA_): 55mA Vaux Max. Current Required 0x0 (SELF_): 0 self powered Value After Reset: 0x7 Testable: unconstrained
21	RW	0x0	DSI Device Specific Initialization. The DSI bit indicates whether special initialization of this function is required. When set, indicates that the function requires a device specific initialization sequence following a transition to the D0uninitialized state. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
20	RO	0x0	reserved

Bit	Attr	Reset Value	Description
19	RO	0x0	PME_CLK PME Clock. Does not apply to PCI Express, the controller hardwires it to 0b. Note: This register field is sticky. Value After Reset: 0x0
18:16	RW	0x3	PM_SPEC_VER Version. This field provides the Power Management specification version. The controller hardwires this field to 011b for functions compliant to PCI Express Base Specification, Revision 4.0, Version 1.0>. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x3 Testable: unconstrained
15:8	RW	0x50	PM_NEXT_POINTER Next Capability Pointer. This field provides an offset into the function's configuration space pointing to the location of next item in the capabilities list. If there are no additional items in the capabilities list, this field is set to 00h. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x50 Testable: unconstrained
7:0	RO	0x01	PM_CAP_ID Capability ID. This field returns 01h to indicate that this is the PCI Power Management Capability. Each function may have only one item in its capability list with Capability ID set to 01h. Value After Reset: 0x1

USP_PCIE_PM_CON_STATUS_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	DATA_REG_ADD_INFO Data. This field is used to report the state dependent data requested by the Data_Select field. The value of this field is scaled by the value reported by the Data_Scale field. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
23	RO	0x0	BUS_PWR_CLK_CON_EN Bus Power/Clock Control Enable. If this field is set, Bus Power/Clock Control is Enable. Value After Reset: 0x0
22	RO	0x0	B2_B3_SUPPORT B2B3 Support for D3hot. If this field is set, B2B3 support for D3hot is available. Value After Reset: 0x0
21:16	RO	0x00	reserved
15	W1C	0x0	PME_STATUS PME_Status. This bit is set when the function normally generates a PME signal. The value of this bit is not affected by the value of the PME_En bit. If PME_Support bit 31 of the Power Management Capabilities register is clear, this bit is permitted to be hardwired to 0b. Functions that consume Aux power must preserve the value of this sticky register when Aux power is available. In such functions, this register value is not modified by Conventional Reset or FLR. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
14:13	RO	0x0	DATA_SCALE Data_Scale. This field indicates the scaling factor to be used when interpreting the value of the Data field. The value and meaning of this field varies depending on which data value has been selected by the Data_Select field. For more details, see 7.5.2.3 section of PCI Express Base Specification. Value After Reset: 0x0
12:9	RO	0x0	DATA_SELECT Data_Select. This 4-bit field is used to select which data is to be reported through the Data and Data_Scale field. If the Data field is not implemented, this field must be hardwired to 0000b. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
8	RW	0x0	PME_ENABLE PME_En. When set, the function is permitted to generate a PME. When clear, the function is not permitted to generate a PME. If PME_Support is 1 xxxxb (PME generation from D3cold) or the function consumes Aux power and Aux power is available this bit is RWS and the bit is not modified by Conventional Reset or FLR. If PME_Support is 0 xxxxb, this field is not sticky (RW). If PME_Support is 0 0000b, the controller hardwires this bit to 0b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
7:4	RO	0x0	reserved
3	RW	0x1	NO_SOFT_RST No_Soft_Reset. This bit indicates the state of the function after writing the PowerState field to transition the function from D3hot to D0. When set, this transition preserves internal function state. The function is in D0Active and no additional software intervention is required. When clear, this transition results in undefined internal function state. Regardless of this bit, functions that transition from D3hot to D0 by Fundamental Reset will return to D0Uninitialized with only PME context preserved if PME is supported and enabled. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1:0	RW	0x0	POWER_STATE PowerState. This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. You can write to this register; however, the read-back value is the actual power state, not the write value. If you attempt to write an unsupported, optional state to this field, the write operation completes normally; however, the data is discarded and no state change occurs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x0 (D0): D0 power state 0x1 (D1): D1 power state 0x2 (D2): D2 power state 0x3 (D3hot): D3hot D3hot power state Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

11.4.4.5 USP_PCIE_MSI Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_MSI_CAP_ID_NEXT_CTRL_REG	0x0000	W	0x018A7005	MSI Capability Header and Message Control Register
USP_PCIE_MSI_CAP_OFF_04H_REG	0x0004	W	0x00000000	Message Address Register for MSI (Offset 04h)
USP_PCIE_MSI_CAP_OFF_08H_REG	0x0008	W	0x00000000	Message Address Register for MSI (Offset 08h)

11.4.4.6 USP_PCIE_MSI Detail Registers Description

USP_PCIE_MSI_CAP_ID_NEXT_CTRL_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved

Bit	Attr	Reset Value	Description
26	RO	0x0	PCI_MSI_EXT_DATA_EN Extended Message Data Enable. If set, the function is enabled to provide Extended Message Data. If clear, the function is not enabled to provide Extended Message Data. Note: The access attributes of this field are as follows: Wire: PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_MSI_EXT_DATA_CAP ? RW : RO Dbi: PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_MSI_EXT_DATA_CAP ? RW : RO Value After Reset: 0x0 Testable: writeAsRead
25	RO	0x0	PCI_MSI_EXT_DATA_CAP Extended Message Data Capable. If set, the function is capable of providing Extended Message Data. If clear, the function does not support providing Extended Message Data. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
24	RO	0x1	PCI_PVM_SUPPORT Per-Vector Masking Capable. If set, the function supports MSI Per-Vector Masking. If clear, the function does not support MSI Per-Vector Masking. This bit must be set if the function is a PF or VF within an SR-IOV Device. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
23	RO	0x1	PCI_MSI_64_BIT_ADDR_CAP 64 bit address capable. If set, the function is capable of sending a 64-bit message address. If clear, the function is not capable of sending a 64-bit message address. This bit must be set if the function is a PCI Express Endpoint. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
22:20	RW	0x0	PCI_MSI_MULTIPLE_MSG_EN Multiple Message Enable. Software writes to this field to indicate the number of allocated vectors (equal to or less than the number of requested vectors). The number of allocated vectors is aligned to a power of two. If a function requests four vectors (indicated by a Multiple Message Capable encoding of 010b), system software can allocate either four, two, or one vector by writing a 010b, 001b, or 000b to this field, respectively. When MSI is enabled, a function will be allocated at least 1 vector. All encodings other than the defined encodings are reserved. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x0 (_1_VECTOR): 1 vector allocated 0x1 (_2_VECTOR): 2 vectors allocated 0x2 (_4_VECTOR): 4 vectors allocated 0x3 (_8_VECTOR): 8 vectors allocated 0x4 (_16_VECTOR): 16 vectors allocated 0x5 (_32_VECTOR): 32 vectors allocated Value After Reset: 0x0

Bit	Attr	Reset Value	Description
19:17	RW	0x5	PCI_MSI_MULTIPLE_MSG_CAP Multiple Message Capable. System software reads this field to determine the number of requested vectors. The number of requested vectors must be aligned to a power of two (if a function requires three vectors, it requests four by initializing this field to 010b). All encodings other than the defined encodings are reserved. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (_1_VECTOR): 1 vector requested 0x1 (_2_VECTOR): 2 vectors requested 0x2 (_4_VECTOR): 4 vectors requested 0x3 (_8_VECTOR): 8 vectors requested 0x4 (_16_VECTOR): 16 vectors requested 0x5 (_32_VECTOR): 32 vectors requested Value After Reset: 0x5 Testable: unconstrained
16	RW	0x0	PCI_MSI_ENABLE MSI Enable. If set and the MSI-X Enable bit in the MSI-X Message Control register is clear, the function is permitted to use MSI to request service and is prohibited from using INTx interrupts. System configuration software sets this bit to enable MSI. A device driver is prohibited from writing this bit to mask a function's service request. For more details on control of INTx interrupts, see section 7.5.1.1 of PCI Express Base Specification. If clear, the function is prohibited from using MSI to request service. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15:8	RW	0x70	PCI_MSI_CAP_NEXT_OFFSET Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x70 Testable: unconstrained
7:0	RO	0x05	PCI_MSI_CAP_ID Capability ID. Indicates the MSI Capability structure. This field returns a Capability ID of 05h indicating that this is an MSI Capability structure. Value After Reset: 0x5

USP_PCIE_MSI_CAP_OFF_04H_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	PCI_MSI_CAP_OFF_04H Message Address - System-specified message address. If the Message Enable bit (bit 16 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG register) is set, the contents of this field specify the DWORD-aligned address (Address[31:02]) for the MSI transaction. Address[1:0] are set to 00b. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
1:0	RO	0x0	reserved

USP_PCIE_MSI_CAP_OFF_08H_REG
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	PCI_MSI_CAP_OFF_0AH For a function that supports a 32-bit message address, this field contains Extended Message Data (System-specified message data). For the MSI Capability structures without per-vector masking, it must be implemented if the Extended Message Data Capable bit is set; otherwise, it is outside the MSI Capability structure and undefined. For the MSI Capability structures with Per-vector Masking, it must be implemented if the Extended Message Data Capable bit is set; otherwise, it is RsvdP. If the Extended Message Data Enable bit (bit 26 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the DWORD Memory Write transaction uses Extended Message Data for the upper 16 bits; otherwise, it uses 0000h for the upper 16 bits. For a function that supports a 64-bit message address, it contains upper 16 bits of the Message Upper Address. Note: The access attributes of this field are as follows: Wire: PCI_MSI_64_BIT_ADDR_CAP || `DEFAULT_EXT_MSI_DATA_CAPABLE ? R/W : R Dbi: PCI_MSI_64_BIT_ADDR_CAP || `DEFAULT_EXT_MSI_DATA_CAPABLE ? R/W : R Value After Reset: 0x0 Testable: writeAsRead
15:0	RW	0x0000	PCI_MSI_CAP_OFF_08H For a function that supports a 32-bit message address, this field contains Message Data (System-specified message data). If the Message Enable bit (bit 16 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the function sends a DWORD Memory Write transaction using Message Data for the lower 16 bits. All 4 Byte Enables are set. The Multiple Message Enable field (bits 22:20 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010b indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000b, the Function is not permitted to modify the message data. For a function that supports a 64-bit message address, it contains lower 16 bits of the Message Upper Address. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_MSI_CAP_OFF_0CH_REG

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	PCI_MSI_CAP_OFF_0EH For a function that supports a 32-bit message address, this field contains the upper Mask Bits when the Per Vector Masking Capable bit (PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_PVM_SUPPORT) is set. For a function that supports a 64-bit message address, this field contains Message Data (System-specified message data). Note: The access attributes of this field are as follows: Wire: (!MSI_64_EN && MSI_PVM_EN_VALUE) ? RW: MSI_64_EN && DEFAULT_EXT_MSI_DATA_CAPABLE ? RW : RO Dbi: (!MSI_64_EN && MSI_PVM_EN_VALUE) ? RW: MSI_64_EN && DEFAULT_EXT_MSI_DATA_CAPABLE ? RW : RO Value After Reset: 0x0 Testable: writeAsRead
15:0	RW	0x0000	PCI_MSI_CAP_OFF_0CH For a function that supports a 32-bit message address, this field contains the lower Mask Bits when the Per Vector Masking Capable bit (PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_PVM_SUPPORT) is set. For a function that supports a 64-bit message address, this field contains Message Data (System-specified message data). If the Message Enable bit (bit 16 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) is set, the function sends a DWORD Memory Write transaction using Message Data for the lower 16 bits. All 4 Byte Enables are set. The Multiple Message Enable field (bits 22:20 of the PCI_MSI_CAP_ID_NEXT_CTRL_REG) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010b indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000b, the Function is not permitted to modify the message data. Note: The access attributes of this field are as follows: Wire: PCI_MSI_64_BIT_ADDR_CAP || MSI_PVM_EN ? R/W : R Dbi: PCI_MSI_64_BIT_ADDR_CAP || MSI_PVM_EN ? R/W : R Value After Reset: 0x0 Testable: writeAsRead

USP_PCIE_MSI_CAP_OFF_10H_REG

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	PCI_MSI_CAP_OFF_10H Used for MSI when the Per Vector Masking Capable bit (PCI_MSI_CAP_ID_NEXT_CTRL_REG.PCI_PVM_SUPPORT) is set. For 32-bit contains Pending Bits. For 64-bit, contains Mask Bits. Note: The access attributes of this field are as follows: Wire: PCI_MSI_64_BIT_ADDR_CAP && MSI_PVM_EN ? R/W : R Dbi: PCI_MSI_64_BIT_ADDR_CAP && MSI_PVM_EN ? R/W : R Value After Reset: 0x0 Testable: writeAsRead

USP_PCIE_MSI_CAP_OFF_14H_REG

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	W1C	0x0	PCI_MSI_CAP_OFF_14H Pending Bits. For each pending bit that is set, the function has a pending associated message. Value After Reset: 0x0

11.4.4.7 USP_PCIE_CAP Registers Summary

11.4.4.8 USP_PCIE_CAP Detail Registers Description

USP_PCIE_CAP_ID_PCIE_NEXT_CAP_PTR_PCIE_CAP_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29:25	RW	0x08	PCIE_INT_MSG_NUM PCIE Interrupt Message Number. Interrupt Message Number. This field indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability structure. For MSI, the value in this field indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this field indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. If both MSI and MSI-X are implemented, they are permitted to use different vectors, though software is permitted to enable only one mechanism at a time. If MSI-X is enabled, the value in this field must indicate the vector for MSI-X. If MSI is enabled or neither is enabled, the value in this field must indicate the vector for MSI. If software enables both MSI and MSI-X at the same time, the value in this field is undefined. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x8 Testable: unconstrained

Bit	Attr	Reset Value	Description
24	RW	0x0	PCIE_SLOT_IMP Slot Implemented. When set, this bit indicates that the Link associated with this Port is connected to a slot (as compared to being connected to a system-integrated device or being disabled). This bit is valid for Downstream Ports. This bit is undefined for Upstream Ports. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
23:20	RO	0x0	PCIE_DEV_PORT_TYPE Device/Port Type. Indicates the specific type of this PCI Express function. Note: Different functions in a Multi-Function Device can generally be of different types. Defined encodings for functions that implement a Type 00h PCI Configuration Space header are: Defined encodings for functions that implement a Type 01h PCI Configuration Space header are: All other encodings are Reserved. Note: Different Endpoint types have notably different requirements in Section 1.3.2 of PCI Express Base Specification regarding I/O resources, Extended Configuration Space, and other capabilities. Values: 0x0 (PCIE_EP): PCI Express Endpoint 0x1 (PCIE_LEGACY_EP): Legacy PCI Express Endpoint 0x4 (ROOT_PORT_PCIE_RC): Root Port of PCI Express Root Complex 0x5 (USP_PCIE_SWITCH): Upstream Port of PCI Express Switch 0x6 (DSP_PCIE_SWITCH): Downstream Port of PCI Express Switch Value After Reset: 0x4 Testable: untestable Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
19:16	RO	0x2	PCIE_CAP_REG Capability Version. Indicates PCI-SIG defined PCI Express Capability structure version number. A version of the specification that changes the PCI Express Capability structure in a way that is not otherwise identifiable (for example, through a new Capability field) is permitted to increment this field. All such changes to the PCI Express Capability structure must be software-compatible. Software must check for Capability Version numbers that are greater than or equal to the highest number defined when the software is written, as functions reporting any such Capability Version numbers will contain a PCI Express Capability structure that is compatible with that piece of software. The controller hardwires this field to 2h for functions compliant to PCI Express Base Specification, Revision 4.0, Version 1.0. Note: This register field is sticky. Value After Reset: 0x2
15:8	RW	0xb0	PCIE_CAP_NEXT_PTR Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0xb0 Testable: unconstrained
7:0	RO	0x10	PCIE_CAP_ID Capability ID. Indicates the PCI Express Capability structure. This field must return a Capability ID of 10h indicating that this is a PCI Express Capability structure. Value After Reset: 0x10

USP_PCIE_CAP_DEVICE_CAPABILITIES_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28	RW	0x0	PCIE_CAP_FLR_CAP Function Level Reset Capability. A value of 1b indicates the function supports the optional Function Level Reset mechanism described in section 6.6.2 of the PCI Express Base Specification. This bit applies to Endpoints only. For all other function types the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
27:26	RO	0x0	PCIE_CAP_CAP_SLOT_PWR_LMT_SCALE Captured Slot Power Limit Scale. Captured Slot Power Limit Scale (Upstream Ports only). Specifies the scale used for the Slot Power Limit Value. This value is set by the Set_Slot_Power_Limit Message or hardwired to 00b (for more details, see section 6.9 of PCI Express Base Specification). Values: 0x0 (_1.0X): 1.0x 0x1 (_0.1X): 0.1x 0x2 (_0.01X): 0.01x 0x3 (_0.001X): 0.001x Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
25:18	RO	0x00	PCIE_CAP_CAP_SLOT_PWR_LMT_VALUE Captured Slot Power Limit Value. Captured Slot Power Limit Value (Upstream Ports only). In combination with the Captured Slot Power Limit Scale value, specifies the upper limit on power available to the adapter. Power limit (in Watts) is calculated by multiplying the value in this field by the value in the Captured Slot Power Limit Scale field except when the Captured Slot Power Limit Scale field equals 00b (1.0x) and the Captured Slot Power Limit Value exceeds EFh, then alternative encodings are used (for more details, see section 7.5.3.9 of PCI Express Base Specification). This value is set by the Set_Slot_Power_Limit Message or hardwired to 00h (for more details, see section 6.9 of PCI Express Base Specification). Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
17:16	RO	0x0	reserved
15	RO	0x1	PCIE_CAP_ROLE_BASED_ERR_REPORT Role-Based Error Reporting. When set, this bit indicates that the function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be set by all functions conforming to the ECN, PCI Express Base Specification, Revision 1.1., or subsequent PCI Express Base Specification revisions. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
14:12	RO	0x0	reserved

Bit	Attr	Reset Value	Description
11:9	RO	0x7	PCIE_CAP_EP_L1_ACCPT_LATENCY Endpoint L1 Acceptable Latency. This field indicates the acceptable latency that an Endpoint can withstand due to the transition from L1 state to the L0 state. It is essentially an indirect measure of the Endpoint's internal buffering. Power management software uses the reported L1 Acceptable Latency number to compare against the L1 Exit Latencies reported (see below) by all components comprising the data path from this Endpoint to the Root Complex Root Port to determine whether ASPM L1 entry can be used with no loss of performance. For functions other than Endpoints, this field is Reserved and the controller hardwires it to 000b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W (Sticky) else R(Sticky) Note: This register field is sticky. Values: 0x0 (MAX_1US): Maximum of 1 us 0x1 (MAX_2US): Maximum of 2 us 0x2 (MAX_4US): Maximum of 4 us 0x3 (MAX_8US): Maximum of 8 us 0x4 (MAX_16US): Maximum of 16 us 0x5 (MAX_32US): Maximum of 32 us 0x6 (MAX_64US): Maximum of 64 us 0x7 (NO_LIMIT): No limit Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
8:6	RW	0x7	PCIE_CAP_EP_L0S_ACCPT_LATENCY Endpoint L0s Acceptable Latency. This field indicates the acceptable total latency that an Endpoint can withstand due to the transition from L0s state to the L0 state. It is essentially an indirect measure of the Endpoint's internal buffering. Power management software uses the reported L0s Acceptable Latency number to compare against the L0s exit latencies reported by all components comprising the data path from this Endpoint to the Root Complex Root Port to determine whether ASPM L0s entry can be used with no loss of performance. For functions other than Endpoints, this field is Reserved and the controller hardwires it to 000b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (MAX_64NS): Maximum of 64 ns 0x1 (MAX_128NS): Maximum of 128 ns 0x2 (MAX_256NS): Maximum of 256 ns 0x3 (MAX_512NS): Maximum of 512 ns 0x4 (MAX_1US): Maximum of 1 us 0x5 (MAX_2US): Maximum of 2 us 0x6 (MAX_4US): Maximum of 4 us 0x7 (NO_LIMIT): No limit Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
5	RO	0x0	PCIE_CAP_EXT_TAG_SUPP Extended Tag Field Supported. This bit, in combination with the 10-Bit Tag Requester Supported bit in the Device Capabilities 2 register, indicates the maximum supported size of the Tag field as a Requester. This bit must be set if the 10-Bit Tag Requester Supported bit is set. Note: 8-bit Tag field generation must be enabled by the Extended Tag Field Enable bit in the Device Control register of the Requester Function before 8-bit Tags can be generated by the Requester. See Section 2.2.6.2 of PCI Express Base Specification for interactions with enabling the use of 10-Bit Tags. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (_5b_TAG): 5-bit Tag field supported 0x1 (_8b_TAG): 8-bit Tag field supported Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
4:3	RW	0x0	PCIE_CAP_PHANTOM_FUNC_SUPPORT Phantom Functions Supported. This field indicates the support for use of unclaimed function numbers to extend the number of outstanding transactions allowed by logically combining unclaimed function numbers (called Phantom Functions) with the Tag identifier (see Section 2.2.6.2 of PCI Express Base Specification for a description of Tag Extensions). With every Function in an ARI Device, the Phantom Functions Supported field must be set to 00b. The remainder of this field description applies only to non-ARI Multi-Function Devices. This field indicates the number of most significant bits of the Function Number portion of Requester ID that are logically combined with the Tag identifier. Note: Phantom Function support for the function must be enabled by the Phantom Functions Enable field in the Device Control register before the Function is permitted to use the Function Number field in the Requester ID for Phantom Functions. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (NO_PHNATOM_FUNC): No Function Number bits are used for Phantom Functions. Multi-Function Devices are permitted to implement up to 8 independent functions. 0x1 (MAX_1_PHANTOM_PER_FUNC): The most significant bit of the Function number in Requester ID is used for Phantom Functions; a Multi-Function Device is permitted to implement Functions 0-3. Functions 0, 1, 2, and 3 are permitted to use Function Numbers 4, 5, 6, and 7 respectively as Phantom Functions. 0x2 (MAX_3_PHANTOM_PER_FUNC): The two most significant bits of Function Number in Requester ID are used for Phantom Functions; a Multi-Function Device is permitted to implement Functions 0-1. Function 0 is permitted to use Function Numbers 2, 4, and 6 for Phantom Functions. Function 1 is permitted to use Function Numbers 3, 5, and 7 as Phantom Functions. 0x3 (SINGLE_FUNC_MAX_7_PHANTOM_FUNC): All 3 bits of Function Number in Requester ID used for Phantom Functions. The device must have a single Function 0 that is permitted to use all other Function Numbers as Phantom Functions. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
2:0	RW	0x0	PCIE_CAP_MAX_PAYLOAD_SIZE Max_Payload_Size Supported. This field indicates the maximum payload size that the function can support for TLPs. All encodings other than the defined encodings are reserved. The functions of a Multi-Function Device are permitted to report different values for this field. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (MAX_128B_SIZE): 128 bytes max payload size 0x1 (MAX_256B_SIZE): 256 bytes max payload size 0x2 (MAX_512B_SIZE): 512 bytes max payload size 0x3 (MAX_1024B_SIZE): 1024 bytes max payload size 0x4 (MAX_2048B_SIZE): 2048 bytes max payload size 0x5 (MAX_4096B_SIZE): 4096 bytes max payload size Value After Reset: 0x1 Testable: unconstrained

USP_PCIE_CAP_DEVICE_CONTROL_DEVICE_STATUS

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21	RO	0x0	PCIE_CAP_TRANS_PENDING Transactions Pending. Endpoints: When set, this bit indicates that the function has issued Non-Posted Requests that have not been completed. A Function reports this bit cleared only when all outstanding Non-Posted Requests have completed or have been terminated by the Completion Timeout mechanism. This bit must also be cleared upon the completion of an FLR. Root and Switch Ports: The controller hardwires this bit to 0b. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
20	RO	0x0	PCIE_CAP_AUX_POWER_DETECTED AUX Power Detected. Functions that require Aux power report this bit as set if Aux power is detected by the function. This bit is derived by sampling the sys_aux_pwr_det input. Value After Reset: 0x1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
19	RW	0x0	PCIE_CAP_UNSUPPORTED_REQ_DETECTED Unsupported Request Detected. This bit indicates that the function received an Unsupported Request. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function Device, each function indicates status of errors as perceived by the respective function. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
18	W1C	0x0	PCIE_CAP_FATAL_ERR_DETECTED Fatal Error Detected. This bit indicates status of Fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For Functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
17	W1C	0x0	PCIE_CAP_NON_FATAL_ERR_DETECTED Non-Fatal Error Detected. This bit indicates status of Non-fatal errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective Function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Uncorrectable Error Mask register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
16	W1C	0x0	PCIE_CAP_CORR_ERR_DETECTED Correctable Error Detected. This bit indicates status of correctable errors detected. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register. For a Multi-Function device, each function indicates status of errors as perceived by the respective function. For functions supporting Advanced Error Handling, errors are logged in this register regardless of the settings of the Correctable Error Mask register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15	RO	0x0	reserved

Bit	Attr	Reset Value	Description
14:12	RW	0x2	PCIE_CAP_MAX_READ_REQ_SIZE Max_Read_Request_Size. This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For functions that do not generate Read Requests larger than 128 bytes and functions that do not generate Read Requests on their own behalf, the controller implements this field as Read Only (RO) with a value of 000b. Values: 0x0 (MAX_128B_SIZE): 128 bytes maximum Read Request size 0x1 (MAX_256B_SIZE): 256 bytes maximum Read Request size 0x2 (MAX_512B_SIZE): 512 bytes maximum Read Request size 0x3 (MAX_1024B_SIZE): 1024 bytes maximum Read Request size 0x4 (MAX_2048B_SIZE): 2048 bytes maximum Read Request size 0x5 (MAX_4096B_SIZE): 4096 bytes maximum Read Request size 0x6 (RESERVED1): RESERVED 0x7 (RESERVED2): RESERVED Value After Reset: 0x
11	RO	0x0	PCIE_CAP_EN_NO_SNOOP Enable No Snoop. If this bit is set, the function is permitted to Set the No Snoop bit in the Requester Attributes of transactions it initiates that do not require hardware enforced cache coherency (see section 2.2.6.5 in PCI Express Base Specification). Note: Setting this bit to 1b should not cause a function to set the No Snoop attribute on all transactions that it initiates. Even when this bit is set, a function is only permitted to set the No Snoop attribute on a transaction when it can guarantee that the address of the transaction is not stored in any cache in the system. The controller hardwires this bit 0b if a function would never set the No Snoop attribute in transactions it initiates. Note: The access attributes of this field are as follows: Wire: R Dbi: R Value After Reset: 0x0

Bit	Attr	Reset Value	Description
10	RW	0x0	PCIE_CAP_AUX_POWER_PM_EN Aux Power PM Enable. This bit is derived by sampling the sys_aux_pwr_det input. When set this bit, enables a function to draw Aux power independent of PME Aux power. Functions that require Aux power on legacy operating systems should continue to indicate PME Aux power requirements. Aux power is allocated as requested in the Aux_Current field of the Power Management Capabilities register (PMC), independent of the PME_En bit in the Power Management Control/Status register (PMCSR). For Multi-Function devices, a component is allowed to draw Aux power if at least one of the functions has this bit set. Note: Functions that consume Aux power must preserve the value of this sticky register when Aux power is available. In such functions, this bit is not modified by Conventional Reset. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
9	RO	0x0	PCIE_CAP_PHANTOM_FUNC_EN Phantom Functions Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, If this bit is set, it enables a function to use unclaimed functions as Phantom functions to extend the number of outstanding transaction identifiers If this bit is clear, the function is not allowed to use Phantom functions For more details, see section 2.2.6.2 of PCI Express Base Specification. Software should not change the value of this bit while the function has outstanding Non-Posted Requests; otherwise, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: DEVICE_CAPABILITIES_REG.PCIE_CAP_PHANTOM_FUNC_SUPPORT ? RW : RO Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_PHANTOM_FUNC_SUPPORT ? RW : RO Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
8	RO	0x0	PCIE_CAP_EXT_TAG_EN Extended Tag Field Enable. This bit, in combination with the 10-Bit Tag Requester Enable bit in the Device Control 2 register, determines how many Tag field bits a Requester is permitted to use. When the 10-Bit Tag Requester Enable bit is clear, If the Extended Tag Field Enable bit is set, the function is permitted to use an 8-bit Tag field as a Requester If the Extended Tag Field Enable bit is clear, the Function is restricted to a 5-bit Tag field See section 2.2.6.2 of PCI Express Base Specification for required behavior when the 10-Bit Tag Requester Enable bit is set. If software changes the value of the Extended Tag Field Enable bit while the function has outstanding Non-Posted Requests, the result is undefined. For functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: DEVICE_CAPABILITIES_REG.PCIE_CAP_EXT_TAG_SUPP ? RW : RO Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_EXT_TAG_SUPP ? Bit	Attr	Reset Value	Description
7:5	RW	0x0	PCIE_CAP_MAX_PAYLOAD_SIZE_CS Max_Payload_Size. This field sets maximum TLP payload size for the Function. As a Receiver, the Function must handle TLPs as large as the set value. As a Transmitter, the Function must not generate TLPs exceeding the set value. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported field (PCIE_CAP_MAX_PAYLOAD_SIZE) in the Device Capabilities (DEVICE_CAPABILITIES_REG) register (for more details, see section 7.5.3.3 of PCI Express Base Specification). This field sets the maximum Read Request size for the function as a Requester. The function must not generate Read Requests with a size exceeding the set value. For Functions that support only the 128-byte max payload size, the controller hardwires this field to 000b. System software is not required to program the same value for this field for all the Functions of a Multi-Function device (for more details, see section 2.2.2 of PCI Express Base Specification). For ARI Devices, Max_Payload_Size is determined solely by the setting in Function0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x0 (MAX_128B_SIZE): 128 bytes maximum Read Request size 0x1 (MAX_256B_SIZE): 256 bytes maximum Read Request size 0x2 (MAX_512B_SIZE): 512 bytes maximum Read Request size 0x3 (MAX_1024B_SIZE): 1024 bytes maximum Read Request size 0x4 (MAX_2048B_SIZE): 2048 bytes maximum Read Request size 0x5 (MAX_4096B_SIZE): 4096 bytes maximum Read Request size 0x6 (RESERVED1): RESERVED 0x7 (RESERVED2): RESERVED Value After Reset: 0x0

Bit	Attr	Reset Value	Description
4	RW	0x1	PCIE_CAP_EN_REL_ORDER Enable Relaxed Ordering. If this bit is set, the function is permitted to set the Relaxed Ordering bit in the Attributes field of transactions it initiates that do not require strong write ordering (for more details, see section 2.2.6.4 and section 2.4 of PCI Express Base Specification). For a function that never sets the Relaxed Ordering attribute in transactions it initiates as a Requester, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1
3	RW	0x0	PCIE_CAP_UNSUPPORT_REQ_REP_EN Unsupported Request Reporting Enable. This bit, in conjunction with other bits, controls the signaling of Unsupported Request Errors by sending error Messages (for more details, see section 6.2.5 and section 6.2.6 of PCI Express Base Specification). For a Multi-Function Device, this bit controls error reporting for each Function from point-of-view of the respective Function. Value After Reset: 0x0
2	RW	0x0	PCIE_CAP_FATAL_ERR_REPORT_EN Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_FATAL Messages (for more details, see section 6.2.5 and section 6.2.6 of of PCI Express Base Specification). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of Fatal errors is internal to the root. No external ERR_FATAL Message is generated. Value After Reset: 0x0
1	RW	0x0	PCIE_CAP_NON_FATAL_ERR_REPORT_EN Non-Fatal Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_NONFATAL Messages (for more details, see section 6.2.5 and Section 6.2.6 of PCI Express Base Specification). For a Multi-Function Device, this bit controls error reporting for each function from point-of-view of the respective Function. For a Root Port, the reporting of Non-fatal errors is internal to the root. No external ERR_NONFATAL Message is generated. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	PCIE_CAP_CORR_ERR_REPORT_EN Correctable Error Reporting Enable. This bit, in conjunction with other bits, controls sending ERR_COR Messages (for more details, see section 6.2.5, section 6.2.6, and section 6.2.10.2 of PCI Express Base Specification). For a Multi-Function device, this bit controls error reporting for each function from point-of-view of the respective function. For a Root Port, the reporting of correctable errors is internal to the root. No external ERR_COR Message is generated. Value After Reset: 0x0

USP_PCIE_CAP_LINK_CAPABILITIES_REG
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	PCIE_CAP_PORT_NUM Port Number. This field indicates the PCI Express Port number for the given PCI Express Link. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
23	RO	0x0	reserved
22	RW	0x1	PCIE_CAP_ASPM_OPT_COMPLIANCE ASPM Optionality Compliance. This field must be set to 1b in all functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
21	RW	0x1	PCIE_CAP_LINK_BW_NOT_CAP ASPM Optionality Compliance. This field must be set to 1b in all functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x1 Testable: unconstrained
20	RO	0x1	PCIE_CAP_DLL_ACTIVE_REP_CAP Data Link Layer Link Active Reporting Capable. For a Downstream Port, the controller hardwires this bit to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine. For a hot-plug capable Downstream Port (as indicated by the Hot-Plug Capable bit of the Slot Capabilities register) or a Downstream Port that supports Link speeds greater than 5.0 GT/s, the controller hardwires this bit to 1b. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b. Value After Reset: 0x1
19	RW	0x0	PCIE_CAP_SURPRISE_DOWN_ERR_REP_CAP Surprise Down Error Reporting Capable. For a Downstream Port, this bit must be set if the component supports the optional capability of detecting and reporting a Surprise Down error condition. For Upstream Ports and components that do not support this optional capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
18	RO	0x0	PCIE_CAP_CLOCK_POWER_MAN Clock Power Management. For Upstream Ports, a value of 1b in this bit indicates that the component tolerates the removal of any reference clock(s) via the "clock request" (CLKREQ#) mechanism when the Link is in the L1 and L2/L3 Clock Power Management. For Upstream Ports, a value of 1b in this bit indicates that the component tolerates the removal of any reference clock(s) via the "clock request" (CLKREQ#) mechanism when the Link is in the L1 and L2/L3 Ready Link states. A value of 0b indicates the component does not have this capability and that reference clock(s) must not be removed in these Link states. L1 PM Substates defines other semantics for the CLKREQ# signal, which are managed independently of Clock Power Management. This Capability is applicable only in form factors that support "clock request" (CLKREQ#) capability. For a Multi-Function device associated with an Upstream Port, each Function indicates its capability independently. Power Management configuration software must only permit reference clock removal if all functions of the Multi-Function device indicate a 1b in this bit. For ARI Devices, all Functions must indicate the same value in this bit. For Downstream Ports, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
17:15	RW	0x4	PCIE_CAP_L1_EXIT_LATENCY L1 Exit Latency. This field indicates the L1 exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from ASPM L1 to L0. If ASPM L1 is not supported, the value is undefined. Note: Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: CX_NFTS !=CX_COMM_NFTS DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (LESS_THAN_1US): Less than 1us 0x1 (_1US_TO_2US): 1 us to less than 2 us 0x2 (_2US_TO_4US): 2 us to less than 4 us 0x3 (_4US_TO_8US): 4 us to less than 8 us 0x4 (_8US_TO_16US): 8 us to less than 16 us 0x5 (_16US_TO_32US): 16 us to less than 32 us 0x6 (_32US_TO_64US): 32 us to 64 us 0x7 (GREATER_THAN_64US): More than 64 us Value After Reset: 0x4 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
14:12	RW	0x6	PCIE_CAP_L0S_EXIT_LATENCY L0s Exit Latency. This field indicates the L0s exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from L0s to L0. If L0s is not supported, the value is undefined; however, see the Implementation Note "Potential Issues With Legacy Software When L0s is Not Supported" in section 5.4.1.1 of PCI Express Base Specification for the recommended value. Note: Exit latencies may be influenced by PCI Express reference clock configuration depending upon whether a component uses a common or separate reference clock. Multi-Function Devices associated with an Upstream Port must report the same value in this field for all functions. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is supported (possible) in the controller when one or more of the following expressions is true: CX_NFTS !=CX_COMM_NFTS DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. USP_PCIE_CAP_LINK_CONTROL_LINK_STATUS_REG
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31	W1C	0x0	PCIE_CAP_LINK_AUTO_BW_STATUS Link Autonomous Bandwidth Status. This bit is set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: RSVDP Dbi: R Value After Reset: 0x0

Bit	Attr	Reset Value	Description
30	W1C	0x0	PCIE_CAP_LINK_BW_MAN_STATUS Link Bandwidth Management Status. This bit is set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: A Link retraining has completed following a write of 1b to the Retrain Link bit. Note: This bit is set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. This bit is not applicable and is Reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. For functions that do not implement the Link Bandwidth Notification Capability, the controller hardwires this bit to 0b. The default value of this bit is 0b. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. Note: The access attributes of this field are as follows: Wire: RSVDP Dbi: R Value After Reset: 0x0
29	RO	0x0	PCIE_CAP_DLL_ACTIVE Data Link Layer Link Active. This bit indicates the status of the Data Link Control and Management State Machine. It returns a 1b to indicate the DL_Active state, 0b otherwise. This bit must be implemented if the Data Link Layer Link Active Reporting Capable bit is 1b. Otherwise, the controller hardwires it to 0b. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
28	RW	0x1	PCIE_CAP_SLOT_CLK_CONFIG Slot Clock Configuration. This bit indicates that the component uses the same physical reference clock that the platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference clock on the connector, this bit must be clear. For a Multi-Function Device, each Function must report the same value for this bit. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x1 Testable: unconstrained
27	RO	0x0	PCIE_CAP_LINK_TRAINING Link Training. This read-only bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state, or that 1b was written to the Retrain Link bit but Link training has not yet begun. Hardware clears this bit when the LTSSM exits the Configuration/Recovery state. This bit is not applicable and Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches, and the controller hardwires it to 0b. Bit	Attr	Reset Value	Description
9	RW	0x0	PCIE_CAP_HW_AUTO_WIDTH_DISABLE Hardware Autonomous Width Disable. When set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RW, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. For components that do not implement the ability autonomously to change Link width, the ciontroller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

Bit	Attr	Reset Value	Description
8	RW	0x0	PCIE_CAP_EN_CLK_POWER_MAN Enable Clock Power Management. Applicable only for Upstream Ports and with form factors that support a "Clock Request" (CLKREQ#) mechanism, this bit operates as follows: For a non-ARI Multi-Function Device, power-management-configuration software must only Set this bit if all Functions of the Multi-Function Device indicate a 1b in the Clock Power Management bit of the Link Capabilities register. The component is permitted to use the CLKREQ# signal to power manage Link clock only if this bit is Set for all Functions. For ARI Devices, Clock Power Management is enabled solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. The CLKREQ# signal may also be controlled via the L1 PM Substates mechanism. Such control is not affected by the setting of this bit. For Downstream Ports and components that do not support Clock Power Management (as indicated by a 0b value in the Clock Power Management bit of the Link Capabilities register), the controller hardwires this bit to 0b. The write value is gated with the PCIE_CAP_CLOCK_POWER_MAN field in LINK_CAPABILITIES_REG. Note: The access attributes of this field are as follows: Wire: LINK_CAPABILITIES_REG.PCIE_CAP_CLOCK_POWER_MAN ? RWS : ROS Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_CLOCK_POWER_MAN ? RWS : ROS Note: This register field is sticky. Values: 0x0 (PM_DISABLE_LOW_CLKREQ): Clock power management is disabled and device must hold CLKREQ# signal low. 0x1 (CLKREQ_IN_USE): When this bit is set, the device is permitted to use CLKREQ# signal to power manage Link clock according to protocol defined in appropriate form factor specification. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
7	RW	0x0	PCIE_CAP_EXTENDED_SYNCH Extended Synch. When set, this bit forces the transmission of additional Ordered Sets when exiting the L0s state (see section 4.2.4.5 of PCI Express Base Specification) and when in the Recovery state (see section 4.2.6.4.1 of PCI Express Base Specification). This mode provides external devices (for example, logic analyzers) monitoring the Link time to achieve bit and Symbol lock before the Link enters the L0 state and resumes communication. For Multi-Function devices if any function has this bit set, then the component must transmit the additional Ordered Sets when exiting L0s or when in Recovery. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
6	RW	0x0	PCIE_CAP_COMMON_CLK_CONFIG Common Clock Configuration. When set, this bit indicates that this component and the component at the opposite end of this Link are operating with a distributed common reference clock. A value of 0b indicates that this component and the component at the opposite end of this Link are operating with asynchronous reference clock. For non-ARI Multi-Function Devices, software must program the same value for this bit in all Functions. If not all Functions are Set, then the component must as a whole assume that its reference clock is not common with the Upstream component. For ARI Devices, Common Clock Configuration is determined solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Components utilize this common clock configuration information to report the correct L0s and L1 Exit Latencies. After changing the value in this bit in both components on a Link, software must trigger the Link to retrain by writing a 1b to the Retrain Link bit of the Downstream Port. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
5	RW	0x0	PCIE_CAP_RETRAIN_LINK Retrain Link. A write of 1b to this bit initiates Link retraining by directing the Physical Layer LTSSM to the Recovery state. If the LTSSM is already in Recovery or Configuration, re-entering Recovery is permitted but not required. If the Port is in DPC when a write of 1b to this bit occurs, the result is undefined. Reads of this bit always return 0b. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress. This bit is not applicable and is Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. This bit always returns 0b when read. Note: The access attributes of this field are as follows: Wire: see description Dbi: see description Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
4	RW	0x0	PCIE_CAP_LINK_DISABLE Link Disable. This bit disables the Link by directing the LTSSM to the Disabled state when set; this bit is Reserved on Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. Writes to this bit are immediately reflected in the value read from the bit, regardless of actual Link state. After clearing this bit, software must honor timing requirements defined in Section 6.6.1 with respect to the first Configuration Read following a Conventional Reset. In a DSP that supports crosslink, the controller gates the write value with the CROSS_LINK_EN field in PORT_LINK_CTRL_OFF. Note: The access attributes of this field are as follows: Wire: CX_CROSSLINK_ENABLE=1 && PORT_LINK_CTRL_OFF.CROSS_LINK_EN=1||CX_CROSSLINK_ENABLE=0 && dsp=1 ? RW : RO Dbi: CX_CROSSLINK_ENABLE=1 && PORT_LINK_CTRL_OFF.CROSS_LINK_EN=1||CX_CROSSLINK_ENABLE=0 && dsp=1? RW : RO Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	PCIE_CAP_RCB Read Completion Boundary (RCB). Root Ports: Indicates the RCB value for the Root Port. Refer to section 2.3.1.1 of PCI Express Base Specification for the definition of the parameter RCB. The controller hardwires this bit for a Root Port and returns its RCB support capabilities. Endpoints and Bridges: Optionally set by configuration software to indicate the RCB value of the Root Port Upstream from the Endpoint or Bridge. Refer to Section 2.3.1.1 of PCI Express Base Specification for the definition of the parameter RCB is same as Root Port. Configuration software must only set this bit if the Root Port Upstream from the Endpoint or Bridge reports an RCB value of 128 bytes (a value of 1b in the Read Completion Boundary bit). For functions that do not implement this feature, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: R/W Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Values: 0x0 (_64B): 64 byte 0x1 (_128B): 128 byte Value After Reset: 0x0 Testable: unconstrained
2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1:0	RW	0x0	PCIE_CAP_ACTIVE_STATE_LINK_PM_CONTROL Active State Power Management (ASPM) Control. This field controls the level of ASPM enabled on the given PCI Express Link. See section 5.4.1.3 of PCI Express Base Specification for requirements on when and how to enable ASPM. Note: "L0s Entry Enabled" enables the Transmitter to enter L0s. If L0s is supported, the Receiver must be capable of entering L0s even when the Transmitter is disabled from entering L0s (00b or 10b). ASPM L1 must be enabled by software in the Upstream component on a Link prior to enabling ASPM L1 in the Downstream component on that Link. When disabling ASPM L1, software must disable ASPM L1 in the Downstream component on a Link prior to disabling ASPM L1 in the Upstream component on that Link. ASPM L1 must only be enabled on the Downstream component if both components on a Link support ASPM L1. For Multi-Function Devices (including ARI Devices), it is recommended that software program the same value for this field in all Functions. For non-ARI Multi-Function Devices, only capabilities enabled in all Functions are enabled for the component as a whole. For ARI Devices, ASPM Control is determined solely by the setting in Function0, regardless of Function 0's D-state. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. Software must not enable L0s in either direction on a given Link unless components on both sides of the Link each support L0s; otherwise, the result is undefined. Values: 0x0 (DISABLED): Disabled 0x1 (L0S_ENTRY_EN): L0s Entry Enabled 0x2 (L1_ENTRY_En): L1 Entry Enabled 0x3 (L0S_L1_ENTRY_EN): L0s and L1 Entry Enabled Value After Reset: 0x0

Bit	Attr	Reset Value	Description
2	RW	0x0	PCIE_CAP_MRL_SENSOR MRL Sensor Present. When set, this bit indicates that an MRL Sensor is implemented on the chassis for this slot. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
1	RW	0x0	PCIE_CAP_POWER_CONTROLLER Power Controller Present. When set, this bit indicates that a software programmable Power Controller is implemented for this slot/adapter (depending on form factor). Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained
0	RW	0x0	PCIE_CAP_ATTENTION_INDICATOR_BUTTON Attention Button Present. When set, this bit indicates that an Attention Button for this slot is electrically controlled by the chassis. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Value After Reset: 0x0 Testable: unconstrained

USP_PCIE_CAP_SLOT_CONTROL_SLOT_STATUS

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:25	RO	0x00	reserved
24	W1C	0x0	PCIE_CAP_DLL_STATE_CHANGED Data Link Layer State Changed. This bit is set when the value reported in the Data Link Layer Link Active bit of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read the Data Link Layer Link Active bit of the Link Status register to determine if the Link is active before initiating configuration cycles to the hot plugged device. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
23	RO	0x0	PCIE_CAP_ELECTROMECH_INTERLOCK_STATUS Electromechanical Interlock Status. If an Electromechanical Interlock is implemented, this bit indicates the status of the Electromechanical Interlock. Values: 0x0 (DISENGAGED): Electromechanical Interlock Disengaged 0x1 (ENGAGED): Electromechanical Interlock Engaged Value After Reset: 0x0
22	RO	0x0	PCIE_CAP_PRESENCE_DETECT_STATE Presence Detect State. This bit indicates the presence of an adapter in the slot, reflected by the logical "OR" of the Physical Layer in-band presence detect mechanism and, if present, any out-of-band presence detect mechanism defined for the slot's corresponding form factor. Note that the in-band presence detect mechanism requires that power be applied to an adapter for its presence to be detected. Consequently, form factors that require a power controller for hot-plug must implement a physical pin presence detect mechanism. This bit must be implemented on all Downstream Ports that implement slots. For Downstream Ports not connected to slots (where the Slot Implemented bit of the PCI Express Capabilities register is 0b), the controller hardwires this bit to 1b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R Values: 0x0 (EMPTY_SLOT): Slot Empty 0x1 (ADAPTER_PRESENT_IN_SLOT): Adapter Present in slot Value After Reset: 0x1 Testable: writeAsRead Reset Mask: 0x0 Volatile: true
21	RO	0x0	PCIE_CAP_MRL_SENSOR_STATE MRL Sensor State. This bit reports the status of the MRL sensor if implemented. Encodings are define as above. Values: 0x0 (MRL_CLOSED): MRL Closed 0x1 (MRL_OPEN): MRL Open Value After Reset: 0x0

Bit	Attr	Reset Value	Description
20	W1C	0x0	PCIE_CAP_CMD_CPLD Command Completed. If Command Completed notification is supported (if the No Command Completed Support bit in the Slot Capabilities register is 0b), this bit is set when a hot-plug command has completed and the Hot-Plug Controller is ready to accept a subsequent command. The Command Completed status bit is set as an indication to host software that the Hot-Plug Controller has processed the previous command and is ready to receive the next command; it provides no guarantee that the action corresponding to the command is complete. If Command Completed notification is not supported, the controller hardwires this bit to 0b. Value After Reset: 0x0
19	W1C	0x0	PCIE_CAP_PRESENCE_DETECTED_CHANGED Presence Detect Changed. This bit is set when the value reported in the Presence Detect State bit is changed. Value After Reset: 0x0
18	W1C	0x0	PCIE_CAP_MRL_SENSOR_CHANGED MRL Sensor Changed. If an MRL sensor is implemented, this bit is set when a MRL Sensor state change is detected. If an MRL sensor is not implemented, this bit must not be set. Value After Reset: 0x0
17	W1C	0x0	PCIE_CAP_POWER_FAULT_DETECTED Power Fault Detected. If a Power Controller that supports power fault detection is implemented, this bit issSet when the Power Controller detects a power fault at this slot. Note: Depending on hardware capability, it is possible that a power fault can be detected at any time, independent of the Power Controller Control setting or the occupancy of the slot. If power fault detection is not supported, this bit must not be set. Value After Reset: 0x0
16	W1C	0x0	PCIE_CAP_ATTENTION_BUTTON_PRESSED Attention Button Pressed. If an Attention Button is implemented, this bit is set when the attention button is pressed. If an Attention Button is not supported, this bit must not be set. Value After Reset: 0x0
15:13	RO	0x0	reserved
12	RW	0x0	PCIE_CAP_DLL_STATE_CHANGED_EN Data Link Layer State Changed Enable. If the Data Link Layer Link Active Reporting capability is 1b, this bit enables software notification when Data Link Layer Link Active bit is changed. If the Data Link Layer Link Active Reporting Capable bit is 0b, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
11	WO	0x0	PCIE_CAP_ELECTROMECH_INTERLOCK_CTRL Electromechanical Interlock Control. If an Electromechanical Interlock is implemented, a write of 1b to this bit causes the state of the interlock to toggle. A write of 0b to this bit has no effect. A read of this bit always returns a 0b. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
10	RW	0x0	PCIE_CAP_POWER_CONTROLLER_CTRL Power Controller Control. If a Power Controller is implemented, this bit when written sets the power state of the slot per the defined encodings. Reads of this bit must reflect the value from the latest write, even if the corresponding hot-plug command is not complete, unless software issues a write, if required to, without waiting for the previous command to complete in which case the read value is undefined. Note: In some cases the power controller may autonomously remove slot power or not respond to a power-up request based on a detected fault condition, independent of the Power Controller Control setting. If the Power Controller Present bit in the Slot Capabilities register is clear, then writes to this bit have no effect and the read value of this bit is undefined. Values: 0x0 (PWR_ON): Power On 0x1 (PWR_OFF): Power Off Value After Reset: 0x0
9:8	RW	0x3	PCIE_CAP_POWER_INDICATOR_CTRL Power Indicator Control. If a Power Indicator is implemented, writes to this field set the Power Indicator to the written state. Reads of this field must reflect the value from the latest write, even if the corresponding hot-plug command is not complete, unless software issues a write without waiting, if required to, for the previous command to complete in which case the read value is undefined. Note: The default value of this field must be one of the non-Reserved values. If the Power Indicator Present bit in the Slot Capabilities register is 0b, this bit is permitted to be read-only with a value of 00b. Values: 0x0 (RESERVED): Reserved 0x1 (ON): On 0x2 (BLINK): Blink 0x3 (OFF): Off Value After Reset: 0x3

2	RW	0x0	PCIE_CAP_MRL_SENSOR_CHANGED_EN MRL Sensor Changed Enable. When set, this bit enables software notification on a MRL sensor changed event (for more details, see Section 6.7.3 of PCI Express Base Specification). If the MRL Sensor Present bit in the Slot Capabilities register is Clear, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0
1	RW	0x0	PCIE_CAP_POWER_FAULT_DETECTED_EN Power Fault Detected Enable. When set, this bit enables software notification on a power fault event (for more details, see Section 6.7.3 of PCI Express Base Specification). If a Power Controller that supports power fault detection is not implemented, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0
0	RW	0x0	PCIE_CAP_ATTENTION_BUTTON_PRESSED_EN Attention Button Pressed Enable. When set to 1b, this bit enables software notification on an attention button pressed event (for more details, see Section 6.7.3 of PCI Express Base Specification). If the Attention Button Present bit in the Slot Capabilities register is 0b, this bit is permitted to be read-only with a value of 0b. Value After Reset: 0x0

USP_PCIE_CAP_ROOT_CONTROL_ROOT_CAPABILITIES_REG

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RO	0x1	PCIE_CAP_CRS_SW_VISIBILITY CRS Software Visibility Capable. When set, this bit indicates that the Root Port is capable of returning Configuration Request Retry Status (CRS) Completion Status to software (for more details, see section 2.3.1 of PCI Express Base Specification). Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W (Sticky) else R (Sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
15:5	RO	0x000	reserved
4	RW	0x0	PCIE_CAP_CRS_SW_VISIBILITY_EN CRS Software Visibility Enable. When set, this bit enables the Root Port to return Configuration Request Retry Status (CRS) Completion Status to software (for more details, see section 2.3.1 of PCI Express Base Specification). For Root Ports that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: No access. Dbi: ROOT_CONTROL_ROOT_CAPABILITIES_REG.PCIE_CAP_CRS_SW_VISIBILITY ? RW : RO Value After Reset: 0x0 Testable: writeAsRead
3	RW	0x0	PCIE_CAP_PME_INT_EN PME Interrupt Enable. When set, this bit enables PME interrupt generation upon receipt of a PME Message as reflected in the PME Status bit (for more details, see Table 7-29 of PCI Express Base Specification). A PME interrupt is also generated if the PME Status bit is set when this bit is changed from clear to set. Value After Reset: 0x0
2	RW	0x0	PCIE_CAP_SYS_ERR_ON_FATAL_ERR_EN System Error on Fatal Error Enable. If set, this bit indicates that a System Error should be generated if a Fatal error (ERR_FATAL) is reported by any of the devices in the Hierarchy Domain associated with this Root Port, or by the Root Port itself. The mechanism for signaling a System Error to the system is system specific. Value After Reset: 0x0
1	RW	0x0	PCIE_CAP_SYS_ERR_ON_NON_FATAL_ERR_EN System Error on Non-Fatal Error Enable. If set, this bit indicates that a System Error should be generated if a Non-fatal error (ERR_NONFATAL) is reported by any of the devices in the Hierarchy Domain associated with this Root Port, or by the Root Port itself. The mechanism for signaling a System Error to the system is system specific. Value After Reset: 0x0
0	RW	0x0	PCIE_CAP_SYS_ERR_ON_CORR_ERR_EN System Error on Correctable Error Enable. If set, this bit indicates that a System Error should be generated if a correctable error (ERR_COR) is reported by any of the devices in the Hierarchy Domain associated with this Root Port, or by the Root Port itself. The mechanism for signaling a System Error to the system is system specific. Value After Reset: 0x0

USP_PCIE_CAP_ROOT_STATUS_REG
Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RO	0x0	PCIE_CAP_PME_PENDING PME Pending. This bit indicates that another PME is pending when the PME Status bit is s et. When the PME Status bit is cleared by software; the PME is delivered by hardware by setting the PME Status bit again and updating the PME Requester ID field appropriately. The PME Pending bit is cleared by hardware if no more PMEs are pending. Value After Reset: 0x0
16	W1C	0x0	PCIE_CAP_PME_STATUS PME Status. This bit indicates that PME was asserted by the PME Requester indicated in the PME Requester ID field. Subsequent PMEs are kept pending until the status register is cleared by software by writing a 1b. Value After Reset: 0x0
15:0	RO	0x0000	PCIE_CAP_PME_REQ_ID PME Requester ID. This field indicates the PCI Requester ID of the last PME Requester. This field is only valid when the PME Status bit is set. Value After Reset: 0x0

USP_PCIE_CAP_DEVICE_CAPABILITIES2_REG

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23:22	RW	0x1	PCIE_CAP2_CFG_MAX_END2END_TLP_PRFXS Max End-End TLP Prefixes. Indicates the maximum number of End-End TLP Prefixes supported by this Function. For more details, see Section 2.2.10.2 of PCI Express Base Specification. If End-End TLP Prefix Supported is clear, this field is RsvdP. Different Root Ports that have the End-End TLP Prefix Supported bit set are permitted to report different values for this field. For Switches where End-End TLP Prefix Supported is set, this field must be 00b indicating support for up to four End-End TLP Prefixes. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x1 (ONE_END_END_TLP_PREFIX): 1 End-End TLP Prefix 0x2 (TWO_END_END_TLP_PREFIX): 2 End-End TLP Prefixes 0x3 (THREE_END_END_TLP_PREFIX): 3 End-End TLP Prefixes 0x0 (FOUR_END_END_TLP_PREFIX): 4 End-End TLP Prefixes Value After Reset: 0x1 Testable: unconstrained
21	RW	0x1	PCIE_CAP2_CFG_END2END_TLP_PRFX_SUPPORT End-End TLP Prefix Supported. Indicates whether End-End TLP Prefix support is offered by a Function. Values are: All Ports of a Switch must have the same value for this bit. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (NO_SUP): No Support 0x1 (SUP): Support is provided to receive TLPs containing End-End TLP Prefixes. Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
20	RW	0x1	PCIE_CAP2_CFG_EXTND_FMT_SUPPOR Extended Fmt Field Supported. If set, the Function supports the 3-bit definition of the Fmt field. If clear, the Function supports a 2-bit definition of the Fmt field. For more details, see section 2.2 of PCI Express Base Specification. Must be set for Functions that support End-End TLP Prefixes. All Functions in an Upstream Port must have the same value for this bit. Each Downstream Port of a component may have a different value for this bit. It is strongly recommended that Functions support the 3-bit definition of the Fmt field. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
19:18	RO	0x3	PCIE_CAP_OBFF_SUPPORT OBFF Supported. This field indicates if OBFF is supported and, if so, what signaling mechanism is used. The value reported in this field must indicate support for WAKE# signaling only if: for a Downstream Port, driving the WAKE# signal for OBFF is supported and the connector or component connected Downstream is known to receive that same WAKE# signal for an Upstream Port, receiving the WAKE# signal for OBFF is supported and, if the component is on an add-in-card, that the component is connected to the WAKE# signal on theconnector. Root Ports, Switch Ports, and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this field. For Bridges and Ports that do not implement this capability, the controller hardwires this field to 00b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Note: This register field is sticky. Values: 0x0 (NOT_SUP): OBFF Not Supported 0x1 (SUP_USING_MSG): OBFF supported using Message signaling only 0x2 (SUP_USING_WAKE): OBFF supported using WAKE# signaling only 0x3 (SUP_USING_MSG_AND_WAKE): OBFF supported using WAKE# and Message signaling Value After Reset: 0x3 Testable: unconstrained
17	RO	0x0	PCIE_CAP2_10_BIT_TAG_REQ_SUPPORT 10-Bit Tag Requester Supported. If this bit is set, the Function supports 10-Bit Tag Requester capability; otherwise, the Function does not. This bit must not be set if the 10-Bit Tag Completer Supported bit is clear. Note: 10-Bit Tag field generation must be enabled by the 10-Bit Tag Requester Enable bit in the Device Control 2 register of the Requester Function before 10-Bit Tags can be generated by the Requester. For more details, see section 2.2.6.2. of PCI Express Base Specification. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
16	RO	0x0	PCIE_CAP2_10_BIT_TAG_COMP_SUPPORT 10-Bit Tag Completer Supported. If this bit is set, the Function supports 10-Bit Tag Completer capability; otherwise, the Function does not. For more details, see section 2.2.6.2. of PCI Express Base Specification. Value After Reset: 0x0
15:14	RO	0x0	PCIE_CAP2_LN_SYS_CLS LN System CLS. Applicable only to Root Ports and RCRBs; must be 00b for all other Function types. This field indicates if the Root Port or RCRB supports LN protocol as an LN Completer, and if so, what cacheline size is in effect. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x0 (LN_COMPLETER_NO_SUP): LN Completer either not supported or not in effect 0x1 (LN_COMPLETER_64B_CACHE): LN Completer with 64-byte cachelines in effect 0x2 (LN_COMPLETER_128B_CACHE): LN Completer with 128-byte cachelines in effect Value After Reset: 0x0
13	RO	0x0	PCIE_CAP_TPH_CMPLT_SUPPORT_1 TPH Completer Supported Bit 1. Value After Reset: 0x0
12	RO	0x0	PCIE_CAP_TPH_CMPLT_SUPPORT_0 TPH Completer Supported Bit 0. Value of this bit along with TPH Completer Supported Bit 1 indicates Completer support for TPH or Extended TPH. Applicable only to Root Ports and Endpoints. For all other Functions, this field is Reserved. For more details, see section 6.17 of PCI Express Base Specification. Values: 0x0 (TPH_EXT_TPH_CMPL_NOT_SUP_OR_RSVD): TPH and Extended TPH Completer not supported (if TPH Completer Supported Bit is 0) or Reserved ((if TPH Completer Supported Bit is 1). 0x1 (TPH_SUP_EXT_TPH_NOT_SUP_OR_BOTH_SUPP): TPH Completer supported; Extended TPH Completer not supported(if TPH Completer Supported Bit is 0) or Both TPH and Extended TPH Completer supported ((if TPH Completer Supported Bit is 1). Value After Reset: 0x0

Bit	Attr	Reset Value	Description
11	RW	0x1	PCIE_CAP_LTR_SUPP LTR Mechanism Supported. A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism. Root Ports, Switches and Endpoints are permitted to implement this capability. For a Multi-Function Device associated with an Upstream Port, each Function must report the same value for this bit. For Bridges and other Functions that do not implement this capability, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(Sticky) else R(Sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
10	RO	0x0	PCIE_CAP_NO_RO_EN_PR2PR_PAR No RO-enabled PR-PR Passing. If this bit is set, the routing element never carries out the passing permitted by Table 2-39 of PCI Express Base Specification entry A2b that is associated with the Relaxed Ordering Attribute field being Set. This bit applies only for Switches and RCs that support peer-to-peer traffic between Root Ports. This bit applies only to Posted Requests being forwarded through the Switch or RC and does not apply to traffic originating or terminating within the Switch or RC itself. All Ports on a Switch or RC must report the same value for this bit. For all other functions, this bit must be 0b. Value After Reset: 0x1
9	RO	0x0	PCIE_CAP_128_CAS_CPL_SUPP 128-bit CAS Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. This bit must be set to 1b if the Function supports this optional capability. For more details, see section 6.15 of PCI Express Base Specification. Value After Reset: 0x0
8	RO	0x0	PCIE_CAP_64_ATOMIC_CPL_SUPP 64-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more details on additional RC requirements, see section 6.15.3.1 of PCI Express Base Specification. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
7	RO	0x0	PCIE_CAP_32_ATOMIC_CPL_SUPP 32-bit AtomicOp Completer Supported. Applicable to Functions with Memory Space BARs as well as all Root Ports; must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. For more details on additional RC requirements, see section 6.15.3.1 of PCI Express Base Specification. Value After Reset: 0x0
6	RO	0x0	PCIE_CAP_ATOMIC_ROUTING_SUPP AtomicOp Routing Supported. Applicable only to Switch Upstream Ports, Switch Downstream Ports, and Root Ports; must be 0b for other Function types. This bit must be set to 1b if the Port supports this optional capability. For more details, see section 6.15 of PCI Express Base Specification. Value After Reset: 0x0
5	RO	0x1	PCIE_CAP_ARI_FORWARD_SUPPORT ARI Forwarding Supported. Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. For more details, see section 6.13 of PCI Express Base Specification. Value After Reset: 0x1
4	RO	0x1	PCIE_CAP_CPL_TIMEOUT_DISABLE_SUPPORT Completion Timeout Disable Supported. A value of 1b indicates support for the Completion Timeout Disable mechanism. The Completion Timeout Disable mechanism is required for Endpoints that issue Requests on their own behalf and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. This mechanism is optional for Root Ports. For all other Functions this field is Reserved and the controller hardwires this bit to 0b. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
3:0	RO	0x0	PCIE_CAP_CPL_TIMEOUT_RANGE Completion Timeout Ranges Supported. This field indicates device Function support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue Requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of Requests issued on PCI Express. For all other Functions this field is Reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50 us to 10 ms Range B: 10 ms to 250 ms Range C: 250 ms to 4 s Range D: 4 s to 64 s Bits are set according to the list below to show timeout value ranges supported. All encodings other than the defined encodings are reserved. It is strongly recommended that the Completion Timeout mechanism not expire in less than 10 ms. Values: 0x0 (NOT_SUP): Completion Timeout programming not supported, the Function must implement a timeout value in the range 50 us to 50 ms. 0x1 (RANGE_A): Range A 0x2 (RANGE_B): Range B 0x3 (RANGE_A_B): Ranges A and B 0x6 (RANGE_B_C): Ranges B and C 0x7 (RANGE_A_B_C): Ranges A, B, and C 0xe (RANGE_B_C_D): Ranges B, C, and D 0xf (RANGE_A_B_C_D): Ranges A, B, C, and D Value After Reset: 0x0

For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. For components that only support speeds below 8.0 GT/s, the controller hardwires this bit to 0b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
19	RO	0x0	PCIE_CAP_EQ_CPL_P2 Equalization 8.0 GT/s Phase 2 Successful. When set to 1b, this bit indicates that Phase 2 of the 8.0 GT/s Transmitter Equalization procedure has successfully completed. Details of the Transmitter Equalization process and when this bit needs to be set to 1b is provided in section 4.2.6.4.2 of PCI Express Base Specification. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. For components that only support speeds below 8.0 GT/s, the controller hardwires this bit to 0b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
18	RO	0x0	PCIE_CAP_EQ_CPL_P1 Equalization 8.0 GT/s Phase 1 Successful. When set to 1b, this bit indicates that Phase 1 of the 8.0 GT/s Transmitter Equalization procedure has successfully completed. Details of the Transmitter Equalization process and when this bit needs to be set to 1b is provided in section 4.2.6.4.2 of PCI Express Base Specification. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. For components that only support speeds below 8.0 GT/s, the controller hardwires this bit to 0b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
17	RO	0x0	PCIE_CAP_EQ_CPL Equalization 8.0 GT/s Complete. When set to 1b, this bit indicates that the Transmitter Equalization procedure at the 8.0 GT/s data rate has completed. Details of the Transmitter Equalization process and when this bit needs to be set to 1b is provided in section 4.2.6.4.2 of PCI Express Base Specification. For Multi-Function Upstream Port, this bit must be implemented in Function 0 and RsvdZ in other Functions. For components that only support speeds below 8.0 GT/s, the controller hardwires this bit to 0b. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
16	RO	0x1	PCIE_CAP_CURR_DEEMPHASIS Current De-emphasis Level. When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. For components that support speeds greater than 2.5 GT/s, Multi-Function Devices associated with an Upstream Port must report the same value in this field for all Functions of the Port. In M-PCIe mode this register is always 0x0. In C-PCIe mode, its contents are derived by sampling the PIPE. Values: 0x1 (_3_5DB): -3.5 dB 0x0 (_6DB): -6 dB Value After Reset: 0x1 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
15:12	RW	0x0	PCIE_CAP_COMPLIANCE_PRESET Compliance Preset/De-emphasis. For 8.0 GT/s and higher Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. The encodings are defined in section 4.2.3.2 of PCI Express Base Specification . Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This field sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. When the Link is operating at 2.5 GT/s, the setting of this field has no effect. Components that support only 2.5 GT/s speed are permitted to hardwire this field to 0000b. For a Multi-Function Device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. This field is intended for debug and compliance testing purposes. System firmware and software is allowed to modify this field only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (_3_5_DB): -3.5 dB (for 5.0 GT/s Data Rate) 0x0 (_6_DB): -6 dB (for 5.0 GT/s Data Rate) Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
11	RW	0x0	PCIE_CAP_COMPLIANCE_SOS Compliance SOS. When set to 1b, the LTSSM is required to send SKP Ordered Sets between sequences when sending the Compliance Pattern or Modified Compliance Pattern. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only. For components that support only the 2.5 GT/s speed, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
10	RW	0x0	PCIE_CAP_ENTER_MODIFIED_COMPLIANCE Enter Modified Compliance. When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
9:7	RW	0x0	PCIE_CAP_TX_MARGIN Transmit Margin, This field controls the value of the non-deemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see Chapter 4 of PCI Express Base Specification for details of how the Transmitter voltage level is determined in various states). 001b-111b: As defined in Section 8.3.4 not all encodings are required to be implemented. For a Multi-Function Device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. For components that support only the 2.5 GT/s speed, the controller hardwires this bit to 000b. This field is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this field only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value. Note: This register field is sticky. Values: 0x0 (NORMAL_RANGE): Normal operating range Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
6	RO	0x0	PCIE_CAP_SEL_DEEMPHASIS Selectable De-emphasis. When the Link is operating at 5.0 GT/s speed, this bit is used to control the transmit de-emphasis of the link in specific situations. For more details, see section 4.2.6 of PCI Express Base Specification. When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. This bit is not applicable and Reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (_3_5_DB): -3.5 dB 0x0 (_6_DB): -6 dB Value After Reset: 0x0 Testable: unconstrained
5	RW	0x0	PCIE_CAP_HW_AUTO_SPEED_DISABLE Hardware Autonomous Speed Disable. When set, this bit disables hardware from changing the Link speed for device-specific reasons other than attempting to correct unreliable Link operation by reducing Link speed. Initial transition to the highest supported common link speed is not blocked by this bit. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
4	RW	0x0	PCIE_CAP_ENTER_COMPLIANCE Enter Compliance. Software is permitted to force a Link to enter Compliance mode (at the speed indicated in the Target Link Speed field and the de-emphasis/preset level indicated by the Compliance Preset/De-emphasis field) by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. For a Multi-Function Device associated with an Upstream Port, the bit in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this bit is of type RsvdP. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3:0	RW	0x3	PCIE_CAP_TARGET_LINK_SPEED Target Link Speed. For Downstream Ports, this field sets an upper limit on Link operational speed by restricting the values advertised by the Upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All encodings other than the defined encodings are reserved. If a value is written to this field that does not correspond to a supported speed (as indicated by the Supported Link Speeds Vector), the result is undefined. If either of the Enter Compliance or Enter Modified Compliance bits are implemented, then this field must also be implemented. The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode. For Upstream Ports, if the Enter Compliance bit is Clear, this field is permitted to have no effect. For a Multi-Function Device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Components that support only the 2.5 GT/s speed are permitted to hardwire this field to 0000b. In M-PCIe mode, the contents of this field are derived from other registers. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (SUP_LINK_SPEED_VECTOR_BIT_0): Supported Link Speeds Vector field bit 0 0x2 (SUP_LINK_SPEED_VECTOR_BIT_1): Supported Link Speeds Vector field bit 1 0x3 (SUP_LINK_SPEED_VECTOR_BIT_2): Supported Link Speeds Vector field bit 2 0x4 (SUP_LINK_SPEED_VECTOR_BIT_3): Supported Link Speeds Vector field bit 3 0x5 (SUP_LINK_SPEED_VECTOR_BIT_4): Supported Link Speeds Vector field bit 4 0x6 (SUP_LINK_SPEED_VECTOR_BIT_5): Supported Link Speeds Vector field bit 5 0x7 (SUP_LINK_SPEED_VECTOR_BIT_6): Supported Link Speeds Vector field bit 6 Value After Reset: 0x3 Testable: unconstrained

11.4.4.9 USP_PCIE_MSIX Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_MSIX_CAP_ID_NEXT_CTRL_REG	0x0000	W	0x003F0011	MSI-X Capability ID, Next Pointer, Control Registers

USP_PCIE_MSIX_PBA_OFFSET_REG	0x0008	W	0x00028004	MSI-X PBA Offset and BIR Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.10 USP_PCIE_MSIX Detail Registers Description

USP_PCIE_MSIX_CAP_ID_NEXT_CTRL_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RW	0x0	PCI_MSIX_ENABLE MSI-X Enable. If Set and the MSI Enable bit in the MSI Message Control Register for MSI is Clear, the Function is permitted to use MSI-X to request service and is prohibited from using INTx interrupts (if implemented). System configuration software Sets this bit to enable MSI-X. A device driver is prohibited from writing this bit to mask a Function's service request. If Clear, the Function is prohibited from using MSI-X to request service. Value After Reset: 0x0
30	RW	0x0	PCI_MSIX_FUNCTION_MASK Function Mask. If Set, all of the vectors associated with the Function are masked, regardless of their per-vector Mask bit values. If Clear, each vector's Mask bit determines whether the vector is masked or not. Setting or Clearing the MSI-X Function Mask bit has no effect on the value of the per-vector Mask bits. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
29:27	RO	0x0	reserved

Bit	Attr	Reset Value	Description
26:16	RW	0x03f	PCI_MSIX_TABLE_SIZE MSI-X Table Size. System software reads this field to determine the MSI-X Table Size N, which is encoded as N-1. For example, a returned value of 000 0000 0011b indicates a table size of 4. SRIOV Note: All VFs in a single PF have the same value for "MSI-X Table Size" (PCI_MSIX_TABLE_SIZE field in SHADOW_PCI_MSIX_CAP_ID_NEXT_CTRL_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_TABLE_SIZE field in the PF PCI_MSIX_CAP_ID_NEXT_CTRL_REG register. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x7f Testable: unconstrained
15:8	RW	0x00	PCI_MSIX_CAP_NEXT_OFFSET MSI-X Next Capability Pointer. This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
7:0	RO	0x11	PCI_MSIX_CAP_ID MSI-X Capability ID. This field indicates the MSI-X Capability structure. This field must return a Capability ID of 11h indicating that this is an MSI-X Capability structure. Value After Reset: 0x11

USP_PCIE_MSIX_TABLE_OFFSET_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:3	RW	0x00004000	PCI_MSIX_TABLE_OFFSET MSI-X Table Offset. Used as an offset from the address contained by one of the Function's Base Address Registers to point to the base of the MSI-X Table. The lower 3 Table BIR bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. SRIOV Note: All VFs in a single PF have the same value for "MSI-X Table Offset" (PCI_MSIX_TABLE_OFFSET field in SHADOW_MSIX_TABLE_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_TABLE_OFFSET field in the PF MSIX_TABLE_OFFSET_REG register. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x4000 Testable: unconstrained

Bit	Attr	Reset Value	Description
2:0	RW	0x4	PCI_MSIX_BIR MSI-X Table BAR Indicator Register Field. This field indicates which one of a Function's Base Address Registers , located beginning at 10h in Configuration Space, or entry in the Enhanced Allocation capability with a matching BEI , is used to map the Function's MSI-X Table into Memory Space. All encodings other than the defined encodings are reserved. For a 64-bit Base Address Register , the Table BIR indicates the lower DWORD. For Functions with Type 1 Configuration Space headers, BIR values 2 through 5 are also Reserved. SRIOV Note: All VFs in a single PF have the same value for "MSI-X Table BAR Indicator Register" (PCI_MSIX_BIR field in SHADOW_MSIX_TABLE_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_BIR field in the PF MSIX_TABLE_OFFSET_REG register. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (BAR_10): Base Address Register 10h 0x1 (BAR_14): Base Address Register 14h 0x2 (BAR_18): Base Address Register 18h 0x3 (BAR_1C): Base Address Register 1Ch 0x4 (BAR_20): Base Address Register 20h 0x5 (BAR_24): Base Address Register 24h Value After Reset: 0x4 Testable: unconstrained

USP_PCIE_MSIX_PBA_OFFSET_REG
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:3	RW	0x00005000	PCI_MSIX_PBA_OFFSET MSI-X PBA Offset. Used as an offset from the address contained by one of the Function's Base Address Registers to point to the base of the MSI-X PBA. The lower 3 PBA BIR bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. SRIOV Note: All VFs in a single PF have the same value for "MSI-X PBA Offset" (PCI_MSIX_PBA_OFFSET field in SHADOW_MSIX_PBA_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_PBA_OFFSET field in the PF MSIX_PBA_OFFSET_REG register. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x5000 Testable: unconstrained
2:0	RW	0x4	PCI_MSIX_PBA_BIR MSI-X PBA BIR. This field indicates which one of a Function's Base Address Registers , located beginning at 10h in Configuration Space, or entry in the Enhanced Allocation capability with a matching BEI, is used to map the Function's MSI-X PBA into Memory Space. The PBA BIR value definitions are identical to those for the Table BIR . SRIOV Note: All VFs in a single PF have the same value for "MSI-X PBA BIR" (PCI_MSIX_PBA_BIR field in SHADOW_MSIX_PBA_OFFSET_REG). To write this common value, you must perform a DBI_CS2 write (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) while accessing the PCI_MSIX_PBA_BIR field in the PF MSIX_PBA_OFFSET_REG register. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x4 Testable: unconstrained

11.4.4.12 USP_PCIE_AER Detail Registers Description

USP_PCIE_AER_EXT_CAP_HDR_OFF

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x148	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x148 Testable: unconstrained
19:16	RW	0x2	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field must be 2h if the End-End TLP Prefix Supported bit is set and must be 1h or 2h otherwise. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x2 Testable: unconstrained
15:0	RW	0x0001	CAP_ID AER Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. The Extended Capability ID for the Advanced Error Reporting Capability is 0001h. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

USP_PCIE_AER_UNCORR_ERR_STATUS_OFF

Address: Operational Base + offset (0x0004)

Root Complex Event Collectors provide support for the above described functionality for RCiEPs (Root Complex integrated Endpoint). Value After Reset: 0x0

USP_PCIE_AER_ROOT_ERR_STATUS_OFF

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:27	RO	0x09	ADV_ERR_INT_MSG_NUM Advanced Error Interrupt Message Number. This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability. For MSI, the value in this register indicates the offset between the base Message Data and the interrupt message that is generated. For MSI-X, the value in this register indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. If MSI-X is enabled, the value in this register must indicate the vector for MSI-X. If MSI is enabled or neither is enabled, the value in this register must indicate the vector for MSI. If software enables both MSI and MSI-X at the same time, the value in this register is undefined. Note: The access attributes of this field are as follows: Wire: No access. Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x9 Testable: unconstrained

11.4.4.14 USP_PCIE_SPCIE Detail Registers Description

USP_PCIE_SPCIE_CAP_HEADER_REG
Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x190	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xfff (MAX_VAL): Max value. Value After Reset: 0x190 Testable: unconstrained
19:16	RW	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
15:0	RW	0x0019	EXTENDED_CAP_ID Secondary PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffff (MAX_VAL): Max value Value After Reset: 0x19 Testable: unconstrained

USP_PCIE_SPCIE_LINK_CONTROL3_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RO	0x0	EQ_REQ_INT_EN Link Equalization Request Interrupt Enable. This bit is RW for Downstream Ports and for Upstream Ports when Crosslink Supported is 1b. This bit is not applicable and is RsvdP for Upstream Ports when the Crosslink Supported bit is 0b. If the Port does not support 8.0 GT/s, this bit is permitted to be hardwired to 0b by the controller. Note: The access attributes of this field are as follows: Wire: RSVDP Dbi: R/W Values: 0x0 (CLEAR): Clear 0x1 (SET): When Set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request 8.0 GT/s bit, the Link Equalization Request 16.0 GT/s bit, or the Link Equalization Request 32.0 GT/s bit has been set. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RO	0x0	PERFORM_EQ Perform Equalization. This bit is RW for Downstream Ports and for Upstream Ports when Crosslink Supported is 1b. This bit is not applicable and is RsvdP for Upstream Ports when the Crosslink Supported bit is 0b. If the Port does not support 8.0 GT/s, this bit is permitted to be hardwired to 0b by the controller. Note: The access attributes of this field are as follows: Wire: RSVDP Dbi: R/W Values: 0x0 (CLEAR): Clear 0x1 (SET): When this bit is 1b and a 1b is written to the Retrain Link bit with the Target Link Speed field set to 8.0 GT/s or higher, the Downstream Port must perform Link Equalization. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

USP_PCIE_SPCIE_LANE_ERR_STATUS_REG

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	W1C	0x0	LANE_ERR_STATUS Lane Error Status Bits per Lane. Each bit indicates if the corresponding Lane detected a Lane-based error. A value of 1b indicates that a Lane based-error was detected on the corresponding Lane Number. For Ports that are narrower than 32 Lanes, the unused upper bits [31: Maximum Link Width] are RsvdZ. For Ports that do not support 8.0 GT/s and do not set these bits based on 8b/10b errors , this field is permitted to be hardwired to 0 by the controller. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_SPCIE_CAP_OFF_0CH_REG

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved

Bit	Attr	Reset Value	Description
30:28	RW	0x0	USP_RX_PRESET_HINT1 Upstream Port 8.0 GT/s Receiver Preset Hint 1. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Receiver preset hint 1 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. Case C: When Operating port is Upstream port and Crosslink Supported bit is 1, Field is not used or affected by the current Link Equalization. Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. For case A and C, Field is HwInit. For case B, Field is RO. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R (sticky) Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
27:24	RW	0x4	USP_TX_PRESET1 Upstream Port 8.0 GT/s Transmitter Preset 1. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Transmitter preset 1 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. Case C: When Operating port is Upstream port and Crosslink Supported bit is 1, Field is not used or affected by the current Link Equalization. Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. For case A and C, Field is HwInit. For case B, Field is RO. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R (sticky) Value After Reset: 0xf Testable: unconstrained
23	RO	0x0	reserved
22:20	RW	0x7	DSP_RX_PRESET_HINT1 Downstream Port 8.0 GT/s Receiver Preset Hint 1. Receiver preset hint 1 value that may be used as a suggested setting for 8.0 GT/s receiver equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. Note: The access attributes of this field are as follows: Wire: RSVDP Dbi: RSVDP Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
19:16	RW	0xf	DSP_TX_PRESET1 Downstream Port 8.0 GT/s Transmitter Preset 1. Transmitter preset 1 value used for 8.0 GT/s equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. Note: The access attributes of this field are as follows: Wire: RSVDP Dbi: RSVDP Value After Reset: 0xf Testable: unconstraine
15	RO	0x0	reserved
14:12	RW	0x7	USP_RX_PRESET_HINT0 Upstream Port 8.0 GT/s Receiver Preset Hint 0. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Receiver preset hint 0 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. Case C: When Operating port is Upstream port and Crosslink Supported bit is 1, Field is not used or affected by the current Link Equalization. Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. For case A and C, Field is HwInit. For case B, Field is RO. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R (sticky) Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
11:8	RW	0x4	USP_TX_PRESET0 Upstream Port 8.0 GT/s Transmitter Preset 0. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Transmitter preset 0 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. Case C: When Operating port is Upstream port and Crosslink Supported bit is 1, Field is not used or affected by the current Link Equalization. Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. For case A and C, Field is HwInit. For case B, Field is RO. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R (sticky) Value After Reset: 0xf Testable: unconstrained
7	RO	0x0	reserved
6:4	RW	0x7	DSP_RX_PRESET_HINT0 Downstream Port 8.0 GT/s Receiver Preset Hint 0. Receiver preset hint 0 value that may be used as a suggested setting for 8.0 GT/s receiver equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. Note: The access attributes of this field are as follows: Wire: RSVDP Dbi: RSVDP Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
3:0	RW	0xf	DSP_TX_PRESET0 Downstream Port 8.0 GT/s Transmitter Preset 0. Transmitter preset 0 value used for 8.0 GT/s equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port. For an Upstream Port if Crosslink Supported is 0b, this field is RsvdP. Otherwise, this field is HwInit. Note: The access attributes of this field are as follows: Wire: RSVDP Dbi: RSVDP Value After Reset: 0xf Testable: unconstrained

USP_PCIE_SPCIE_CAP_OFF_10H_REG
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:28	RW	0x7	USP_RX_PRESET_HINT1 Upstream Port 8.0 GT/s Receiver Preset Hint 1. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Receiver preset hint 1 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. Case C: When Operating port is Upstream port and Crosslink Supported bit is 1, Field is not used or affected by the current Link Equalization. Field value will be used if a future crosslink negotiation switches the Operating Port Direction so that case A applies. For case A and C, Field is HwInit. For case B, Field is RO. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R (sticky) Value After Reset: 0x7 Testable: unconstrained

Bit	Attr	Reset Value	Description
27:24	RW	0x4	USP_TX_PRESET1 Upstream Port 8.0 GT/s Transmitter Preset 1. The write value is gated with the PCIE_CAP_CROSS_LINK_SUPPORT field of LINK_CAPABILITIES2_REG. Field contains the Transmitter preset 1 value sent or received during 8.0 GT/s Link Equalization. Case A: When Operating port is Downstream port and whether the Crosslink is supported or not, this field representss the value sent on Lane 0 during 8.0 GT/s equalization. Case B: When Operating port is Upstream port and Crosslink Supported bit is 0, this field is intended for debug and diagnostics. It contains the value captured from Lane 0 during Link Equalization. 11.4.4.15 USP_PCIE_ATS Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_ATS_CAP_HDR_REG	0x0000	W	0x0001000F	ATS Extended Capability Header
USP_PCIE_ATS_CAPABILITIES_CTRL_REG	0x0004	W	0x00000020	ATS Requester Capability Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.16 USP_PCIE_ATS Detail Registers Description

USP_PCIE_ATS_CAP_HDR_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x000	NEXT_OFFSET Next Capability Offset. The offset to the next PCI Extended Capability structure or 000h if no other items exist in the linked list of capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x178 Testable: unconstrained

Bit	Attr	Reset Value	Description
19:16	RW	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
15:0	RW	0x000f	CAP_ID ATS Extended Capability ID. This field must return a Capability ID of 000Fh indicating that this is an ATS Extended Capability structure. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0xf Testable: unconstrained

USP_PCIE_ATS_CAPABILITIES_CTRL_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21	RW	0x0	ENABLE Enable (E). When Set, the Function is enabled to cache translations. Behavior is undefined if this bit is Set, and the value of the PASID Enable, Execute Requested Permission Enable, or Privileged Mode Requested Enable bits are changed. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0 Testable: unconstrained
20:16	RW	0x00	STU Smallest Translation Unit (STU). This value indicates to the Function the minimum number of 4096-byte blocks that is indicated in a Translation Completions or Invalidate Requests. This is a power of 2 multiplier and the number of blocks is 2 STU. A value of 0 0000b indicates one block and a value of 1 1111b indicates 2^31 blocks (or 8 TB total). Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15:7	RO	0x000	reserved
6	RW	0x0	GLOBAL_INVAL_SPPRTD Global Invalidate Supported. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): The Function supports Invalidation Requests that have the Global Invalidate bit Set. 0x0 (CLEAR): The Function ignores the Global Invalidate bit in all Invalidate Requests. This bit is 0b if the Function does not support the PASID TLP Prefix. Value After Reset: 0x0 Testable: unconstrained
5	RW	0x1	PAGE_ALIGNED_REQ Page Aligned Request. If Set, indicates the Untranslated Address is always aligned to a 4096 byte boundary. Setting this field is recommended. This field permits software to distinguish between implementations compatible with this specification and those compatible with an earlier version of this specification in which a Requester was permitted to supply anything in bits [11:2]. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
4:0	RW	0x00	INVALIDATE_Q_DEPTH Invalidate Queue Depth. The number of Invalidate Requests that the Function can accept before putting backpressure on the Upstream connection. If 0 0000b, the Function can accept 32 Invalidate Requests. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained

11.4.4.17 USP_PCIE_PRS_EXT Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_PRS_EXT_CAP_HDR_REG	0x0000	W	0x00000000	Page Request Services Capability Header
USP_PCIE_PRS_EXT_CONTROL_STATUS_REG	0x0004	W	0x00000000	Page Request Services Control and Status Register
USP_PCIE_PRS_EXT_REQ_CAPACITY_REG	0x0008	W	0x00000001	Page Request Services Outstanding Capacity
USP_PCIE_PRS_EXT_REQ_ALLOCATION_REG	0x000C	W	0x00000000	Page Request Services Outstanding Allocation

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.18 USP_PCIE_PRS_EXT Detail Registers Description

USP_PCIE_PRS_EXT_CAP_HDR_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x000	PRS_NEXT_OFFSET Page Request Services PCI Express Extended Capability Next Offset. The offset to the next PCI Extended Capability structure or 000h if no other items exist in the linked list of capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xfff (MAX_VAL): Max value Value After Reset: 0x188 Testable: unconstrained
19:16	RW	0x0	PRS_CAP_VERSION Page Request Services PCI Express Extended Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field is depends on the version of the specification. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	PRS_CAP_ID Page Request Services PCI Express Extended Capability ID. This field indicates that the associated extended capability structure is a Page Request Extended Capability. This field must return a Capability ID of 0013h. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffff (MAX_VAL): Max value Value After Reset: 0x13 Testable: unconstrained

USP_PCIE_PRS_EXT_CONTROL_STATUS_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RW	0x0	PRS_PASID The PASID TLP Prefix is required. Function behavior is undefined if this bit is Clear and the Function receives a PRG Response Message with a PASID TLP Prefix. Function behavior is undefined if this bit is Set and the Function receives a PRG Response Message with no PASID TLP Prefix when the corresponding Page Requests had a PASID TLP Prefix. This bit is RsvdZ if the Function does not support the PASID TLP Prefix . Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (CLEAR): The Function does not expect PASID TLP Prefixes on any PRG Response Message. 0x1 (SET): The Function expects a PASID TLP Prefix on PRG Response Messages when the corresponding Page Requests had a PASID TLP Prefix. Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
24	RO	0x0	PRS_STOPPED PRS mechanism stopped requests for additional pages. This field is only meaningful if Enable is Clear. If Enable is Set, this field is undefined. When the Enable field is Cleared, after having been previously Set, the interface transitions to the stopping state and Clears this field. After all page requests currently outstanding at the Function(s) have completed, this field is Set and the interface enters the disabled state. If there were no outstanding page requests, this field may be Set immediately when Enable is Cleared. Resetting the interface will cause an immediate transition to the disabled state. While in the stopping state, receipt of a Response Failure message will result in the immediate transition to the disabled state (Setting this field). For SR-IOV, this field is Set only when all associated Functions (PF and VFs) have stopped issuing page requests. The cfg_prs_stopped output pin reflects the value of this register field. Values: 0x0 (CLEAR): The associated page request interface either has not stopped or has stopped issuing new Page Requests but has outstanding Page Requests. 0x1 (SET): The associated page request interface has stopped issuing additional page requests and that all previously issued Page Requests have completed. Value After Reset: 0x1 Testable: writeAsRead Volatile: true
23:18	RO	0x00	reserved
17	W1C	0x0	PRS_UPRGI PRS has received a response with Unexpected Page Request Group Index. This field, when Set, indicates that the Function has received a PRG Response Message containing a PRG index that has no matching request. This field is Set by the Function and cleared when a one is written to the field. For SR-IOV, this field is Set in the PF if any associated Function (PF or VF) receives a PRG Response Message that does has no matching request. The cfg_prs_uprgi output pin reflects the value of this register field. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
16	W1C	0x0	PRS_RESP_FAILURE PRS has received a PRG response failure. This field, when Set, indicates that the Function has received a PRG Response Message indicating a Response Failure. The Function expects no further responses from the host (any received are ignored). This field is Set by the Function and Cleared when a one is written to the field. For SR-IOV, this field is Set in the PF if any associated Function (PF or VF) receives a PRG Response Message indicating Response Failure. The cfg_prs_response_failure output pin reflects the value of this register field. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15:2	RO	0x0000	reserved
1	RO	0x0	PRS_RESET Page Request Services Reset. Reads of this field return 0b. The cfg_prs_reset output pin reflects the value of this register field. Values: 0x0 (CLEAR): No action is initiated if this field is written to 0b, or if this field is written with any value while the Enable field is set. 0x1 (SET): When the Enable field is clear, or is being cleared in the same register update that sets this field, writing a 1b to this field, clears the associated implementation dependent page request credit counter and pending request state for the associated Page Request Interface. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
0	RW	0x0	PRS_ENABLE Page Request Services Enabled. If both this field and the Stopped field are Clear, then the Page Request Interface will not issue new page requests, but has outstanding page requests that have been transmitted or are queued for transmission. When the Page Request Interface is transitioned from not-Enabled to Enabled, its status flags (Stopped, Response Failure, and Unexpected Response flags) are cleared. Enabling a Page Request Interface that has not successfully Stopped has indeterminate results. The cfg_prs_enable output pin reflects the value of this register field. Values: 0x0 (CLEAR): The Page Request Interface is not allowed to issue page requests. 0x1 (SET): Indicates that the Page Request Interface is allowed to make page requests. Value After Reset: 0x0

USP_PCIE_PRS_EXT_REQ_CAPACITY_REG
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000001	PRS_OUTSTANDING_CAPACITY Page Request Services Outstanding Capacity value. This is the upper limit on the number of pages that can be usefully allocated to the Page Request Interface. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x1 Testable: unconstrained

USP_PCIE_PRS_EXT_REQ_ALLOCATION_REG
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	PRS_OUTSTANDING_ALLOCATION Page Request Services Outstanding Allocation value. This Field contains the number of outstanding page request messages the associated Page Request Interface is allowed to issue. The cfg_prs_outstanding_allocation output pin reflects the value of this register field. Values: 0x0 (MIN_VAL): Min value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0

11.4.4.19 USP_PCIE_LTR Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_LTR_CAP_HDR_REG	0x0000	W	0x16010018	LTR Extended Capability Header
USP_PCIE_LTR_LATENCY_REG	0x0004	W	0x00000000	LTR Max Snoop and No-Snoop Latency Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.20 USP_PCIE_LTR Detail Registers Description

USP_PCIE_LTR_CAP_HDR_REG
Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RO	0x160	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x190 Testable: unconstrained
19:16	RO	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field is depends on version of the specification. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
15:0	RO	0x0018	CAP_ID LTR Extended Capacity ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability for the LTR Extended Capability is 0018h. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x18 Testable: unconstrained

USP_PCIE_LTR_LATENCY_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved

Bit	Attr	Reset Value	Description
28:26	RW	0x0	MAX_NO_SNOOP_LAT_SCALE Max No-Snoop Latency Scale. This register provides a scale for the value contained within the Max No-Snoop LatencyValue field. Encoding is the same as the LatencyScale fields in the LTR Message. It is strongly recommended that any updates to this field are reflected in LTR Message(s) sent by the device within 1 ms. Hardware operation is undefined if software writes a Not Permitted value to this field. Value After Reset: 0x0
25:16	RW	0x000	MAX_NO_SNOOP_LAT Max No-Snoop Latency Value. Along with the Max No-Snoop LatencyScale field, this register specifies the maximum no-snoop latency that a device is permitted to request. Software should set this to the platform?s maximum supported latency or less. It is strongly recommended that any updates to this field are reflected in LTR Message(s) sent by the device within 1 ms. Value After Reset: 0x0
15:13	RO	0x0	reserved
12:10	RW	0x0	MAX_SNOOP_LAT_SCALE Max Snoop Latency Scale. This register provides a scale for the value contained within the Max Snoop LatencyValue field. Encoding is the same as the LatencyScale fields in the LTR Message. It is strongly recommended that any updates to this field are reflected in LTR Message(s) sent by the device within 1 ms. Hardware operation is undefined if software writes a Not Permitted value to this field. Value After Reset: 0x0
9:0	RW	0x000	MAX_SNOOP_LAT Max Snoop Latency Value. Along with the Max Snoop LatencyScale field,this register specifies the maximum snoop latency that a device is permitted to request. Software should set this to the platform?s maximum supported latency or less. It is strongly recommended that any updates to this field are reflected in LTR Message(s) sent by the device within 1 ms. Value After Reset: 0x0

11.4.4.22 USP_PCIE_L1SUB Detail Registers Description

USP_PCIE_L1SUB_CAP_HEADER_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x1d0	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h, if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b although software must mask them to allow for future uses of these bits. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1d0 Testable: unconstrained
19:16	RW	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This field is depends on version of the specification. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained
15:0	RW	0x001e	EXTENDED_CAP_ID L1SUB Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Extended Capability ID for L1 PM Substates is 001Eh. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1e Testable: unconstrained

USP_PCIE_L1SUB_CAPABILITY_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:19	RW	0x05	PWR_ON_VALUE_SUPPORT Port T Power On Value. Along with the Port T_POWER_ON_SCALE field in the L1 PM Substates Capabilities register sets the time (in us) that this Port requires the port on the opposite side of Link to wait in L1.2.Exit after sampling CLKREQ# asserted before actively driving the interface. The value of Port T_POWER_ON is calculated by multiplying the value in this field by the scale value in the Port T_POWER_ON_SCALE field in the L1 PM Substates Capabilities register. Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT||L1SUB_CAPABILITY_REG.L1_2_PCIPM_SUPPORT ? RWS : RSVDP Value After Reset: 0x5 Testable: writeAsRead
18	RO	0x0	reserved
17:16	RW	0x0	PWR_ON_SCALE_SUPPORT Port T Power On Scale. Specifies the scale used for the Port T_POWER_ON_VALUE field in the L1 PM Substates Capabilities register. Range of values are given below. Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT||L1SUB_CAPABILITY_REG.L1_2_PCIPM_SUPPORT ? RWS : RSVDP Values: 0x0 (_2us): Scale is 2us 0x1 (_10us): Scale is 10us 0x2 (_100us): Scale is 100us 0x3 (Reserved): Reserved Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
15:8	RW	0x0a	COMM_MODE_SUPPORT Port Common Mode Restore Time. Time (in us) required for this Port to re-establish common mode. Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT||L1SUB_CAPABILITY_REG.L1_2_PCIPM_SUPPORT ? RWS : RSVDP Value After Reset: 0xa Testable: writeAsRead
7:5	RO	0x0	reserved
4	RW	0x1	L1_PMSUB_SUPPORT L1 PM Substates ECN Supported. When Set this field indicates that this Port supports L1 PM Substates. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: R/W (sticky) Value After Reset: 0x1
3	RW	0x1	L1_1_ASPM_SUPPORT ASPM L11 Supported. When Set this field indicates that ASPM L1.1 is supported. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: R/W (sticky) Value After Reset: 0x1
2	RW	0x1	L1_2_ASPM_SUPPORT ASPM L12 Supported. When Set this field indicates that ASPM L1.2 is supported. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: R/W (sticky) Value After Reset: 0x1
1	RW	0x1	L1_1_PCIPM_SUPPORT PCI-PM L11 Supported. When Set this field indicates that PCI-PM L1.1 is supported, and must be Set by all Ports implementing L1 PM Substates. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: R/W (sticky) Value After Reset: 0x1

Bit	Attr	Reset Value	Description
0	RW	0x1	L1_2_PCIPM_SUPPORT PCI-PM L12 Supported. When Set this field indicates that PCI-PM L1.2 is supported. Note: The access attributes of this field are as follows: Wire: HWINIT Dbi: R/W (sticky) Value After Reset: 0x1

USP_PCIE_L1SUB_CONTROL1_REG

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:29	RW	0x0	L1_2_TH_SCA LTR L12 Threshold Scale. This field provides a scale for the value contained within the LTR_L1.2_THRESHOLD_Value. Hardware operation is undefined if software writes a Not-Permitted value to this field. Required for all Ports Ports for which the ASPM L12 Supported bit is Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT ? RW : RSVDP Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT ? RW : RSVDP Value After Reset: 0x0 Testable: writeAsRead
28:26	RO	0x0	reserved
25:16	RW	0x000	L1_2_TH_VAL LTR L12 Threshold Value. Along with the LTR_L1.2_THRESHOLD_Scale, this field indicates the LTR threshold used to determine if entry into L1 results in L1.1 (if enabled) or L1.2 (if enabled). Required for all Ports for which the ASPM L12 Supported bit is Set, otherwise this field is of type RsvdP. Note: The access attributes of this field are as follows: Wire: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT ? RW : RSVDP Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT ? RW : RSVDP Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
15:8	RW	0x0a	T_COMMON_MODE Common Mode Restore Time. Sets value of TCOMMONMODE (in us), which must be used by the Downstream Ports for timing the re-establishment of common mode. This field is of type RsvdP for Upstream Ports. Note: The access attributes of this field are as follows: Wire: No access. Dbi: L1SUB_CAPABILITY_REG.L1_2_ASPM_SUPPORT||L1SUB_CAPABILITY_REG.L1_2_PCIPM_SUPPORT ? RW : RSVDP Value After Reset: 0xa Testable: writeAsRead
7:4	RO	0x0	reserved
3	RW	0x0	L1_1_ASPM_EN ASPM L11 Enable. When Set this field, enables ASPM L1.1. For Ports for which the ASPM L1.1 Supported bit is clear, this bit is permitted to be hardwired to 0. Required for both Upstream and Downstream Ports. For compatibility with possible future extensions, software must not enable L1 PM Substates unless the L1 PM Substates Supported field in the L1 PM Substates Capabilities Register is Set. Value After Reset: 0x0
2	RW	0x0	L1_2_ASPM_EN ASPM L12 Enable. When Set this field, enables ASPM L1.2. For Ports for which the ASPM L1.2 Supported bit is clear, this bit is permitted to be hardwired to 0. Required for both Upstream and Downstream Ports. For compatibility with possible future extensions, software must not enable L1 PM Substates unless the L1 PM Substates Supported field in the L1 PM Substates Capabilities Register is Set. Value After Reset: 0x0
1	RW	0x0	L1_1_PCIPM_EN PCI-PM L11 Enable. When Set this field, enables PCI-PM L1.1. Required for both Upstream and Downstream Ports. For compatibility with possible future extensions, software must not enable L1 PM Substates unless the L1 PM Substates Supported field in the L1 PM Substates Capabilities Register is Set. Value After Reset: 0x0
0	RW	0x0	L1_2_PCIPM_EN PCI-PM L12 Enable. When Set this field, enables PCI-PM L1.2. For Ports for which the PCI-PM L1.2 Supported bit is clear, this bit is permitted to be hardwired to 0. Required for both Upstream and Downstream Ports. For compatibility with possible future extensions, software must not enable L1 PM Substates unless the L1 PM Substates Supported field in the L1 PM Substates Capabilities Register is Set. Value After Reset: 0x0

11.4.4.24 USP_PCIE_DPA Detail Registers Description

USP_PCIE_DPA_EXT_CAP_HDR_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RO	0x1a0	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1d0 Testable: unconstrained
19:16	RO	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
15:0	RO	0x0016	EXT_CAP_ID DPA Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the DPA Extended Capability is 0016h. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky. Value After Reset: 0x16 Testable: unconstrained

USP_PCIE_DPA_CAP_REG

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RW	0xff	XLCY1 Transition Latency Value 1 (Xlcy1). This value is multiplied by the Transition Latency Unit to determine the maximum Transition Latency for the substate. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0xff
23:16	RW	0x80	XLCY0 Transition Latency Value 0 (Xlcy0). This value is multiplied by the Transition Latency Unit to determine the maximum Transition Latency for the substate. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x80
15:14	RO	0x0	reserved

Bit	Attr	Reset Value	Description
13:12	RW	0x1	PAS Power Allocation Scale. The encodings provide the scale to determine power allocation per substate in Watts. The value corresponding to the substate in the Substate Power Allocation field is multiplied by this field to determine the power allocation for the substate. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (_10.0X): 10.0x 0x1 (_1.0X): 1.0x 0x2 (_0.1X): 0.1x 0x3 (_0.01X): 0.01x Value After Reset: 0x1
11:10	RO	0x0	reserved
9:8	RW	0x1	TLUNIT Transition Latency Unit (TLunit). A substate's Transition Latency Value is multiplied by the Transition Latency Unit to determine the maximum Transition Latency for the substate. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (_1MS): 1ms 0x1 (_10MS): 10ms 0x2 (_100MS): 100ms 0x3 (RSVD): Reserved Value After Reset: 0x1
7:5	RO	0x0	reserved
4:0	RW	0x07	SUBSTATE_MAX Maximum Substate Number. Value of this field indicates the maximum substate number, which is the total number of supported substates minus one. A value of 0 0000b indicates support for one substate. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x7

USP_PCIE_DPA_LAT_IND_REG

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	X1_INDICATOR1 Transition Latency Indicator Bits. Each bit indicates which Transition Latency Value is associated with the corresponding substate. A value of 0b indicates Transition Latency Value 0 ; a value of 1b indicates Transition Latency Value 1. Only bits [Substate_Max :0] are defined. Bits above Substate_Max are RsvdP. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_DPA_STATUS_CNTRL_REG

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20:16	RW	0x00	SUBSTATE_CONTROL Substate Control. This field can be used by the software to configure the Function substate. The software can write the substate value in this field to initiate a substate transition. When the Substate Control Enabled bit in the DPA Status Register is Set, this field determines the Function substate. When the Substate Control Enabled bit in the DPA Status Register is Clear, this field has no effect on the Function substate. Value After Reset: 0x0
15:9	RO	0x00	reserved

Bit	Attr	Reset Value	Description
8	RW	0x1	SUBSTATE_CONTROL_EN Substate Control Enabled. This field can be used by the software to disable the Substate Control field in the DPA Control Register. Hardware sets this bit following a Conventional Reset or FLR. Software can clear this bit by writing a 1b to it. Software cannot set this bit directly. Note: The access attributes of this field are as follows: Wire: RW1C Dbi: R/W Values: 0x1 (SET): The Substate Control field determines the current substate. 0x0 (CLEAR): The Substate Control field has no effect on the current substate. Value After Reset: 0x1 Testable: writeAsRead Volatile: true
7:5	RO	0x0	reserved
4:0	RW	0x00	SUBSTATE_STATUS Substate Status. This field indicates current substate for this Function. Note: The access attributes of this field are as follows: Wire: R Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DPA_PWR_ALLOC_ARRAY0
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:24	RW	0x1d	PWR_ALLOC_VAL3 Substate Power Allocation Substate 3. The value in this field is multiplied by the Power Allocation Scale to determine power allocation in Watts for the substate 3. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x1d

Bit	Attr	Reset Value	Description
23:16	RW	0x1e	PWR_ALLOC_VAL2 Substate Power Allocation Substate 2. The value in this field is multiplied by the Power Allocation Scale to determine power allocation in Watts for the substate 2. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x1e
15:8	RW	0x1f	PWR_ALLOC_VAL1 Substate Power Allocation Substate 1. The value in this field is multiplied by the Power Allocation Scale to determine power allocation in Watts for the substate 1. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x1f
7:0	RW	0x20	PWR_ALLOC_VAL0 Substate Power Allocation Substate 0. The value in this field is multiplied by the Power Allocation Scale to determine power allocation in Watts for the substate 0. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x20

USP_PCIE_DPA_PWR_ALLOC_ARRAY4

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:24	RW	0x19	PWR_ALLOC_VAL7 Substate Power Allocation Substate 7. The value in this field is multiplied by the Power Allocation Scale to determine power allocation in Watts for the substate 7. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x19

Bit	Attr	Reset Value	Description
23:16	RW	0x1a	PWR_ALLOC_VAL6 Substate Power Allocation Substate 6. The value in this field is multiplied by the Power Allocation Scale to determine power allocation in Watts for the substate 6. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x1a
15:8	RW	0x1b	PWR_ALLOC_VAL5 Substate Power Allocation Substate 5. The value in this field is multiplied by the Power Allocation Scale to determine power allocation in Watts for the substate 5. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x1b
7:0	RW	0x1c	PWR_ALLOC_VAL4 Substate Power Allocation Substate 4. The value in this field is multiplied by the Power Allocation Scale to determine power allocation in Watts for the substate 4. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x1c

11.4.4.25 USP_PCIE_RAS_DES Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_RAS_DES_CAP_HEADER_REG	0x0000	W	0x2A01000B	Vendor-Specific Extended Capability Header
USP_PCIE_RAS_DES_VENDOR_SPECIFIC_HEADER_REG	0x0004	W	0x10040002	Vendor-Specific Header
USP_PCIE_RAS_DES_EVENT_COUNTER_CONTROL_REG	0x0008	W	0x00000000	Event Counter Contro
USP_PCIE_RAS_DES_EVENT_COUNTER_DATA_REG	0x000C	W	0x00000000	Event Counter Data
USP_PCIE_RAS_DES_TIME_BASED_ANALYSIS_CONTROL_REG	0x0010	W	0x00000000	Time-based Analysis Control

Name	Offset	Size	Reset Value	Description
USP_PCIE_RAS_DES_TIME_BASED_ANALYSIS_DATA_REG	0x0014	W	0x00000000	Time-based Analysis Data
USP_PCIE_RAS_DES_TIME_BASED_ANALYSIS_DATA_63_32_REG	0x0018	W	0x00000000	Upper 32 bits of Time-based Analysis Data
USP_PCIE_RAS_DES_EINJ_ENABLE_REG	0x0030	W	0x00000000	Error Injection Enable
USP_PCIE_RAS_DES_EINJ0_CRC_REG	0x0034	W	0x00000000	Error Injection Control 0 (CRC Error)
USP_PCIE_RAS_DES_EINJ1_SEQNUM_REG	0x0038	W	0x00000000	Error Injection Control 1 (Sequence Number Error)
USP_PCIE_RAS_DES_EINJ2_DLLP_REG	0x003C	W	0x00000000	Error Injection Control 2 (DLLP Error)
USP_PCIE_RAS_DES_EINJ3_SYMBOL_REG	0x0040	W	0x00000000	Error Injection Control 3 (Symbol Error)
USP_PCIE_RAS_DES_EINJ4_FC_REG	0x0044	W	0x00000000	Error Injection Control 4 (FC Credit Error)
USP_PCIE_RAS_DES_EINJ5_SP_TLP_REG	0x0048	W	0x00000000	Error Injection Control 5 (Specific TLP Error)
USP_PCIE_RAS_DES_EINJ6_COMPARE_POINT_H0_REG	0x004C	W	0x00000000	Error Injection Control 6 (Compare Point Header DWORD #0)
USP_PCIE_RAS_DES_EINJ6_COMPARE_POINT_H1_REG	0x0050	W	0x00000000	Error Injection Control 6 (Compare Point Header DWORD #1)
USP_PCIE_RAS_DES_EINJ6_COMPARE_POINT_H2_REG	0x0054	W	0x00000000	Error Injection Control 6 (Compare Point Header DWORD #2)
USP_PCIE_RAS_DES_EINJ6_COMPARE_POINT_H3_REG	0x0058	W	0x00000000	Error Injection Control 6 (Compare Point Header DWORD #3)
USP_PCIE_RAS_DES_EINJ6_COMPARE_VALUE_H0_REG	0x005C	W	0x00000000	Error Injection Control 6 (Compare Value Header DWORD #0)
USP_PCIE_RAS_DES_EINJ6_COMPARE_VALUE_H1_REG	0x0060	W	0x00000000	Error Injection Control 6 (Compare Value Header DWORD #1)
USP_PCIE_RAS_DES_EINJ6_COMPARE_VALUE_H2_REG	0x0064	W	0x00000000	Error Injection Control 6 (Compare Value Header DWORD #2)
USP_PCIE_RAS_DES_EINJ6_COMPARE_VALUE_H3_REG	0x0068	W	0x00000000	Error Injection Control 6 (Compare Value Header DWORD #3)
USP_PCIE_RAS_DES_EINJ6_CHANGE_POINT_H0_REG	0x006C	W	0x00000000	Error Injection Control 6 (Change Point Header DWORD #0)
USP_PCIE_RAS_DES_EINJ6_CHANGE_POINT_H1_REG	0x0070	W	0x00000000	Error Injection Control 6 (Change Point Header DWORD #1)
USP_PCIE_RAS_DES_EINJ6_CHANGE_POINT_H2_REG	0x0074	W	0x00000000	Error Injection Control 6 (Change Point Header DWORD #2)

Name	Offset	Size	Reset Value	Description
USP_PCIE_RAS_DES_EINJ6_CHANGE_POINT_H3_REG	0x0078	W	0x00000000	Error Injection Control 6 (Change Point Header DWORD #3)
USP_PCIE_RAS_DES_EINJ6_CHANGE_VALUE_H0_REG	0x007C	W	0x00000000	Error Injection Control 6 (Change Value Header DWORD #0)
USP_PCIE_RAS_DES_EINJ6_CHANGE_VALUE_H1_REG	0x0080	W	0x00000000	Error Injection Control 6 (Change Value Header DWORD #1)
USP_PCIE_RAS_DES_EINJ6_CHANGE_VALUE_H2_REG	0x0084	W	0x00000000	Error Injection Control 6 (Change Value Header DWORD #2)
USP_PCIE_RAS_DES_EINJ6_CHANGE_VALUE_H3_REG	0x0088	W	0x00000000	Error Injection Control 6 (Change Value Header DWORD #3)
USP_PCIE_RAS_DES_EINJ6_TLP_REG	0x008C	W	0x00000000	Error Injection Control 6 (Packet Error)
USP_PCIE_RAS_DES_SD_CONTROL1_REG	0x00A0	W	0x00000000	Silicon Debug Control 1
USP_PCIE_RAS_DES_SD_CONTROL2_REG	0x00A4	W	0x00000000	Silicon Debug Control 2
USP_PCIE_RAS_DES_SD_STATUS_L1LANE_REG	0x00B0	W	0x00180000	Silicon Debug Status(Layer1 Per-lane)
USP_PCIE_RAS_DES_SD_STATUS_L1LTSSM_REG	0x00B4	W	0x00000200	Silicon Debug Status(Layer1 LTSSM)
USP_PCIE_RAS_DES_SD_STATUS_PM_REG	0x00B8	W	0x00000000	Silicon Debug Status(PM)
USP_PCIE_RAS_DES_SD_STATUS_L2_REG	0x00BC	W	0x00FFF000	Silicon Debug Status(Layer2)
USP_PCIE_RAS_DES_SD_STATUS_L3FC_REG	0x00C0	W	0x00000000	Silicon Debug Status(Layer3 FC)
USP_PCIE_RAS_DES_SD_STATUS_L3_REG	0x00C4	W	0x00000000	Silicon Debug Status(Layer3)
USP_PCIE_RAS_DES_SD_EQ_CONTROL1_REG	0x00D0	W	0x00000000	Silicon Debug EQ Control 1
USP_PCIE_RAS_DES_SD_EQ_CONTROL2_REG	0x00D4	W	0x00000000	Silicon Debug EQ Control 2
USP_PCIE_RAS_DES_SD_EQ_CONTROL3_REG	0x00D8	W	0x00000000	Silicon Debug EQ Control 3
USP_PCIE_RAS_DES_SD_EQ_STATUS1_REG	0x00E0	W	0x00000000	Silicon Debug EQ Status 1
USP_PCIE_RAS_DES_SD_EQ_STATUS2_REG	0x00E4	W	0x00000000	Silicon Debug EQ Status 2
USP_PCIE_RAS_DES_SD_EQ_STATUS3_REG	0x00E8	W	0x00000000	Silicon Debug EQ Status 3

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.26 USP_PCIE_RAS_DES Detail Registers Description

USP_PCIE_RAS_DES_CAP_HEADER_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x2a0	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xfff (MAX_VAL): Max value Value After Reset: 0x2d0 Testable: writeAsRead
19:16	RW	0x1	CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Value of this field is depends on the version of the specification. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x1 Testable: writeAsRead

Bit	Attr	Reset Value	Description
15:0	RW	0x000b	EXTENDED_CAP_ID PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Extended Capability ID for the Vendor-Specific Extended Capability is 000Bh. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffff (MAX_VAL): Max value Value After Reset: 0xb Testable: writeAsRead

USP_PCIE_RAS_DES_VENDOR_SPECIFIC_HEADER_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:20	RO	0x100	VSEC_LENGTH VSEC Length. This field indicates the number of bytes in the entire VSEC structure, including the Vendor-Specific Extended Capability Header, the Vendor-Specific Header, and the vendor-specific registers. Values: 0x0 (MIN_VAL): Min value 0xfff (MAX_VAL): Max value Value After Reset: 0x100
19:16	RO	0x4	VSEC_REV VSEC Rev. This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x4
15:0	RO	0x0002	VSEC_ID VSEC ID. This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field. Values: 0x0 (MIN_VAL): Min value 0xffff (MAX_VAL): Max value Value After Reset: 0x2

USP_PCIE_RAS_DES_EVENT_COUNTER_CONTROL_REG

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27:16	RW	0x000	EVENT_COUNTER_EVENT_SELECT Event Counter Data Select. This field in conjunction with the EVENT_COUNTER_LANE_SELECT field indexes the Event Counter data returned by the EVENT_COUNTER_DATA_REG register. 27-24: Group number(4-bit: 0..0x7) 23-16: Event number(8-bit: 0..0x13) within the Group .. For detailed definitions of Group number and Event number, see the RAS DES chapter in the Databook. Note: This register field is sticky. Values: 0x0 (EBUF_OVERFLOW): Ebuf Overflow 0x1 (EBUF_UNDERRUN): Ebuf Underrun 0x700 (TX_MEM_WRITE): Tx Memory Write 0x713 (RX_MSG_TLP): Rx Message TLP Value After Reset: 0x0 Testable: writeAsRead
15:12	RO	0x0	reserved
11:8	RW	0x0	EVENT_COUNTER_LANE_SELECT Event Counter Lane Select. This field in conjunction with EVENT_COUNTER_EVENT_SELECT indexes the Event Counter data returned by the EVENT_COUNTER_DATA_REG register. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Lane0 0xf (MAX_VAL): Lane15 Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
7	RO	0x0	EVENT_COUNTER_STATUS Event Counter Status. This register returns the current value of the Event Counter selected by the following fields: EVENT_COUNTER_EVENT_SELECT EVENT_COUNTER_LANE_SELECT Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): Set Value After Reset: 0x0 Testable: writeAsRead Volatile: true
6:5	RO	0x0	reserved
4:2	WO	0x0	EVENT_COUNTER_ENABLE Event Counter Enable. Enables/disables the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. By default, all event counters are disabled. You can enable/disable a specific Event Counter by writing the 'per event off' or 'per event on' codes. You can enable/disable all event counters by writing the 'all on' or 'all off' codes. The read value is always '0'. For other values no change. Values: 0x1 (PER_EVENT_OFF): per event off 0x3 (PER_EVENT_ON): per event on 0x5 (ALL_OFF): all off 0x7 (ALL_ON): all on Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
1:0	WO	0x0	EVENT_COUNTER_CLEAR Event Counter Clear. Clears the Event Counter selected by the EVENT_COUNTER_EVENT_SELECT and EVENT_COUNTER_LANE_SELECT fields in this register. You can clear the value of a specific Event Counter by writing the 'per clear' code and you can clear all event counters at once by writing the 'all clear' code. The read value is always '0'. Other values are reserved. Values: 0x0 (NO_CHANGE): no change 0x1 (PER_CLEAR): per clear 0x2 (NO_CHANGE_2): no change 0x3 (ALL_CLEAR): all clear Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_RAS_DES_EVENT_COUNTER_DATA_REG
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	EVENT_COUNTER_DATA Event Counter Data. This register returns the data selected by the following fields: EVENT_COUNTER_EVENT_SELECT in EVENT_COUNTER_CONTROL_REG Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_RAS_DES_TIME_BASED_ANALYSIS_CONTROL_REG
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	TIME_BASED_REPORT_SELECT Time-based Report Select. Selects what type of data is measured for the selected duration (TIME_BASED_DURATION_SELECT), and returned in TIME_BASED_ANALYSIS_DATA. Each type of data is measured using one of three types of units: Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. Total time in ps is [Value of TIME_BASED_ANALYSIS_DATA returned when TIME_BASED_REPORT_SELECT=0x00] * TIME_BASED_ANALYSIS_DATA. Values 0-4 and 7-8 correspond to Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. Aux_clk Cycles. Total time in ps is [Period of platform specific clock] * TIME_BASED_ANALYSIS_DATA. Values 5, 6, and 9 correspond to aux_clk Cycles. Core_clk Cycles for 20GT/s, 25GT/s (CCIX ESM data rate). Total time in ps is [Value of TIME_BASED_ANALYSIS_DATA returned when TIME_BASED_REPORT_SELECT=0x10] * TIME_BASED_ANALYSIS_DATA. Values 10-14 and 17-18 correspond to Core_clk Cycles for 2.5GT/s, 5.0GT/s, 8.0GT/s, 16.0GT/s, 32GT/s. Data Bytes. Actual amount of bytes is 16 * TIME_BASED_ANALYSIS_DATA. Values 20-23 correspond to data bytes. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x0 (ONE_CYCLE): Duration of 1 cycle 0x1 (TX_L0S): TxL0s 0x2 (RX_L0S): RxL0s 0x3 (L0): L0 0x4 (L1): L1 0x7 (CFG_RCVRY): Configuration/Recovery 0x8 (TX_RX_L0S): TxL0s and RxL0s 0x5 (L1_1): L1.1 0x6 (L1_2): L1.2 0x9 (L1_AUX): L1 aux 0x10 (_1_CYCLE): Duration of 1 cycle 0x11 (TX_L0S_): TxL0s 0x12 (RX_L0S_): RxL0s 0x13 (L0_): L0 0x14 (L1_): L1 0x17 (CFG_RCVRY_): Configuration/Recovery 0x18 (TX_RX_L0S_): TxL0s and RxL0s 0x20 (TX_PCIE_TLP): Tx PCIe TLP data payload Bytes 0x21 (RX_PCIE_TLP): Rx PCIe TLP data payload Bytes 0x22 (TX_CCIX_TLP): Tx CCIX TLP data payload Bytes 0x23 (RX_CCIX_TLP): Rx CCIX TLP data payload Bytes Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
23:16	RO	0x00	reserved
15:8	RW	0x00	TIME_BASED_DURATION_SELECT Time-based Duration Select. Selects the duration of time-based analysis. When "manual control" is selected and TIMER_START is set to '1', this analysis never stops until TIMER_STOP is set to '0'. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x0 (MANUAL): Manual control 0x1 (_1_MS): 1ms 0x2 (_2_MS): 10ms 0x3 (_100_MS): 100ms 0x4 (_1_S): 1s 0x5 (_2_S): 2s 0x6 (_4_S): 4s 0xff (_4_US): 4us (Debug purpose) Value After Reset: 0x1 Testable: writeAsRead
7:1	RO	0x00	reserved
0	RW	0x0	TIMER_START Timer Start. This bit will be cleared automatically when the measurement is finished. Note: The app_ras_des_tba_ctrl input also sets the contents of this field and controls the measurement start/stop. Note: This register field is sticky. Values: 0x1 (START_RESTART): Start/Restart 0x0 (STOP): Stop Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_RAS_DES_TIME_BASED_ANALYSIS_DATA_REG
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	TIME_BASED_ANALYSIS_DATA Time Based Analysis Data. This register returns the data selected by the TIME_BASED_REPORT_SELECT field in TIME_BASED_ANALYSIS_CONTROL_REG. The results are cleared when next measurement starts. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0 Testable: untestable Volatile: true

USP_PCIE_RAS_DES_TIME_BASED_ANALYSIS_DATA_63_32_REG

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	TIME_BASED_ANALYSIS_DATA_63_32 Upper 32 bits of Time Based Analysis Data. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_RAS_DES_EINJ_ENABLE_REG

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
6	RW	0x0	ERROR_INJECTION6_ENABLE Error Injection6 Enable (Specific TLP Error). Enables insertion of errors into the packets that you select. You can set this bit to '1' when you have disabled RAS datapath protection (DP) by setting CX_RASDP = CX_RASDP_RAM_PROT =0. You can set this bit to '1' when you have disabled the address translation by setting ADDR_TRANSLATION_SUPPORT_EN=0. For more details, see the EINJ6_COMPARE_*_REG/EINJ6_CHANGE_*_REG/EINJ6_TLP_REG registers. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5	RW	0x0	ERROR_INJECTION5_ENABLE Error Injection5 Enable (TLP Duplicate/Nullify Error). Enables insertion of duplicate/nullified TLPs. For more details, see the EINJ5_SP_TLP_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
4	RW	0x0	ERROR_INJECTION4_ENABLE Error Injection4 Enable (FC Credit Update Error). Enables insertion of errors into UpdateFCs. For more details, see the EINJ4_FC_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
3	RW	0x0	ERROR_INJECTION3_ENABLE Error Injection3 Enable (Symbol DataK Mask Error or Sync Header Error). Enables DataK masking of special symbols or the breaking of the sync header. For more details, see the EINJ3_SYMBOL_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2	RW	0x0	ERROR_INJECTION2_ENABLE Error Injection2 Enable (DLLP Error). Enables insertion of DLLP errors. For more details, see the EINJ2_DLLP_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
1	RW	0x0	ERROR_INJECTION1_ENABLE Error Injection1 Enable (Sequence Number Error). Enables insertion of errors into sequence numbers. For more details, see the EINJ1_SEQNUM_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
0	RW	0x0	ERROR_INJECTION0_ENABLE Error Injection0 Enable (CRC Error). Enables insertion of errors into various CRC. For more details, see the EINJ0_CRC_REG register. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_RAS_DES_EINJ0_CRC_REG

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved

Bit	Attr	Reset Value	Description
11:8	RW	0x0	EINJ0_CRC_TYPE Error injection type. Selects the type of CRC error to be inserted. All encodings other than the defined encodings are reserved. Note: This register field is sticky. Values: 0x0 (TLP_LCRC_ERR): (TX Path) New TLP's LCRC error injection 0x1 (_16b_CRC_ERR_ACK_NAK_DLLP): (TX Path) 16bCRC error injection of ACK/NAK DLLP 0x2 (_16b_CRC_ERR_UPD_FC): (TX Path) 16bCRC error injection of Update-FC DLLP 0x3 (TLP_ECRC_ERR): (TX Path) New TLP's ECRC error injection 0x4 (FCRC_ERR_TLP): (TX Path) TLP's FCRC error injection (128b/130b) 0x5 (PARITY_TSOS_ERR): (TX Path) Parity error of TSOS (128b/130b) 0x6 (PARITY_SKPOS_ERR): (TX Path) Parity error of SKPOS (128b/130b) 0x8 (LCRC_ERR): (RX Path) LCRC error injection 0xb (ECRC_ERR): (RX Path) ECRC error injection Value After Reset: 0x0 Testable: writeAsRead
7:0	RW	0x00	EINJ0_COUNT Error injection count. Indicates the number of errors. This register is decremented when the errors have been inserted. If the counter value is 0x01 and error is inserted, ERROR_INJECTION0_ENABLE in EINJ_ENABLE_REG returns 0b. If the counter value is 0x00 and ERROR_INJECTION0_ENABLE=1, the errors are inserted until ERROR_INJECTION0_ENABLE is set to '0'. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

11:6	RO	0x00	EQ_REMOTE_CURSOR EQ Remote Cursor. Indicates Remote cursor coefficient value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5:0	RO	0x00	EQ_REMOTE_PRE_CURSOR EQ Remote Pre-Cursor. Indicates Remote pre cursor coefficient value. Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

11.4.4.27 USP_PCIE_VSECDMA Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_VSECDMA_EXT_CAP_HDR_OFF	0x0000	W	0x0001000B	PCIe Extended Capability ID, Capability Version, and Next Capability Offset Register
USP_PCIE_VSECDMA_VENDOR_SPECIFIC_HDR_OFF	0x0004	W	0x01800006	Vendor Specific Header Register
USP_PCIE_VSECDMA_DEVICE_INFORMATION_OFF	0x0008	W	0x00A80401	DMA and related AXI Bridge Implementation Information
USP_PCIE_VSECDMA_NUM_CHAN_OFF	0x000C	W	0x00020002	Number of Implemented Channels Register
USP_PCIE_VSECDMA_UNROLL_ADDR_OFFSET_LOW_OFF	0x0010	W	0x00000000	DMA Register Map Start Address Offset Low Register
USP_PCIE_VSECDMA_UNROLL_ADDR_OFFSET_HIGH_OFF	0x0014	W	0x00000000	DMA Register Map Start Address Offset High Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.28 USP_PCIE_VSECDMA Detail Registers Description

USP_PCIE_VSECDMA_EXT_CAP_HDR_OFF

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x000	NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b although software must mask them to allow for future uses of these bits. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x0 Testable: writeAsRead
19:16	RW	0x1	CAP Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. A version of the specification that changes the Extended Capability in a way that is not otherwise identifiable (that is, through a new Capability field) is permitted to increment this field. All such changes to the Capability structure must be software-compatible. Software must check for Capability Version numbers that are greater than or equal to the highest number defined when the software is written, as Functions reporting any such Capability Version numbers will contain a Capability structure that is compatible with that piece of software. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0x1 Testable: writeAsRead

Bit	Attr	Reset Value	Description
15:0	RW	0x000b	ID PCI Express Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Value After Reset: 0xb Testable: writeAsRead

USP_PCIE_VSECDMA_VENDOR_SPECIFIC_HDR_OFF
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:20	RO	0x018	VSEC_LENGTH VSEC Length. This field indicates the number of bytes in the entire VSEC structure, including the Vendor-Specific Extended Capability Header, the Vendor-Specific Header, and the vendor-specific registers. Value After Reset: 0x18
19:16	RO	0x0	VSEC_REV VSEC Rev. This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field. Value After Reset: 0x0
15:0	RO	0x0006	VSEC_ID VSEC ID. This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field. Value After Reset: 0x6

USP_PCIE_VSECDMA_DEVICE_INFORMATION_OFF
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26	RO	0x0	MASTER_PAGE_BOUNDARY_POINTER_WIDTH This field provides address page boundary information. It reports the value of CC_MSTR_PAGE_BOUNDARY_PW configuration parameter. Value After Reset: 0xd

Bit	Attr	Reset Value	Description
25:23	RO	0x1	MASTER_BURST_LENGTH Reports the CC_MSTR_BURST_LEN configuration parameter. Values: 0x0 (MSTR_BRSTLEN_8): 8 bits 0x1 (MSTR_BRSTLEN_16): 16 bits 0x2 (MSTR_BRSTLEN_32): 32 bits 0x3 (MSTR_BRSTLEN_64): 64 bits 0x4 (MSTR_BRSTLEN_128): 128 bits 0x5 (MSTR_BRSTLEN_256): 256 bits Value After Reset: 0x1
22:20	RO	0x2	MASTER_BUS_WIDTH This field provides information regarding the AXI master data bus width. It reports the value of MASTER_BUS_DATA_WIDTH configuration parameter. Values: 0x0 (MSTR_BUSWD_32): 32 bits 0x1 (MSTR_BUSWD_64): 64 bits 0x2 (MSTR_BUSWD_128): 128 bits 0x3 (MSTR_BUSWD_256): 256 bits 0x4 (MSTR_BUSWD_512): 512 bits Value After Reset: 0x2
19	RO	0x1	AXI This field provides information about AXI interface usage. It reports the value of AXI_POPULATED configuration parameter. Value After Reset: 0x1
18:16	RO	0x0	CHANNEL_SEPARATION If the MAP_FORMAT is set to HDMA_NATIVE, this field specifies the read write channel address separation. Other values are reserved. Values: 0x0 (CHSEP_256): 256 separated 0x1 (CHSEP_512): 512 separated 0x2 (CHSEP_1K): 1k separated 0x3 (CHSEP_2K): 2k separated 0x4 (CHSEP_4K): 4k separated 0x5 (CHSEP_8K): 8k separated 0x6 (CHSEP_16K): 16k separated 0x7 (CHSEP_32K): 32k separated Value After Reset: 0x0
15:11	RO	0x00	PFN Physical Function Number. This field provides information regarding the DMA register and physical function mapping. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
10:8	RO	0x4	BARN Bar Number. This field provides information regarding the DMA register and BAR number mapping. Value After Reset: 0x4
7:3	RO	0x00	reserved
2:0	RO	0x1	MAP_FORMAT Defines the register map format and features to be one of the following values: Other values are reserved. Values: 0x0 (EDMA_LEGACY_PL): Legacy DMA register map accessed by the port-logic registers 0x1 (EDMA_LEGACY_UNROLL): Legacy DMA register map, mapped to a PF/BAR 0x5 (HDMA_COMPATIBILITY_MODE): HDMA compatibility mode (CC_LEGACY_DMA_MAP =1) register map, mapped to a PF/BAR 0x7 (HDMA_NATIVE): HDMA native (CC_LEGACY_DMA_MAP =0) register map, mapped to a PF/BAR Value After Reset: 0x1

USP_PCIE_VSECDMA_NUM_CHAN_OFF
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25:16	RO	0x002	NUM_DMA_RD_CHAN This field provides information regarding the number of implemented read channels. It reports the value of CC_NUM_DMA_RD_CHAN parameter. Value After Reset: 0x2
15:10	RO	0x00	reserved
9:0	RO	0x002	NUM_DMA_WR_CHAN This field provides information regarding the number of implemented write channels. It reports the value of CC_NUM_DMA_WR_CHAN parameter. Value After Reset: 0x2

USP_PCIE_VSECDMA_UNROLL_ADDR_OFFSET_LOW_OFF
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	UNROLL_ADDR_OFFSET_LOW BAR address offset, 32-bit LSB. Value After Reset: 0x0

USP_PCIE_VSECDMA_UNROLL_ADDR_OFFSET_HIGH_OFF
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	UNROLL_ADDR_OFFSET_HIGH BAR address offset, 32-bit MSB. Value After Reset: 0x0

11.4.4.29 USP_PCIE_RESBAR Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_RESBAR_CAP_HDR_REG	0x0000	W	0x00010015	Resizable BAR Capability Header
USP_PCIE_RESBAR_CAP_REG_0_REG	0x0004	W	0x00007FF0	Resizable BAR0 Capability Register
USP_PCIE_RESBAR_CTRL_REG_0_REG	0x0008	W	0x00000AC0	Resizable BAR0 Control Register
USP_PCIE_RESBAR_CAP_REG_1_REG	0x000C	W	0x00007FF0	Resizable BAR1 Capability Register
USP_PCIE_RESBAR_CTRL_REG_1_REG	0x0010	W	0x00000A01	Resizable BAR1 Control Register
USP_PCIE_RESBAR_CAP_REG_2_REG	0x0014	W	0x00003FF0	Resizable BAR2 Capability Register
USP_PCIE_RESBAR_CTRL_REG_2_REG	0x0018	W	0x00000902	Resizable BAR2 Control Register
USP_PCIE_RESBAR_CAP_REG_3_REG	0x001C	W	0x00001FF0	Resizable BAR3 Capability Register
USP_PCIE_RESBAR_CTRL_REG_3_REG	0x0020	W	0x00000003	Resizable BAR3 Control Register
USP_PCIE_RESBAR_CAP_REG_4_REG	0x0024	W	0x00000010	Resizable BAR4 Capability Register
USP_PCIE_RESBAR_CTRL_REG_4_REG	0x0028	W	0x00000004	Resizable BAR4 Capability Register
USP_PCIE_RESBAR_CAP_REG_5_REG	0x002C	W	0x00000010	Resizable BAR5 Capability Register
USP_PCIE_RESBAR_CTRL_REG_5_REG	0x0030	W	0x00000005	Resizable BAR5 Control Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.30 USP_PCIE_RESBAR Detail Registers Description

USP_PCIE_RESBAR_CAP_HDR_REG

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:20	RW	0x000	RESBAR_CAP_NEXT_OFFSET Next Capability Offset. This field contains the offset to the next PCI Express Extended Capability structure or 000h if no other items exist in the linked list of Capabilities. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xfff (MAX_VAL): Max value Value After Reset: 0x0 Testable: unconstrained
19:16	RW	0x1	RESBAR_CAP_VERSION Capability Version. This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. This bit depends on the version of the specification. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x1 Testable: unconstrained

Bit	Attr	Reset Value	Description
15:0	RW	0x0015	RESBAR_EXT_CAP_ID Resizable BAR Extended Capability ID. This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. The Extended Capability ID for the Resizable BAR Capability is 0015h. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xffff (MAX_VAL): Max value Value After Reset: 0x15 Testable: unconstrained

USP_PCIE_RESBAR_CAP_REG_0_REG
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	RESBAR_CAP_REG_0_128TB Up to 128TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 128 TB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 128 TB. Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
30	RW	0x0	RESBAR_CAP_REG_0_64TB Up to 64TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 64 TB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 64 TB. Value After Reset: 0x0 Testable: writeAsRead
29	RW	0x0	RESBAR_CAP_REG_0_32TB Up to 32TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 32 TB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 32 TB. Value After Reset: 0x0 Testable: writeAsRead
28	RW	0x0	RESBAR_CAP_REG_0_16TB Up to 16TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 16 TB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 16 TB. Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
27	RW	0x0	RESBAR_CAP_REG_0_8TB Up to 8TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 8 TB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 8 TB. Value After Reset: 0x0 Testable: writeAsRead
26	RW	0x0	RESBAR_CAP_REG_0_4TB Up to 4TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 4 TB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 4 TB. Value After Reset: 0x0 Testable: writeAsRead
25	RW	0x0	RESBAR_CAP_REG_0_2TB Up to 2TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 2 TB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 2 TB. Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
24	RW	0x0	RESBAR_CAP_REG_0_1TB Up to 1TB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 1 TB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 1TB. Value After Reset: 0x0 Testable: writeAsRead
23	RW	0x0	RESBAR_CAP_REG_0_512GB Up to 512GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 512 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 512 GB. Value After Reset: 0x0 Testable: writeAsRead
22	RW	0x0	RESBAR_CAP_REG_0_256GB Up to 256GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 256 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 256 GB. Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
21	RW	0x0	RESBAR_CAP_REG_0_128GB Up to 128GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 128 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 128 GB. Value After Reset: 0x0 Testable: writeAsRead
20	RW	0x0	RESBAR_CAP_REG_0_64GB Up to 64GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 64 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 64 GB. Value After Reset: 0x0 Testable: writeAsRead
19	RW	0x0	RESBAR_CAP_REG_0_32GB Up to 32GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 32 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 32 GB. Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
18	RW	0x0	RESBAR_CAP_REG_0_16GB Up to 16GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 16 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 16 GB. Value After Reset: 0x0 Testable: writeAsRead
17	RW	0x0	RESBAR_CAP_REG_0_8GB Up to 8GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 8 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 8 GB. Value After Reset: 0x0 Testable: writeAsRead
16	RW	0x0	RESBAR_CAP_REG_0_4GB Up to 4GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 4 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 4 GB. Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
15	RW	0x0	RESBAR_CAP_REG_0_2GB Up to 2GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 2 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 2 GB. Value After Reset: 0x0 Testable: writeAsRead
14	RW	0x1	RESBAR_CAP_REG_0_1GB Up to 1GB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 1 GB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 1 GB. Value After Reset: 0x1 Testable: writeAsRead
13	RW	0x1	RESBAR_CAP_REG_0_512MB Up to 512MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 512 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 512 MB. Value After Reset: 0x1 Testable: writeAsRead

Bit	Attr	Reset Value	Description
12	RW	0x1	RESBAR_CAP_REG_0_256MB Up to 256MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 256 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 256 MB. Value After Reset: 0x1 Testable: writeAsRead
11	RW	0x1	RESBAR_CAP_REG_0_128MB Up to 128MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 128 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 128 MB. Value After Reset: 0x1 Testable: writeAsRead
10	RW	0x1	RESBAR_CAP_REG_0_64MB Up to 64MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 64 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 64 MB. Value After Reset: 0x1 Testable: writeAsRead

Bit	Attr	Reset Value	Description
9	RW	0x1	RESBAR_CAP_REG_0_32MB Up to 32MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 32 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 32 MB. Value After Reset: 0x1 Testable: writeAsRead
8	RW	0x1	RESBAR_CAP_REG_0_16MB Up to 16MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 16 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 16 MB. Value After Reset: 0x1 Testable: writeAsRead
7	RW	0x1	RESBAR_CAP_REG_0_8MB Up to 8MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 8 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 8 MB. Value After Reset: 0x1 Testable: writeAsRead

Bit	Attr	Reset Value	Description
6	RW	0x1	RESBAR_CAP_REG_0_4MB Up to 4MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 4 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 4 MB. Value After Reset: 0x1 Testable: writeAsRead
5	RW	0x1	RESBAR_CAP_REG_0_2MB Up to 2MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 2 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 2 MB. Value After Reset: 0x1 Testable: writeAsRead
4	RW	0x1	RESBAR_CAP_REG_0_1MB Up to 1MB BAR Supported. When Set, indicates that the Function supports operating with the BAR0 sized to 1 MB. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky. Values: 0x1 (SET): If Set, function supports operating with BAR sized to 256 TB. Value After Reset: 0x0 Testable: writeAsRead
15:14	RO	0x0	reserved
13:8	RW	0x00	RESBAR_CTRL_REG_BAR_SIZE BAR3 Size. The default value of this field is equal to the default size of the address space that the BAR3 resource is requesting via the BAR?s read-only bits. For backward compatibility with software, the default value must be in the range from 0 to 19. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x0 (MIN_VAL): 1MB(2^20 bytes) 0x2b (MAX_VAL): 8EB(2^63 bytes) Value After Reset: 0x9 Testable: writeAsRead
7:5	RO	0x0	RESBAR_CTRL_REG_NUM_BARS Number of Resizeable BARs. This field indicates the total number of resizable BARs in the capability structure for the Function. The value of this field must be in the range of 01h to 06h. The field is valid in Resizable BAR3 Control register (0) (at offset 008h), and is RsvdP for all others. Note: This register field is sticky. Values: 0x1 (BAR1): one resizable BAR for the function 0x2 (BAR2): two resizable BARs for the function. 0x3 (BAR3): three resizable BARs for the function. 0x4 (BAR4): four resizable BARs for the function. 0x5 (BAR5): five resizable BARs for the function. 0x6 (BAR6): six resizable BARs for the function. Value After Reset: 0x0
4:3	RO	0x0	reserved

Bit	Attr	Reset Value	Description
2:0	RO	0x3	RESBAR_CTRL_REG_IDX_3 BAR Index. This encoded value points to the beginning of the BAR3. For a 64-bit Base Address register, the BAR Index indicates the lower DWORD. This value indicates which BAR supports a negotiable size. Note: This register field is sticky. Values: 0x0 (BAR_10h): BAR located at offset 10h. 0x1 (BAR_14h): BAR located at offset 14h. 0x2 (BAR_18h): BAR located at offset 18h. 0x3 (BAR_1Ch): BAR located at offset 1Ch. 0x4 (BAR_20h): BAR located at offset 20h. 0x5 (BAR_24h): BAR located at offset 24h. Value After Reset: 0x3

2:0	RO	0x5	RESBAR_CTRL_REG_IDX_5 BAR Index. This encoded value points to the beginning of the BAR5. For a 64-bit Base Address register, the BAR Index indicates the lower DWORD. This value indicates which BAR supports a negotiable size. Note: This register field is sticky. Values: 0x0 (BAR_10h): BAR located at offset 10h. 0x1 (BAR_14h): BAR located at offset 14h. 0x2 (BAR_18h): BAR located at offset 18h. 0x3 (BAR_1Ch): BAR located at offset 1Ch. 0x4 (BAR_20h): BAR located at offset 20h. 0x5 (BAR_24h): BAR located at offset 24h. Value After Reset: 0x5

11.4.4.31 USP_PCIE_PL Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_PL_ACK_LATENCY_TIMER_OFF	0x0000	W	0x0C23040B	Ack Latency Timer and Replay Timer Register
USP_PCIE_PL_VENDOR_SPEC_DLLP_OFF	0x0004	W	0xFFFFFFFF	Vendor Specific DLLP Register
USP_PCIE_PL_PORT_FORCE_OFF	0x0008	W	0x00800004	Port Force Link Register
USP_PCIE_PL_ACK_F_ASPM_CTRL_OFF	0x000C	W	0x1BD2D200	Ack Frequency and L0-L1 ASPM Control Register
USP_PCIE_PL_PORT_LINK_CTRL_OFF	0x0010	W	0x00030120	Port Link Control Register
USP_PCIE_PL_LANE_SKEW_OFF	0x0014	W	0x08000000	Lane Skew Register
USP_PCIE_PL_TIMER_CTRL_MAX_FUNC_NUM_OFF	0x0018	W	0x00000000	Timer Control and Max Function Number Register
USP_PCIE_PL_SYMBOL_TIMER_FILTER_1_OFF	0x001C	W	0x00000140	Symbol Timer Register and Filter Mask 1 Register
USP_PCIE_PL_FILTER_MASK_2_OFF	0x0020	W	0x00000000	Filter Mask 2 Register
USP_PCIE_PL_AMBA_MUL_OB_DECOMP_NP_SUB_REQ_CTRL_OFF	0x0024	W	0x00000001	AMBA Multiple Outbound Decomposed NP SubRequests Control Register
USP_PCIE_PL_PL_DEBUG0_OFF	0x0028	W	0x00000000	Debug Register 0
USP_PCIE_PL_PL_DEBUG1_OFF	0x002C	W	0x00000000	Debug Register 1
USP_PCIE_PL_TX_P_FC_CREDIT_STATUS_OFF	0x0030	W	0x00000000	Transmit Posted FC Credit Status
USP_PCIE_PL_TX_NP_FC_CREDIT_STATUS_OFF	0x0034	W	0x00000000	Transmit Non-Posted FC Credit Status
USP_PCIE_PL_TX_CPL_FC_CREDIT_STATUS_OFF	0x0038	W	0x00000000	Transmit Completion FC Credit Status

Name	Offset	Size	Reset Value	Description
USP_PCIE_PL_QUEUE_STATUS_OFF	0x003C	W	0x00000000	Queue Status
USP_PCIE_PL_VC_TX_ARBI_1_OFF	0x0040	W	0x0000000F	VC Transmit Arbitration Register 1
USP_PCIE_PL_VC_TX_ARBI_2_OFF	0x0044	W	0x00000000	VC Transmit Arbitration Register 2
USP_PCIE_PL_VC0_P_RX_Q_CTRL_OFF	0x0048	W	0x45227110	Segmented-Buffer VC0 Posted Receive Queue Control
USP_PCIE_PL_VC0_NP_RX_Q_CTRL_OFF	0x004C	W	0x0505C017	Segmented-Buffer VC0 Non-Posted Receive Queue Control
USP_PCIE_PL_VC0_CPL_RX_Q_CTRL_OFF	0x0050	W	0x05000000	Segmented-Buffer VC0 Completion Receive Queue Control
USP_PCIE_PL_GEN2_CTRL_OFF	0x010C	W	0x000102D2	Link Width and Speed Change Control Register
USP_PCIE_PL_PHY_STATUS_OFF	0x0110	W	0x00000000	PHY Status Register
USP_PCIE_PL_PHY_CONTROL_OFF	0x0114	W	0x00000001	PHY Control Register
USP_PCIE_PL_TRGT_MAP_CTRL_OFF	0x011C	W	0x00000047	Programmable Target Map Control Register
USP_PCIE_PL_CLOCK_GATING_CTRL_OFF	0x018C	W	0x00000003	RADM clock gating enable control register
USP_PCIE_PL_GEN3_RELATED_OFF	0x0190	W	0x00000000	Gen3 Control Register
USP_PCIE_PL_GEN3_EQ_CONTROL_OFF	0x01A8	W	0x04059F61	Gen3 EQ Control Register
USP_PCIE_PL_GEN3_EQ_FB_MODE_DIR_CHANGE_OFF	0x01AC	W	0x00000040	Gen3 EQ Direction Change Feedback Mode Control Register
USP_PCIE_PL_ORDER_RULE_CTRL_OFF	0x01B4	W	0x00000000	Order Rule Control Register
USP_PCIE_PL_PIPE_LOOPBACK_CONTROL_OFF	0x01B8	W	0x0000000F	PIPE Loopback Control Register
USP_PCIE_PL_MISC_CONTROL_1_OFF	0x01BC	W	0x00037F40	DBI Read-Only Write Enable Register
USP_PCIE_PL_MULTI_LANE_CONTROL_OFF	0x01C0	W	0x00000080	UpConfigure Multi-lane Control Register
USP_PCIE_PL_PHY_INTEROP_CTRL_OFF	0x01C4	W	0x0001E044	PHY Interoperability Control Register
USP_PCIE_PL_TRGT_CPL_LUT_DELETE_ENTRY_OFF	0x01C8	W	0x00000000	TRGT_CPL_LUT Delete Entry Control Register
USP_PCIE_PL_LINK_FLUSH_CONTROL_OFF	0x01CC	W	0x00000000	Link Reset Request Flush Control Register
USP_PCIE_PL_AMBA_ERROR_RESPONSE_DEFAULT_OFF	0x01D0	W	0x00009C00	AXI Bridge Slave Error Response Register
USP_PCIE_PL_AMBA_LINK_TIMEOUT_OFF	0x01D4	W	0x00000032	Link Down AXI Bridge Slave Timeout Register
USP_PCIE_PL_AMBA_ORDERING_CTRL_OFF	0x01D8	W	0x00000000	AMBA Ordering Control
USP_PCIE_PL_COHERENCY_CONTROL_1_OFF	0x01E0	W	0x00000000	ACE Cache Coherency Control Register 1

Name	Offset	Size	Reset Value	Description
USP_PCIE_PL_COHERENCY_CONTROL_2_OFF	0x01E4	W	0x00000000	ACE Cache Coherency Control Register 2
USP_PCIE_PL_COHERENCY_CONTROL_3_OFF	0x01E8	W	0x00000000	ACE Cache Coherency Control Register 3
USP_PCIE_PL_AXI_MSTR_MSG_ADDR_LOW_OFF	0x01F0	W	0x00000000	Lower 32-bits of the Programmable AXI Address
USP_PCIE_PL_AXI_MSTR_MSG_ADDR_HIGH_OFF	0x01F4	W	0x00000000	Upper 32-bits of the Programmable AXI Address
USP_PCIE_PL_PCIE_VERSION_NUMBER_OFF	0x01F8	W	0x3536302A	PCIe Controller IIP Release Version Number
USP_PCIE_PL_PCIE_VERSION_TYPE_OFF	0x01FC	W	0x6C703035	PCIe Controller IIP Release Version Type
USP_PCIE_PL_MSIX_ADDRESS_MATCH_LOW_OFF	0x0240	W	0x00000000	MSI-X Address Match Low Register
USP_PCIE_PL_MSIX_ADDRESS_MATCH_HIGH_OFF	0x0244	W	0x00000000	MSI-X Address Match High Register
USP_PCIE_PL_MSIX_DOORBELL_OFF	0x0248	W	0x00000000	MSI-X Doorbell Register
USP_PCIE_PL_MSIX_RAM_CTRL_OFF	0x024C	W	0x00000000	MSI-X RAM Power Mode and Debug Control Register
USP_PCIE_PL_DTIM_CTRL0_OFF	0x03B0	W	0x001FFFFF	DTI Master Control Register 0
USP_PCIE_PL_DTIM_CTRL1_OFF	0x03B4	W	0x00000000	DTI Master Control Register 1
USP_PCIE_PL_DTIM_CTRL2_OFF	0x03B8	W	0x00000000	DTI Master Control Register 2
USP_PCIE_PL_DTIM_CTRL3_OFF	0x03BC	W	0x00004210	DTI Master Control Register 3
USP_PCIE_PL_DTIM_CTRL4_OFF	0x03C0	W	0x00000000	DTI Master Control Register 4
USP_PCIE_PL_DTIM_CTRL5_OFF	0x03C4	W	0x00000000	DTI Master Control Register 5
USP_PCIE_PL_DTIM_INT_STATUS_OFF	0x03CC	W	0x00000000	DTI Master Interrupt Status Register
USP_PCIE_PL_DTIM_INT_EN_OFF	0x03D0	W	0x00000000	DTI Master Interrupt Enable Register
USP_PCIE_PL_DTIM_INT_CLR_OFF	0x03D4	W	0x00000000	DTI Master Interrupt Clear Register
USP_PCIE_PL_DTIM_INT_MSK_OFF	0x03D8	W	0x00000000	DTI Master Interrupt Mask Register
USP_PCIE_PL_DTIM_MSI_ADDR_UPR_OFF	0x03DC	W	0x00000000	DTI Master MSI Upper Address Register
USP_PCIE_PL_DTIM_MSI_ADDR_LWR_OFF	0x03E0	W	0x00000000	DTI Master MSI Lower Address Register
USP_PCIE_PL_DTIM_MSI_DATA_OFF	0x03E4	W	0x00000000	DTI Master MSI Data Register
USP_PCIE_PL_DTIM_ERR_LOG0_OFF	0x03E8	W	0x00000000	DTI Master Error Logging Register 0
USP_PCIE_PL_DTIM_ERR_LOG1_OFF	0x03EC	W	0x00000000	DTI Master Error Logging Register 1
USP_PCIE_PL_DTIM_ERR_LOG2_OFF	0x03F0	W	0x00000000	DTI Master Error Logging Register 2

Name	Offset	Size	Reset Value	Description
USP_PCIE_PL_DTIM_DIAG_OFF	0x03FC	W	0x00000010	DTI Master Debug Diagnostic Register
USP_PCIE_PL_PL_APP_BUS_DEV_NUM_STATUS_OFF	0x0410	W	0x00000000	Application Driven bus and Device Number Register
USP_PCIE_PL_PCIPM_TRAFFIC_CTRL_OFF	0x041C	W	0x00000000	TLP Traffic during Non-D0 State Control Register
USP_PCIE_PL_PL_LTR_LATENCY_OFF	0x0430	W	0x00000000	LTR Latency Register
USP_PCIE_PL_AUX_CLK_FREQ_OFF	0x0440	W	0x00000018	Auxiliary Clock Frequency Control Register
USP_PCIE_PL_L1_SUBSTATES_OFF	0x0444	W	0x000000D2	L1 Substates Timing Register
USP_PCIE_PL_POWERDOWN_CTRL_STATUS_OFF	0x0448	W	0x00000020	Powerdown Control and Status Register
USP_PCIE_PL_PIPE_RELATED_OFF	0x0490	W	0x00000000	PIPE Related Register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.32 USP_PCIE_PL Detail Registers Description

USP_PCIE_PL_ACK_LATENCY_TIMER_OFF

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RW	0x0c23	REPLAY_TIME_LIMIT Replay Timer Limit. The replay timer expires when it reaches this limit. The controller initiates a replay upon reception of a NAK or when the replay timer expires. For more details, see "Transmit Replay" in the Databook. You can modify the effective timer limit through the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-4, 3-5, and 3-6 of the PCI Express Base Specification. If there is a change in the payload size or link speed, the controller overrides any value that you have written to this register field, and resets the field back to the specification-defined value. The controller does not change the value in the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. Value After Reset: 0xc23 Testable: untestable Volatile: true

Bit	Attr	Reset Value	Description
15:0	RW	0x040b	ROUND_TRIP_LATENCY_TIME_LIMIT Ack Latency Timer Limit. The Ack latency timer expires when it reaches this limit. For more details, see "ACK/NAK Scheduling" in the Databook. You can modify the effective timer limit through the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-7, 3-8, and 3-9 of the PCI Express Base Specification. The limit must reflect the round trip latency from requester to completer. If there is a change in the payload size or link width, the controller overrides any value that you have written to this register field, and resets the field back to the specification-defined value. The controller does not change the value in the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. Value After Reset: 0x40b Testable: untestable Volatile: true

USP_PCIE_PL_VENDOR_SPEC_DLLP_OFF
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:0	RW	0xffffffff	VENDOR_SPEC_DLLP Vendor Specific DLLP Register. You can use this register to send a specific PCI Express DLLP. Your application can write 8-bit DLLP Type and 24-bit Payload data into this register, and set the VENDOR_SPECIFIC_DLLP_REQ field of the PORT_LINK_CTRL_OFF, to send the DLLP. Bits[7:0]: DLLP Type Bits[31:8]: Vendor Defined Payload (24 bits) Note: This register field is sticky. Values: 0x0 (ZERO): Zero value 0xffffffff (MAX): Max value Value After Reset: 0xffffffff

USP_PCIE_PL_PORT_FORCE_OFF
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

Bit	Attr	Reset Value	Description
23	RW	0x1	DO_DESKEW_FOR_SRIS Use the transitions from TS2 to Logical Idle Symbol, SKP OS to Logical Idle Symbol, EIEOS to Logical Idle Symbol, and FTS Sequence to SKP OS to do deskew instead of using received SKP OS or TS1 to TS2 transition if DO_DESKEW_FOR_SRIS is set to '1'. Note: This register field is sticky. Value After Reset: 0x1
22	RW	0x0	SUPPORT_PART_LANES_RXEI_EXIT Support LTSSM transition from Polling.Active to Polling.Config based on Rx 8 TSs on any lanes which are Rx EI exit too from base spec after 24ms timeout. This prevents some lanes detected but not Rx EI exit and LTSSM cannot move to Polling.Config. You must set the parameter CX_AUTO_LANE_FLIP_CTRL_EN true for the auto lanes reversal. Note: This register field is sticky. Values: 0x1 (SUPPORT): Any lanes receives 8 consecutive TS OSs, LTSSM moves from Polling.Active to Polling.Config. If all lanes do not receive 8 consecutive TS OSs and any predetermined lanes are still on Rx ElecIdle, LTSSM moves from Polling.Active to Polling.Compliance. 0x0 (UNSUPPORT): Any lanes receives 8 consecutive TS OS and all predetermined lanes have Rx ElecIdle exit, LTSSM moves from Polling.Active to Polling.Config. This is legacy mode from Base Spec. Any predetermined lanes are still on Rx ElecIdle, LTSSM moves from Polling.Active to Polling.Compliance. Value After Reset: 0x0
21:16	RW	0x00	LINK_STATE Forced LTSSM State. The LTSSM state that the controller is forced to when you set the FORCE_EN bit (Force Link). LTSSM state encoding is defined by the lts_state variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15	WO	0x0	FORCE_EN Force Link. The controller supports a testing and debug capability to allow your software to force the LTSSM state machine into a specific state, and to force the controller to transmit a specific Link Command. Asserting this bit triggers the following actions: Forces the LTSSM to the state specified by the Forced LTSSM State field. Forces the controller to transmit the command specified by the Forced Link Command field. This is a self-clearing register field. Reading from this register field always returns a '0'. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0 Testable: writeAsRead Volatile: true
14:12	RO	0x0	reserved
11:8	RW	0x0	FORCED_LTSSM Forced Link Command. The link command that the controller is forced to transmit when you set FORCE_EN bit (Force Link). Link command encoding is defined by the ltssm_cmd variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky. Value After Reset: 0x0
7:0	RW	0x04	LINK_NUM Link Number. Not used for endpoint. Note: This register field is sticky. Value After Reset: 0x4

USP_PCIE_PL_ACK_F_ASPM_CTRL_OFF

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved

Bit	Attr	Reset Value	Description
30	RW	0x0	ENTER_ASPM ASPM L1 Entry Control. Note: This register field is sticky. Values: 0x1 (IDLE_TO_L1): Controller enters ASPM L1 after a period in which it has been idle. 0x0 (L0S_TO_L1): Controller enters ASPM L1 only after idle period during which both receive and transmit are in L0s. Value After Reset: 0x0
29:27	RW	0x3	L1_ENTRANCE_LATENCY L1 Entrance Latency. Note: Programming this timer with a value greater that 32us has no effect unless extended sync is used, or all of the credits are infinite. Note: This register field is sticky. Values: 0x0 (_1_US): 1 us 0x1 (_2_US): 2 us 0x2 (_4_US): 4 us 0x3 (_8_US): 8 us 0x4 (_16_US): 16 us 0x5 (_32_US): 32 us 0x6 (_64_US): 64Us 0x7 (_64US_): 64 us Value After Reset: 0x3
26:24	RW	0x3	L0S_ENTRANCE_LATENCY L0s Entrance Latency. Note: This register field is sticky. Values: 0x0 (_1_US): 1 us 0x1 (_2_US): 2 us 0x2 (_3_US): 3 us 0x3 (_4_US): 4 us 0x4 (_5_US): 5 us 0x5 (_6_US): 6 us 0x6 (_7_US): 7 US 0x7 (_7US_): 7 us Value After Reset: 0x3

Bit	Attr	Reset Value	Description
23:16	RO	0xd2	COMMON_CLK_N_FTS Common Clock N_FTS. This is the N_FTS when common clock is used. The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. This field is only writable (sticky) when all of the following configuration parameter equations are true: CX_NFTS !=CX_COMM_NFTS DEFAULT_L0S_EXIT_LATENCY !=DEFAULT_COMM_L0S_EXIT_LATENCY DEFAULT_L1_EXIT_LATENCY !=DEFAULT_COMM_L1_EXIT_LATENCY Note: The access attributes of this field are as follows: Wire: R Dbi: R Values: 0x0 (ZERO): The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. 0xff (MAX_VAL): The maximum number of FTS ordered-sets that a component can request is 255. Value After Reset: 0xd2
15:8	RW	0xd2	ACK_N_FTS The number of Fast Training Sequence(N_FTS) ordered sets to be transmitted when transitioning from L0s to L0. Note: This register field is sticky. Values: 0x0 (ZERO): The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. 0xff (MAX_VAL): The maximum number of FTS ordered-sets that a component can request is 255. Value After Reset: 0xd2

Bit	Attr	Reset Value	Description
7:0	RW	0x00	ACK_FREQ Ack Frequency. The controller accumulates the number of pending ACKs specified here (up to 255) before scheduling an ACK DLLP. 0: Indicates that this Ack Frequency Counter feature is turned off. The controller generates a low-priority ACK request for every TLP that it receives. The controller waits until the ACK Latency Timer expires, then converts the current low-priority ACK request to a high-priority ACK request and schedules the DLLP for transmission to the remote link partner. 1-255: Indicates that the controller will schedule a high-priority ACK after receiving this number of TLPs. It might schedule the ACK before receiving this number of TLPs if the ACK Latency Timer expires, but never later. For a typical system, you do not have to modify the default setting. For more details, see "ACK/NAK Scheduling" in the Databook. Note: This register field is sticky. Values: 0x0 (MIN_VAL): The value '0' indicates that this Ack Frequency Counter feature is turned off. 0xff (MAX_VAL): Any value between 1 and 255 indicates that the controller will schedule a high-priority ACK after receiving the specified number of TLPs. Value After Reset: 0x0

USP_PCIE_PL_PORT_LINK_CTRL_OFF
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	TRANSMIT_LANE_REVERSALE_ENABLE TRANSMIT_LANE_REVERSALE_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
26	RW	0x0	EXTENDED_SYNCH EXTENDED_SYNCH is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
25	RW	0x0	CORRUPT_LCRC_ENABLE CORRUPT_LCRC_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
24	RW	0x0	BEACON_ENABLE BEACON_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
23:22	RO	0x0	reserved
21:16	RW	0x03	LINK_CAPABLE Link Mode Enable. Sets the number of lanes in the link that you want to connect to the link partner. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Predetermined Number of Lanes" field of the "Link Width and Speed Change Control Register". For more information, see "How to Tie Off Unused Lanes". For information on upsizing and downsizing the link width, see "Link Establishment". Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (X1): x1 0x3 (X2): x2 0x7 (X4): x4 0xf (X8): x8 0x1f (X16): x16 0x3f (X32): x32 (not supported) Value After Reset: 0x7 Testable: unconstrained
15:12	RO	0x0	reserved
11:8	RW	0x1	LINK_RATE LINK_RATE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
7	RW	0x0	FAST_LINK_MODE Fast Link Mode. Sets all internal LTSSM millisecond timers to Fast Mode for speeding up simulation. Forces the LTSSM training (link initialization) to use shorter time-outs and to link up faster. The default scaling factor can be changed using the DEFAULT_FAST_LINK_SCALING_FACTOR parameter or through the FAST_LINK_SCALING_FACTOR field in the TIMER_CTRL_MAX_FUNC_NUM_OFF register. Fast Link Mode can also be activated by setting the diag_ctrl_bus[2] pin to '1'. For more details, see the "Fast Link Simulation Mode" section in the "Integrating the Controller with the PHY or Application RTL or Verification IP" chapter of the User Guide. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
6	RW	0x0	LINK_DISABLE LINK_DISABLE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
5	RW	0x1	DLL_LINK_EN DLL Link Enable. Note: This register field is sticky. Values: 0x1 (ENABLE): Enables link initialization. 0x0 (DISABLE): The controller does not transmit InitFC DLLPs and does not establish a link. Value After Reset: 0x1
4	RO	0x0	reserved
3	RW	0x0	RESET_ASSERT Reset Assert. Triggers a recovery and forces the LTSSM to the hot reset state (downstream port only). Note: This register field is sticky. Values: 0x1 (SET): Set 0x0 (CLEAR): Clear Value After Reset: 0x0

Bit	Attr	Reset Value	Description
2	RW	0x0	LOOPBACK_ENABLE Loopback Enable. Turns on loopback. For more details, see "Loopback" in the Databook. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
1	RW	0x0	SCRAMBLE_DISABLE Scramble Disable. Turns off data scrambling. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
0	W1C	0x0	VENDOR_SPECIFIC_DLLP_REQ Vendor Specific DLLP Request. Reading from this self-clearing register field always returns a '0'. Values: 0x1 (SET): When software writes a '1' to this bit, the controller transmits the DLLP contained in the VENDOR_SPEC_DLLP field of VENDOR_SPEC_DLLP_OFF 0x0 (CLEAR): This is a self clearing register Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_PL_LANE_SKEW_OFF
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31	RW	0x0	DISABLE_LANE_TO_LANE_DESKEW Disable Lane-to-Lane Deskew. Causes the controller to disable the internal Lane-to-Lane deskew logic. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
30:27	RW	0x1	IMPLEMENT_NUM_LANES Implementation-specific Number of Lanes. Set the implementation-specific number of lanes. The number of lanes to be used when in Loopback Master. The number of lanes programmed must be equal to or less than the valid number of lanes set in LINK_CAPABLE field. You must configure this field before initiating Loopback by writing in the LOOPBACK_ENABLE field. The controller will transition from Loopback.Entry to Loopback.Active after receiving two consecutive TS1 Ordered Sets with the Loopback bit asserted on the implementation specific number of lanes configured in this field. Note: This register field is sticky. Values: 0x0 (_1_LANE): 1 lane 0x1 (_2_LANE): 2 lanes 0x3 (_4_LANE): 4 lanes 0x7 (_8_LANE): 8 lanes 0xf (_16_LANE): 16 lanes Value After Reset: 0x3
26	RW	0x0	ELASTIC_BUFFER_MODE Selects Elasticity Buffer operating mode: Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (HALF_FULL): Nominal Half Full Buffer mode 0x1 (EMPTY): Nominal Empty Buffer Mode Value After Reset: 0x1

Bit	Attr	Reset Value	Description
25	RW	0x0	ACK_NAK_DISABLE Ack/Nak Disable. Prevents the controller from sending ACK and NAK DLLPs. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
24	RW	0x0	FLOW_CTRL_DISABLE Flow Control Disable. Prevents the controller from sending FC DLLPs. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
23:0	RW	0x000000	INSERT_LANE_SKEW INSERT_LANE_SKEW is an internally reserved field. Do not use. Note: This register field is sticky. Values: 0x0 (MIN): Zero value 0xff (MAX): Max value Value After Reset: 0x0

USP_PCIE_PL_TIMER_CTRL_MAX_FUNC_NUM_OFF
Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31	RO	0x0	reserved
30:29	RW	0x0	FAST_LINK_SCALING_FACTOR Fast Link Timer Scaling Factor. Sets the scaling factor of LTSSM timer when FAST_LINK_MODE field in PORT_LINK_CTRL_OFF is set to '1'. Default is set by the hidden configuration parameter DEFAULT_FAST_LINK_SCALING_FACTOR which defaults to '0'. Note: This register field is sticky. Values: 0x0 (SF_1024): Scaling Factor is 1024 (1ms is 1us). When the LTSSM is in Config or L12 Entry State, 1ms timer is 2us, 2ms timer is 4us and 3ms timer is 6us. 0x1 (SF_256): Scaling Factor is 256 (1ms is 4us) 0x2 (SF_64): Scaling Factor is 64 (1ms is 16us) 0x3 (SF_16): Scaling Factor is 16 (1ms is 64us) Value After Reset: 0x2

Bit	Attr	Reset Value	Description
28:24	RW	0x00	UPDATE_FREQ_TIMER UPDATE_FREQ_TIMER is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
23:19	RW	0x00	TIMER_MOD_ACK_NAK Ack Latency Timer Modifier. Increases the timer value for the Ack latency timer in increments of 64 clock cycles. A value of '0' represents no modification to the timer value. For more details, see the ROUND_TRIP_LATENCY_TIME_LIMIT field of the ACK_LATENCY_TIMER_OFF register. Note: This register field is sticky. Value After Reset: 0x0
18:14	RW	0x00	TIMER_MOD_REPLAY_TIMER Replay Timer Limit Modifier. Increases the time-out value for the replay timer in increments of 64 clock cycles at Gen1 or Gen2 speed, and in increments of 256 clock cycles at Gen3 speed. A value of '0' represents no modification to the timer limit. For more details, see the REPLAY_TIME_LIMIT field of the ACK_LATENCY_TIMER_OFF register. At Gen3 speed, the controller automatically changes the value of this field to DEFAULT_GEN3_REPLAY_ADJ. Note: This register field is sticky. Value After Reset: 0xa Testable: writeAsRead Reset Mask: 0x0 Volatile: true
13:8	RO	0x00	reserved
7:0	RW	0x00	MAX_FUNC_NUM Maximum function number that can be used in a request. Configuration requests targeted at function numbers above this value are returned with UR (unsupported request). Note: This register field is sticky. Values: 0x0 (MIN): Zero value 0xff (MAX): Max value Value After Reset: 0x0

USP_PCIE_PL_SYMBOL_TIMER_FILTER_1_OFF
Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31	RW	0x0	CX_FLT_MASK_RC_CFG_DISCARD CX_FLT_MASK_RC_CFG_DISCARD 0: For RADM RC filter to not allow CFG transaction being received 1: For RADM RC filter to allow CFG transaction being received
30	RW	0x0	CX_FLT_MASK_RC_IO_DISCARD CX_FLT_MASK_RC_IO_DISCARD 0: For RADM RC filter to not allow IO transaction being received 1: For RADM RC filter to allow IO transaction being received
29	RW	0x0	CX_FLT_MASK_MSG_DROP CX_FLT_MASK_MSG_DROP 0: Drop MSG TLP (except for Vendor MSG). Send decoded message on the SII. 1: Do not Drop MSG (except for Vendor MSG). Send message TLPs to your application on TRGT1 and send decoded message on the SII. The default for this bit is the inverse of FLT_DROP_MSG. That is, if FLT_DROP_MSG =1, then the default of this bit is '0' (drop message TLPs). This bit only controls message TLPs other than Vendor MSGs. Vendor MSGs are controlled by Filter Mask Register 2, bits [1:0]. The controller never passes ATS Invalidate messages to the SII interface regardless of this filter rule setting. The controller passes all ATS Invalidate messages to TRGT1 (or AXI bridge master), as they are too big for the SII.
28	RW	0x0	CX_FLT_MASK_CPL_ECRC_DISCARD CX_FLT_MASK_CPL_ECRC_DISCARD Only used when completion queue is advertised with infinite credits and is in store-and-forward mode. 0: Discard completions with ECRC errors 1: Allow completions with ECRC errors to be passed up Reserved field for SW.
27	RW	0x0	CX_FLT_MASK_ECRC_DISCARD CX_FLT_MASK_ECRC_DISCARD 0: Discard TLPs with ECRC errors 1: Allow TLPs with ECRC errors to be passed up
26	RW	0x0	CX_FLT_MASK_CPL_LEN_MATCH CX_FLT_MASK_CPL_LEN_MATCH 0: Enforce length match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err 1: Mask length match for completions
25	RW	0x0	CX_FLT_MASK_CPL_ATTR_MATCH CX_FLT_MASK_CPL_ATTR_MATCH 0: Enforce attribute match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask attribute match for completions

Bit	Attr	Reset Value	Description
24	RW	0x0	CX_FLT_MASK_CPL_TC_MATCH CX_FLT_MASK_CPL_TC_MATCH 0: Enforce Traffic Class match for completions; a violation results in a malformed TLP error, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Traffic Class match for completions
23	RW	0x0	CX_FLT_MASK_CPL_FUNC_MATCH CX_FLT_MASK_CPL_FUNC_MATCH 0: Enforce function match for completions; a violation results in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask function match for completions
22	RW	0x0	CX_FLT_MASK_CPL_REQID_MATCH CX_FLT_MASK_CPL_REQID_MATCH 0: Enforce Req. Id match for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Req. Id match for completions
21	RW	0x0	CX_FLT_MASK_CPL_TAGERR_MATCH CX_FLT_MASK_CPL_TAGERR_MATCH 0: Enforce Tag Error Rules for completions; a violation result in cpl_abort, and possibly AER of unexp_cpl_err, cpl_rcvd_ur, cpl_rcvd_ca 1: Mask Tag Error Rules for completions
20	RW	0x0	CX_FLT_MASK_LOCKED_RD_AS_UR CX_FLT_MASK_LOCKED_RD_AS_UR 0: Treat locked Read TLPs as UR for EP; Supported for RC 1: Treat locked Read TLPs as Supported for EP; UR for RC
19	RW	0x0	CX_FLT_MASK_CFG_TYPE1_REQ_AS_UR CX_FLT_MASK_CFG_TYPE1_REQ_AS_UR 0: Treat CFG type1 TLPs as UR for EP; Supported for RC 1: Treat CFG type1 TLPs as Supported for EP; UR for RC When CX_SRIOV_ENABLE is set then this bit is set to allow the filter to process Type 1 Config requests if the EP consumes more than one bus number.
18	RW	0x0	CX_FLT_MASK_UR_OUTSIDE_BAR CX_FLT_MASK_UR_OUTSIDE_BAR 0: Treat out-of-bar TLPs as UR 1: Do not treat out-of-bar TLPs as UR
17	RW	0x0	CX_FLT_MASK_UR_POIS CX_FLT_MASK_UR_POIS 0: Treat poisoned request TLPs as UR 1: Do not treat poisoned request TLPs as UR The native controller always passes poisoned completions to your application except when you are using the DMA read channel.

Bit	Attr	Reset Value	Description
16	RW	0x0	CX_FLT_MASK_UR_FUNC_MISMATCH CX_FLT_MASK_UR_FUNC_MISMATCH 0: Treat Function MisMatched TLPs as UR 1: Do not treat Function MisMatched TLPs as UR Note: This register field is sticky. Value After Reset: 0x0
15	RW	0x0	DISABLE_FC_WD_TIMER Disable FC Watchdog Timer. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
14:11	RW	0x0	EIDLE_TIMER EIDLE_TIMER is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
10:0	RW	0x140	SKP_INT_VAL SKP Interval Value. The number of symbol times to wait between transmitting SKP ordered sets. The controller waits the number of symbol times in this register plus 1, between transmitting SKP ordered sets. Your application must program this register accordingly. For example, if 1536 were programmed into this register (in a 250 MHz controller), then the controller actually transmits SKP ordered sets once every 1537 symbol times. The value programmed to this register is actually clock ticks and not symbol times. In a 125 MHz controller, programming the value programmed to this register should be scaled down by a factor of 2 (because one clock tick =two symbol times in this case). Note: This value is not used at Gen3 speed; the skip interval is hardcoded to 370 blocks. Note: This register field is sticky. Value After Reset: 0x140

Bit	Attr	Reset Value	Description
24	RW	0x0	LANE_UNDER_TEST The Lane Under Test is the lane for Forced Lane Flip or for Loopback Eq. Only one lane is configured each time. The default of this field is the CX_DEFAULT_LANE_UNDER_TEST configuration parameter. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (MIN_VAL): Zero 0x1 (MAX_VAL): CX_NL Value After Reset: 0x0
23	RW	0x0	SELECTABLE_DEEMPH_BIT_MUX The selectable deemphasis bit (Symbol 4 bit 6) of the transmitted TS2 Ordered Sets for DSP in Recovery.RcvrCfg state is muxed between the Selectable De-emphasis field in the Link Control 2 register and the value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP. Note: This register field is sticky. Values: 0x0 (FROM_LINK_CTRL_2_REG): The value from the Selectable De-emphasis field in the Link Control 2 register 0x1 (REQUESTED_BY_USP): The value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP Value After Reset: 0x0
22	RW	0x0	SELECT_DEEMPH_VAR_MUX The select_deemphasis variable for DSP on entry to Recovery.RcvrCfg state is muxed between the Selectable De-emphasis field in the Link Control 2 register and the value requested by the Upstream Port in the eight consecutive TS1 Ordered Sets it received. Note: This register field is sticky. Values: 0x0 (REQUESTED_BY_USP): The value requested by USP in Recovery.RcvrLock state through Tx TS1s from USP 0x1 (FROM_LINK_CTRL_2_REG): The value from the Selectable De-emphasis field in the Link Control 2 register Value After Reset: 0x0

Bit	Attr	Reset Value	Description
21	RW	0x0	GEN1_EI_INFERENCE Electrical Idle Inference Mode at Gen1 Rate. Programmable mode to determine inferred electrical idle (EI) in Recovery.Speed or Loopback.Active (as slave) state at Gen1 speed by looking for a '1' value on RxElecIdle instead of looking for a '0' on RxValid. If the PHY fails to deassert the RxValid signal in Recovery.Speed or Loopback.Active (because of corrupted EIOS for example), then EI cannot be inferred successfully in the controller by just detecting the condition RxValid=0. Note: This register field is sticky. Values: 0x0 (RXELECIDLE_TO_INFER): Use RxElecIdle signal to infer Electrical Idle 0x1 (RXVALID_TO_INFER): Use RxValid signal to infer Electrical Idle Value After Reset: 0x0
20	RW	0x0	SEL_DEEMPHASIS Used to set the de-emphasis level for upstream ports. This bit selects the level of de-emphasis the link operates at. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (N_6DB): -6 dB 0x1 (N_3_5DB): -3.5 dB Value After Reset: 0x0
19	RW	0x0	CONFIG_TX_COMP_RX Config Tx Compliance Receive Bit. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (SET): When set to 1, signals LTSSM to transmit TS ordered sets with the compliance receive bit assert (equal to '1'). 0x0 (CLEAR): Clear Value After Reset: 0x0

Bit	Attr	Reset Value	Description
18	RW	0x0	CONFIG_PHY_TX_CHANGE Config PHY Tx Swing. Controls the PHY transmitter voltage swing level. The controller drives the mac_phy_txswing output from this register bit field. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (FULL_SWING): Full Swing 0x1 (LOW_SWING): Low Swing Value After Reset: 0x0
17	RW	0x0	DIRECT_SPEED_CHANGE Directed Speed Change. When the speed change occurs, the controller will clear the contents of this field; and a read to this field by your software will return a '0'. To manually initiate the speed change: Write to LINK_CONTROL2_LINK_STATUS2_REG.PCIE_CAP_TARGET_LINK_SPEED in the local device Deassert this field Assert this field If you set the default of this field using the DEFAULT_GEN2_SPEED_CHANGE configuration parameter to '1', then the speed change is initiated automatically after link up, and the controller clears the contents of this field. If you want to prevent this automatic speed change, then write a lower speed value to the Target Link Speed field of the Link Control 2 register (LINK_CONTROL2_LINK_STATUS2_OFF.PCIE_CAP_TARGET_LINK_SPEED) through the DBI before link up. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Values: 0x1 (SET): Writing '1' to this field instructs the LTSSM to initiate a speed change to Gen2 or Gen3 after the link is initialized at Gen1 speed. 0x0 (CLEAR): Clear Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
16	RW	0x1	AUTO_LANE_FLIP_CTRL_EN Enable Auto flipping of the lanes. You must set the CX_AUTO_LANE_FLIP_CTRL_EN configuration parameter to include the hardware for this feature in the controller. For more details, see the 'Lane Reversal' appendix in the Databook. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x1 Testable: unconstrained
15:13	RW	0x0	PRE_DET_LANE Predetermined Lane for Auto Flip. This field defines which physical lane is connected to logical Lane0 by the flip operation performed in Detect. This field is used to restrict the receiver detect procedure to a particular lane when the default detect and polling procedure performed on all lanes cannot be successful. A notable example of when it is useful to program this field to a value different from the default, is when a lane is asymmetrically broken, that is, it is detected in Detect LTSSM state but it cannot exit Electrical Idle in Polling LTSSM state. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x0 (LANE0): Connect logical Lane0 to physical lane 0 or CX_NL-1 or CX_NL/2-1 or CX_NL/4-1 or CX_NL/8-1, depending on which lane is detected 0x1 (LANE1): Connect logical Lane0 to physical lane 1 0x2 (LANE3): Connect logical Lane0 to physical lane 3 0x3 (LANE7): connect logical lane0 to physical lane 7 0x4 (LANE15): Connect logical Lane0 to physical lane 15 Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
12:8	RW	0x02	NUM_OF_LANES Predetermined Number of Lanes. Defines the number of lanes which are connected and not bad. Used to limit the effective link width to ignore 'broken" or "unused" lanes that detect a receiver. Indicates the number of lanes to check for exit from Electrical Idle in Polling.Active and L2.Idle. It is possible that the LTSSM might detect a receiver on a bad or broken lane during the Detect Substate. However, it is also possible that such a lane might also fail to exit Electrical Idle and therefore prevent a valid link from being configured. This value is referred to as the "Predetermined Number of Lanes" in section 4.2.6.2.1 of the PCI Express Base Specification. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Link Mode Enable" field of PORT_LINK_CTRL_OFF. The value in this register is normally the same as the encoded value in PORT_LINK_CTRL_OFF. If you find that one of your used lanes is bad then you must reduce the value in this register. For more information, see "How to Tie Off Unused Lanes" in the Databook. For information on upsizing and downsizing the link width, see "Link Establishment" in the Databook. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (_1_LANE): 1 lane 0x2 (_2_LANE): 2 lanes 0x3 (_3_LANE): 3 lanes Value After Reset: 0x4 Testable: unconstrained
7:0	RW	0xd2	FAST_TRAINING_SEQ Sets the Number of Fast Training Sequences (N_FTS) that the controller advertises as its N_FTS during Gen2 or Gen3 link training. This value is used to inform the link partner about the PHY's ability to recover synchronization after a low power state. The number should be provided by the PHY vendor. Do not set N_FTS to zero; doing so can cause the LTSSM to go into the recovery state when exiting from L0s. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0xd2

USP_PCIE_PL_PHY_STATUS_OFF
Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	PHY_STATUS PHY Status. Data received directly from the phy_cfg_status bus. These is a GPIO register reflecting the values on the static phy_cfg_status input signals. The usage is left completely to the user and does not in any way influence controller functionality. You can use it for any static sideband status signalling requirements that you have for your PHY. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Zero value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

USP_PCIE_PL_PHY_CONTROL_OFF

Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000001	PHY_CONTROL PHY Control. Data sent directly to the cfg_phy_control bus. This is a GPIO register driving the values on the static cfg_phy_control output signals, and does not in any way influence controller functionality. It can be used for any static sideband control signaling requirements that you have for your PHY. Usage of this register and the associated GPIO bus is RESERVED when the controller is connected to a Synopsys PHY. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Zero value 0xffffffff (MAX_VAL): Max value Value After Reset: 0x1

USP_PCIE_PL_TRGT_MAP_CTRL_OFF

Address: Operational Base + offset (0x011C)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved

Bit	Attr	Reset Value	Description
20:16	RW	0x00	TARGET_MAP_INDEX The number of the PF Function on which the Target Values are set. This register does not respect the Byte Enable setting, any write will affect all register bits. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15:7	RO	0x000	reserved
6	RW	0x1	TARGET_MAP_ROM Target Value for the ROM page of the PF Function selected by the index number. This register does not respect the Byte Enable setting, any write will affect all register bits. Value After Reset: 0x1 Testable: writeAsRead Volatile: true
5:0	RW	0x07	TARGET_MAP_PF Target Values for each BAR on the PF Function selected by the index number. This register does not respect the Byte Enable setting, any write will affect all register bits. Value After Reset: 0x2f Testable: writeAsRead Volatile: true

USP_PCIE_PL_CLOCK_GATING_CTRL_OFF
Address: Operational Base + offset (0x018C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
1	RW	0x1	AXI_CLK_GATING_EN AXI Clock Gating Enable. This register enables the AXI Bridge to autonomously enable and disable the AXI Master clock, the AXI Slave clock and the AXI DBI slave clock. The DWC_pcie_clk_rst.v module provides the gated clock, mstr_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, mstr_aclk_active, is asserted. For the AXI Slave this module provides the gated clock, slv_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, slv_aclk_active, is asserted. If the AXI DBI Slave is enabled (DBI_4SLAVE_POPULATED=1) the module provides the gated clock, dbi_axi_aclk_gated, to the AXI Bridge and is enabled when the controllers clock enable signal, dbi_aclk_active, is asserted. The controller de-asserts the clock enable signals when the respective AXI Master/Slave interfaces are idle. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable (default) Value After Reset: 0x1
0	RW	0x1	RADM_CLK_GATING_EN RADM Clock Gating Enable. This register, if set, enables the RADM to autonomously enable and disable its clock. The DWC_pcie_clk_rst.v module provides the gated clock, radm_clk_g, to the RADM and is enabled when the controllers clock enable signal, en_radm_clk_g, is asserted. The RADM clock is a gated version of the controller clock, core_clk. The controller de-asserts en_radm_clk_g when there is no Rx traffic, Rx queues and pre/post-queue pipelines are empty, RADM completion LUT is empty, and there are no FLR actions pending. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable (default) Value After Reset: 0x1

USP_PCIE_PL_GEN3_RELATED_OFF
Address: Operational Base + offset (0x0190)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved

23	RW	0x0	GEN3_EQ_INVREQ_EVAL_DIFF_DISABLE Eq InvalidRequest and RxEqEval Different Time Assertion Disable. Disable the assertion of Eq InvalidRequest and RxEqEval at different time. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
22:19	RO	0x0	reserved
18	RW	0x0	GEN3_DC_BALANCE_DISABLE DC Balance Disable. Disable DC Balance feature. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0
17	RW	0x0	GEN3_DLLP_XMT_DELAY_DISABLE DLLP Transmission Delay Disable. Disable delay transmission of DLLPs before equalization. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
16	RW	0x0	GEN3_EQUALIZATION_DISABLE Equalization Disable. Disable equalization feature. This bit cannot be changed once the LTSSM starts link training. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
15:14	RO	0x0	reserved

Bit	Attr	Reset Value	Description
13	RW	0x0	RXEQ_RGRDLESS_RXTS When set to '1', the controller as Gen3 EQ master asserts RxEqEval to instruct the PHY to do Rx adaptation and evaluation after a 500ns timeout from a new preset request. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: The access attributes of this field are as follows: Wire: see description Dbi: see description Note: This register field is sticky. Values: 0x0 (ASSERT_1US): mac_phy_rxeqeval asserts after 1us and 2 TS1 received from remote partner. 0x1 (ASSERT_500NS): mac_phy_rxeqeval asserts after 500ns regardless of TS's received or not. Value After Reset: 0x1 Testable: writeAsRead
12	RW	0x0	RXEQ_PH01_EN Rx Equalization Phase 0/Phase 1 Hold Enable. When this bit is set the upstream port holds phase 0 (the downstream port holds phase 1) for 10ms. Holding phase 0 or phase 1 can be used to allow sufficient time for Rx Equalization to be performed by the PHY. This bit is used during Virtex-7 Gen3 equalization. The programmable bits [RXEQ_PH01_EN, EQ_PHASE_2_3] can be used to obtain the following variations of the equalization procedure: Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: The access attributes of this field are as follows: Wire: see description Dbi: see description Note: This register field is sticky. Values: 0x0 (TX_EQ_23): Tx equalization only in phase 2/3 0x1 (NO_TX_EQ_NO_RX_EQ): No Tx equalization Value After Reset: 0x0 Testable: writeAsRead

Bit	Attr	Reset Value	Description
11	RW	0x0	EQ_REDO Equalization Redo Disable. Disable autonomous mechanism for requesting to redo the equalization process. The received presets or coefficients mismatch in Recovery.RcvrLock after Recovery EQ phases causes the EQ redo requests. If the EQ redo is infinite or you do not want eq requests and redo, setting this bit to 1 will stop the EQ requests and EQ redo so that the link can go ahead to L0 state for packet trasmissions. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0 Testable: unconstrained
10	RW	0x0	EQ_EIEOS_CNT Equalization EIEOS Count Reset Disable. Disable requesting reset of EIEOS count during equalization. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Values: 0x1 (DISABLE): Disable Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
9	RW	0x0	EQ_PHASE_2_3 Equalization Phase 2 and Phase 3 Disable. This applies to downstream ports only. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: The access attributes of this field are as follows: Wire: see description Dbi: see description Note: This register field is sticky. Values: 0x1 (TX_EQ_23_RX_EQ_PH01): No Rx equalization 0x0 (NO_TX_EQ_RX_EQ_PH01): Rx equalization in phase 0/1 Value After Reset: 0x0 Testable: writeAsRead
8	RW	0x0	DISABLE_SCRAMBLER_GEN_3 Disable Scrambler for Gen3 and Gen4 Data Rate. The Gen3 and Gen4 scrambler/descrambler within the controller needs to be disabled when the scrambling function is implemented outside of the controller (for example within the PHY). Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rate. Note: This register field is sticky. Value After Reset: 0x0
7:2	RO	0x00	reserved
1	RW	0x0	NO_SEED_VALUE_CHANGE If this bit is set to 1, the seed value of LFSR for scrambler at Gen3 rate does not change after LinkUp = 1. This bit takes effect only when CX_AUTO_LANE_FLIP_CTRL_EN is supported. This feature requires both sides of the link support it. Note: this register is shared for Gen3 and Gen4/Gen5 data rates. Note: This register field is sticky. Values: 0x1 (NO_CHANGE): Not Change Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	GEN3_ZRXDC_NONCOMPL Gen3 Receiver Impedance ZRX-DC Not Compliant. Receivers that operate at 8.0 GT/s with an impedance other than the range defined by the ZRX-DC parameter for 2.5 GT/s (40-60 Ohms) must meet additional behavior requirements in the following LTSSM states: Polling, Rx_L0s, L1, L2, and Disabled. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shared for Gen3 and Gen4/Gen5 data rates. Note: This register field is sticky. Values: 0x0 (RCVR_COMPLIES): The receiver complies with the ZRX-DC parameter for 2.5 GT/s when operating at 8 GT/s or higher. 0x1 (RCVR_NOT_COMPLIES): The receiver does not comply with the ZRX-DC parameter for 2.5 GT/s when operating at 8 GT/s or higher. Value After Reset: 0x1

USP_PCIE_PL_GEN3_EQ_CONTROL_OFF

Bit	Attr	Reset Value	Description
6	RW	0x1	GEN3_LOWER_RATE_EQ_REDO_ENABLE Support EQ redo and lower rate change. Note: Gen3 and Gen4 share the same register bit and have the same feature. Note: This register field is sticky. Values: 0x0 (NO_SUP): Not supported 0x1 (SUP): Supported Value After Reset: 0x1 Testable: writeAsRead Volatile: true
5	RW	0x1	GEN3_EQ_EVAL_2MS_DISABLE Phase2_3 2 ms Timeout Disable. Determine behavior in Phase2 for USP (Phase3 if DSP) when the PHY does not respond within 2ms to the assertion of RxEqEval. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (ABORT_CURRENT_EVA): Abort the current evaluation, stop any attempt to modify the remote transmitter settings, Phase2 is terminated by the 24ms timeout 0x1 (IGNORE_2MS_TIMEOUT): Ignore the 2ms timeout and continue as normal. This is used to support PHYs that require more than 2ms to respond to the assertion of RxEqEval. Value After Reset: 0x1 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
4	RW	0x0	GEN3_EQ_PHASE23_EXIT_MODE Behavior After 24 ms Timeout (when optimal settings are not found). For a USP: Determine next LTSSM state from Phase2 after 24ms Timeout 0: Recovery.Speed 1: Recovery.Equalization.Phase3 When optimal settings are not found then: Equalization Phase 2 Successful status bit is not set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 0 Equalization Phase 2 Successful status bit is set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 1 Equalization Phase 2 Complete status bit is set in the "Link Status Register 2" For a DSP: Determine next LTSSM state from Phase3 after 24ms Timeout 0: Recovery.Speed 1: Recovery.Equalization.RcvrLock When optimal settings are not found then: Equalization Phase 3 Successful status bit is not set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 0 Equalization Phase 3 Successful status bit is set in the "Link Status Register 2" when GEN3_EQ_PHASE23_EXIT_MODE = 1 Equalization Phase 3 Complete status bit is set in the "Link Status Register 2" Note: GEN3_EQ_PHASE23_EXIT_MODE = 1 affects Direction Change feed back mode. EQ requests for Figure Of Merit mode complete before 24 ms timeout. Please see GEN3_EQ_PSET_REQ_VEC Register for more. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (RCVRY_SPEED): Recovery.Speed 0x1 (RCVRY_EQ): USP: Recovery.Equalization.Phase3; DSP: Recovery.Equalization.RcvrLock Value After Reset: 0x1

Bit	Attr	Reset Value	Description
3:0	RW	0x1	GEN3_EQ_FB_MODE Feedback Mode. Other values are reserved. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is a shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (DIR_CHG): Direction Change 0x1 (FOM): Figure Of Merit Value After Reset: 0x1 Testable: writeAsRead Volatile: true

USP_PCIE_PL_GEN3_EQ_FB_MODE_DIR_CHANGE_OFF
Address: Operational Base + offset (0x01AC)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:14	RW	0x0	GEN3_EQ_FMDC_MAX_POST_CUSROR_DELTA Convergence Window Aperture for C+1. Post-cursor coefficients maximum delta within the convergence window depth. Allowed range: 0,1,2,..15. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x0 Testable: unconstrained

Bit	Attr	Reset Value	Description
13:10	RW	0x0	GEN3_EQ_FMDC_MAX_PRE_CUSROR_DELTA Convergence Window Aperture for C-1. Pre-cursor coefficients maximum delta within the convergence window depth. Allowed range: 0,1,2,..15. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x0 Testable: unconstrained
9:5	RW	0x02	GEN3_EQ_FMDC_N_EVALS Convergence Window Depth. Number of consecutive evaluations considered in Phase 2/3 when determining if optimal coefficients have been found. Allowed range: 0,1,2,..16 up to a maximum of CX_GEN3_EQ_COEFQ_DEPTH. When set to 0, EQ Master is performed without sending any requests to the remote partner in Phase 2 for USP and Phase 3 for DSP. Therefore, the remote partner will not change its transmitter coefficients and will move to the next state. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0x1f (MAX_VAL): Maximum of CX_GEN3_EQ_COEFQ_DEPTH Value After Reset: 0x2 Testable: unconstrained

Bit	Attr	Reset Value	Description
4:0	RW	0x00	GEN3_EQ_FMDC_T_MIN_PHASE23 Minimum Time (in ms) To Remain in EQ Master Phase. The LTSSM stays in EQ Master phase for at least this amount of time, before starting to check for convergence of the coefficients. Allowed values 0,1,...,24. Note: When CX_GEN4_SPEED/CX_GEN5_SPEED, this register is shadow register for Gen3 and Gen4/Gen5 data rate. If RATE_SHADOW_SEL==00b, this register is for Gen3 data rate. If RATE_SHADOW_SEL==01b, this register is for Gen4 data rate. If RATE_SHADOW_SEL==10b, this register is for Gen5 data rate. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0x18 (MAX_VAL): Max value Value After Reset: 0x0 Testable: unconstrained

USP_PCIE_PL_ORDER_RULE_CTRL_OFF
Address: Operational Base + offset (0x01B4)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RW	0x00	CPL_PASS_P Completion Passing Posted Ordering Rule Control. Determines if CPL can pass halted P queue. Values: 0x0 (CPL_CAN_NOT_PASS): CPL can not pass P (recommended) 0x1 (CPL_CAN_PASS): CPL can pass P Value After Reset: 0x0
7:0	RW	0x00	NP_PASS_P Non-Posted Passing Posted Ordering Rule Control. Determines if NP can pass halted P queue. Values: 0x0 (NP_CAN_NOT_PASS): NP can not pass P (recommended). 0x1 (NP_CAN_PASS): NP can pass P Value After Reset: 0x0

USP_PCIE_PL_PIPE_LOOPBACK_CONTROL_OFF
Address: Operational Base + offset (0x01B8)

Bit	Attr	Reset Value	Description
31	RW	0x0	PIPE_LOOPBACK PIPE Loopback Enable. Indicates RMMI Loopback if M-PCIe. Note: This register field is sticky. Value After Reset: 0x0
30:27	RO	0x0	reserved
26:24	RW	0x0	RXSTATUS_VALUE RXSTATUS_VALUE is an internally reserved field. Do not use. Value After Reset: 0x0 Testable: writeAsRead Reset Mask: 0x0 Volatile: true

21:16	RW	0x00	RXSTATUS_LANE RXSTATUS_LANE is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
15:0	RW	0x000f	LPBK_RXVALID LPBK_RXVALID is an internally reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0xf

USP_PCIE_PL_MISC_CONTROL_1_OFF
Address: Operational Base + offset (0x01BC)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved
22	RW	0x0	PORT_LOGIC_WR_DISABLE Disable port logic register write from wire side. Note: The access attributes of this field are as follows: Wire: R (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
21	RW	0x0	P2P_ERR_RPT_CTRL Determines whether to enable Peer to Peer (P2P) error reporting. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable P2P error reporting 0x1 (ENABLE): Enable P2P error reporting Value After Reset: 0x0
20	RW	0x0	P2P_TRACK_CPL_TO_REG Determines whether to track completion of transmitted Non-Posted TLPs in P2P mode. Note: This register field is sticky. Values: 0x0 (DO_NOT_TRACk): Do not track completion 0x1 (TRACK): Track completion Value After Reset: 0x0
19:18	RW	0x0	TARGET_ABOVE_CONFIG_LIMIT_REG Configuration requests with an address greater than CONFIG_LIMIT_REG are directed to either ELBI or TRGT1 interface based on the setting of this field. This field can have the following values: Note: This register field is sticky. Values: 0x1 (ELBI): ELBI 0x2 (TRGT1): TRGT1 Value After Reset: 0x1
17:8	RW	0x37f	CONFIG_LIMIT_REG Configuration requests are directed either to CDM or ELBI/RTRGT1 based on the value of this field. Configuration requests with an address less CONFIG_LIMIT_REG are directed to the CDM Configuration requests with an address greater than CONFIG_LIMIT_REG are directed to either ELBI or TRGT1 interface based on the setting of TARGET_ABOVE_CONFIG_LIMIT_REG field. Your application must set a proper value for this field based on your extended configuration registers. For more details, see the "CDM/ELBI Register Space Access Through CFG Request" in "Register Module, LBC, and DBI" section in the "Controller Operations" chapter of the Databook. Note: This register field is sticky. Value After Reset: 0x37f

Bit	Attr	Reset Value	Description
7	RW	0x0	CFG_TLP_BYPASS_EN_REG Setting of this field defines how to decide the destination of Configuration requests. Note: When app_req_retry_en is asserted, the setting of this field is ignored. Note: This register field is sticky. Values: 0x1 (ONE): Configuration TLPs are routed according to the setting of TARGET_ABOVE_CONFIG_LIMIT_REG, regardless the value of CONFIG_LIMIT_REG. 0x0 (ZERO): Configuration TLPs are routed according to the setting of TARGET_ABOVE_CONFIG_LIMIT_REG, depending on the setting of CONFIG_LIMIT_REG. Refer to the definition of CONFIG_LIMIT_REG for details. Value After Reset: 0x0
6	RW	0x1	CPLQ_MNG_EN This field enables the Completion Queue Management feature. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x1
5	RW	0x0	ARI_DEVICE_NUMBER When ARI is enabled, this field enables use of the device ID. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0
4	RW	0x0	DISABLE_AUTO_LTR_CLR_MSG Disable the autonomous generation of LTR clear message in upstream port. This field can have the following values: For more details, see "Latency Tolerance Reporting (LTR) Message Generation [EP Mode]" in "Message Generation" section of the "Controller Operations" chapter of the Databook. Note: This register field is sticky. Values: 0x0 (ALLOW): Allow the autonomous generation of LTR clear message. 0x1 (DISABLE): Disable the autonomous generation of LTR clear message. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
3	RW	0x0	SIMPLIFIED_REPLAY_TIMER Enables Simplified Replay Timer (Gen4). For more details, see "Transmit Replay" in "Transmit TLP Processing" section in the "Controller Operations" chapter of the Databook. Simplified Replay Timer can have the following Values: A value from 24,000 to 31,000 Symbol Times when Extended Synch is 0b. A value from 80,000 to 100,000 Symbol Times when Extended Synch is 1b. The Simplified Replay Timer value must not be changed while the link is in use. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0
2	RW	0x0	UR_CA_MASK_4_TRGT1 When this field is set to '1', the controller suppresses error logging, error message generation, and CPL generation for non-posted requests TLPs (with UR filtering status) forwarded to your application (that is, when DEFAULT_TARGET =1). For more details, see "Advanced Error Handling For Received TLPs" chapter of the Databook. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): Set Value After Reset: 0x0
1	RW	0x0	DEFAULT_TARGET Default target for an IO or MEM request with UR/CA/CRS received. Based on the value of this field the controller either drops or forwards these requests to your application. For more details, see "ECRC Handling" and "Request TLP Routing Rules" in "Receive Routing" section of the "Controller Operations" chapter of the Databook. Note: This register field is sticky. Values: 0x0 (DROP_IO_MEM_REQ): The controller drops all incoming I/O or MEM requests (after corresponding error reporting). A completion with UR status is generated for non-posted requests. 0x1 (FWD_IO_MEM_UR_CA_CRS): The controller forwards all incoming I/O or MEM requests with UR/CA/CRS status to your application. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	DBI_RO_WR_EN Write to RO Registers Using DBI. For more details, see "Writing to Read-Only Registers" in "Register Module, LBC, and DBI" section in the "Controller Operations" chapter of the Databook. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): Your application can write to some RO and HwInit register fields through the DBI when you set this field to '1'. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_PL_MULTI_LANE_CONTROL_OFF

Address: Operational Base + offset (0x01C0)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x1	UPCONFIGURE_SUPPORT Upconfigure Support. The controller sends this value as the Link Upconfigure Capability in TS2 Ordered Sets in Configuration.Complete state. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Note: This register field is sticky. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
6	RW	0x0	DIRECT_LINK_WIDTH_CHANGE Directed Link Width Change. If the upconfigure_capable variable is '1' and the PCIE_CAP_HW_AUTO_WIDTH_DISABLE bit in LINK_CONTROL_LINK_STATUS_REG is '0', the controller starts upconfigure or autonomous width downsizing (to the TARGET_LINK_WIDTH value) in the Configuration state. If TARGET_LINK_WIDTH value is 0x0, the controller does not start upconfigure or autonomous width downsizing in the Configuration state. The controller self-clears this field when the controller accepts this request. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x0 (CLEAR): Clear 0x1 (SET): The controller always moves to Configuration state through Recovery state when this bit is set to '1'. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
5:0	RW	0x00	TARGET_LINK_WIDTH Target Link Width. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x0 (NOT_START): Controller does not start upconfigure or autonomous width downsizing in the Configuration state. 0x1 (X1): x1 0x2 (X2): x2 0x4 (X4): x4 0x8 (X8): x8 0x10 (X16): x16 0x20 (X32): x32 Value After Reset: 0x0

USP_PCIE_PL_PHY_INTEROP_CTRL_OFF

Address: Operational Base + offset (0x01C4)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
17:12	RW	0x1e	PHY_RST_TIMER Decide how many aux clock cycles the PHY reset lasts (0 to 63 aux clock cycles). Note: This register field is sticky. Values: 0x0 (MIN_VAL): Zero value 0x3f (MAX_VAL): Max value Value After Reset: 0x1e
11	RO	0x0	reserved
10	RW	0x0	L1_CLK_SEL L1 Clock control bit. This field is reserved for internal use. You should not write to this field and change the default unless specifically instructed by Synopsys support. Note: This register field is sticky. Values: 0x1 (NO_REQ): Controller does not request aux_clk switch and core_clk gating in L1. 0x0 (CAN_REQ): Controller requests aux_clk switch and core_clk gating in L1. Value After Reset: 0x0
9	RW	0x0	L1_NOWAIT_P1 L1 entry control bit. This field is reserved for internal use. You should not write to this field and change the default unless specifically instructed by Synopsys support. Note: The access attributes of this field are as follows: Wire: R/W (sticky) Dbi: R/W (sticky) Note: This register field is sticky. Values: 0x1 (NO_WAIT_FOR_ACK): Controller does not wait for PHY to acknowledge transition to P1 before entering L1. 0x0 (WAIT_FOR_ACK): Controller waits for the PHY to acknowledge transition to P1 before entering L1. Value After Reset: 0x1

Bit	Attr	Reset Value	Description
8	RW	0x0	L1SUB_EXIT_MODE L1 Exit Control Using phy_mac_pclkack_n. This field is reserved for internal use. You should not write to this field and change the default unless specifically instructed by Synopsys support. If PCLK as PHY input is selected, you should not write to this field and change the default value since PCLK as PHY input doesn't support any value other than the default. Note: This register field is sticky. Values: 0x1 (NO_WAIT_FOR_PCLKACK): Controller exits L1 without waiting for the PHY to assert phy_mac_pclkack_n. 0x0 (WAIT_FOR_PCLKACK): Controller waits for the PHY to assert phy_mac_pclkack_n before exiting L1. Value After Reset: 0x0
7	RO	0x0	reserved
6:0	RW	0x44	RXSTANDBY_CONTROL Rxstandby Control. Bits 0..5 determine if the controller asserts the RxStandby signal (mac_phy_rxstandby) in the indicated condition. Bit 6 enables the controller to perform the RxStandby/RxStandbyStatus handshake. This field is reserved for internal use. You should not write to this field and change the default unless specifically instructed by Synopsys support. [0]: Rx EIOS and subsequent T TX-IDLE-MIN [1]: Rate Change [2]: Inactive lane for upconfigure/downconfigure [3]: PowerDown=P1orP2 [4]: RxL0s.Idle [5]: EI Infer in L0 [6]: Execute RxStandby/RxStandbyStatus Handshake Note: This register field is sticky. Value After Reset: 0x44

USP_PCIE_PL_TRGT_CPL_LUT_DELETE_ENTRY_OFF
Address: Operational Base + offset (0x01C8)

Bit	Attr	Reset Value	Description
31	RW	0x0	DELETE_EN This is a one-shot bit. This is a self-clearing register field. Reading from this register field always returns a '0'. Values: 0x0 (CLEAR): Clear 0x1 (SET): A '1' write to this bit triggers the deletion of the target completion LUT entry that is specified in the LOOK_UP_ID field. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
30:0	RW	0x00000000	LOOK_UP_ID This number selects one entry to delete of the TRGT_CPL_LUT. Value After Reset: 0x0

USP_PCIE_PL_LINK_FLUSH_CONTROL_OFF

Address: Operational Base + offset (0x01CC)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	AUTO_FLUSH_EN Enables automatic flushing of pending requests before sending the reset request to the application logic to reset the PCIe controller and the AXI Bridge. The flushing process is initiated if any of the following events occur: Hot reset request. A downstream port (DSP) can "hot reset" an upstream port (USP) by sending two consecutive TS1 ordered sets with the hot reset bit asserted. Warm (Soft) reset request. Generated when exiting from D3 to D0 and cfg_pm_no_soft_rst=0. Link down reset request. A high to low transition on smlh_req_rst_not indicates the link has gone down and the controller is requesting a reset. If you disable automatic flushing, your application is responsible for resetting the PCIe controller and the AXI Bridge. For more details see "Warm and Hot Resets" section in the Architecture chapter of the Databook. Note: This register field is sticky. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x1

USP_PCIE_PL_AMBA_ERROR_RESPONSE_DEFAULT_OFF

Address: Operational Base + offset (0x01D0)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:10	RW	0x27	AMBA_ERROR_RESPONSE_MAP AXI Slave Response Error Map. Allows you to selectively map the errors received from the PCIe completion (for non-posted requests) to the AXI slave responses, slv_rresp or slv_bresp. The recommended setting is SLVERR. CRS is always mapped to OKAY. [0] 0: UR (unsupported request) -> DECERR 1: UR (unsupported request) -> SLVERR [1] 0: CRS (configuration retry status) -> DECERR 1: CRS (configuration retry status) -> SLVERR [2] 0: CA (completer abort) -> DECERR 1: CA (completer abort) -> SLVERR [3]: RESERVED (0x0) [4]: RESERVED (0x0) [5] 0: Completion Timeout -> DECERR 1: Completion Timeout -> SLVERR. The AXI bridge internally drops (processes internally but not passed to your application) a completion that has been marked by the Rx filter as UC or MLF, and does not pass its status directly down to the slave interface. It waits for a timeout and then signals "Completion Timeout" to the slave interface. The controller sets the AXI slave read databus to 0xFFFF for all error responses. Note: This register field is sticky. Value After Reset: 0x27
9:5	RO	0x00	reserved
4:3	RW	0x0	AMBA_ERROR_RESPONSE_CRS CRS Slave Error Response Mapping. Determines the AXI slave response for CRS completions. For more details see "Error Handling" in the AXI chapter of the Databook. Note: This register field is sticky. Values: 0x0 (OK_): OKAY 0x1 (OK_CRS_CMPL): OKAY with all FFFF_FFFF data for all CRS completions 0x2 (OK_READ_REQ): OKAY with FFFF_0001 data for CRS completions to vendor ID read requests, OKAY with FFFF_FFFF data for all other CRS completions 0x3 (SLVERR_DECERR): SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Value After Reset: 0x0

Bit	Attr	Reset Value	Description
2	RW	0x0	AMBA_ERROR_RESPONSE_VENDORID Vendor ID Non-existent Slave Error Response Mapping. Determines the AXI slave response for errors on reads to non-existent Vendor ID register. For more details see "Error Handling" in the AXI chapter of the Databook. Note: This register field is sticky. Values: 0x0 (_OK_): OKAY (with FFFF data). 0x1 (_ERR_): SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Value After Reset: 0x0
1	RO	0x0	reserved
0	RW	0x0	AMBA_ERROR_RESPONSE_GLOBAL Global Slave Error Response Mapping. Determines the AXI slave response for all error scenarios on non-posted requests. For more details see "Error Handling" in the AXI chapter of the Databook. The error response mapping is not applicable to Non-existent Vendor ID register reads. Note: This register field is sticky. Values: 0x0 (OK_): OKAY (with FFFF data for non-posted requests) 0x1 (ERR_): SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Value After Reset: 0x0

USP_PCIE_PL_AMBA_LINK_TIMEOUT_OFF

Address: Operational Base + offset (0x01D4)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	LINK_TIMEOUT_ENABLE_DEFAULT Disable Flush. Note: This register field is sticky. Values: 0x0 (ENABLE): Enable 0x1 (DISABLE): You can disable the flush feature by setting this field to '1'. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
7:0	RW	0x32	LINK_TIMEOUT_PERIOD_DEFAULT Timeout Value (ms). The timer will timeout and then flush the bridge TX request queues after this amount of time. The timer counts when there are pending outbound AXI slave interface requests and the PCIe TX link is not transmitting any of these requests. The timer is clocked by core_clk. Note: This register field is sticky. Value After Reset: 0x32

USP_PCIE_PL_AMBA_ORDERING_CTRL_OFF
Address: Operational Base + offset (0x01D8)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	AX_MSTR_ZEROLREAD_FW AXI Master Zero Length Read Forward to the application. The DW PCIe controller AXI bridge is able to terminate in order with the Posted transactions the zero length read, implementing the PCIe express flush semantics of the Posted transactions. Values: 0x0 (_0_LN_RD_TERMINATE): The zero length Read is terminated at the DW PCIe AXI bridge master 0x1 (_0_LN_RD_FWD): The zero length Read is forward to the application. Value After Reset: 0x0
6:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4:3	RW	0x0	AX_MSTR_ORDR_P_EVENT_SEL AXI Master Posted Ordering Event Selector. This field selects how the master interface determines when a P write is completed when enforcing the PCIe ordering rule, "NP must not pass P" at the AXI Master Interface. The AXI protocol does not support ordering between channels. Therefore, NP reads can pass P on your AXI bus fabric. This can result in an ordering violation when the read overtakes a P that is going to the same address. Therefore, the bridge master does not issue any NP requests until all outstanding P writes reach their destination. It does this by waiting for the all of the write responses on the B channel. This can affect the performance of the master read channel. For scenarios where the interconnect serializes the AXI master "AW", "W" and "AR" channels,you can increase the performance by reducing the need to wait until the complete Posted transaction has effectively reached the application slave. Note: This setting will not affect: MSI interrupt catcher and P data ordering. This is always driven by the B'last event. DMA read engine TLP ordering. This is always driven by the B'last event. NP write transactions which are always serialized with P write transactions. Values: 0x0 (B): B'last event: wait for the all of the write responses on the B channel thereby ensuring that the complete Posted transaction has effectively reached the application slave (default). 0x1 (AW): AW'last event: wait until the complete Posted transaction has left the AXI address channel at the bridge master. 0x2 (W): W'last event: wait until the complete Posted transaction has left the AXI data channel at the bridge master. 0x3 (RSVD): Reserved Value After Reset: 0x0
2	RO	0x0	reserved
1	RW	0x0	AX_SNP_EN AXI Serialize Non-Posted Requests Enable. This field enables the AXI Bridge to serialize same ID Non-Posted Read/Write Requests on the wire. Serialization implies one outstanding same ID NP Read or Write on the wire and used to avoid AXI RAR and WAW hazards at the remote link partner. For more details, see the "Optional Serialization of AXI Slave Non-posted Requests" section in the AXI chapter of the Databook. Values: 0x0 (DISABLE): Disable 0x1 (ENABLE): Enable Value After Reset: 0x0

1	RW	0x0	MSIX_RAM_CTRL_TABLE_SD MSIX Table RAM Shut Down. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): Set this bit to drive the cfg_msix_table_sd output to signal your external logic to place the MSIX Table RAM in Shut Down low-power mode. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	MSIX_RAM_CTRL_TABLE_DS MSIX Table RAM Deep Sleep. Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): Set this bit to drive the cfg_msix_table_ds output to signal your external logic to place the MSIX Table RAM in Deep Sleep low-power mode. Value After Reset: 0x0

USP_PCIE_PL_DTIM_CTRL0_OFF

Address: Operational Base + offset (0x03B0)

Bit	Attr	Reset Value	Description
31	RW	0x0	DTIM_CTRL0_IREQ_SW_FLUSH_EN Invalidate Request Software Flush Enable. If set enables software to flush pending DTI-ATS invalidate requests from the invalidate request queue. Software forces the flush by writing to the DTIM_CTRL1.INV_REQ_FLUSH_SID register. The flushing mechansim enables software to remove invalidate requests from the request queue in response to a UR from an Endpoint function. Prior to removing unsupported invalidate requests software should disable the hardware invalidate request timer (DTIM_CTRL0.IREQ_TMR_EN=0). To continue monitoring outstanding invalidate requests enable the timer once again. The timer restarts from its programmed timeout value (DTIM_CTRL5.IREQ_TMR_TRGT_TO). Note: Software initiated flushing does not result in a sync or timeout error. Note: This register field is sticky. Value After Reset: 0x0
30	RW	0x0	DTIM_CTRL0_IREQ_TMR_EN Invalidate Request Timer Enable. If set enables the DTIM to flush timed out DTI-ATS invalidate requests from the invalidate request queue. The invalidate request timer times each invalidation request sent on the wire. If disabled the responsibilty to flush the request is passed to software. Software writes to the DTIM_CTRL1.INV_REQ_FLUSH_SID register field to flush all pending requests associated with the particular Stream ID (SID). Subsequent received PCIe invalidate completions, associated with the particular SID, are treated as unexpected completions (completion received but no request pending). Timed out invalidate requests result in a sync error response to an outstanding sync request. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
29	RW	0x0	DTIM_CTRL0_IREQ_BYTE_ORDER Invalidate Request Byte Order. In normal operation PCIe data bytes are transmitted in little endian format, that is, PCIe data byte 0 is the first byte transmitted on the wire. The format of the DTI-ATS untranslated address and the PCIe untranslated address embedded in the two DWORD data field of the invalidate request message is defined in big endian format, that is, PCIe byte 0 contains the most significant byte of the address, byte 7. To align the DTI-ATS data byte order to PCIe data byte order the bytes are reversed. To be robust against misinterpretation of the byte order software can reverse the bytes by setting this bit. Note: This register field is sticky. Values: 0x0 (LITTLE_ENDIAN): DTI-ATS Invalidate Request data bytes are transmitted in little endian format. 0x1 (BIG_ENDIAN): DTI-ATS Invalidate Request data bytes are transmitted in big endian format. Value After Reset: 0x0
28	RW	0x0	DTIM_CTRL0_TRESP_BYTE_ORDER Translation Response Byte Order. In normal operation PCIe data bytes are transmitted in little endian format, that is, PCIe data byte 0 is the first byte transmitted on the wire. The format of the DTI-ATS translated address and the PCIe translated address embedded in the two DWORD data field of the translation completion is defined in big endian format, that is, PCIe byte 0 contains the most significant byte of the address, byte 7. To align the DTI-ATS data byte order to PCIe data byte order the bytes are reversed. To be robust against misinterpretation of the byte order software can reverse the bytes by setting this bit. Note: This register field is sticky. Values: 0x0 (LITTLE_ENDIAN): DTI-ATS Translation Response data bytes are transmitted in little endian format. 0x1 (BIG_ENDIAN): DTI-ATS Translation Response data bytes are transmitted in big endian format. Value After Reset: 0x0
27:24	RO	0x0	reserved

Bit	Attr	Reset Value	Description
23:16	RW	0x1f	DTIM_CTRL0_TOK_TRANS_REQ Number of Translation Request Tokens Requested. Its default value is configured by the visible parameter, CC_DTIM_NUM_TRANS_TOKENS_REQUESTED. Software can overide this value at initialization time. The number of tokens requested is equal to TOK_TRANS_REQ + 1 (1 to 256). Note: This register field is sticky. Value After Reset: 0x1f
15:0	RW	0xffff	DTIM_CTRL0_ROOT_PORT_ID Root Port ID. Its default value is configured by the visible parameter, CC_ROOT_PORT_ID. Software can overide this value at initialization time. Note: This register field is sticky. Value After Reset: 0xffff

USP_PCIE_PL_DTIM_CTRL1_OFF

Address: Operational Base + offset (0x03B4)

Bit	Attr	Reset Value	Description
31	RW	0x0	DTIM_CTRL1_FLUSH_IREQ_GLOB Flush Invalidate Requests Global. Flushes all outstanding DTI-ATS invalidate requests. The flush is triggered when a 32-bit write to the DTIM_CTRL1 register is performed and FLUSH_IREQ_GLOB =1. Forcing the errored sync ack avoids deadlocking the SMMU in scenarios where the Endpoint function fails to complete the outstanding invalidate requests. In normal operation invalidate requests are flushed by hardware when the per Stream ID invalidate request timer expires. This field is primarily a test feature enabling software to force the sync ack to a pending sync request without having to wait for hardware to time out and flush all prior invalidate requests. Flushing outstanding DTI-ATS invalidate requests does not result in a timeout or a sync error (sync ack with its ERROR =1) if a sync request is outstanding. PCIe invalidate completions received after the flush sequence is complete are discarded and treated as unexpected completions (completion received but no request pending). If enabled, software is notified if unexpected completions are received. This field is valid if DTIM_CTRL0.FLUSH_CTRL_SW_EN is set. Note: This register field is sticky. Value After Reset: 0x0
30:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	DTIM_CTRL1_FLUSH_IREQ_SID Flush Invalidate Request Stream ID. Flushes all pending DTI-ATS invalidate requests, associated with a particuar Stream ID (SID/BDF), from the invalidate request queue. The flush is triggered when a 32-bit write to the DTIM_CTRL1 register is performed and FLUSH_IREQ_GLOB=0. FLUSH_IREQ_SID specifies the flushed Stream ID. This flushing mechanism enables software to remove invalidate requests from the request queue in response to a ERR_NONFATAL message from an Endpoint function. Software flushing of invalidate requests prior to a hardware invalidate request timeout does not result in a timeout error or a sync error (sync ack with its ERROR=1) if a sync request is outstanding. PCIe invalidate completions received with the flushed Stream ID are discarded and treated as unexpected completions (completion received but no request pending). If enabled, software is notified if unexpected completions are received. This field is valid if DTIM_CTRL0.FLUSH_CTRL_SW_EN is set. Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_PL_DTIM_CTRL2_OFF

Address: Operational Base + offset (0x03B8)

7:0	RW	0x00	DTIM_ERR_LOG2_ERR_TRESP_UR_TID Unexpected Translation Response ID. This field contains the DTI-ATS translation response translation ID associated with the first unexpeted translation response. A translation response is unexpected when a response is received without a corresponding outstanding translation request. These bits are set by hardware and cleared by software (DTIM_INT_CLR.ERR_TRESP_UID_INT_CLR=1) Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_PL_DTIM_DIAG_OFF
Address: Operational Base + offset (0x03FC)

Bit	Attr	Reset Value	Description
31	RO	0x0	DTIM_DIAG_SUP_PRI Indicates of DTI-ATS Page Request/Responses are supported by the SMMU. The field corresponds to the SUP_PRI field of the DTI_ATS_CONDIS_ACK message. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
30:25	RO	0x00	reserved

Bit	Attr	Reset Value	Description
24	RO	0x0	DTIM_DIAG_VERSION Acknowledged DTI-ATS Protocol Version. The field corresponds to the VERSION field of the DTI_ATS_CONDIS_ACK message. 0000: DTI-ATSv1 Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23:20	RO	0x0	DTIM_DIAG_OAS Maximum address size permitted for translated addresses. The field corresponds to the OAS field of the DTI_ATS_CONDIS_ACK message. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
19:16	RO	0x0	reserved
15:8	RO	0x00	DTIM_DIAG_TOK_TREQ_GNT This field indicates the number of pre-allocated tokens for translation requests that have been granted by the SMMU. The number of translation tokens granted is equal to the value of this field plus one. The field corresponds to the TOK_TRANS_GNT field of the DTI_ATS_CONDIS_ACK message. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6	RO	0x0	DTIM_DIAG_IREQ_FLUSH_SID_LWR_Q_EMPTY Invalidation Request Flush SID Lower Queue Empty Flag. If set, this bit indicates that all outstanding invalidate requests associated with the flushed Endpoint function, DTIM_CTRL1.IREQ_FLUSH_SID_LWR, have been flushed from the invalidate request queue. The flag is set when the software initiated flush sequence completes. If subsequent in-flight invalidate requests are received post the flush sequence then this flag will be cleared. Further flushing of the invalidate request queue is required in this case. Note: It is expected the SMMU stops sending invalidate requests to the DTIM prior to triggering the flush sequence. At some point all in-flight invalidate requests associated with the Endpoint function will be flushed. Value After Reset: 0x1 Testable: writeAsRead Volatile: true
5	RO	0x0	DTIM_DIAG_IREQ_FLUSH_DONE Invalidate Request Flush Done. Invalidate Request Flush Done. If set this bit indicates that the software initiated invalidate request queue flush sequence has completed. The flag is initially cleared by hardware when the flush sequence is initially triggerred by a write to the DTIM_CTRL1 register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
4	RO	0x1	DTIM_DIAG_IREQ_ORDRQ_EMPTY Invalidation Request Order Q Empty Flag. If set this bit indicates the DTI-ATS invalidate request queue is empty, that is, all invalidate requests have received a completion or invalidate request have not be sent to the DTIM or sent to the DTIM but discarded (broadcast DTI-ATS invalidate requests). Value After Reset: 0x1 Testable: writeAsRead Volatile: true
3:2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1:0	RO	0x0	DTIM_DIAG_CONDIS_STATE Connect/Disconnect FSM state. The field corresponds to the current state of the Connect/Disconnect FSM. The following encoding applies: Other value are reserved. Values: 0x0 (DISCONNECTED): DISCONNECTED 0x1 (REQ_CONNECT): REQ_CONNECT 0x2 (CONNECTED): CONNECTED 0x3 (REQ_DISCONNECT): REQ_DISCONNED Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_PL_PL_APP_BUS_DEV_NUM_STATUS_OFF

USP_PCIE_PL_AUX_CLK_FREQ_OFF

Address: Operational Base + offset (0x0440)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
9:0	RW	0x018	AUX_CLK_FREQ The aux_clk frequency in MHz. This value is used to provide a 1 us reference for counting time during low-power states with aux_clk when the PHY has removed the pipe_clk. Frequencies lower than 1 MHz are possible but with a loss of accuracy in the time counted. If the actual frequency (f) of aux_clk does not exactly match the programmed frequency (f_prog), then there is an error in the time counted by the controller that can be expressed in percentage as: err% = (f_prog/f-1)*100. For example if f=2.5 MHz and f_prog=3 MHz, then err% =(3/2.5-1)*100 =20%, meaning that the time counted by the controller on aux_clk will be 20% greater than the time in us programmed in the corresponding time register (for example T_POWER_ON). Note: This register field is sticky. Value After Reset: 0x18

USP_PCIE_PL_L1_SUBSTATES_OFF
Address: Operational Base + offset (0x0444)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RW	0x0	L1SUB_LOW_POWER_CLOCK_SWITCH_MODE If the bit is set to 1'b1 the controller will delay the switching of aux_clk to the slow platform clock until it detects that the link partner has de-asserted CLKREQ#. Note: This register field is sticky. Values: 0x0 (CLEAR): The reference clock may be gated off when CLKREQ# is de-asserted. 0x1 (SET): The reference clock shall be kept running regardless of the CLKREQ# setting. Value After Reset: 0x0
7:6	RW	0x3	L1SUB_T_PCLKACK Max delay (in 1us units) between a MAC request to remove the clock on mac_phy_pclkreq_n and a PHY response on phy_mac_pclkack_n. If the PHY does not respond within this time the request is aborted. Range is 1..4 Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0x3 (MAX_VAL): Max value Value After Reset: 0x3

Bit	Attr	Reset Value	Description
5:2	RW	0x4	L1SUB_T_L1_2 Duration (in 1us units) of L1.2. Range is 1..16. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0xf (MAX_VAL): Max value Value After Reset: 0x4
1:0	RW	0x2	L1SUB_T_POWER_OFF Duration (in 1us units) of L1.2.Entry. Range is 1..4. Note: This register field is sticky. Values: 0x0 (MIN_VAL): Min value 0x3 (MAX_VAL): Max value Value After Reset: 0x2

USP_PCIE_PL_POWERDOWN_CTRL_STATUS_OFF

Address: Operational Base + offset (0x0448)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	RW	0x0	POWERDOWN_PHY_POWERDOWN This field represents the Powerdown value that has been acknowledged by the PHY. It is updated with the value of Powerdown driven by the controller, when the PHY has returned the Phystatus acknowledgment for the Powerdown transition. Value After Reset: 0x2 Testable: writeAsRead Volatile: true
7:4	RW	0x2	POWERDOWN_MAC_POWERDOWN This field represents the Powerdown value driven by the controller to the PHY. Value After Reset: 0x2 Testable: writeAsRead Volatile: true
3:2	RO	0x0	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	POWERDOWN_VMAIN_ACK Set this bit to 1 if you do not want to perform the handshake with the power-switch after PERST# assertion. By default the controller will perform the handshake with the power-switch if L1 power gating is enabled Note: This register field is sticky. Values: 0x0 (CLEAR): Clear 0x1 (SET): If you do not want to perform the handshake with the power-switch after PERST# assertion. Value After Reset: 0x0
0	WO	0x0	POWERDOWN_FORCE This field is a one shot field. This field could be used for debug purposes in event that the P2 Powerdown transition does not complete. It will allow the controller to proceed with the transition to the P1 Powerdown state. This field always reads back as 1'b0. Values: 0x0 (CLEAR): Clear 0x1 (SET): Writing a value of 1 to this field causes the controller to complete the P2 Powerdown handshake regardless of whether the PHY has returned Phystatus. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

11.4.4.38 USP_PCIE_IATU Detail Registers Description

USP_PCIE_IATU_REGION_CTRL_1_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved

Bit	Attr	Reset Value	Description
22:20	RW	0x0	CTRL_1_FUNC_NUM Function Number. When the address of an outbound TLP is matched to this region and the FUNC_BYPASS field in the "iATU Region Control 2 Register" is '0', then the function number used in generating the function part of the requester ID (RID) field of the TLP is taken from this 5-bit register. The value in this register must be 0x0 unless multifunction operation in the controller is enabled (CX_NFUNC > 1). When you are using the AXI Bridge, then this field is swapped before AXI decomposition occurs so that the correct "Max_Read_Request_Size" and "Max_Payload_Size" values are used. Note: This register field is sticky. Value After Reset: 0x0
19:18	RO	0x0	reserved
17:16	RW	0x0	AT AT. When the address of an outbound TLP is matched to this region, then the AT field of the TLP is changed to the value in this register. Only valid when the ATS_ENABLE configuration parameter is '1'. Note: This register field is sticky. Value After Reset: 0x0
15:14	RO	0x0	reserved
13	RW	0x0	INCREASE_REGION_SIZE Increase the maximum ATU Region size. When set, the maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky. Values: 0x1 (ENABLE): Maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE 0x0 (DISABLE): Maximum ATU Region size is 4 GB (default) Value After Reset: 0x0
12:11	RO	0x0	reserved
10:9	RW	0x0	ATTR When the address of an outbound TLP is matched to this region, then the ATTR field of the TLP is changed to the value in this register. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
8	RW	0x0	TD This is a reserved field. Do not use. Note: This register field is sticky. Value After Reset: 0x0
7:5	RW	0x0	TC When the address of an outbound TLP is matched to this region, then the TC field of the TLP is changed to the value in this register. Note: This register field is sticky. Value After Reset: 0x0
4:0	RW	0x00	TYPE When the address of an outbound TLP is matched to this region, then the TYPE field of the TLP is changed to the value in this register. Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_REGION_CTRL_2_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RW	0x0	REGION_EN Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky. Value After Reset: 0x0
30	RO	0x0	reserved
29	RW	0x0	INVERT_MODE Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0

Bit	Attr	Reset Value	Description
28	RW	0x0	CFG_SHIFT_MODE CFG Shift Mode. The iATU uses bits [27:12] of the untranslated address (on the XALI0/1/2 interface or AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 3.1 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space. Note: This register field is sticky. Value After Reset: 0x0
27	RW	0x0	DMA_BYPASS DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. Note: This field is reserved for the SW product. You must set it to '0'. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
26:24	RO	0x0	reserved
23	RW	0x0	HEADER_SUBSTITUTE_EN Header Substitute Enable. When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. Encodings are as above. Note: This register field is sticky. Values: 0x1 (FILL_BYTES): LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. 0x0 (FORM_ADDR): LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register forms the new address of the translated region. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
22	RW	0x0	INHIBIT_PAYLOAD Inhibit TLP Payload Data for TLP's in Matched Region; assign iATU region to be TLP without data. When enabled and region address is matched, the iATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs such as slv_wstrb. Encoding are define as above. Note: This register field is sticky. Values: 0x1 (NO_SUPPORT_FOR_DATA_TLP): Fmt[1] =0 so that only TLP type without data is sent. For example, a Msg instead of MsgD will be sent. 0x0 (SUPPORT_DATA_TLP): Fmt[1] =0/1 so that TLPs with or without data can be sent. Value After Reset: 0x0
21	RO	0x0	reserved
20	RW	0x0	SNP TLP Header Fields Translation Bypass. In this mode header fields of the translated TLP is taken from your application transmit interface or, if AMBA is configured, from the AMBA sideband bus (slv_awmisc_info) and not from the corresponding fields of the IATU_REGION_CTRL_1_OFF_OUTBOUND_i or IATU_REGION_CTRL_2_OFF_OUTBOUND_i registers. The header fields are TC PH TH ST AT Attr (IDO, RO and NS). Note: This register field is sticky. Value After Reset: 0x0
19	RW	0x0	FUNC_BYPASS Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "iATU Region Control 1 Register" or the VF_NUMBER field of the "iATU Control 3 Register." Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
18:17	RO	0x0	reserved

Bit	Attr	Reset Value	Description
16	RW	0x0	TAG_SUBSTITUTE_EN TAG Substitute Enable. When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. Note (CX_TPH_ENABLE=1): TAG substitution for MWr will not occur because this field (byte 6) in the TLP header is the ST field. ST substitution can still take place using the MSG_CODE field in IATU_REGION_CTRL_2_OFF_OUTBOUND_i. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
15:8	RW	0x00	TAG TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set. Note: This register field is sticky. Value After Reset: 0x0
7:0	RW	0x00	MSG_CODE MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register. Memory TLPs: (ST: Steering Tag). When the ST field of an outbound TLP is matched to this region, and the translated TLP TYPE field targets memory space; then the ST field of the TLP is changed to the value in this register. Only Valid when the CX_TPH_ENABLE configuration parameter is 1. Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_LWR_BASE_ADDR_OFF_OUTBOUND_i
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LWR_BASE_RW Forms bits [31:n] of the start address of the address region to be translated. n is log2(CX_ATU_MIN_REGION_SIZE) Note: This register field is sticky. Value After Reset: 0x0
15:0	RO	0x0000	LWR_BASE_HW Forms bits [n-1:0] of the start address of the address region to be translated. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. n is log2(CX_ATU_MIN_REGION_SIZE) Value After Reset: 0x0

USP_PCIE_IATU_UPPER_BASE_ADDR_OFF_OUTBOUND_i
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	UPPER_BASE_RW Forms bits [63:32] of the start (and end) address of the address region to be translated. In systems with a 32-bit address space, this register is not used and therefore writing to this register has no effect. Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_LIMIT_ADDR_OFF_OUTBOUND_i
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	LIMIT_ADDR_RW Forms upper bits of the end address of the address region to be translated. Note: This register field is sticky. Value After Reset: 0x0
15:4	RO	0xfff	LIMIT_ADDR_HW Forms lower bits of the end address of the address region to be translated. The end address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always all ones. A write to this location is ignored by the PCIe controller. Note: This register field is sticky. Value After Reset: 0xfff

Bit	Attr	Reset Value	Description
3:0	RO	0x0	CBUF_INCR Circular Buffer. Note: This register field is sticky. Value After Reset: 0xf

USP_PCIE_IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LWR_TARGET_RW_OUTBOUND When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_ is '0' (normal operation): LWR_TARGET_RW[31:n] forms MSB's of the Lower Target part of the new address of the translated region; LWR_TARGET_RW[n-1:0] are not used. (The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so the lower bits of the start address of the new address of the translated region (bits n-1:0) are always '0'). n is log2(CX_ATU_MIN_REGION_SIZE). When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_i is '1': LWR_TARGET_RW[31:0] forms bytes 8-11 (for 3 dword header) or bytes 12-15 (for 4 dword header) of the outbound TLP header. Usage scenarios include the transmission of Vendor Defined Messages where the controller determines the content of bytes 12 to 15 of the TLP header. Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_UPPER_TARGET_ADDR_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	UPPER_TARGET_RW Forms bits [63:32] of the start address (Upper Target part) of the new address of the translated region. Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_UPPR_LIMIT_ADDR_OFF_OUTBOUND_i

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	UPPR_LIMIT_ADDR_HW Forms MSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_OUTBOUND_i is '1'. These bits are always '0'. Value After Reset: 0x0
0	RW	0x0	UPPR_LIMIT_ADDR_RW Forms the LSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_OUTBOUND_i is '1' Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_REGION_CTRL_1_OFF_INBOUND_i

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:23	RO	0x000	reserved
22:20	RW	0x0	CTRL_1_FUNC_NUM Function Number. MEM-I/O: When the Address and BAR matching logic in the controller indicate that a MEM-I/O transaction matches a BAR in the function corresponding to this value, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Region Control 2 Register" is set. CFG0/CFG1: When the destination function number as specified in the routing ID of the TLP header matches the function, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Region Control 2 Register" is set. Note: This register field is sticky. Value After Reset: 0x0
19:18	RO	0x0	reserved
17:16	RW	0x0	AT When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "AT Match Enable" bit of the "iATU Region Control 2 Register" is set. Only valid when the ATS_ENABLE configuration parameter is '1'. Note: This register field is sticky. Value After Reset: 0x0
15:14	RO	0x0	reserved

Bit	Attr	Reset Value	Description
13	RW	0x0	INCREASE_REGION_SIZE Increase the maximum ATU Region size. When set, the maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky. Values: 0x1 (ENABLE): Maximum ATU Region size is determined by CX_ATU_MAX_REGION_SIZE 0x0 (DISABLE): Maximum ATU Region size is 4 GB (default) Value After Reset: 0x0
12:11	RO	0x0	reserved
10:9	RW	0x0	ATTR When the ATTR field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "iATU Region Control 2 Register" is set. Note: This register field is sticky. Value After Reset: 0x0
8	RW	0x0	TD When the TD field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TD Match Enable" bit of the "iATU Region Control 2 Register" is set. Note: This register field is sticky. Value After Reset: 0x0
7:5	RW	0x0	TC When the TC field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TC Match Enable" bit of the "iATU Region Control 2 Register" is set. Note: This register field is sticky. Value After Reset: 0x0
4:0	RW	0x00	TYPE When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_REGION_CTRL_2_OFF_INBOUND_i
Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31	RW	0x0	REGION_EN Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
30	RW	0x0	MATCH_MODE Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM-I/O TLPs, this field is interpreted as follows: -0: Address Match Mode. The iATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. -1: BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: -0: Routing ID Match Mode. The iATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the iATU region for matching to proceed. -1: Accept Mode. The iATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: -0: Address Match Mode. The iATU treats the third dword and fourth dword of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers. -1: Vendor ID Match Mode. This mode is relevant for ID-routed Vendor Defined Messages. The iATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third dword of the TLP header, but matches against the Vendor ID in bits [15:0] of the third dword of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth dword of the TLP header. - If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN = 1 AND MSG_TYPE_MATCH_MODE =1, then Match Mode is ignored. Note: This register field is sticky. Values: 0x0 (ZERO): The interpretation is dependent on TLP type, that is, MEM/IO, CFG0, or MSG/MSGD TLPs. 0x1 (ONE): The interpretation is dependent on TLP type, that is, MEM/IO, CFG0, or MSG/MSGD TLPs. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
29	RW	0x0	INVERT_MODE Invert Mode Enable. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). When set all regions of that type must use address match mode. Note: This register field is sticky. Values: 0x1 (ENABLE): Invert Mode Enable 0x0 (DISABLE): Invert Mode Disable Value After Reset: 0x0
28	RW	0x0	CFG_SHIFT_MODE CFG Shift Enable. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address. Note: This register field is sticky. Values: 0x1 (ENABLE): CFG Shift Enable 0x0 (DISABLE): CFG Shift Disable Value After Reset: 0x0
27	RW	0x0	FUZZY_TYPE_MATCH_CODE Fuzzy Type Match Enable. When enabled, the iATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. MWr, MRd, and MRdLk TLPs are seen as identical The Routing field of Msg/MsgD TLPs is ignored FetchAdd, Swap, and CAS are seen as identical. For example, CFG0 in the TYPE field in the "iATU Region Control 1 Register" matches against an inbound CfgRd0, CfgRd1, CfgWr0, or CfgWr1 TLP. Note: This register field is sticky. Values: 0x1 (ENABLE): Fuzzy Type Match Enable 0x0 (DISABLE): Fuzzy Type Match Disable Value After Reset: 0x0
26	RO	0x0	reserved

Bit	Attr	Reset Value	Description
25:24	RW	0x0	RESPONSE_CODE Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled. Note: This register field is sticky. Values: 0x0 (NORMAL_RADM): Normal RADM filter response is used. 0x1 (UNSUP_REQ): Unsupported request (UR) 0x2 (COMPL_ABORT): Completer abort (CA) 0x3 (NOT_USED): Not used / undefined / reserved Value After Reset: 0x0
23	RW	0x0	SINGLE_ADDR_LOC_TRANS_EN Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the iATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs when the AXI bridge is enabled. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
22	RO	0x0	reserved
21	RW	0x0	MSG_CODE_MATCH_EN Message Code Match Enable (Msg TLPS). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "iATU Region Control 2 Register") occurs (in MSG transactions) for address translation to proceed. ST Match Enable (Mem TLPs). Ensures that a successful ST TLP field comparison match (see ST field of the "iATU Region Control 2 Register") occurs (in MEM transactions) for address translation to proceed. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. Note: This register field is sticky. Values: 0x1 (ENABLE): Message Code Match Enable (for Msg TLPS) or ST Match Enable (for Mem TLPs) 0x0 (DISABLE): Virtual Function Number Match Disable Value After Reset: 0x0
20	RO	0x0	reserved

Bit	Attr	Reset Value	Description
19	RW	0x0	FUNC_NUM_MATCH_EN Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "iATU Region Control 1 Register") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed. Note: This register field is sticky. Values: 0x1 (ENABLE): Function Number Match Enable 0x0 (DISABLE): Function Number Match Disable Value After Reset: 0x0
18	RO	0x0	reserved
17	RW	0x0	AT_MATCH_EN AT Match Enable. Ensures that a successful AT TLP field comparison match (see AT field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Only valid when the ATS_ENABLE configuration parameter is '1'. Note: This register field is sticky. Values: 0x1 (ENABLE): AT Match Enable 0x0 (DISABLE): AT Match Disable Value After Reset: 0x0
16	RW	0x0	ATTR_MATCH_EN ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky. Values: 0x1 (ENABLE): ATTR Match Enable 0x0 (DISABLE): ATTR Match Disable Value After Reset: 0x0
15	RW	0x0	TD_MATCH_EN TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky. Values: 0x1 (ENABLE): TD Match Enable 0x0 (DISABLE): TD Match Disable Value After Reset: 0x0

Bit	Attr	Reset Value	Description
14	RW	0x0	TC_MATCH_EN TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "iATU Region Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky. Values: 0x1 (ENABLE): TC Match Enable 0x0 (DISABLE): TC Match Disable Value After Reset: 0x0
13	RW	0x0	MSG_TYPE_MATCH_MODE Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the IATU_REGION_CTRL_1_VIEWPORT_OFF_INBOUND_i register (TYPE[4:3]=2'b10) will be translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM or ATS messages when AXI bridge is configured on client interface. Note: This register field is sticky. Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable Value After Reset: 0x0
12:11	RO	0x0	reserved

Bit	Attr	Reset Value	Description
10:8	RW	0x0	BAR_NUM BAR Number. When the BAR number of an inbound MEM or IO TLP " that is matched by the normal internal BAR address matching mechanism " is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "iATU Region Control 2 Register" is set. IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR. Note: This register field is sticky. Values: 0x0 (BAR0): BAR0 0x1 (BAR1): BAR1 0x2 (BAR2): BAR2 0x3 (BAR3): BAR3 0x4 (BAR4): BAR4 0x5 (BAR5): BAR5 0x6 (ROM): ROM 0x7 (RSVD): reserved Value After Reset: 0x0
7:0	RW	0x00	MSG_CODE MSG TLPs: (Message Code). When the TYPE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Message Code Match Enable" bit of the "iATU Region Control 2 Register" is set. Memory TLPs: (ST: Steering Tag). When the ST field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "ST Match Enable" bit of the "iATU Region Control 2 Register" is set. The setting is independent of the setting of the TH field. Only Valid when the CX_TPH_ENABLE configuration parameter is '1'. Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_LWR_BASE_ADDR_OFF_INBOUND_i
Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LWR_BASE_RW Forms bits [31:n] of the start address of the address region to be translated. n is log2(CX_ATU_MIN_REGION_SIZE) Note: This register field is sticky. Value After Reset: 0x0
15:0	RO	0x0000	LWR_BASE_HW Forms bits [n-1:0] of the start address of the address region to be translated. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. n is log2(CX_ATU_MIN_REGION_SIZE) Value After Reset: 0x0

USP_PCIE_IATU_UPPER_BASE_ADDR_OFF_INBOUND_i
Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	UPPER_BASE_RW Forms bits [63:32] of the start (and end) address of the address region to be translated. Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_LIMIT_ADDR_OFF_INBOUND_i
Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LIMIT_ADDR_RW Forms upper bits of the end address of the address region to be translated. When SINGLE_ADDR_LOC_TRANS_EN = 1, MSG_TYPE_MATCH_MODE = 1, and CBUF_INCR > 0 then this field forms the upper bits of the limit address for the circular buffer. Note: This register field is sticky. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15:4	RO	0xfff	LIMIT_ADDR_HW Forms lower bits of the end address of the address region to be translated. The end address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary, so these bits are always all ones. When SINGLE_ADDR_LOC_TRANS_EN = 1, MSG_TYPE_MATCH_MODE = 1, and CBUF_INCR > 0 then this field forms lower bits of the limit address for the circular buffer. A write to this location is ignored by the PCIe controller. Note: This register field is sticky. Value After Reset: 0xfff
3:0	RW	0x0	CBUF_INCR Circular Buffer Increment. When CX_ATU_SLOC_CBUF = 0, then this field is Read-only and forms the lowest bits of the end address of the address region to be translated. When CX_ATU_SLOC_CBUF = 1, then this field is R/W and forms the upper bits of the Circular Buffer Increment size (CBUF_INCR) field for Single Location Address translation. The increment value (in bytes) is decoded as follows: 0000b: 0 (Default; legacy Single Address Location mode) 0001b: 4 0010b: 8 0011b: 16 0100b: 32 0101b: 64 0110b: 128 0111b: 256 1000b: 512 1001b: 1024 1010b: 2048 1011b: 4096 1100b: 8192 1101b: rsvd. 1110b: rsvd. 1111b: rsvd. Note: A write to any bit in the CBUF_INCR field resets the circular buffer pointer ? that is, the next matched received Message will be translated to the start address of the Circular Buffer. This field must be written to AFTER the target and limit registers have been updated. Note: The access attributes of this field are as follows: Wire: No access. Dbi: R (sticky) Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_LWR_TARGET_ADDR_OFF_INBOUND_i
Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	LWR_TARGET_RW Forms MSB's of the Lower Target part of the new address of the translated region. These bits are always '0'. Field size depends on log2(CX_ATU_MIN_REGION_SIZE) in address match mode. Field size depends on log2(BAR_MASK+1) in BAR match mode. Note: This register field is sticky. Value After Reset: 0x0
15:0	RO	0x0000	LWR_TARGET_HW Forms the LSB's of the Lower Target part of the new address of the translated region. The start address must be aligned to a CX_ATU_MIN_REGION_SIZE kB boundary (in address match mode); and to the Bar size boundary (in BAR match mode) so that these bits are always '0'. If the BAR is smaller than the iATU region size, then the iATU target address must align to the iATU region size; otherwise it must align to the BAR size. A write to this location is ignored by the PCIe controller. Field size depends on log2(CX_ATU_MIN_REGION_SIZE) in address match mode. Field size depends on log2(BAR_MASK+1) in BAR match mode. Value After Reset: 0x0

USP_PCIE_IATU_UPPER_TARGET_ADDR_OFF_INBOUND_i

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	UPPER_TARGET_RW Forms bits [63:32] of the start address (Upper Target part) of the new address of the translated region. In systems with a 32-bit address space, this register is not used and therefore writing to this register has no effect. Note: This register field is sticky. Value After Reset: 0x0

USP_PCIE_IATU_UPPR_LIMIT_ADDR_OFF_INBOUND_i

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	UPPR_LIMIT_ADDR_HW Forms MSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_INBOUND_i is '1'. These bits are always '0'. Value After Reset: 0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	UPPR_LIMIT_ADDR_RW Forms the LSB's of the Upper Limit part of the region "end address" to be translated. Only applies to 64-bit systems and when the INCREASE_REGION_SIZE field in IATU_REGION_CTRL_1_OFF_INBOUND_i is '1' Note: This register field is sticky. Value After Reset: 0x0

11.4.4.39 USP_PCIE_DMA Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_DMA_CTRL_DATA_ARB_PRIOR_OFF	0x0000	W	0x00000688	DMA Arbitration Scheme for TRGT1 Interface
USP_PCIE_DMA_CTRL_OFF	0x0008	W	0x00020002	DMA Number of Channels Register
USP_PCIE_DMA_WRITE_ENGINE_EN_OFF	0x000C	W	0x00000000	DMA Write Engine Enable Register
USP_PCIE_DMA_WRITE_DOORBELL_OFF	0x0010	W	0x00000000	DMA Write Doorbell Register
USP_PCIE_DMA_WRITE_CHANNEL_ARB_WEIGHT_LOW_OFF	0x0018	W	0x00008421	DMA Write Engine Channel Arbitration Weight Low Register
USP_PCIE_DMA_WRITE_CHANNEL_ARB_WEIGHT_HIGH_OFF	0x001C	W	0x00000000	DMA Write Engine Channel Arbitration Weight High Register
USP_PCIE_DMA_READ_ENGINE_EN_OFF	0x002C	W	0x00000000	DMA Read Engine Enable Register
USP_PCIE_DMA_READ_DOORBELL_OFF	0x0030	W	0x00000000	DMA Read Doorbell Register
USP_PCIE_DMA_READ_CHANNEL_ARB_WEIGHT_LOW_OFF	0x0038	W	0x00008421	DMA Read Engine Channel Arbitration Weight Low Register
USP_PCIE_DMA_READ_CHANNEL_ARB_WEIGHT_HIGH_OFF	0x003C	W	0x00008421	DMA Read Engine Channel Arbitration Weight High Register
USP_PCIE_DMA_WRITE_INT_STATUS_OFF	0x004C	W	0x00000000	DMA Write Interrupt Status Register
USP_PCIE_DMA_WRITE_INT_MASK_OFF	0x0054	W	0x00030003	DMA Write Interrupt Mask Register
USP_PCIE_DMA_WRITE_INT_CLEAR_OFF	0x0058	W	0x00000000	DMA Write Interrupt Clear Register
USP_PCIE_DMA_WRITE_ERR_STATUS_OFF	0x005C	W	0x00000000	DMA Write Error Status Register
USP_PCIE_DMA_WRITE_DONE_IMWR_LOW_OFF	0x0060	W	0x00000000	DMA Write Done IMWr Address Low Register
USP_PCIE_DMA_WRITE_DONE_IMWR_HIGH_OFF	0x0064	W	0x00000000	DMA Write Done IMWr Interrupt Address High Register
USP_PCIE_DMA_WRITE_ABORT_IMWR_LOW_OFF	0x0068	W	0x00000000	DMA Write Abort IMWr Address Low Register
USP_PCIE_DMA_WRITE_ABORT_IMWR_HIGH_OFF	0x006C	W	0x00000000	DMA Write Abort IMWr Address High Register

Name	Offset	Size	Reset Value	Description
USP_PCIE_DMA_WRITE_CH01_IMWR_DATA_OFF	0x0070	W	0x00000000	DMA Write Channel 1 and 0 IMWr Data Register
USP_PCIE_DMA_WRITE_CH23_IMWR_DATA_OFF	0x0074	W	0x00000000	DMA Write Channel 3 and 2 IMWr Data Register
USP_PCIE_DMA_WRITE_CH45_IMWR_DATA_OFF	0x0078	W	0x00000000	DMA Write Channel 5 and 4 IMWr Data Register
USP_PCIE_DMA_WRITE_CH67_IMWR_DATA_OFF	0x007C	W	0x00000000	DMA Write Channel 7 and 6 IMWr Data Register
USP_PCIE_DMA_WRITE_LINKED_LIST_ERR_EN_OFF	0x0090	W	0x00000000	DMA Write Linked List Error Enable Register

11.4.4.40 USP_PCIE_DMA Detail Registers Description

USP_PCIE_DMA_CTRL_DATA_ARB_PRIOR_OFF

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RO	0x0	VERSION Reports the version of Register Map of eDMA. Value After Reset: 0x0
11:9	RW	0x3	RDBUFF_TRGT_WEIGHT DMA Read Channel MWr Requests. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x3

Bit	Attr	Reset Value	Description
8:6	RW	0x2	RD_CTRL_TRGT_WEIGHT DMA Read Channel MRd Requests (for LL element/descriptor access). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x2
5:3	RW	0x1	WR_CTRL_TRGT_WEIGHT DMA Write Channel MRd Requests (for DMA data requests and LL element/descriptor access). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1
2:0	RW	0x0	RTRGT1_WEIGHT Non-DMA Rx Requests. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_DMA_CTRL_OFF
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RW	0x0	DIS_C2W_CACHE_RD Disable DMA Read Channel's "completion to memory write" context cache pre-fetch function. Note: For internal debugging only. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
24	RW	0x0	DIS_C2W_CACHE_WR Disable DMA Write Channel's "completion to memory write" context cache pre-fetch function. Note: For internal debugging only. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
23:20	RO	0x0	reserved

Bit	Attr	Reset Value	Description
19:16	RO	0x2	NUM_DMA_RD_CHAN Number of Read Channels. You can read this register to determine the number of read channels configured. Value After Reset: 0x2
15:4	RO	0x000	reserved
3:0	RO	0x2	NUM_DMA_WR_CHAN Number of Write Channels. You can read this register to determine the number of write channels configured. Value After Reset: 0x2

USP_PCIE_DMA_WRITE_ENGINE_EN_OFF
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH7 Enable Handshake for DMA Write Engine Channel 7. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
22	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH6 Enable Handshake for DMA Write Engine Channel 5. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
21	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH5 Enable Handshake for DMA Write Engine Channel 5. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
20	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH4 Enable Handshake for DMA Write Engine Channel 4. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

Bit	Attr	Reset Value	Description
19	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH3 Enable Handshake for DMA Write Engine Channel 3. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
18	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH2 Enable Handshake for DMA Write Engine Channel 2. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
17	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH1 Enable Handshake for DMA Write Engine Channel 1. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
16	RW	0x0	DMA_WRITE_ENGINE_EN_HSHAKE_CH0 Enable Handshake for DMA Write Engine Channel 0. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
15:1	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	DMA_WRITE_ENGINE DMA Write Engine Enable. For normal operation, you must initially set this bit to '1', before any other software setup action. You do not need to toggle or rewrite to this bit during normal operation. You should set this bit to '0' when you want to "Soft Reset" the DMA controller write logic. There are three possible reasons for resetting the DMA controller write logic: The "Abort Interrupt Status" bit is set in the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF), and any of the bits in the DMA Write Error Status Register (DMA_WRITE_ERR_STATUS_OFF) are set. Resetting the DMA controller write logic re-initializes the control logic, ensuring that the next DMA write transfer is executed successfully. You have executed the procedure outlined in "Stop Bit", after which, the "Abort Interrupt Status" bit is set and the Channel Status(CS) field of the DMA Write Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_i) is set to "Stopped". Resetting the DMA controller write logic re-initializes the control logic ensuring that the next DMA write transfer is executed successfully. During software development, when you incorrectly program the DMA write engine. To "Soft Reset" the DMA controller write logic, you must: De-assert the DMA write engine enable bit. Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA write engine enable bit returns a '0'. Assert the DMA write engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA write transfer does not start until you write to the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x1 (ENABLE): Enable 0x0 (DISABLE): Disable (Soft Reset) Value After Reset: 0x0 Testable: untestable Volatile: true

USP_PCIE_DMA_WRITE_DOORBELL_OFF
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31	RW	0x0	WR_STOP Stop. Set in conjunction with the Doorbell Number field. The DMA write channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the DMA Write Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_0) to ensure that the write channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)". Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
30:3	RO	0x0000000	reserved
2:0	RW	0x0	WR_DOORBELL_NUM Doorbell Number. You must write the channel number to this register to start the DMA write transfer for that channel. The DMA detects a write to this register field even if the value of this field does not change. You do not need to toggle or write any other value to this register to start a new transfer. The range of this field is 0x0 to 0x7, where 0x0 corresponds to channel 0. Note: A write to this field triggers the controller to exit L1 substates. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: tru

USP_PCIE_DMA_WRITE_CHANNEL_ARB_WEIGHT_LOW_OFF

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved

Bit	Attr	Reset Value	Description
19:15	RW	0x01	WRITE_CHANNEL3_WEIGHT Channel 3 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1
14:10	RW	0x01	WRITE_CHANNEL2_WEIGHT Channel 2 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1
9:5	RW	0x01	WRITE_CHANNEL1_WEIGHT Channel 1 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1
4:0	RW	0x01	WRITE_CHANNEL0_WEIGHT Channel 0 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1

USP_PCIE_DMA_WRITE_CHANNEL_ARB_WEIGHT_HIGH_OFF

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved

Bit	Attr	Reset Value	Description
19:15	RW	0x00	WRITE_CHANNEL7_WEIGHT Channel 7 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1
14:10	RW	0x00	WRITE_CHANNEL6_WEIGHT Channel 6 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1
9:5	RW	0x00	WRITE_CHANNEL5_WEIGHT Channel 5 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1
4:0	RW	0x00	WRITE_CHANNEL4_WEIGHT Channel 4 Weight. The weight is initialized by software before ringing the doorbell. The value is used by the channel weighted round robin arbiter to select the next channel read request. A value of '0' means that one TLP is issued before moving to the next channel. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x1

15:1	RO	0x0000	reserved
0	RW	0x0	DMA_READ_ENGINE DMA Read Engine Enable. 1: Enable 0: Disable (Soft Reset) For normal operation, you must initially set this bit to "1", before any other software setup actions. You do not need to toggle or rewrite to this bit during normal operation. You should set this field to "0" when you want to "Soft Reset" the DMA controller read logic. There are three possible reasons for resetting the DMA controller read logic: The "Abort Interrupt Status" bit is set (in the "DMA Read Interrupt Status Register" (DMA_READ_INT_STATUS_OFF), and any of the bits in the "DMA Read Error Status Low Register" (DMA_READ_ERR_STATUS_LOW_OFF) is set. Resetting the DMA controller read logic re-initializes the control logic, ensuring that the next DMA read transfer is executed successfully. You have executed the procedure outlined in "Stop Bit", after which, the "Abort Interrupt Status" bit is set and the channel Status field (CS) of the DMA read "DMA Channel Control 1 Register " (DMA_CH_CONTROL1_OFF_WRCH_0) is set to "Stopped". Resetting the DMA controller read logic re-initializes the control logic ensuring that the next DMA read transfer is executed successfully. During software development, when you incorrectly program the DMA read engine. To "Soft Reset" the DMA controller read logic, you must: De-assert the DMA read engine enable bit. Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA read engine enable bit returns a "0". Assert the DMA read engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA read transfer does not start until you write to the "DMA Read Doorbell Register" (DMA_READ_DOORBELL_OFF). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W

USP_PCIE_DMA_READ_DOORBELL_OFF
Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31	RW	0x0	RD_STOP Stop. Set in conjunction with the Doorbell Number field. The DMA read channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the DMA Channel Control 1 Register (DMA_CH_CONTROL1_OFF_RDCH_i) to ensure that the read channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)". Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
30:3	RO	0x0000000	reserved
2:0	RW	0x0	RD_DOORBELL_NUM Doorbell Number. You must write 0x0 to this register to start the DMA read transfer for that channel. The DMA detects a write to this register field even if the value of this field does not change. The range of this field is 0x0 to 0x7, where 0x0 corresponds to channel 0. Note: A write to this field triggers the controller to exit L1 substates. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
23:16	RO	0x00	CPL_TIMEOUT Completion Time Out. The DMA read channel has timed-out while waiting for the remote device to respond to the MRd request, or a malformed CplD has been received. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For details, see "Interrupts and Error Handling" . Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the DMA Read Interrupt Clear Register (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true
15:8	RO	0x00	CPL_ABORT Completer Abort. The DMA read channel has received a PCIe completer abort completion status from the remote device in response to the MRd request. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For more details, see "Interrupts and Error Handling". Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the DMA Read Interrupt Clear Register (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
7:0	RO	0x00	UNSUPPORTED_REQ Unsupported Request. The DMA read channel has received a PCIe unsupported request completion status from the remote device in response to the MRd request. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Enabling: For more details, see "Interrupts and Error Handling". Masking: The DMA read interrupt Mask register has no effect on this register. Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the DMA Read Interrupt Clear Register (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register. Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_READ_LINKED_LIST_ERR_EN_OFF
Address: Operational Base + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	RW	0x0	RD_CHANNEL_LLLAIE Read Channel LL Local Abort Interrupt Enable (LLLAIE). You enable the read channel Local Abort interrupt through this bit. The LIE and RIE bits in the LL element enable the read channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling". Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
15:1	RO	0x0000	reserved
0	RW	0x0	RD_CHANNEL_LLRAIE Read Channel LL Remote Abort Interrupt Enable (LLRAIE). You enable the read channel Remote Abort interrupt through this bit. The LIE and RIE bits in the LL element enable the read channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling". Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_DMA_READ_DONE_IMWR_LOW_OFF
Address: Operational Base + offset (0x00CC)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_READ_DONE_LOW_REG The DMA uses this field to generate bits [63:32] of the address field for the Done IMWr TLP. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_DMA_READ_DONE_IMWR_HIGH_OFF
Address: Operational Base + offset (0x00D0)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_READ_DONE_HIGH_REG The DMA uses this field to generate bits [31:0] of the address field for the Abort IMWr TLP. Bits [1:0] must be '00' as this address must be dword aligned. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_DMA_READ_ABORT_IMWR_LOW_OFF
Address: Operational Base + offset (0x00D4)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_READ_ABORT_LOW_REG The DMA uses this field to generate bits [31:0] of the address field for the Abort IMWr TLP. Bits [1:0] must be '00' as this address must be dword aligned. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_DMA_READ_ABORT_IMWR_HIGH_OFF
Address: Operational Base + offset (0x00D8)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_READ_ABORT_HIGH_REG The DMA uses this field to generate bits [63:32] of the address field for the Abort IMWr TLP. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_DMA_READ_CH01_IMWR_DATA_OFF
Address: Operational Base + offset (0x00DC)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	RD_CHANNEL_1_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 1. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
15:0	RW	0x0000	RD_CHANNEL_0_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 0. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_DMA_READ_CH23_IMWR_DATA_OFF
Address: Operational Base + offset (0x00E0)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	RD_CHANNEL_3_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 2. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x
15:0	RW	0x0000	RD_CHANNEL_2_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 2. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x

USP_PCIE_DMA_READ_CH45_IMWR_DATA_OFF
Address: Operational Base + offset (0x00E4)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	RD_CHANNEL_5_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 5. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	RD_CHANNEL_4_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 4. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_DMA_READ_CH67_IMWR_DATA_OFF

Address: Operational Base + offset (0x00E8)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	RD_CHANNEL_7_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 7. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0
15:0	RW	0x0000	RD_CHANNEL_6_DATA The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for read channel 6. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0

USP_PCIE_DMA_WRITE_ENGINE_HSHAKE_CNT_LOW_OFF

Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:24	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH3 DMA handshake counter for DMA Write Engine Channel 3. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
23:21	RO	0x0	reserved
20:16	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH2 DMA handshake counter for DMA Write Engine Channel 2. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
15:13	RO	0x0	reserved

Bit	Attr	Reset Value	Description
12:8	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH1 DMA handshake counter for DMA Write Engine Channel 1. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
7:5	RO	0x0	reserved
4:0	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH0 DMA handshake counter for DMA Write Engine Channel 0. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0

USP_PCIE_DMA_WRITE_ENGINE_HSHAKE_CNT_HIGH_OFF

Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:24	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH7 DMA handshake counter for DMA Write Engine Channel 7. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
23:21	RO	0x0	reserved
20:16	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH6 DMA handshake counter for DMA Write Engine Channel 6. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
15:13	RO	0x0	reserved
12:8	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH5 DMA handshake counter for DMA Write Engine Channel 5. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0
7:5	RO	0x0	reserved
4:0	RO	0x00	DMA_WRITE_ENGINE_HSHAKE_CNT_CH4 DMA handshake counter for DMA Write Engine Channel 4. If CC_DMA_HSHAKE =1, the data transfer in Linked List mode starts only when the counter is non-zero. Value After Reset: 0x0

USP_PCIE_DMA_READ_ENGINE_HSHAKE_CNT_LOW_OFF

USP_PCIE_DMA_CH_CONTROL1_OFF_WRCH_i
Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	DMA_AT Address Translation TLP Header Bit (AT). The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
29:27	RW	0x0	DMA_TC Traffic Class TLP Header Bit (TC). The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
26	RO	0x0	reserved
25	RW	0x0	DMA_RO Relaxed Ordering TLP Header Bit (RO). DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
24	RW	0x0	DMA_NS_SRC Source No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
23	RW	0x0	DMA_NS_DST Destination No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
22	RW	0x0	DMA_MEM_TYPE Master AXI ACE-Lite Cache Coherency Control. This field sets the DMA channel memory type of the address space of the data transfer as follows: For more details, see "ACE-Lite Features and Limitations" section of the Databook. Irrespective of the value of this field, Linked list descriptor requests have this attribute set to 0x1. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x0 (PERIPHERAL): peripheral type 0x1 (MEM_TYPE): memory type Value After Reset: 0x0 Testable: writeAsRead Volatile: true
21:17	RO	0x00	reserved
16:12	RW	0x00	DMA_FUNC_NUM Function Number (FN). The controller uses this field when generating the requester ID for the MRd/MWr DMA TLP. When you have enabled SR-IOV, then this field is ignored if you have set the VFE field in the "DMA Write Channel Control 2 Register" (DMA_CH_CONTROL2_OFF_WRCH_0). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
11:10	RO	0x0	reserved

Bit	Attr	Reset Value	Description
9	RW	0x0	LLE Linked List Enable (LLE). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x1 (ENABLE): Enable linked list operation 0x0 (DISABLE): Disable linked list operation Value After Reset: 0x0 Testable: writeAsRead Volatile: true
8	RW	0x0	CCS Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6:5	RO	0x0	CS Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: Values: 0x0 (RESERVED): Reserved 0x1 (RUNNING): This channel is active and transferring data 0x2 (HALTED): An error condition has been detected, and the DMA has stopped this channel 0x3 (STOPPED): The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF) Value After Reset: 0x0 Testable: writeAsRead Volatile: true
4	RW	0x0	RIE Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	LIE Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2	RW	0x0	LLP Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (non-contiguous) element. The DMA loads this field with the LLP of the linked list element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
1	RW	0x0	TCB Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	CB Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_TRANSFER_SIZE_OFF_WRCH_i
Address: Operational Base + offset (0x0208)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_TRANSFER_SIZE DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA write channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_SAR_LOW_OFF_WRCH_i
Address: Operational Base + offset (0x020C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_LOW Source Address Register (lower 32 bits). Indicates the next address to be read from. The DMA increments the SAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The SAR is the address of the remote memory. DMA Write: The SAR is the address of the local memory. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_SAR_HIGH_OFF_WRCH_i
Address: Operational Base + offset (0x0210)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_HIGH Source Address Register (higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_DAR_LOW_OFF_WRCH_i
Address: Operational Base + offset (0x0214)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_LOW Destination Address Register (lower 32 bits). Indicates the next address to be written to. The DMA increments the DAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The DAR is the address of the local memory. DMA Write: The DAR is the address of the remote memory. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_DAR_HIGH_OFF_WRCH_i
Address: Operational Base + offset (0x0218)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_HIGH Destination Address Register (Higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: tru

USP_PCIE_DMA_LLP_LOW_OFF_WRCH_i
Address: Operational Base + offset (0x021C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_LOW Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list after the previous element is consumed. When the current element is a data element; this field is incremented by 6 DWORDS. When the current element is a link element; this field is overwritten by the LL Element Pointer of the element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_LLP_HIGH_OFF_WRCH_i
Address: Operational Base + offset (0x0220)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_HIGH Higher 32 bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list as elements are consumed. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_CH_CONTROL1_OFF_RDCH_i
Address: Operational Base + offset (0x0300)

Bit	Attr	Reset Value	Description
31:30	RW	0x0	DMA_AT Address Translation TLP Header Bit (AT). The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
29:27	RW	0x0	DMA_TC Traffic Class TLP Header Bit (TC). The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
26	RO	0x0	reserved
25	RW	0x0	DMA_RO Relaxed Ordering TLP Header Bit (RO) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
24	RW	0x0	DMA_NS_SRC Source No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
23	RW	0x0	DMA_NS_DST Destination No Snoop TLP Header Bit. The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
22	RW	0x0	DMA_MEM_TYPE Master AXI ACE-Lite Cache Coherency Control. This field sets the DMA channel memory type of the address space of the data transfer as follows: For more details, see "ACE-Lite Features and Limitations" section of the Databook. Irrespective of the value of this field, Linked list descriptor requests have this attribute set to 0x1. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x0 (PERIPHERAL): peripheral 0x1 (MEM_TYPE): main memory Value After Reset: 0x0 Testable: writeAsRead Volatile: true
21:17	RO	0x00	reserved

Bit	Attr	Reset Value	Description
16:12	RW	0x00	DMA_FUNC_NUM Function Number (FN). The controller uses this field when generating the requester ID for the MRd/MWr DMA TLP. When you have enabled SR-IOV, then this field is ignored if you have set the VFE field in the DMA Read Channel Control 2 Register (DMA_CH_CONTROL2_OFF_RDCH_0). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
11:10	RO	0x0	reserved
9	RW	0x0	LLE Linked List Enable (LLE). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Values: 0x1 (ENABLE): Enable linked list operation 0x0 (DISABLE): Disable linked list operation Value After Reset: 0x0 Testable: writeAsRead Volatile: true
8	RW	0x0	CCS Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
7	RO	0x0	reserved

Bit	Attr	Reset Value	Description
6:5	RO	0x0	CS Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: Values: 0x0 (RSVD): Reserved 0x1 (RUN): Running. This channel is active and transferring data. 0x2 (HALT): Halted. An error condition has been detected, and the DMA has stopped this channel. 0x3 (STOP): Stopped. The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the DMA Read Doorbell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF). Value After Reset: 0x0 Testable: writeAsRead Volatile: true
4	RW	0x0	RIE Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
3	RW	0x0	LIE Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
2	RW	0x0	LLP Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (non-contiguous) element. The DMA loads this field with the LLP of the linked list element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true
1	RW	0x0	TCB Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. This field is not defined in a data LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

Bit	Attr	Reset Value	Description
0	RW	0x0	CB Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_TRANSFER_SIZE_OFF_RDCH_i
Address: Operational Base + offset (0x0308)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DMA_TRANSFER_SIZE DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA read channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_SAR_LOW_OFF_RDCH_i
Address: Operational Base + offset (0x030C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_LOW Source Address Register (Lower 32 bits). Indicates the next address to be read from. The DMA increments the SAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The SAR is the address of the remote memory. DMA Read: The SAR is the address of the local memory. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_SAR_HIGH_OFF_RDCH_i
Address: Operational Base + offset (0x0310)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	SRC_ADDR_REG_HIGH Source Address Register (higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_DAR_LOW_OFF_RDCH_i
Address: Operational Base + offset (0x0314)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_LOW Destination Address Register (Lower 32 bits). Indicates the next address to be written to. The DMA increments the DAR as the DMA transfer progresses. In LL mode, the DMA overwrites this with the corresponding dword of the LL element. DMA Read: The DAR is the address of the local memory. DMA Read: The DAR is the address of the remote memory. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_DAR_HIGH_OFF_RDCH_i
Address: Operational Base + offset (0x0318)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	DST_ADDR_REG_HIGH Destination Address Register (higher 32 bits). In LL mode, the DMA overwrites this with the corresponding dword of the LL element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_LLP_LOW_OFF_RDCH_i
Address: Operational Base + offset (0x031C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_LOW Lower bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list after the previous element is consumed. When the current element is a data element; this field is incremented by 6 DWORDS. When the current element is a link element; this field is overwritten by the LL Element Pointer of the element. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

USP_PCIE_DMA_LLP_HIGH_OFF_RDCH_i
Address: Operational Base + offset (0x0320)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	LLP_HIGH Higher 32 bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list as elements are consumed. Note: The access attributes of this field are as follows: Wire: R/W Dbi: R/W Value After Reset: 0x0 Testable: writeAsRead Volatile: true

11.4.4.41 USP_PCIE_ELBI Registers Summary

Name	Offset	Size	Reset Value	Description
USP_PCIE_ELBI_APP_ELBI_INT_GEN0	0x0E00	W	0x00000000	ELBI Interface Application Interrupt Generate Register 0
USP_PCIE_ELBI_APP_ELBI_INT_GEN1	0x0E04	W	0x00000000	ELBI Interface Application Interrupt Generate Register 1
USP_PCIE_ELBI_APP_ELBI_INTMSK0	0x0E08	W	0x00000000	ELBI Interface Application Interrupt Mask Register 0
USP_PCIE_ELBI_APP_ELBI_INTMSK1	0x0E0C	W	0x00000000	ELBI Interface Application Interrupt Mask Register 1
USP_PCIE_ELBI_APP_ELBI_USER4	0x0E10	W	0x00000000	ELBI Interface Application User Register 4

Name	Offset	Size	Reset Value	Description
USP_PCIE_ELBI_APP_ELBI_USER5	0x0E14	W	0x00000000	ELBI Interface Application User Register 5
USP_PCIE_ELBI_APP_ELBI_USER6	0x0E18	W	0x00000000	ELBI Interface Application User Register 6
USP_PCIE_ELBI_APP_ELBI_INTSTS	0x0E1C	W	0x00000000	ELBI Interface Application Interrupt Status Register
USP_PCIE_ELBI_APP_ELBI_USER8	0x0E20	W	0x00000000	ELBI Interface Application User Register 8
USP_PCIE_ELBI_APP_ELBI_USER9	0x0E24	W	0x00000000	ELBI Interface Application User Register 9
USP_PCIE_ELBI_APP_ELBI_USER10	0x0E28	W	0x00000000	ELBI Interface Application User Register 10
USP_PCIE_ELBI_APP_ELBI_USER11	0x0E2C	W	0x00000000	ELBI Interface Application User Register 11
USP_PCIE_ELBI_APP_ELBI_USER12	0x0E30	W	0x00000000	ELBI Interface Application User Register 12
USP_PCIE_ELBI_APP_ELBI_USER13	0x0E34	W	0x00000000	ELBI Interface Application User Register 13
USP_PCIE_ELBI_APP_ELBI_USER14	0x0E38	W	0x00000000	ELBI Interface Application User Register 14
USP_PCIE_ELBI_APP_ELBI_USER15	0x0E3C	W	0x00000000	ELBI Interface Application User Register 15

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

11.4.4.42 USP_PCIE_ELBI Detail Registers Description

USP_PCIE_ELBI_APP_ELBI_INT_GEN0

Address: Operational Base + offset (0x0E00)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15:0	RW	0x0000	elbi_app_int_0 Interrupt Status Generation These registers can be set "1" by wire access to generate interrupt to local CPU through ep_elbi_app_int.

USP_PCIE_ELBI_APP_ELBI_INT_GEN1

Address: Operational Base + offset (0x0E04)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15:0	RW	0x0000	elbi_app_int_1 Interrupt Status Generation These registers can be set "1" by wire access to generate interrupt to local CPU through ep_elbi_app_int.

USP_PCIE_ELBI_APP_ELBI_INTMSK0

Address: Operational Base + offset (0x0E08)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15:0	RW	0x0000	elbi_app_intmsk Interrupt Status Generation These registers can be set "1" by wire access to generate interrupt to local CPU through ep_elbi_app_int.

USP_PCIE_ELBI_APP_ELBI_INTMSK1

Address: Operational Base + offset (0x0E0C)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15:0	RW	0x0000	elbi_app_intmsk Interrupt Status Generation These registers can be set "1" by wire access to generate interrupt to local CPU through ep_elbi_app_int.

USP_PCIE_ELBI_APP_ELBI_USER4

Address: Operational Base + offset (0x0E10)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_USER5

Address: Operational Base + offset (0x0E14)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_USER6

Address: Operational Base + offset (0x0E18)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_INTSTS

Address: Operational Base + offset (0x0E1C)

Bit	Attr	Reset Value	Description
31:16	W1C	0x0000	elbi_app_intsts_1 Interrupt Status 1 1'b0: No interrupt 1'b1: Interrupt Write "1" to clear each status bit
15:0	W1C	0x0000	elbi_app_intsts_0 Interrupt Status 0 1'b0: No interrupt 1'b1: Interrupt Write "1" to clear each status bit

USP_PCIE_ELBI_APP_ELBI_USER8

Address: Operational Base + offset (0x0E20)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_USER9
Address: Operational Base + offset (0x0E24)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_USER10
Address: Operational Base + offset (0x0E28)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_USER11
Address: Operational Base + offset (0x0E2C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_USER12
Address: Operational Base + offset (0x0E30)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_USER13
Address: Operational Base + offset (0x0E34)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_USER14
Address: Operational Base + offset (0x0E38)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

USP_PCIE_ELBI_APP_ELBI_USER15
Address: Operational Base + offset (0x0E3C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	app_data Application User Define Information.

11.5 Interface Description

Table 11-10 PCIe IO Usage Model

Signal name	Direction	IO Attribute
BUTTON_RSTN	I	pull down
WAKEN	I/O	Open Drain, pull up
PERSTN	I/O	pull down
CLKREQN	I/O	Open Drain, pull up

11.6 Application Notes

11.6.1 Clock and Reset

11.6.1.1 Clock Overview

The PCIe module uses multiple clock domains, it consists of system bus clocks (APB and AXI), Core function clock, PIPE interface clock, Power management clock, and PCIe PHY reference clock.

Table 11-16 Clock Overview

Clock Name	Note
pclk/core_clk/pipe_clk	PIPE and Core clock from PHY PLL generated
mstr_aclk	AXI master clock
slv_aclk	AXI slave clock
dbi_aclk	DBI AXI slave clock
aux_clk	Low power clock(24MHz)
apb_clk	APB slave clock for Client

The system bus clock is generated from SOC main PLL internally, please refer to the relative CRU for details. System bus clock gating is handled automatically by PCIe controller

Core function clock is derived from the PIPE interface clock output from the PCIe PHY. In specific low power state, core function clock is gated and switch to Power management clock automatically. After power up, if the PHY is not ready(phystatus is not de-assert), accessing the core through AXI slave will be held until it is ready.

The PHY TX PLL generates PIPE interface clock from the platform reference clock. The PCIe link Training and transaction is completely dependent upon availability of this clock. Application should not initiate transactions before ensuring that the PHY PLL is locked.

The Power management clock which should be fixed with 24MHz driven by crystal input clock. The PCIe controller uses this clock for counting time during L1 substates. You must program the frequency of this clock into the L1_SUBSTATES_OFF register with a value of 24MHz to count real time.

Many PCIe connections, especially backplane connections, require a synchronous reference clock between the two link partners. To achieve this a common clock source, referred to as REFCLK in the PCI Express Card Electromechanical Specification, should be used by both ends of the PCIe link.

11.6.1.2 PCIe PHY Reference Clock

The PHY usually use the external dedicated 100M differential clock as reference clock, the clock should be compatible with the CEM specification.

For low BOM cost usage, In RC mode, PCIe PHY can use internal single-ended clock which can be configured to 24Mhz(Combo PHY), 25Mhz(Combo PHY), 100Mhz(Combo PHY and PCIe 3.0 PHY). Meanwhile, in Combo PHY mode, PCIe PHY can provide differential clock output for system application. The source of differential clock output can be select from internal single-ended clock or PHY TX PLL.

The PCIe 3.0 PHY can use internal SoC 100M reference by setting the ref_use_pad to "0". To get better SI, the unused should be gated.

11.6.1.3 Reset Overview

11.6.1.3.1 Power-On Reset

The power-on reset is used as Cold reset of the PCIe. The entire module is reset when power-on reset is asserted and also generate a phy_rst_n to reset the PHY link. After de-assertion of the power-on reset, the PCIe PHY and PCIe Core function reset keeps until the software release. Software should finish PCIe PHY initialization before de-asserting the power-on reset. The power-on reset is controlled by CRU, the power-on reset is keep asserted until the software de-assert the reset request.

11.6.1.3.2 System reset

The PCIe Controller has the following distinct resets, all of these are configurable through software driver. This section describes the function of each of the reset inputs.

- button_rst_n: Button reset from board if related IO has been used. Please refer to Interface Description section for more information. This reset has an equal functionality with power-on reset.
- perst_n: This reset works as Warm Reset of PCIe if related IO has been used. Please refer to Interface Description section for more information.
- core_rst_n: This is the main reset for the PCIe Controller. It resets all the logic in the core running in the CORE_CLK(partial of PCLK) domain, except for the PMC module. It keeps reset with power-up reset by default. It also should be asserted when Hot Reset or link down reset occurs, but Application software can delay core_rst_n been asserted until system is ready to do core reset. This delayed reset operation will be discussed in next section.
- AXI Reset: All three AXI interface has its own reset input: mstr_aresetn, slv_aresetn, dbi_resetn. Each resets all logic in the specific AXI clock domain. Typically, these resets are be asserted whenever core_rst_n is asserted. Application software shall have the knowledge of choosing an appropriate time to drive this reset in order to avoid times when a transaction is in flight.
- non_sticky_rst_n: Resets all non-sticky bit registers in the configuration register space.
- sticky_rst_n : Resets all sticky bit registers in the configuration register space.
- pwr_rst_n: Resets the PMC module and resets all registers in the PM clock domain, including sticky bits. It is the power-on reset.
- phy_rst_n: output reset signal to reset the PCIe PHY. This reset asserted along with Cold Reset, Warm Reset, Hot Reset.

11.6.1.3.3 Hot Reset and Link-Down Reset

A downstream port (DSP) can hot reset an upstream port (USP) by sending two consecutive TS1 ordered sets with the hot reset bit asserted. Eventually, the DSP and USP assert link_req_rst_not to request external logic to reset them. Alternatively, during normal operation, the link might fail and go down. After this link-down event, the controller requests the reset module to hot-reset the controller. There is no difference in the handling of a link-down reset or a hot reset.

Hot Reset or Link-down reset cannot be activated before no transaction is appending on system bus. Application software must confirm that system bus is in IDLE state then let the reset operation go on.

To prevent your application from hanging when the controller is reset, the controller must cleanly terminate all transactions that are still in-progress. In AXI configurations with a segmented-buffer Rx queue architecture, the controller automatically executes this process before asserting link_req_rst_not. To disable automatic flushing, set the AUTO_FLUSH_EN field in LINK_FLUSH_CONTROL_OFF to '0'.

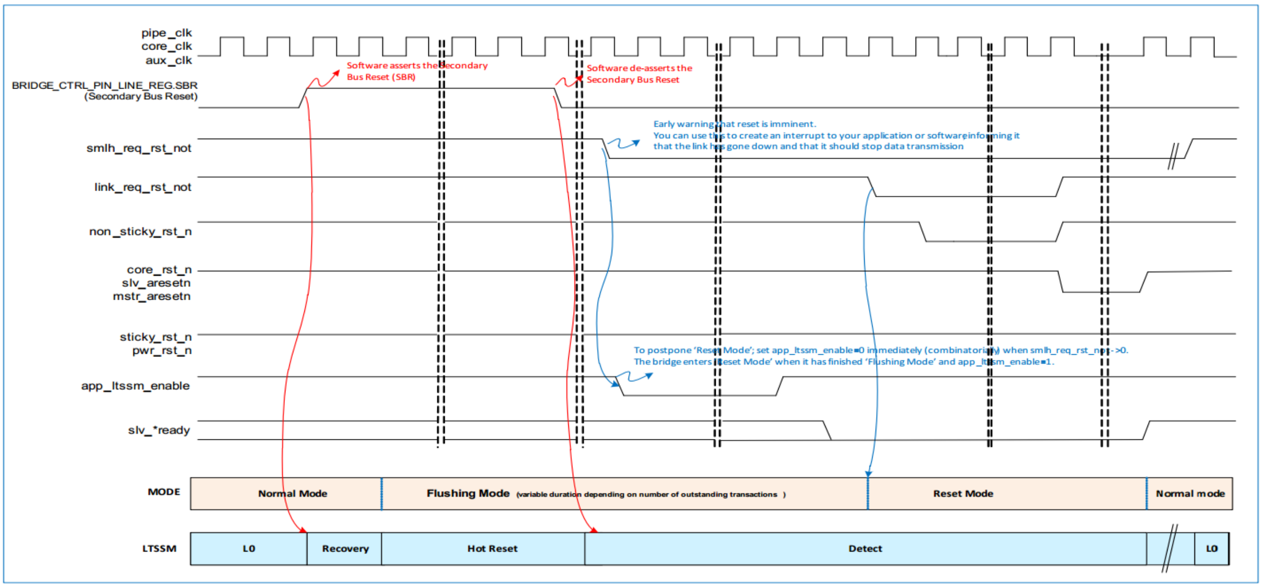

Fig. 11-5 Delaying the PCIe Hot Reset

Figure above illustrates the timing of handling Hot Reset. When Hot Reset or Link-down reset occurs, controller will assert smlh_req_rst_not as an early warning. This warning is an interrupt bit in Client Register group(link_req_rst_not_int). If you want to delay the reset of the controller so that it continues to accept and terminate slave requests, or to read out some register status through the DBI, you must set app_ltssm_enable =0 immediately (combinatorially) after smlh_req_rst_not ->0, as shown in above, this can be achieved by enable the app_dly1_en, app_ltssm_enable will be de-asserted immediately to disable the LTSSM. Then the Hot Reset process is holding on, software then should set the PCIe BIU in IDLE state. This delay will be end-up by asserting app_dly1_done.

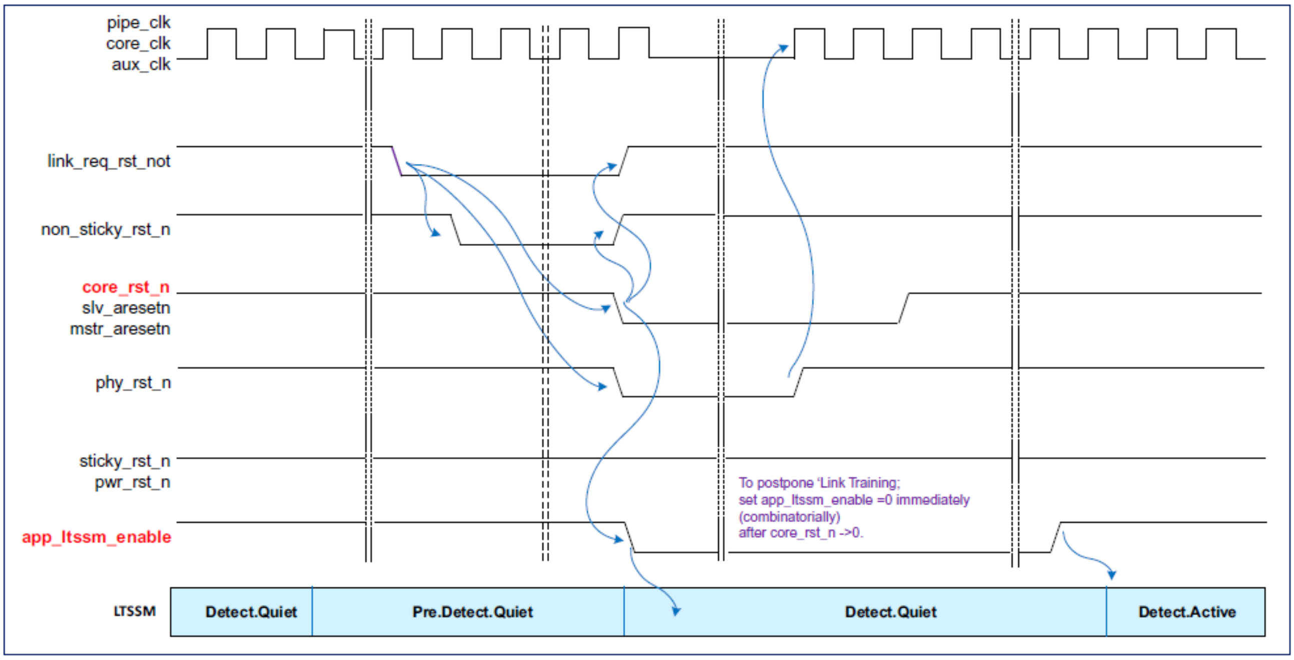

Fig. 11-6 Delaying the Link Training After Hot Reset

If you want to delay link re-establishment (after reset) so that you can reprogram some registers through DBI, you must set app_ltssm_enable =0 immediately after core_rst_n as shown in above. This can be achieved by enable the app_dly2_en, and end-up the delay by assert app_dly2_done.
To be compatible with old version client design, the app_ltssm_enable_enhance is a new

way to control the glue behavior of the app_ltssm_enable. It's advised set app_ltssm_enable_enhance to "1" when the version >= 0x50600. The mechanisms of delaying the Hot reset are available only in app_ltssm_enable_enhance mode.

11.6.2 Initialization

11.6.2.1 Initialization Sequence for RC Mode

The initialization sequence for RC mode is as follows:

1. Configure the IO for CLKREQ# and WAKE# signals. Configure the optional signals button_rst_n and perst_n if they are used. Please refer to section Interface Description for details.
2. De-assert the PCIe 3.0 PHY PMA output clamp(pcie30_clamp_n) if PCIe 3.0 PHY used.
3. If want to change the default pcie30_phy_mode or other critical configurations that need to be followed by phy_reset, please assert pcie30_phy_resetn
4. Configure the CRU registers to provide appropriate reference clock to PCIe PHY if internal reference used. Check all the CRU control registers, such as PLL/DIV/CKG(clock gating), to make sure the reference and other clock is working normally. Please refer to CRU Chapter for more information.
5. Configure Combo PIPE PHY or PCIe 3.0 PHY General Register File, to set PHY working mode, control the unused PIPE signals and initialize the PHY, the source of the reference or output the differential reference clock.
6. De-assert the PCIe 3.0 pcie30_phy_resetn if necessary
7. Sometimes, it is also necessary to configure the PHY internal register to adjust some analog trim.
8. De-assert the power-up reset of PCIe Controller. Delay some time or wait PLL lock if the PLL lock flag is accessible.
9. Set the app_ltssm_enable_enhance to enable enhance control mode of app_ltssm_enable
10. Initialize the device_type as Root Complex. You can program Client and controller registers before Link training start if necessary. Link training can be initialed by setting ltssm_enable bit in register PCIE_CLIENT_GENERAL_CON to 1. Link training success will set phy_link_up_int to 1. And if data flow initialization success, dll_link_up_int interrupt status bit will be set to 1. These two bits can be polled in LTSSM_STATUS or GENERAL_DEBUG_INFO, besides, it can be informed by interrupt optionally. The controller tries to linkup at maximum Link width/speed, if you want to resize or change speed, please refer to internal application document about speed changing and lane resizing. It is strongly recommended that set direct_speed_change bit to 1 in PL_GEN2_CTRL_OFF before link training.
11. Software emulation and initialization.
12. Writes to Bus Master Enable (BME), Memory Space Enable (MSE), then application can start application traffic generation.

11.6.2.2 Initialization Sequence for EP Mode

The initialization sequence for EP mode is similar with Root Complex, except:

- Normally, perst_n is input for EP device if it is used.
- The reference clock of PHY is normally provided by mother board.
- The device_type to EP mode.
- EP doesn't do emulation.

11.6.2.3 SRIS Mode

Software can enable support for the Separate Refclk with Independent Spread Spectrum Clocking (SRIS) feature as defined by the PCI Express Base Specification, Revision 5.0, Version 1.0, by setting CX_SRIS_SUPPORT =1. This also populates the app_sris_mode input pin. When CX_SRIS_SUPPORT =1 and app_sris_mode =1, then L0s is not supported and must not be advertised in the ASPM Support Capability Registers.

The SRIS mode is only support when controller interfaces with PCIe 3.0 PHY that supports SRIS. Software should initialize the controller and PHY by setting below registers before power-up the PHY.

- app_sris_mode in Client.
- Set rxX_sris_mode_en to “1”, and rxX_cmn_refclk_mode to “0” in PCIe 3.0 PHY GRF

11.6.2.4 Tie Off Unused Lanes

N/A
It is automatically implemented by hardware.

11.6.3 Address Translation

The controller uses the internal Address Translation Unit(iATU) to implement a local address translation scheme that replaces the TLP address and TLP header fields in the current TLP request header.

The iAUT has several inbound Address Translation regions and several outbound Address Translation regions. The minimum size of an Address Translation Region is 64k and the maximum size of an Address Translation Region is 4G.

11.6.3.1 Outbound Features

Address translation is used for mapping different address ranges to different memory spaces supported by your application. A typical example maps your application memory space to PCI memory space. The ATU also supports type translation. Without address translation, your application address is passed unmodified to the TLPs directly through the Tx application interface. You can program the iATU to implement your own outbound address translation scheme. The outbound features are as follows:

- Address Match mode operation for MEM and I/O, CFG, and MSG TLPs. No translation for completions.
- Supports type translation through TLP type header field replacement for MEM or I/O types to MSG/CFG types.
- Programmable TLP header field replacement. Including TYPE, TC, AT, ATTR, MSG-Code, TH, PH, ST.
- Multiple (up to 16) address regions programmable for location and size.
- Programmable enable/disable per region.
- Automatic FMT field translation between three DWORDs and four DWORDs for 64-bit addresses.
- Invert Address Matching mode to translate accesses outside of a successful address match.
- Configuration Shift mode. Optimizes the memory footprint of CFG accesses destined for the Rx application interface in a multifunction device.
- Response code which defines the completion status to return for accesses matching a region.
- Supports regions from 64 KB to 4 GB in size.
- Payload Inhibit marks all TLPs as having no payload data.
- Header Substitution replaces bytes 8 to 11 (for 3 DWORD header) or bytes 12 to 15 (for 4 DWORD header), inclusive, of the outbound TLP header.
- Tag Substitution of the outbound TLP tag field.
- Function number bypass mode to allow function number information to be supplied from your application transmit interface while translating the address and other attributes of the TLP.
- DMA bypass mode to allow TLPs which are initiated by the embedded DMA engine, to pass through the iATU untranslated.

11.6.3.2 Outbound Basic Operation

The address field of each request MEM and I/O TLP is checked to see if it falls into any of the enabled address regions defined by the Start and End addresses as defined in Figure below. When an address match is found, then the TLP address field is modified as follows:

Translated Address = Original Address - Base Address + Target Address

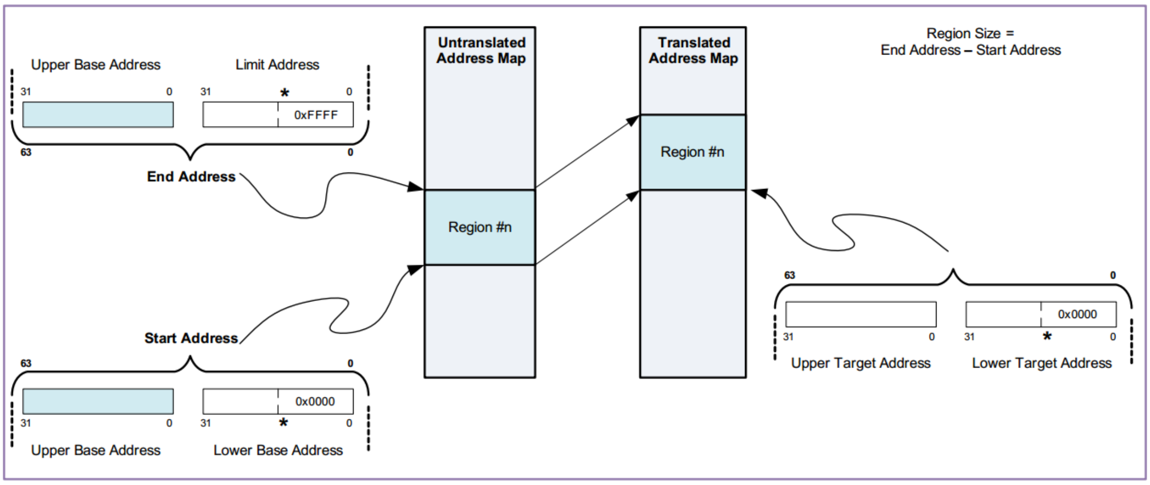

Fig. 11-7 PCIe Hot Reset Control Structure

The TYPE, TC, AT, TH, PH, ST, Function Number, and ATTR header fields are replaced with the corresponding fields in the IATU_REGION_CTRL_1_OFF_OUTBOUND_0 register. When your application address field matches more than one of the CX_ATU_NUM_OUTBOUND_REGIONS address regions, then the first (from lowest number 0) enabled region to be matched is used. For details on what happens when there is no address match, see "No Address Match Result". This operational mode (called Address Match Mode) is always used for outbound translation.

The minimum size of an address translation region is 64KB. So, the lower 16 bits of the Base, Limit, and Target registers are zero and all address regions are aligned on 64 KB boundaries.

11.6.3.3 Outbound Detailed Operation

11.6.3.3.1 RID BDF Number Replacement

When there is a successful address match on an outbound TLP, then the function number used in generating the function part of the requester ID field of the TLP is taken from the 3-bit Function Number field of the IATU_REGION_CTRL_1_OFF_OUTBOUND_iregister. The value in this field must be 0x0 unless multifunction operation in the controller is enabled. To override this behavior, use the "Function Number Translation Bypass Feature" described later.

11.6.3.3.2 iATU Outbound MSG Handling

The iATU supports TYPE translation/conversion of MEM and I/O TLPs to Msg/MsgD TLPs. This supports applications that are unable to directly generate Msg/MsgD TLPs. When there is a successful address match on an outbound MEM TLP, and the translated TLP type field is MSG (that is, the type field of the IATU_REGION_CTRL_1_OFF_OUTBOUND_i register is 10xxx), then the message code field of the TLP is set to the value in the Message Code field of the IATU_REGION_CTRL_2_OFF_OUTBOUND_iregister.A Memory Write with an effective length of '0' is converted to Msg and all other MWr TLPs are converted to MsgD.

11.6.3.3.3 MEM-CFG Type Translation

The iATU supports translation of I/O and MEM TLPs to CFG TLPs. This is useful for applications that are unable to generate CFG TLPs. The 16-bit BDF is located at bits [31:16] of the translated address where:

Translated Address = Original Address - Base Address + Target Address

As an example:

Original Address[31:16] = {13h0,function_no[2:0]}
Base Address[31:16] = 16h0
Target Address[31:16] = {bus_no[7:0],device_no[4:0],3h0}

then:

Translated Address[31:16] = BDF ={bus_no[7:0], device_no[4:0], function_no[2:0]}

To handle eight functions (as the previous example indicates), you should use a 19-bit wide region size. For CFG transactions created directly by your application (asopposed to the iATU), you must ensure that the BDF field does not match any programmed iATU address region or else unintentional type translation could occur.

11.6.3.3.4 CFG Shift Feature

This feature is enabled by setting the CFG_SHIFT_MODE field the IATU_REGION_CTRL_2_OFF_OUTBOUND_0 register. The iATU uses bits [27:12] of the original address to form bits [31:16] (BDF location) of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space.

11.6.3.3.5 FMT Translation

The iATU automatically sets the TLP format field for three DWORDs when it detects all zeros in the upper 32 bits of the translated address. Otherwise, it sets it to four DWORDs when it detects a 64-bit address (that is, when there is a '1' in the upper 32 bits of the translated address). When the original address and the translated address are of different format, the iATU ensures that the TLP header size matches the translated address format.

11.6.3.3.6 Invert Feature

In normal operation an address match on an outbound TLP occurs when the untranslated address is in the region bounded by the base address and limit address. When the invert feature is activated, an address match occurs when the untranslated address is not in the region bounded by the base address and limit address. This feature is activated by setting the Invert field of the IATU_REGION_CTRL_2_OFF_OUTBOUND_iregister.

11.6.3.3.7 DMA Bypass Feature

When you do not want the iATU to translate outbound requests that are generated by the DMA, you must implement one of the following approaches:

- Ensure that the combination of DMA channel address programming and iATU control register programming causes no translation of DMA traffic to be done in the iATU.
- Activate the DMA bypass mode to allow request TLPs which are initiated by the embedded DMA controller to pass through the iATU untranslated. You can activate the DMA bypass mode by setting the DMA Bypass field of the IATU_REGION_CTRL_2_OFF_OUTBOUND_i register to 1.

11.6.3.3.8 Function Number Translation Bypass Feature

In this mode the function number of the translated TLP is taken from your application transmit interface and not from the Function Number field of the REGION_CTRL_1_OFF_OUTBOUND_i register. You can activate the function number bypass mode by setting the Function Number Translation Bypass Enable field in the IATU_REGION_CTRL_2_OFF_OUTBOUND_i to '1'.

11.6.3.3.9 General Bypass

Application can program PCIE_CLIENT_AXI_SLV_ATU_BYPASS register to do general ATU bypassing. Note that you should make sure that there is no transfer pending before you program this register.

11.6.3.3.10 Header Substitution (Tx)

When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. The expected usage scenario is for Vendor Defined Msg/MsgD and ATS transactions over the AXI bridge which is normally inefficient requiring a very large iATU region. Enabled using the HEADER_SUBSTITUTE_EN field in IATU_REGION_CTRL_2_OFF_OUTBOUND_i.

11.6.3.3.11 Tag Substitution (Tx)

When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in IATU_REGION_CTRL_2_OFF_OUTBOUND_i. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. Enabled using the TAG_SUBSTITUTE_EN field in IATU_REGION_CTRL_2_OFF_OUTBOUND_i.

Your application must not attempt to perform TAG substitution for outgoing non-posted TLPs.

Note: If the iATU is programmed to allow a TLP to be matched to more than one iATU outbound regions, the Function Number Translation Bypass field of the

IATU_REGION_CTRL_2_OFF_OUTBOUND_i register should be same for every region where that TLP can be matched.

11.6.3.4 Outbound Programming Example

Define Outbound Region 1 as:
64 KB I/O region from 0x80000000_d000000to 0x80000000_d000ffff, to be mapped to 0x00010000in the PCIe I/O space.

1. Setup the Region Base and Limit Address Registers.
   Write 0xd0000000to Address {0x208} to set the Lower Base Address.
   Write 0x80000000to Address {0x20C} to set the Upper Base Address.
   Write 0xd000ffff to Address {0x210} to set the Limit Address.
2. Setup the Target Address Registers.
   Write 0x00010000to Address {0x214} to set the Lower Target Address.
   Write 0x00000000to Address {0x218} to set the Upper Target Address.
3. Configure the region through the Region Control 1 Register.
   Write 0x00000002to Address {0x200} to define the type of the region to be I/O.
4. Enable the region.
   Write 0x80000000to Address {0x204} to enable the region.

11.6.3.5 Inbound Features

Address translation is used for mapping different address ranges to different memory spaces supported by your application. A typical example maps your application memory space to PCI memory space. The iATU supports type translation. Without address translation, your application address is passed from the TLPs directly through the AXI application interface. You can program the iATU to implement your own inbound address translation scheme without external logic.

- Programmable Match mode operation for MEM, I/O, CFG, and MSG TLPs. No translation for completions.
- Selectable BAR Match mode operation for I/O and MEM TLPs:
  - TLPs destined for the internal CDM (or ELBI) in an upstream port are not translated.
  - TLPs that are not error-free (ECRC, malformed and so on) are not translated.
- Programmable TLP header field matching:
  - TYPE/TD/TC/AT/ATTR/MSG-Code/TH/PH/ST
  - Function Number
- Multiple address regions programmable for location and size.
- Programmable enable/disable per region.
- Automatic FMT field translation between three DWORDs and four DWORDs for 64-bit addresses.
- Invert Address Matching mode to translate accesses outside of a successful address match.
- ECAM Configuration Shift mode to allow a 256 MB CFG1 space to be located anywhere in the 64-bit address space.
- Supports regions from 64 KB to 4 GB in size.
- Single Address Location to allow all TLPs to be translated to a single address location.
- Msg Type Match Mode to allow matching of any TLP of type Message.

11.6.3.6 Inbound Basic Operation

11.6.3.6.1 Overview

The following translation rules and limitations apply:

- When there is no match, then the address is untranslated. In addition
- TLPs destined for the internal registers in an upstream port are not translated.
- TLPs that are not error-free (ECRC, malformed and so on) are not translated.
- Address translation of all TLP types (MEM, I/O, CFG, and MSG) except completion is supported in Address Match mode. In BAR Match mode, only translation of I/O and MEM is supported.

The setting of the MATCH_MODE field in IATU_REGION_CTRL_2_OFF_INBOUND_0 determines how iATU inbound matching is done for each TLP type.

Table 11-17 Determination of Match Mode

TLP Type	MATCH_MODE =0	MATCH_MODE =1
MEM or I/O	Address Match Mode	BAR Match Mode
CFG0	Routing ID Match Mode	Accept Mode
MSG/MSGD	Address Match Mode	Vendor ID Match Mode

11.6.3.6.2 I/O and MEM Match Modes

Inbound address translation for I/O and MEM TLPs operates in one of two matching modes as determined by the "Inbound Match Mode" field in the IATU_REGION_CTRL_2_OFF_INBOUND_0 register.

Address Match Mode:

The operation is similar to "Outbound Basic Operation (Address Match Mode)". The address field of each request TLP is checked to see if it falls into any of the enabled address regions. When an address match is found then the TLP address field is modified as follows:

Address = Address - Base Address + Target Address

BAR Match Mode:

Looking for an address match is a two-step process.

1. The standard internal PCI Express BAR Matching Mechanism checks if the address field of any MEM and I/O request TLP falls into any address region defined by the enabled BAR addresses and masks.
2. When a matched BAR is found, then the iATU compares the BAR ID to the BAR Number field in the IATU_REGION_CTRL_2_OFF_INBOUND_0 register for all enabled regions. Figure below provides more details on inbound translation in BAR Match Mode.

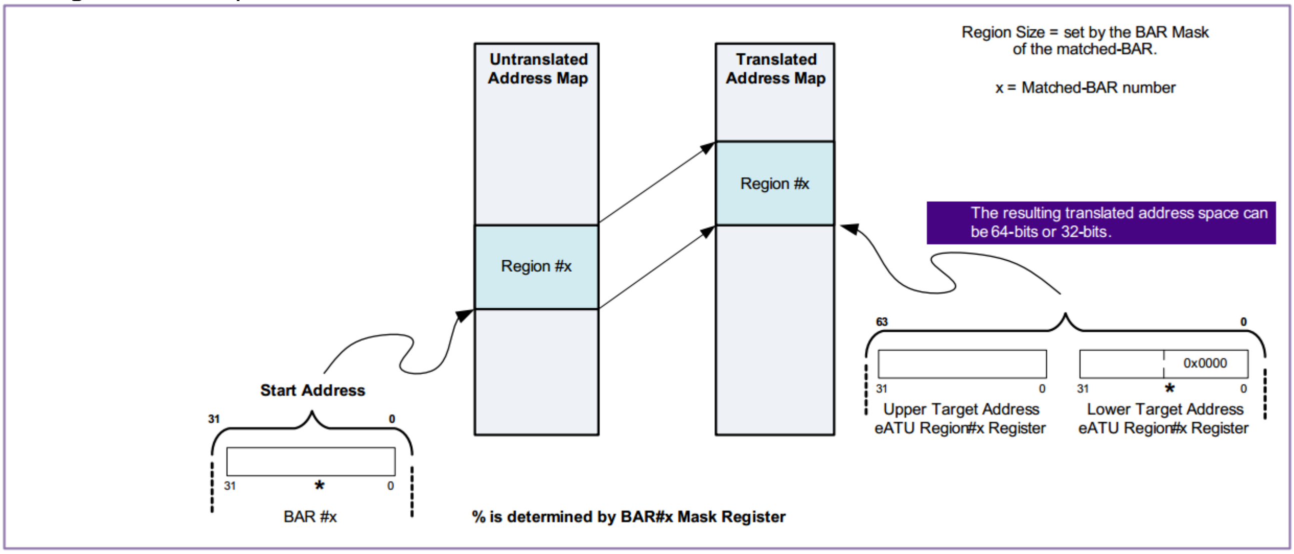

Fig. 11-8 Inbound BAR Match Mode

11.6.3.7 Inbound Detailed Operation

11.6.3.7.1 Single Address Location

When enabled and region address is matched, the TLPs can be translated to a single address location as determined by the target address register of the iATU region. This feature can be enabled using the SINGLE_ADDR_LOC_TRANS_EN field in IATU_REGION_CTRL_2_OFF_INBOUND_i. This feature is useful for translating messages on AXI bridge.

11.6.3.7.2 CFG Handling (Upstream Port)

The controller normally routes CFG TLPs (to the internal CDM or ELBI) without translation. The iATU only translates CFG0 TLPs that the controller has routed to the TRGT1. Inbound address translation for CFG0 TLPs operates in one of two matching modes as determined by the Inbound CFG0 Match Mode field in the IATU_REGION_CTRL_2_OFF_INBOUND_i register.

Accept Mode

The controller always accepts CFG0 TLPs even when the CFG bus number does not match the current bus number of the device. This mode follows that behavior. The routing ID of received CFG0 TLPs are ignored when determining a match.

Routing ID Match Mode

The operation is similar to “Outbound Basic Operation (Address Match Mode)”. The routing ID of the inbound CFG0 TLP must fall within the Base and Limit of the defined iATU region for matching to proceed. The iATU interprets the routing ID (Bytes1 8-11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM and I/O transactions.

CFG Shift Feature

Inbound CFG transactions routed to the Rx application interface can exist anywhere in address space, because the PCIe controller filter processes the routing ID (BDF) as bits [31:16] of an address. This BDF changes according on the PCIe bus topology. A compressor feature (CFG Shift Feature) can be enabled by setting the CFG Shift bit in the IATU_REGION_CTRL_2_OFF_INBOUND_i register. Bits [15:12] of the third DWORD1 of CFG TLPs are reserved. The compressor feature uses this fact to reduce the memory requirement. This shifts/maps the BDF (bits [31:16] of the third header DWORD, which would be matched against the Base and Limit addresses) of the incoming CfgRd0/CfgWr0 down to bits [27:12] of the translated address.

11.6.3.7.3 Optional Matching Fields

In address and BAR match modes, a successful address/BAR match can be optionally gated by successful matching of the following programmable TLP header fields (per region):

- TYPE/TD/TC/AT/ATTR/TH/PH/ST
- MSG Code (MSG TLPs only)
- Function number (MEM, I/O, or CFG TLPs only)
- Virtual function number (MEM or I/O TLPs only)

For each of the previous fields in the IATU_REGION_CTRL_1_OFF_INBOUND_i register, there is an associated Match Enable bit in the IATU_REGION_CTRL_2_OFF_INBOUND_i register. Address translation only proceeds when compares on all enabled field are successful.

11.6.3.7.4 Response Code Feature

When the Response Code field of the IATU_REGION_CTRL_REG_2_INBOUND_i register is set to a value other than 00, the controller uses it to determine the completion status field of completion TLPs sent in response to successfully match non-posted TLPs. This can be set to unsupported request (UR) or completer abort (CA). When the error response field is set to 2b00, then the normal receive filter response for this TLP is used.

11.6.3.7.5 Inbound MSG Handling

Inbound message (Msg/MsgD) transactions can use one of two matching modes:

Address Match Mode

The third and fourth header DWORDs are treated as an address and are compared against the iATU Region Base and Limit Address registers. For vendor defined messages this allows specific messages to be filtered into memory at the target address. The Upper Base address should be set to BDF and Vendor ID. The Lower Base address can be used as a filter for specific messages.

Vendor ID Match Mode

This mode is relevant for ID-routed vendor defined messages. The iATU ignores the routing ID (BDF) in bits [31:16] of the third DWORD of the TLP header1 but compares it against the vendor ID in bits [15:0] of the third DWORD of the TLP header (bytes1 10 and 11). This

allows vendor defined messages to be filtered against specific vendor IDs without needing to know the BDF number which might vary depending on the PCI topology. Bits [15:0] of the Region Upper Base register should be programmed with the required vendor ID as follows:
Region Upper Base [15:8] =byte 10
Region Upper Base [7:0] =byte 11
The lower base and limit register should be programmed to translate TLPs based on vendor-specific information in the fourth DWORD of the TLP header.

11.6.3.7.6 Msg Type Match Mode

Inbound message (Msg/MsgD) transactions can also use Msg Type Matching mode. When this mode is enabled and Single Address Location is enabled, the iATU matches Msg TLP Type field with TYPE field of IATU_REGION_CTRL_1_OFF_INBOUND_i register.

If Fuzzy Type Match Mode is also enabled, then any Msg received will be matched (that is, Msg Type's sub-field r[2:0], which specifies the Message routing mechanism, is ignored). The Message should be consumed by your application before the next message arrives as all messages go to the same address.

If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN is set for any region, then you must ensure that the same TLP cannot be matched in any other region where SINGLE_ADDRESS_LOCATION_TRANSLATE_EN is not set. If this happens radm_trgt1_hdr_uppr_bytes could have incorrect data.

11.6.3.7.7 Fuzzy Type Match Mode

When enabled, the iATU relaxes the matching of the TLP type field against the expected type field so that:

- CfgRd0 and CfgRd1 TLPs are seen as identical. Similar with CfgWr0 and CfgWr1.
- MWr, MRd and MRdLk TLPs are seen as identical.
- The routing field of MsgD TLPs is ignored.
- Atomic Ops TLPs-FetchAdd, Swap, and CAS are seen as identical.

For example, CFG0 in the type of field in the IATU_REGION_CTRL_1_OFF_INBOUND_i register matches against an inbound CfgRd0, CfgRd1, CfgWr0, or CfgWr1 TLP. To enable this feature, set the Fuzzy Type Match Mode bit of the IATU_REGION_CTRL_OFF_2_INBOUND_i register.

11.6.3.7.8 FMT Translation

The iATU automatically sets the TLP format field for three DWORDs when it detects all zeroed in the upper 32 bits of the translated address. Otherwise, it sets it to four DWORDs when it detects a 64-bit address (when there is a 1 in the upper 32 bits of the translated address). When the original address and the translated address are of a different format then the iATU ensures that the TLP header size matches the translated address format.

11.6.3.7.9 Invert Feature

Normally an address match on an inbound TLP occurs when the untranslated address is in the region bounded by the Base address and Limit address. When the Invert feature is activated, an address match occurs when the untranslated address is not in the region bounded by the Base address and Limit address. This feature is activated by setting the Invert field of the IATU_REGION_CTRL_OFF_2_INBOUND_i register.

11.6.3.8 Inbound Programming Example

You must not update the iATU registers while operations are in progress on the AXI bridge slave interface.

Example 1:

Define Inbound Region 2 as: MEM region matching BAR4 (BAR match mode) mapping to 0x8000_0000_2000_0000 in your application memory space
1. Setup the Target Address Registers.
   Write 0x20000000 to Address {0x508} to set the Lower Target Address.
   Write 0x80000000 to Address {0x50C} to set the Upper Target Address.
2. Configure the region through the Region Control 1 Register.

Write 0x00000000 to Address {0x500} to define the type of the region to be MEM.
3. Enable the region for BAR Match Mode.
Write 0xC0000400 to Address {0x504} to enable the region for BAR match mode for BAR#4.

Example 2:

MEM region matching TLPs with addresses in the range 0x00010000 to 0x0005ffff mapped to 0x2000_0000 - 0x2004_ffff in your application memory space.
1. Setup the Region Base and Limit Address Registers.
Write 0x00010000 to Address {0x108} to set the Lower Base Address.
Write 0x00000000 to Address {0x10C} to set the Upper Base Address.
Write 0x0005ffff to Address {0x110} to set the Limit Address
2. Setup the Target Address Registers.
Write 0x20000000 to Address {0x114} to set the Lower Target Address.
Write 0x10000000 to Address {0x118} to set the Upper Target Address.
3. Configure the region through the Region Control 1 Register.
Write 0x00000000 to Address {0x100} to define the type of the region to be MEM.
4. Enable the region.
Write 0x80000000 to Address {0x104} to enable the region in address match mode

11.6.4 PCIe Embedded DMA

11.6.4.1 PCIe DMA Overview

The RC system CPU, or the EP application CPU, can off load the transfer ring of large blocks of data to the embedded DMA controller, leaving the CPU free to perform other tasks. The DMA is configured to have 2 read channels and 2 write channels. It can simultaneously perform the following types of memory transactions:

DMA write
Transfer (copy) of a block of data from local memory to remote memory.
DMA read
Transfer (copy) of a block of data from remote memory to local memory.

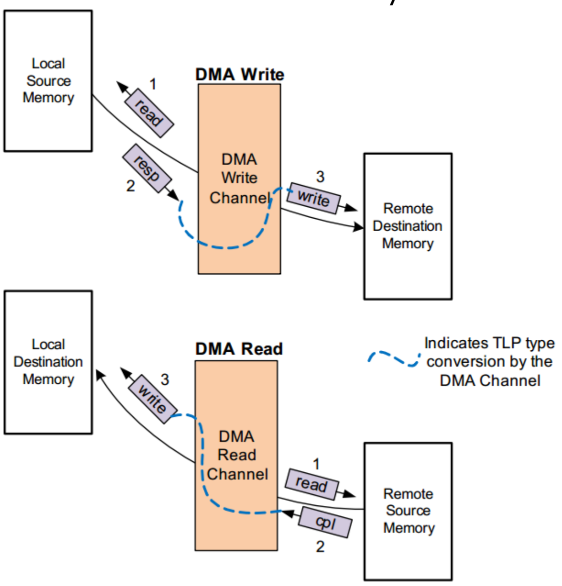

Fig. 11-9 System Level View of PCIe Embedded DMA

Therefore, the DMA supports full duplex operation, processing read and write transfers at the same time, and in parallel with normal (non-DMA) traffic. Upon completion of a DMA transfer or an error, the DMA optionally interrupts the local CPU or sends an interrupt MWr (IMWr) to the remote CPU. The DMA is highly configurable, and you can program it using the local DBI or over the PCIe wire.

In linked list mode, the DMA fetches the transfer control information (called channel context) for each transfer (block), from a list of DMA elements that have constructed in local memory.

11.6.4.2 Interrupts and Error Handling

The DMA generates two interrupts, read channel interrupt and write channel interrupt. Each of them can be caused by one of the two reasons:

Done: The DMA successfully completes the transfer.

Abort: The DMA fails to complete the transfer, or an error occurs during the transfer.

The interrupts are signaled to the software on your CPU, using one or both of the following mechanisms:

- Locally through the edma_rd_int or edma_wr_int field of PCIE_CLIENT_INTR_STATUS_MISC register.
- Remotely using a posted memory write (IMWr), which can be interpreted as an MSI or MSIX when directed toward the RC.

For remote interrupt, there are two programmable IMWr addresses per channel, one each for the done and abort interrupts. For MSI, you must program all IMWRr address registers with the same MSI address, as PCIe only supports a single MSI address per function.

A single IMWr data register is used for both types of interrupts, so you must read DMA_READ_INT_STATUS_OFF(or DMA_WRITE_INT_STATUS_OFF) to identify the interrupt type.

The interrupt handling mechanism is different for linked list (LL) mode (than non LL mode), and there are also some differences between the read and write channels.

11.6.4.2.1 Non Linked List Mode Interrupt Handling

You enable the local and remote interrupts through the local and remote interrupt enable (LIE and RIE) bits: DMA_CH_CONTROL1_OFF_WRCH_0.lie and DMA_CH_CONTROL1_OFF_WRCH_0.rie.

In the write channel, there is only one error condition that results in an abort interrupt. For more details, see “Linked List Mode” on next section. You mask, clear, and read the status of each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure below:

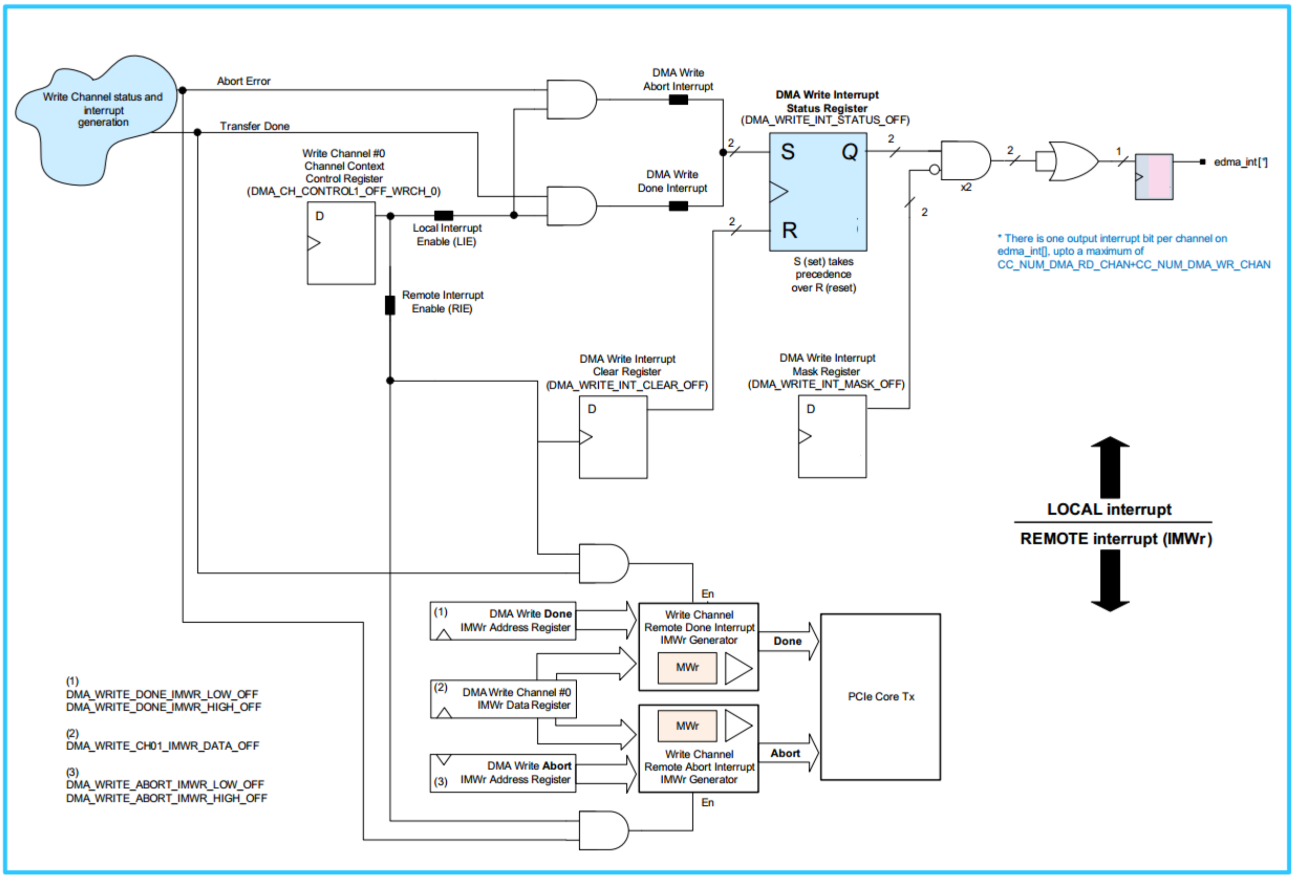

Fig. 11-10 Write Interrupt Generation - Non Linked List Mode

In the read channel, there are five error conditions that results in an abort interrupt. For more details, see “Linked List Mode” on next section. You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure below. However, you can read the status of each of the five abort errors (that contribute to the abort interrupt) through DMA_READ_ERR_STATUS_LOW_OFF and DMA_READ_ERR_STATUS_HIGH_OFF.

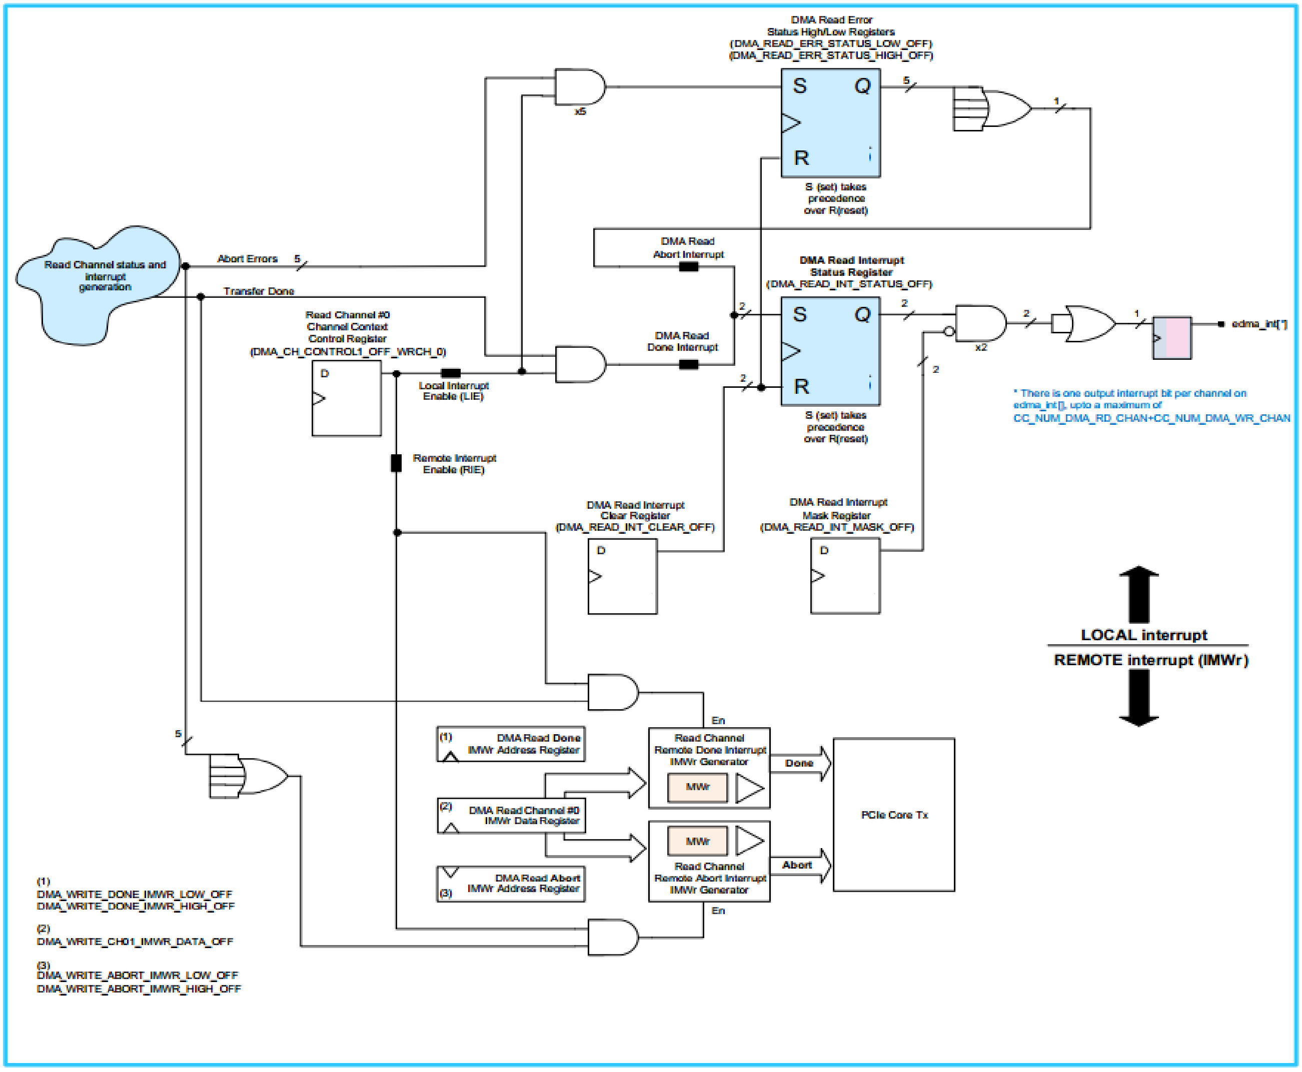

Fig. 11-11 Read Interrupt Generation - Non Linked List Mode

11.6.4.2.2 Linked List Mode Interrupt Handling

The LIE and RIE bits in the LL element enable the channel done interrupts (local and remote). The LLLAIE and LLRAIE bits of the DMA_WRITE_LINKED_LIST_ERR_EN_OFF and DMA_READ_LINKED_LIST_ERR_EN_OFF registers enable the channel abort interrupts (local and remote). In the write channel, there are two error conditions that results in an abort interrupt. For more details, see "Linked List Mode" on next section. You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure below. You can read the status of each of the two abort errors (that contribute to the abort interrupt) through the DMA_WRITE_ERR_STATUS_OFF register.

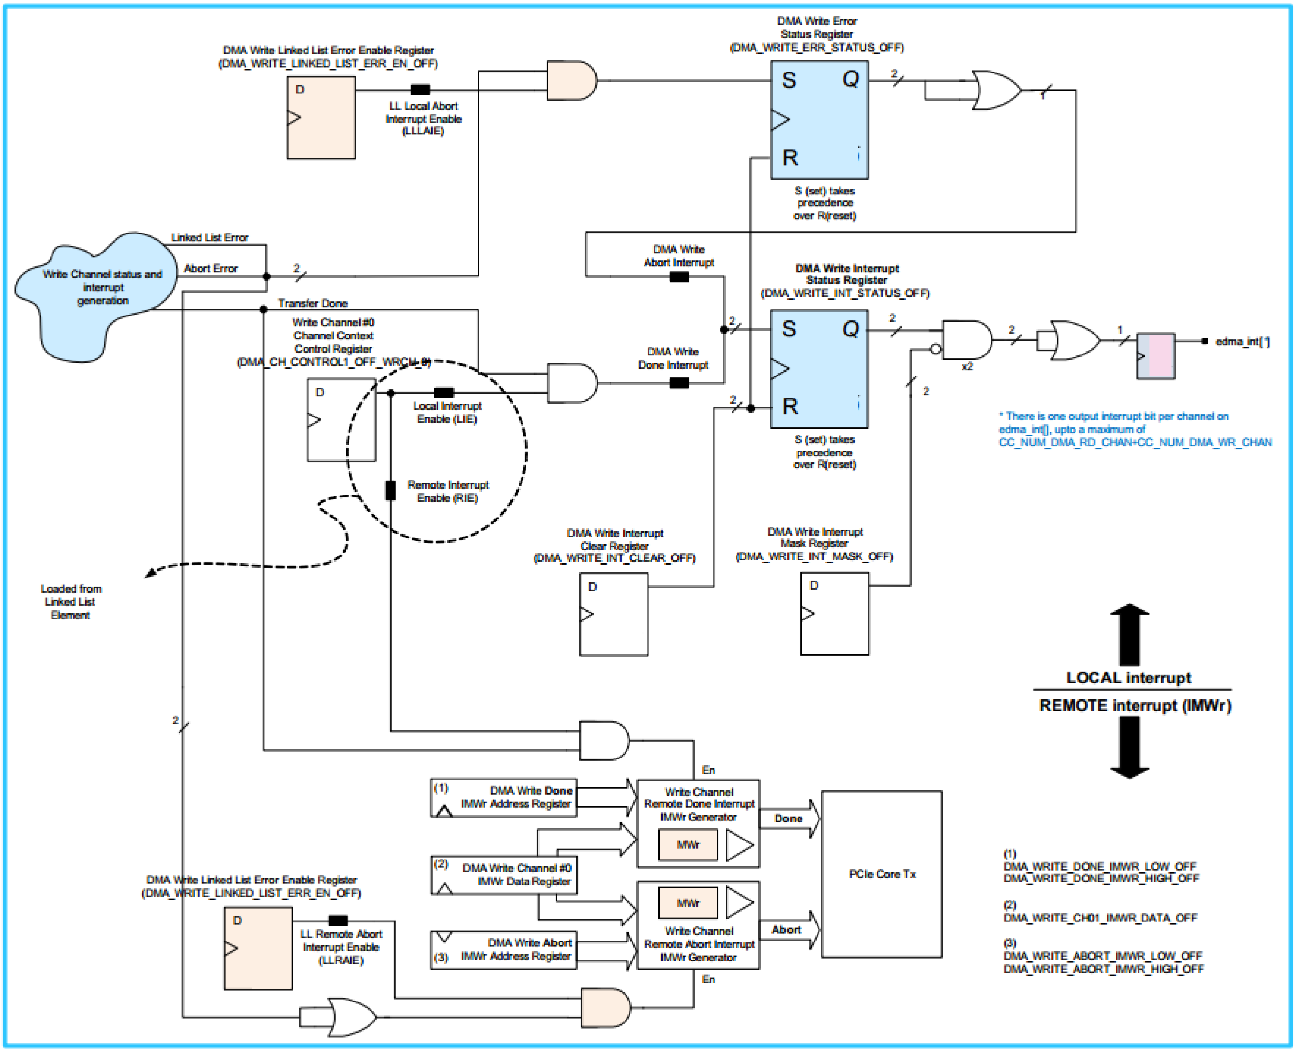

Fig. 11-12 Write Interrupt Generation - Linked List Mode

In the read channel, there are six error conditions that results in an abort interrupt. For more details, see "Linked List Mode" on next section. You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure below. You can read the status of each of the six abort errors (that contribute to the abort interrupt) through the DMA_READ_ERR_STATUS_LOW_OFF and DMA_READ_ERR_STATUS_HIGH_OFF registers.

In non-linked list mode, LIE acts as a global switch. However, when in linked list mode, LIE is just local to the current linked list element and the global switch is LLLAIE.

If the DMA driver is running on the host and the interrupt service routine is reading local interrupts to determine if the transfer is successful, then you must set LIE and RIE in the same element and you should mask or ignore the local interrupt pin. Setting RIE and LIE in element A followed by RIE (only) in element B is not a verified usage scenario.

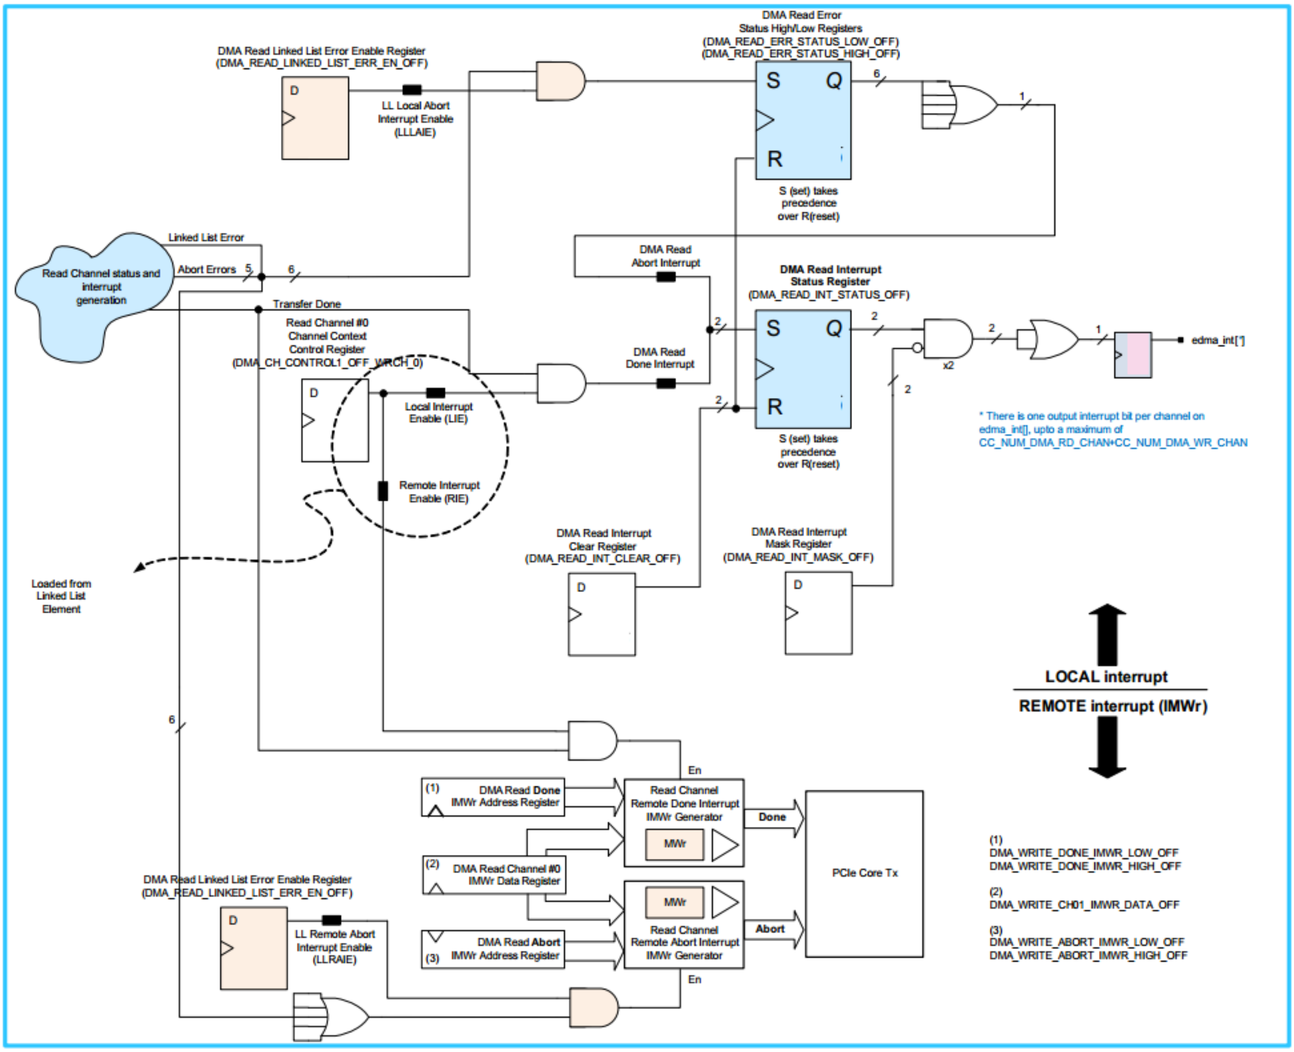

Fig. 11-13 Read Interrupt Generation - Linked List Mode

11.6.4.3 Linked List Mode

The DMA provides a linked list (LL) mode to efficiently move data from source to destination with minimal intervention from the local CPU. This mode provides an alternative to programming the DMA multiple times to transfer multiple blocks of data. The programming information (address, size, and so on) for each block of memory is pre-programmed by your software into a LL element (also known as a descriptor) in local memory. Each element (called a data element) in the LL structure (called a transfer list) can transfer up to 4 GB of data.

You enable LL operation for a channel, by setting the LLE field of the DMA_CH_CONTROL1_OFF_[WRCH|RDCH]_0 register to 1. Your application must produce the LL element structure in local memory as shown in figure below. Normally, all of the elements are contiguous (one after the other) in memory, and each element has six DWORDs containing the information about the block of data to be transferred. You program the channel context registers (DMA_LLP_LOW_OFF_WRCH_0 and DMA_LLP_HIGH_OFF_WRCH_0) with the location of where you have placed the LL element structure in local memory.

When you start the DMA transfer (by writing to the DMA Write Doorbell Register DMA_WRITE_DOORBELL_OFF or DMA Read Doorbell Register DMA_READ_DOORBELL_OFF), the DMA reads (consumes) each element from local memory, and loads the information (SAR, DAR, size, and so on) from that element into the channel context registers in the DMA. These channel context registers determine the operation of the channel that the DMA controller is currently servicing. The DMA then proceeds to transfer the block of data (as defined by the element), and when it is finished, reads the next element from local memory.

Normally, all of the elements are contiguous (one after the other) in memory, with the starting address defined in the channel context DMA Linked List Pointer Low Register DMA_LLP_LOW_OFF_WRCH_0.

When you want to jump in local memory to another element list (or recycle the consumed elements), then you set the LLP bit in the element (for example, link element #N-1 in figure below), specify the location of the next element structure using the LL Element Pointer DWORDs, and, set TCB to 1 (for recycling) or to 0 (to jump to another list).

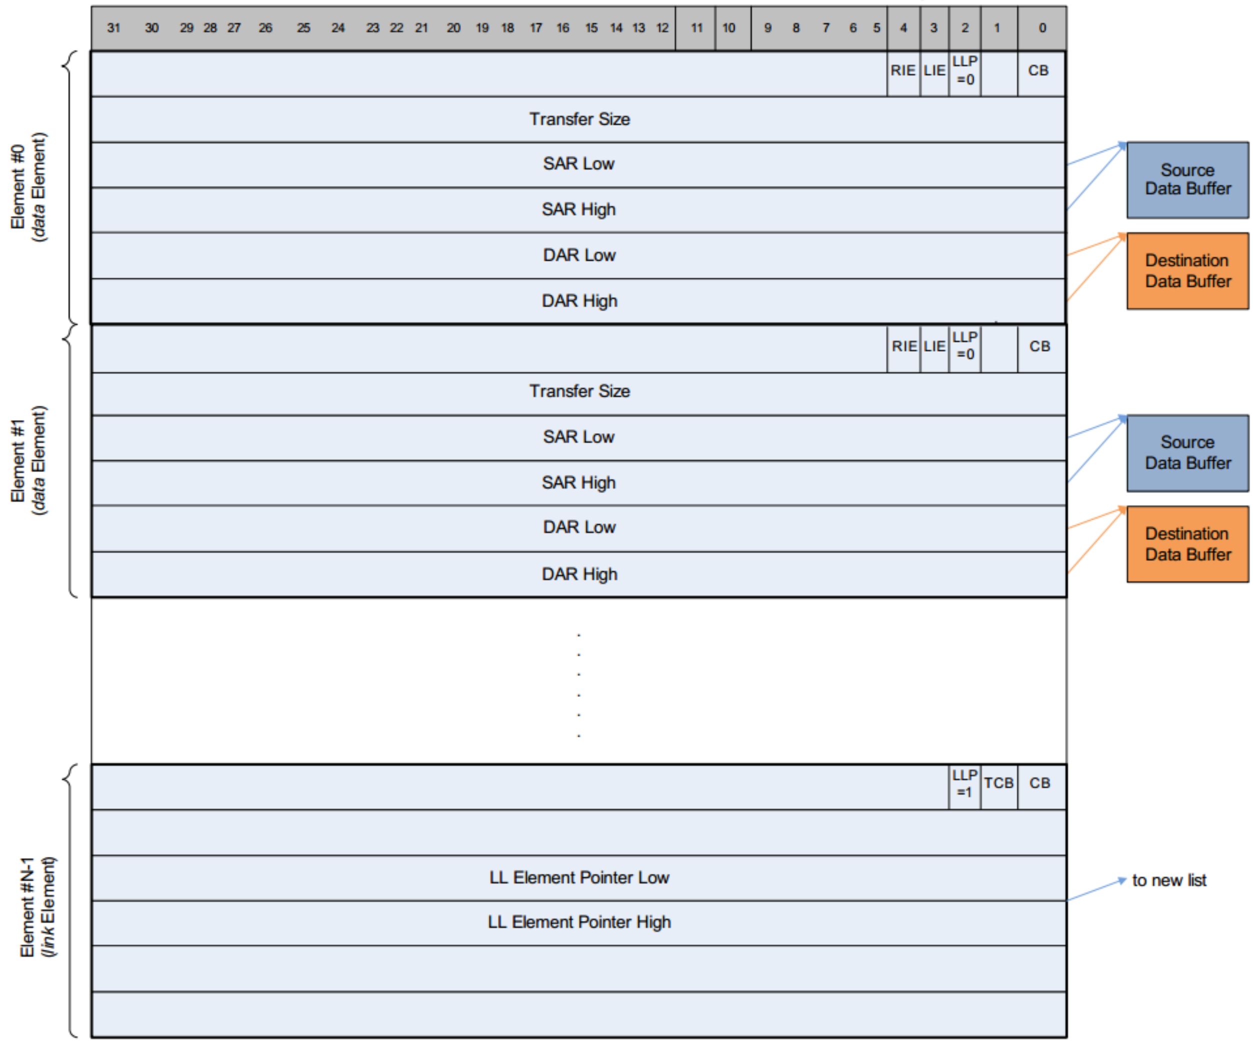

Fig. 11-14 Linked List Element/Descriptor Structure in Local Memory

11.6.4.3.1 LL Element and Channel Context Registers

Notice the similarity between a data element and the DMA Channel Context registers for each channel. Each element has six DWORDs as in Figure 9-6. There are eight channel context registers (DWORDs) for a channel. The DMA loads the six element DWORDs into the following channel context:

- CB, LLP, LIE, and RIE fields of the DMA Channel Control 1 register
- DMA Transfer Size
- DMA SAR Low and DMA SAR High
- DMA DAR Low and DMA DAR High

The definitions of the element DWORD bit fields are the same as the DMA Channel Context registers described in the register section, with the exception of the LIE and RIE bits. The LIE and RIE bits in a LL element, only enable the done interrupt. In non-LL mode, the RIE and LIE bits (in the channel context registers) enable the done and abort interrupts.

11.6.4.4 Flow Control

11.6.4.4.1 Overview

This optional feature is available only for those channels which are configured to operate in linked list (LL) mode. It enables your application to flow control the DMA controller by using

PCIE_CLIENT_DMA_HSHAKE_TOGG register, that is, your application determines when data block transfer starts.
In normal mode, as soon as the DMA is doorbelled, the DMA reads the LL descriptor, and starts the data block transfer. When this feature is enabled, the DMA reads the descriptor, but starts the data transfer only when your application logic toggles the [w|r]dxfer_go_togg field in PCIE_CLIENT_DMA_HSHAKE_TOGG register.

The DMA handshake mechanism can be turned on or off per channel using DMA_[WRITE/READ]_ENGINE_EN_OFF register. The handshake mechanism cannot be enabled/disabled when the channel status isactive, that is, when DMA_CH_CONTROL1_OFF_[WR|RD]CH_i.CS =01.

11.6.4.4.2 DMA Handshake Operation

The handshake between the DMA and your application is done using [w|r]dxfer_go_togg and [w|r]dxfer_done_togg. In case of a DMA Write, your application should toggle the wdxfer_go_togg signal to indicate data block availability. In case of a DMA Read, your application should toggle the rdxfer_go_togg signal to indicate that your application hardware is ready to receive a data block.

To keep a track of [w|r]dxfer_go_togg signal toggles, the DMA implements a 5-bit handshake counter for each write/read channel. When your application toggles [w|r]dxfer_go_togg signal, the handshake counter is incremented. The handshake counter value is taken into account by the DMA before performing the data transfer for each descriptor. The data transfer happens only when the handshake counter value is non-zero. When the data transfer is complete, the DMA decrements the handshake counter, and toggles [w|r]dxfer_done_togg signal to indicate completion of data transfer to your application.

The handshake counter is 5-bit wide, so only 32 outstanding [w|r]dxfer_go_toggrequests can be handled by the DMA for each channel. The DMA does not implement an overflow protection or overflow error indication mechanism for the handshake counter. It is the responsibility of your application to keep the number of [w|r]dxfer_go_togg toggles under check.

One example of the DMA operation when the handshake feature is enabled for a write channel is as follows:

1. The CPU doorbells channel 0.
2. The DMA resets the handshake counter for channel 0.
3. The DMA reads LL element 0 descriptor. After the DMA receives descriptor read completions, the DMA checks the value of the handshake counter.
   If handshake counter =0, DMA waits until handshake counter >0 before transferring the data block.
   If handshake counter >0, DMA transfers the data block immediately.
4. After the data transfer is complete, the DMA Decrements the handshake counter, and Toggles wdxfer_done_togg.
5. Steps 3-4 are repeated for all the remaining elements of the linked list.

11.6.4.5 Using the DMA

11.6.4.5.1 Source and Destination Address Registers

The DMA channel context SAR and DAR registers (DMA_SAR_LOW_OFF_WRCH_0, DMA_SAR_HIGH_OFF_WRCH_0 etc.) provide support for remote-to-local, and local-to-remote PCIe address mapping. You program the start of the local and remote data buffers using these registers, and the DMA increments the SAR and DAR as the DMA transfer progresses. For a write transfer, the SAR is the address of the local memory, and the DAR is the address of the remote memory, as shown in figure below.

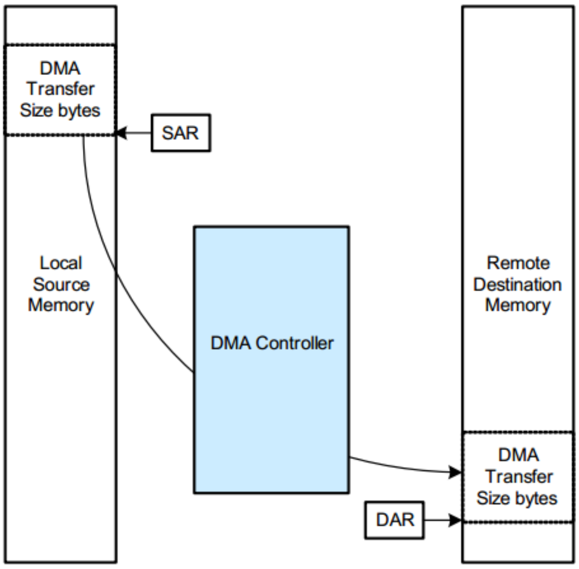

Fig. 11-15 Write Transfer: SAR and DAR for Write Channel

For a read transfer, the SAR is the address of the remote memory, and the DAR is the address of the local memory, as shown in Figure below.

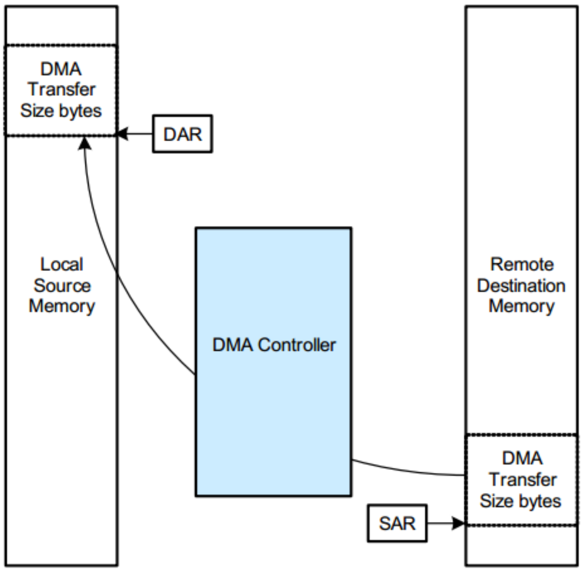

Fig. 11-16 Read Transfer: SAR and DAR for Write Channel

11.6.4.5.2 DMA Transfer Size Registers

You program the DMA transfer size using the DMA Transfer Size Register (DMA_TRANSFER_SIZE_OFF_WRCH_0 or DMA_TRANSFER_SIZE_OFF_RDCH_0). The maximum DMA transfer size is 4GB, and the minimum transfer size is one byte (0x1). The DMA decrements the value in this register as the DMA transfer progresses. When all bytes are successfully transferred, the value in this register is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element.

You can read this register to monitor the transfer progress. However, in some scenarios there is a delay before the controller updates this register. For example, when less than three channels are door belled, this register is only updated after a descriptor finishes (LL mode), or the transfer ends (non-LL mode).

11.6.4.5.3 Starting The DMA Transfer

After you program the DMA controller registers (including writing to the DMA Read Engine Enable or DMA Write Engine Enable register), you start a DMA transfer by writing zero to the Doorbell Number field of the DMA_WRITE_DOORBELL_OFF or DMA_READ_DOORBELL_OFF. You can program and start both a read and a write transfer at the same time. The DMA supports full duplex operation, processing read and write transfers at the same time and in parallel with normal (non-DMA) traffic.

11.6.4.5.4 Detecting the End of The DMA Transfer

11.6.4.5.4.1 Detecting End of Transfer without Errors

The normal end of a DMA transfer is detected by any of the following methods:
- Local interrupt asserted.
- Remote interrupt (IMWr) received.
- Channel status field of the Channel Control 1 register is Stopped, and the DMA Transfer Size register is 0x0.
- Polling of the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF) or DMA Read Interrupt Status Register (DMA_READ_INT_STATUS_OFF).

11.6.4.5.4.2 Detecting End of Transfer with Errors

The abnormal end of a DMA transfer is detected by any of the following methods:
- Local interrupt (pin) asserted.
- Remote interrupt (IMWr) received.
- Polling of the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF) or DMA Read Interrupt Status Register (DMA_READ_INT_STATUS_OFF).
- Channel Status field of the Channel Control 1 register is Halted. When the DMA controller detects an error, it forces the DMA to stop issuing requests for the channel. It also sets the channel status field of the Channel Control 1 register to Halted, generates an abort interrupt (if enabled), and sends an abort IMWr (if enabled). The DMA Transfer Size register indicates the remaining number bytes to be transferred, except when there is an AXI write error during a DMA read transfer.
- Channel Status field of the Channel Control 1 register is Stopped, and the DMA Transfer Size register is not 0x0. You have prematurely stopped this channel as described in "Stopping the DMA Transfer (Software Stop)"on next section

11.6.4.5.5 Stopping the DMA Transfer (Software Stop)

You can manually abort (stop) the DMA transfer by writing the channel number to the Doorbell Number field and writing 1 to the Stop field in DMA_[WRITE|READ]_DOORBELL_OFF. This causes the DMA to:
- Place the channel in a Stopped state. The channel Status field in DMA_CH_CONTROL1_OFF_WRCH_0 is Stopped and the value in DMA_TRANSFER_SIZE_OFF_WRCH_0 will not be 0x0.
- Wait for all outstanding pending transactions.
- Assert the abort interrupt (if it is enabled) in DMA_WRITE_INT_STATUS_OFF.

You might also do this as part of a function level reset (FLR). FLR does not directly affect the DMA transfer so you must manually stop the DMA transfer before initiating an FLR.

11.6.4.6 Programming Examples

This section provides two programming and operation example flows.

11.6.4.6.1 Non-LL Write Transfer

In this example, the IMWr generation is disabled, as the local CPU initiates the DMA transfer. The local CPU is interrupted using the pcie_sys_int interrupt. The SAR is the address of the local memory, and the DAR is the address of the remote memory. Write DMA Transfer is from 0xBEEF_BEE0 to 0xCAFE_CAF0. Table below provides the programming details for this example transfer. The transfer size is 1MB.

Table 11-18 Write DMA Transfer Example

Address 0x380000+	NAME	Value
0x00C	DMA Write Engine Enable You must not write 0 to this register. Even temporarily writing 0 to this register resets the DMA logic.	0x1
0x054	DMA Write Interrupt Mask	0x0
0x200	DMA Channel Control 1 register ■ Local Interrupt Enable (LIE) =1 ■ Remote Interrupt Enable (RIE) =0	0x04000008

Address 0x380000+	NAME	Value
	■ AT, RO, NS, TC, Function Number =0	
0x208	DMA Transfer Size	0x00100000
0x20C	DMA SAR Low	0xBEEF_BEE0
0x210	DMA SAR High	0x0000_0000
0x214	DMA DAR Low	0xCAFE_CAF0
0x218	DMA DAR High	0x0000_0000
0x010	DMA Write Doorbell	0x0

11.6.4.6.2 Non-LL Read Transfer

In this example, the local interrupt generation is disabled, as the remote CPU initiates the DMA transfer. The remote CPU is interrupted using an IMWr. The SAR is the address of the remote memory, and the DAR is the address of the local memory. Read DMA Transfer from 0xBEEF_BEE0 to 0xCAFE_CAF0. Table below provides the programming details for this example transfer. The transfer size is 1MB.

Table 11-19 Read DMA Transfer Example

Address 0x380000+	NAME	Value
0x02C	DMA Read Engine Enable You must not write 0 to this register. Even temporarily writing 0 to this register resets the DMA logic.	0x1
0x0CC/0x0D0	DMA Read Done IMWr Address Low and high	IMWr Address #1
0x0D4/0x0D8	DMA Read Abort IMWr Address Low and High	IMWr Address #2
0x0DC	DMA Read Channel 0 IMWr Data	IMWr Data
0x200	DMA Channel Control 1 register ■ Local Interrupt Enable (LIE) =0 ■ Remote Interrupt Enable (RIE) =1 ■ AT, RO, NS, TC, Function Number =0	0x04000010
0x208	DMA Transfer Size	0x00100000
0x20C	DMA SAR Low	0xBEEF_BEE0
0x210	DMA SAR High	0x0000_0000
0x214	DMA DAR Low	0xCAFE_CAF0
0x218	DMA DAR High	0x0000_0000
0x030	DMA Read Doorbell	0x0

11.6.5 PCIe Message Handling

This section describes the processing of messages through the controller. For a proper understanding of messages, you should be familiar with Section 2.2.8, “Message Request Rules” of the PCI Express Base Specification, Revision 3.0.

11.6.5.1 Message Generation

These are three methods to generate PCIe Messages:

- Specific MSG interface
  You can use PCIE_CLIENT_MSG_GEN_CON register to generate messages such as:
  - Vendor-Defined Message
  - Legacy PCI Interrupt Message
  - PME_Turn_Off message
  - Unlock message
  - LTR Message
  - OBFF Message

  Refer to register description for more details.
- AXI bridge

In this method, you should program the PCIE_CLIENT_AXI_SLV_AWMISC_HDR PCIE_CLIENT_AXI_SLV_AWMISC_HDR3 and PCIE_CLIENT_AXI_SLV_AWMISC_HDR4 registers to set these parameters:
slv_awmisc_info [4:0] =MSG
slv_awmisc_info [20:13] = message code
slv_awmisc_tag [5:0] = tag
slv_awmisc_info_hdr_[3|4]dw = 3rd and 4th TLP header DWORD
Then you can send zero length memory write (slv_awstrb=0) to generate the message. You must not program registers mentioned above when there are normal transfers pending on AXI slave interface. And should set these registers in normal value when you want to send MWr TLP. This method is not recommended because of these limitations.

- AXI bridge and iATU

Program related client register fields as follows:
slv_awmisc_info[4:0] =MEM
slv_awmisc_info_hdr_[3|4]dw = 3rd and 4th TLP header DWORD
Then iATU needs to be configured to to translate MWr to Msg TLPs. Refer to "Address Translation" for more details. This method is not recommended because that it needs additional iATU resources.

11.6.5.2 Message Reception

PCIe controller use pcie_msg_int interrupt to indicate the reception of PCIe Message. Application can poll to PCIE_CLIENT_INTR_STATUS_MSG_RX register to check the status of Message reception. Refer to register information for details.

11.6.6 PCIe Power Management

11.6.6.1 Overview

The controller supports two categories of PM operations to control the device state (D-state) and link state. For a proper understanding of PCIe Power management you should be familiar with Section 5, "Power Management" of the PCI Express Base Specification, Revision 3.0.

Software PCI Compatible PM (PCI-PM)

- D-state PM of Function. The host software can direct the function to enter any of the D1, D2, or D3 low-power states. It does this by writing to the Power Management Control and Status Register (PMCSR) in the PCI-PM capability structure.
- D-state PM of Link. Link states are not visible to PCI-PM legacy compatible software and are derived from the power management D-states of the components connected to that link. The action of changing the D-state in the PMCSR indirectly causes a change in the link power state. The L1 state is entered whenever all functions of a USP on a link are programmed to a non-D0 state. The entry into L2 and L3 states is initiated by the DSP.

PCIe PM Mechanisms

- Active State PM (ASPM).When the USP is in L0 and detects idleness on the link for a specific amount of time, it automatically transitions the link to the L0s or L1 (optional) power state.
- L1 Substates. This is an optional PCIe feature that enables components on a link to further reduce idle power consumption while the link is in L1, including almost complete removal of power for the high speed PHY circuits.

11.6.6.2 L0s Operation

L0s is a low-power state enabled by ASPM. ASPM controls entry into L0s for the transmitter. The remote device controls entry into L0s for the receiver.

11.6.6.2.1 L0s Entry

All of these conditions must be met:

- ASPM L0s is enabled through the ASPM Control field in the Link Control register.
- L0s entry conditions as defined in Section 5.4.1.1.1, "Entry into the L0s State" of the PCI Express Base Specification, Revision 3.0, exist for a duration of time (determined by the L0S_ENTRANCE_LATENCY field in ACK_F_ASPM_CTRL_OFF).

- No higher stage of power-down requested.

11.6.6.2.2 L0s Exit

Any of these conditions can be met:

- A DLLP or TLP is pending to be sent.
- L1 entry conditions as defined in Section 5.4.1.2.1, “Entry into the L1 State” of the PCI Express Base Specification, Revision 3.0, are satisfied.
- PCIe link partner requests to enter into link recovery.

11.6.6.3 L1 Operation (Non-substates)

The following topic will be discussed in this section: L1 (ASPM/PM) Entry and Exit Conditions and L1 Clock PM (L1 with REFCLK removal/PLL Off) Entry and Exit Conditions.

11.6.6.3.1 L1 (ASPM/PM) Entry

L1 is a low-power state enabled either by ASPM (L1-ASPM) or by the software changing the D-state (L1-PM). The L1 state is a bi-directional link low-power state and both link partners must negotiate to go to this state.

The L1-ASPM entry negotiation handshake uses PM_Active_State_Request_L1 DLLPs, PM_Request_Ack DLLPs, and PM_Active_State_Nak MSG TLPs. Refer to PCIe Basic Specification for more information.

There are three scenarios that cause the controller to enter L1 under ASPM conditions.

Scenario 1: L1 Idle Timeout In L0s

All of these conditions must be met in the USP:

- ASPM L1 and L0s are enabled through the ASPM Control field in the Link Control register.
- The ENTER_ASPMfield of ACK_F_ASPM_CTRL_OFFis set to ‘0’ and the link state is L0s for both link partners, or the ENTER_ASPMfield of ACK_F_ASPM_CTRL_OFFis set to ‘1’.
- L1 entry conditions as defined in Section 5.4.1.2.1, “Entry into the L1 State” of the PCI Express Base Specification, Revision 3.0, exist for a duration of time (determined by the L1_ENTRANCE_LATENCYfield in ACK_F_ASPM_CTRL_OFF).
- No higher stage of power-down requested.
- Your USP application is not asserting the app_xfer_pending field in PCIE_CLIENT_POWER_CON register.
- There are no in-progress transactions in the controller
- There are no pending requests at the AXI slave interface, that is, slv_a*valid must be 0.
- There are no pending DMA transfers.

Scenario 2: L1 Idle Timeout In L0

All of these conditions must be met in the USP:

- ASPM L1 is enabled and L0s is not enabled through the ASPM Control field in the Link Control register.
- Link state is L0.
- L1 entry conditions as defined in Section 5.4.1.2.1, “Entry into the L1 State” of the PCI Express Base Specification, Revision 3.0, exist for a duration of time (determined by the L1_ENTRANCE_LATENCYfield in ACK_F_ASPM_CTRL_OFF).
- No higher stage of power down-requested.
- Your USP application is not asserting the app_xfer_pending field in PCIE_CLIENT_POWER_CON register.
- There are no in-progress transactions in the controller.
- There are no pending requests at the AXI slave interface, that is, slv_a*valid must be 0.
- There are no pending DMA transfers.

Scenario 3: Application Controlled (USP only)

All of these conditions must be met in the USP:

- ASPM L1 is enabled through the ASPM Control field in the Link Control register.
- Your application writes 1 to the app_req_entr_l1 field in PCIE_CLIENT_POWER_CON register.
- Your USP application is not asserting the app_xfer_pending field in PCIE_CLIENT_POWER_CON register.
- There are no in-progress transactions in the controller.

- There are no pending requests at the AXI slave interface, that is, slv_a*validmust be 0.
- There are no pending DMA transfers.

L1-PM Entry

The power management state of a link is determined bythe D-state of theUSP.When you change the device state of the USP to D1, D2, or D3hot by writing to the PMCSR, the controller must initiate a link state transition to L1.

An USP application asserting the app_xfer_pending field does not prevent L1-PM entry, but will cause immediate exit from L1-PM.

11.6.6.3.2 L1-PM/L1-ASPM Exit

Any of these conditions are met:

- A DLLP or TLP is pending to be sent.
- Your application asserts the app_req_exit_l1 field.
- Link partner is requesting exit from L1.
- Your application asserts the app_xfer_pending field.
- Your application asserts the app_pm_xmt_pme field.

When the USP is programmed with capability to support PME; it sends a PME message to the RC which calls the PM software to transition the USP to the D0 state. Therefore, you should only use app_pm_xmt_pme for L1-PM exit.

- PM software (RC) requests a higher stage of power-down by writing to the PMCSR in the USP.
- Your application (USP) requests transmission of VDM, MSI/MSIX, or LTR message. Legacy interrupt is not included.
- Your application (DSP) requests transmission of Unlock message.
- Your application is requesting to send traffic by asserting or slv_a*valid.
- Your application doorbells a DMA read or write channel, or DMA controller is requesting data.
- Your application (DSP) initiates link disable, or link retrain (by setting PCIE_CAP_LINK_DISABLE or PCIE_CAP_RETRAIN_LINK field in LINK_CONTROL_LINK_STATUS_REG to 1).
- Your application (DSP) initiates hot reset by either:
  - setting RESET_ASSERT field in PORT_LINK_CTRL_OFF to 1, or
  - setting SBR field in BRIDGE_CTRL_INT_PIN_INT_LINE_REG to 1, or
  - toggling app_init_rst field in PCIE_CLIENT_GENERAL_CON.
- Your application requests a speed change (by setting DIRECT_SPEED_CHANGE field in GEN2_CTRL_OFF to 1).
- Your application requests link width change (by setting DIRECT_LINK_WIDTH_CHANGE field in MULTI_LANE_CONTROL_OFF is set to 1).

11.6.6.3.3 L1 Clock PM

For an USP, host software uses the Enable Clock Power Management bit in the Link Control register to enable this feature. For a DSP, this register bit is hard coded to ‘0’ and cannot be used to control this behavior. Your application can use the app_clk_pm_en input to dynamically control whether to execute L1 with or without Clock PM.

- The Support Clock Power Management bit in the Link Capabilities register must be set. For downstream ports it is hardcoded to 0, for upstream ports it can be accessed through the DBI.
- The Enable Clock Power Management bit in the Link Control register must be set.
- You must set the app_clk_pm_en field to 1. The controller only samples app_clk_pm_en when L1 is entered.

L1 with Clock PM and L1 substates work orthogonal to each other. L1 with Clock PM uses the mac_phy_pclkreq_n[0]signaling, and L1 substates uses the mac_phy_pclkreq_n[1]signaling. However, L1 substates takes precedence over Clock PM within the cores PM state machine.

11.6.6.4 L1 Substate

The L1 substates are applicable in both the ASPM and PCI-PM L1 link states. L1 substates management utilizes a per-link sideband signal called CLKREQ#.

- During L1 substates it is assumed that core_clk is turned off and that aux_clk is active. It is required that your application switches aux_clk to a low frequency free running clock on entry into L1.

- The controller uses aux_clk for counting time during L1 substates. You must program the frequency of this clock into the L1_SUBSTATES_OFF register with a value in the range 1...1000MHz to count real time. Frequencies lower than 1 MHz are possible, but with a loss of accuracy in the time counted.
- When the electrical idle detection circuitry is disabled, it is assumed that the PHY holds the signal phy_mac_rxelecidle to 1.

After the link has entered L1 through the normal L1 negotiation, the USP can initiate the sequence for entering the target L1 substate (L1.1 or L1.2) by tri-stating its CLKREQ# output buffer. The entry sequence can only proceed if the DSP is also tri-stating its CLKREQ# output buffer, resulting in the bidirectional CLKREQ# signal being pulled up to 1. Otherwise CLKREQ# will remain asserted at 0 and the link state will stay in L1. The exit sequence can be initiated by either port by asserting CLKREQ# to 0. For each port there are two cases to consider, the first where the exit is initiated locally, the second where the exit is initiated remotely. L1 substates management utilizes a per-link sideband signal called CLKREQ#.

11.6.6.4.1 L1 Substates Software Control

When the controller enters L1, the target L1 substate depends on several programming bits:

- PM Control/Status Register
  - USP: The current D-state
  - DSP: The DLLP type that was used by USP to request L1
- L1 Substates Control 1 Register
  - ASPM PM L1.1 Enabled
  - ASPM PM L1.2 Enabled
  - PCI PM L1.1 Enabled
  - PCI PM L1.2 Enabled

After the USP controller enters L1, it uses the D-state of the device to determine if L1 was entered in ASPM mode or PCI-PM mode.

After the DSP controller enters L1, it uses the USPs DLLPL1 request type to determine if L1 was entered in ASPM mode or PCI-PM mode. The next tables shows the target L1 substate as a function of the relevant programming bits.

Table 11-20 Target L1 Substate as a Function of Software Controls (USP)

D-State	ASPM L1.1 Enabled	ASPM L1.2 Enabled	LTR >= Threshold	PCI PM L1.1 Enabled	PCI PM L1.2 Enabled	Target L1 Substate
!D0	-	-	-	0	0	L1
!D0	-	-	-	1	0	L1.1
!D0	-	-	-	-	1	L1.2
D0	0	0	-	-	-	L1
D0	1	0	-	-	-	L1.1
D0	0	1	0	-	-	L1
D0	1	1	0	-	-	L1.1
D0	-	1	1	-	-	L1.2

Table 11-21 Target L1 Substate as a Function of Software Controls (DSP)

DLLP Receive	ASPM L1.1 Enabled	ASPM L1.2 Enabled	LTR >= Threshold	PCI PM L1.1 Enabled	PCI PM L1.2 Enabled	Target L1 Substate
PM_Enter_L1	-	-	-	0	0	L1
	-	-	-	1	0	L1.1
	-	-	-	-	1	L1.2
PM_	0	0	-	-	-	L1

DLLP Receive	ASPM L1.1 Enabled	ASPM L1.2 Enabled	LTR >= Threshold	PCI PM L1.1 Enabled	PCI PM L1.2 Enabled	Target L1 Substate
Active_State_Request_L1	1	0	-	-	-	L1.1
	0	1	0	-	-	L1
	1	1	0	-	-	L1.1
	-	1	1	-	-	L1.2

The Reported LTR is the maximum of the snoop/no snoop latency values embedded in LTR messages transmitted by the upstream ports or received by the downstream port. The controller stores these values in the port logic LTR Latency Register (LTR_LATENCY_OFF). When the requirement bit in the message is 0, the latency value is considered infinite (that is, the check with the threshold always pass).

11.6.6.4.2 L1 Substates Entry and Exit

PCIe link entered L1 substate automatically if related enable bit is set and LTSSM already in L1 state, refer to section L1 Substates Software Control for details.

L1 substates Exit can be triggered locally or Remotely. For locally initiated exit, refer to section L1-PM/L1-ASPM Exit. Remotely initiated exit begins when CLKREQ# is asserted by remote PCIe partner.

11.6.6.5 L2 and L3 Power Down Entry and Exit

L2/L3 entry is initiated after the RC calls power management software to initiate the removal of power and clocks. USPs of devices in D0, D1, D2, and D3hot must respond to the receipt of a PME_Turn_Off MSG TLP by transmitting a PME_TO_Ack MSG TLP. The device must then request a link transition to L2/L3_Ready. L2/L3_Ready is a bi-directional link power down state. If your application is not ready to be shut down, it must keep the app_ready_entr_l23 field de-asserted.

L2/L3 Entry

All of these conditions must be met:

- PME_Turn_Off/PME_TO_Ack handshake has been completed.
- Your USP application is ready to be turned off; app_ready_entr_l23=1.
- After sending the PME_TO_Ack, the USP initiates the L2/L3 Ready transition protocol by sending the PM_Enter_L23 DLLP. The RC responds with the PM_Request_Ack.

L2/L3 Exit

Any of these conditions can be met:

- When the USP is programmed with capability to support PME, your application can assert the apps_pm_xmt_pme field to request the controller to wake up. The USP then sends a PM_PME MSG TLP to the RC which calls the PM software to transition the USP out of the D3 state.
- Device is programmed with capability to support PME and your application requests the controller to wake up by triggering a native hot-plug event.
- Link partner is requesting exit from L2/L3.

11.6.6.6 Dynamic Power Allocation (DPA)

The DPA capability enables software to actively manage and optimize function power usage when in the D0 state. DPA is not applicable to power states D1-D3.
For details on how your application interacts with the controller, see the description of the dpa_sub_upd_int field in PCIE_CLIENT_INTR_STATUS_MISC register.

11.6.7 PCIe Interrupt

The PCIe provides several types of interrupts to system interrupt controller. They can be divided into MSI/MSI-X, PCIe Error interrupt, PCIe Message Receive interrupt, PCIe Legacy interrupt, PCIe System interrupt and PCIe Power Management Interrupt etc. When operating as RC, the PCIe is capable of handling both MSI/MSI-X and legacy interrupts. This is because when operating as RC it should be able to service both PCIe end points as well as legacy endpoints. It is capable of generating MSI or Legacy interrupt if the PCIe is configured as EP. Notes that PCIe EP component can't generate both Legacy and MSI/MSI-X interrupt. It is either one or the other. The interrupt type an EP generates is configured during configuration time.

Interrupt status and mask bits are located in client register group, some interrupts are handled by client register directly, but some interrupts are generated by events deep into controller and software should clear the root cause to serve the interrupt events. For more information, refer to the register description.

The pcie_edma_wr/rd_int is more efficient than service by pcie_sys_int, it is available depends on Chip ID.

Table 11-22 PCIe Interrupt Table

System Interrupt Event ID	Interrupt description (level 1)	Interrupt subset (level 2)	Support mode

Chapter 12 USB2.0 Host & PHY

12.1 Overview

USB2.0 host subsystem include two USB2.0 host controller and USB2.0 PHY. The two host are same. USB2.0 host controller supports fully USB2.0 functions with one EHCI host controller and one OHCI host controller, and each host controller has one USB port. OHCI host controller only supports full-speed and low-speed mode and is used for full-speed devices and low-speed devices. EHCI only supports high-speed mode and is used for high-speed devices. OHCI host controller and EHCI host controller shares the same USB port, EHCI host controller will auto select the owner (OHCI or EHCI) of this USB port depending on the speed mode of attached devices, when selecting OHCI as owner, OHCI host controller will serve for the attached device; when selecting EHCI as owner, EHCI host controller will serve for the attached device.

USB2.0 host supports the following features:

- Compatible Specifications
  - Universal Serial Bus Specification, Revision 2.0
  - Enhanced host Controller Interface Specification (EHCI), Revision 1.0
  - Open host Controller Interface Specification (OHCI), Revision 1.0a
- Support High-speed (480Mbps), Full-speed (12Mbps) and Low-speed (1.5Mbps)

12.2 Block Diagram

USB2.0 host subsystem include two USB2.0 host controller and USB2.0 PHY.

USB2.0 host Controller comprises with:

- EHCI host Controller: Perform High-speed transactions
- OHCI host Controller: Perform full/low-speed transactions
- Port Routing Control: Select EHCI host Controller or OHCI host Controller

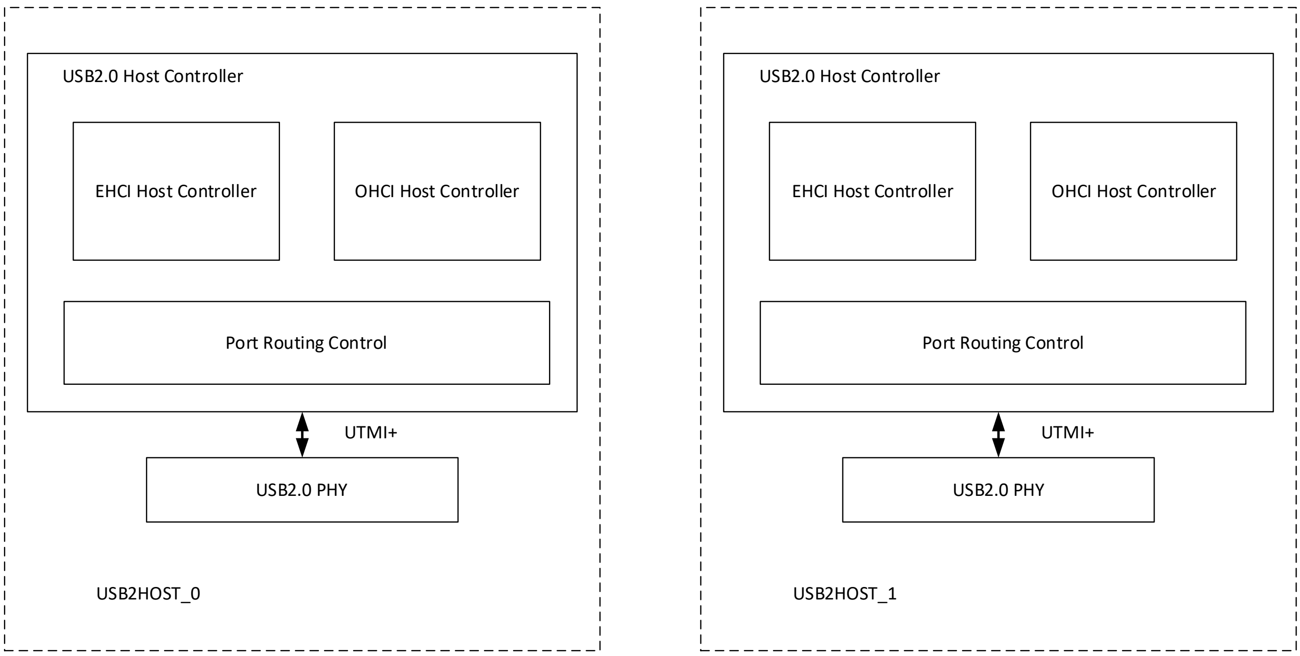

Fig. 12-1 USB2.0 Host Block Diagram

12.3 Function Description

12.3.1 EHCI Host Controller

It performs descriptors and data read or write from or to system memory and packs or unpack USB transactions from or to UTMI+ interface defined in EHCI specification for high-speed data transmission.

12.3.2 OHCI Host Controller

It performs descriptors and data read/write from/to system memory and packs or un-pack USB transactions from or to UTMI+ interface defined in OHCI specification for full-speed or low-speed data transmission.

12.3.3 Port Routing Control

As part of logic in the EHCI host controller, it is used to auto-select EHCI or OHCI host controller to serve the attached device depending on the speed of the attached device.

12.4 Register Description

12.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 12-1 USB2.0 Host Controller Address Mapping

Base Address	Device
0xFC800000~0xFC87FFFF	USB2HOST_0 controller
0xFC880000~0xFC8FFFFF	USB2HOST_1 controller
USB2.0 Host Controller Address Mapping	
Offset Address Range	**Register Type**
0x00000 ~ 0x3ffff	EHCI
0x40000 ~ 0x7ffff	OHCI

EHCI and OHCI register definitions, please refer to Enhanced Host Controller Interface Specification (EHCI), Revision 1.0 and Open Host Controller Interface Specification (OHCI), Revision 1.0a.

12.5 Interface Description

Table 12-2 USB2.0 PHY Interface Description

Pad Name	Direction	Descriptions
USB20_HOST0_DM	I/O	USB D- Signal
USB20_HOST0_DP	I/O	USB D+ Signal
USB20_HOST0_REXT	I/O	USB2.0 PHY Transmitter Resistor Tune Pin
USB20_HOST1_DM	I/O	USB D- Signal
USB20_HOST1_DP	I/O	USB D+ Signal
USB20_HOST1_REXT	I/O	USB2.0 PHY Transmitter Resistor Tune Pin

12.6 Application Notes

12.6.1 Host Charge Detect Sequence

The USB2.0 PHY supports battery charger detection to enable device draw increased current from VBUS for charging and/or powering up from dedicated charging ports or charging downstream ports.

The related signals with GRF is following:

Table 12-3 USB2PHY Battery Charging GRF Description

GRF	Description
USB2PHY_GRF_CON2[5]	CHRGSEL: This signal selects whether the Battery Charger circuit sets voltage sourcing on the DP line and sensing on the DM line or voltage sourcing on DM and sensing on DP.
USB2PHY_GRF_CON2[6]	VDATDETENB: This signal activates the Battery Charger comparator and enables detection of the DP and DM lines according to the Battery Charging specification.
USB2PHY_GRF_CON2[7]	VDATSRCENB: This signal activates the voltage sourcing on the DP or DM line.
USB2PHY_GRF_STATUS0[0]	CHGDET: This signal is the battery charge detection (VDAT_REF) comparator output.
USB2PHY_GRF_STATUS0[1]	FSVPLUS: This signal is the DP FS/LS single ended receiver output, which is also the VLGC output.
USB2PHY_GRF_STATUS0[2]	FSVMINUS: This signal is the DM FS/LS single ended receiver output, which is also the VLGC output.
USB2PHY_GRF_STATUS0[11]	OTGSESSVLD0: This signal is the VBUS session valid detection and can be used by a portable device to detect the VBUS voltage from the host or charger port.

Table 1-6 lists the detection flow.

Table 12-4 USB2PHY Battery Charging Operations

Mode of Operation	Inputs			Outputs			
	CHRGSEL	VDATDETENB	VDATSRCENB	OTGSESSVLD	CHGDET	FSVPUS	FSVMINUS
Battery charging is disabled	X	0	0	X	0	X	X
PHY is operating as a host CDP with no PD detected.	1	1	0	X	0	0	X
PHY is operating as a host CDP that detects an attached PD, which supports the BC specification.	1	1	1	X	1	0	X
PHY is operating as a host CDP that detects a connect from the PD D+ pullup.	1	1	0	X	X	1	0

12.6.2 Program Flow

Please refer to Enhanced Host Controller Interface Specification (EHCI), Revision 1.0 and Open Host Controller Interface Specification (OHCI), Revision 1.0a.

Chapter 13 USB3 Controller

13.1 Overview

USB3 sub-system include three USB3.0 controller and some PHYs. Two of the USB3.0 controller (marked as USB3OTG_0 and USB3OTG_1) in PD_USB can act as static host, static device, USB2.0/3.0 OTG A device or B device basing on the status of input ID from USB2.0 PHY. The two controllers respectively connect to one USB3.0 PHY and one USB2.0 PHY. They can perform data transmission between host and device as host or device for Super-Speed/High-Speed/Full-Speed/Low-Speed. The other one (marked as USB3OTG_2) in PD_PHP only support USB3.0 Host and only connect to one USB3.0 PHY and be used for Super-Speed.
USB3.0 sub-system supports the following features:

- General Features
  1. Compatible Specification
     - Universal Serial Bus 3.0 Specification, Revision 1.0
     - Universal Serial Bus Specification, Revision 2.0 (exclude USB3OTG_2)
     - eXtensible Host Controller Interface for Universal Serial Bus (xHCI), Revision 1.1
  2. Support Control/Bulk (including stream)/Interrupt/Isochronous Transfer
  3. Simultaneous IN and OUT transfer for USB3.0, up to 8Gbps bandwidth
  4. Descriptor caching and data pre-fetching used to improve system performance in high-latency systems
  5. LPM protocol in USB 2.0 (exclude USB3OTG_2) and U0, U1, U2, and U3 states for USB 3.0
  6. Dynamic FIFO memory allocation for endpoints
  7. Keep-Alive feature in LS mode and (micro-)SOFs in HS/FS modes (exclude USB3OTG_2)
  8. Low MIPS requirement
     - Driver involved only in setting up transfers and high-level error recovery
     - Hardware handles data packing and routing to a specific pipe
- Application Interface Features
  1. AHB Slave interface
  2. AXI Master interface
     - Programmable burst lengths up to 16
     - Handle fixed burst address alignment
     - Programmable number of outstanding read/write requests up to 16
     - Concurrent read/write to get best performance of USB3.0 duplex operation
- USB3.0 Device Features
  1. Up to 10 IN endpoints, including control endpoint 0
  2. Up to 6 OUT endpoints, including control endpoint 0
  3. Up to 16 endpoint transfer resources, each one for each endpoint
  4. Flexible endpoint configuration for multiple applications/USB set-configuration modes
  5. Hardware handles ERDY and burst
  6. Stream-based bulk endpoints with controller automatically initiating data movement
  7. Isochronous endpoints with isochronous data in data buffers
  8. Flexible Descriptor with rich set of features to support buffer interrupt moderation, multiple transfers, isochronous, control, and scattered buffering support
- USB Class-Specific Device Features
  1. Stream support for UASP application
  2. Gathering of scattered packet to support Ethernet Over USB
  3. Scheduling of multiple Ethernet packets without interrupt
  4. Variable FIFO buffer allocation for each endpoint
  5. For isochronous applications, scheduling of variable-length payloads for each microframe
  6. Microframe precise scheduling for isochronous applications
  7. Configurable endpoint type selection and dynamic FIFO allocation to facilitate multi-function/composite device implementation. During set-config or alternate-setting, device resources are reconfigured to meet the configuration or alternate setting

requirements.

- USB 3.0 xHCI Host Features
  1. Support up to 64 devices
  2. Support 1 interrupter
  3. Support 1 USB2.0 port (exclude USB3OTG_2) and 1 Super-Speed port
  4. Support standard or open-source xHCI and class driver
- USB 3.0 Dual-Role Device (DRD) Features
  1. Static Device Operation
  2. Static Host Operation
  3. USB3.0/USB2.0 OTG A device and B device basing on ID, USB3OTG_2 only support USB3.0
  4. Not Support USB3.0/USB2.0 OTG session request protocol (SRP), host negotiation protocol (HNP) and Role Swap Protocol (RSP)
- Miscellaneous Features
  5. USB2.0 PHY support Battery Charge detection
  6. USB3OTG_0 and USB3OTG_1 support USB Type-C and DP Alt Mode (DP should refer to DP TX Controller section)
  7. USB3OTG_2 PHY combos with PCIE and SATA, this could refer to Multi-PHY section

13.2 Block Diagram

USB3OTG_0 and USB3OTG_1 comprises with:

- Bus Interface: Register Interface/Data and Descriptors DMA management
- SS/HS/FS/LS MAC: USB part logic
- USB2.0 PHY: UTMI+ interface USB2.0 PHY
- USBDP PHY: USB3.0 and DP combo

Note: For detail about USBDP PHY, please refer to USBDP PHY section.

USB3OTG_2 comprises with:

- Bus Interface: Register Interface/Data and Descriptors DMA management
- SS/HS/FS/LS MAC: USB2.0 part logic not used
- USB3/PCIE/SATA Combo PHY

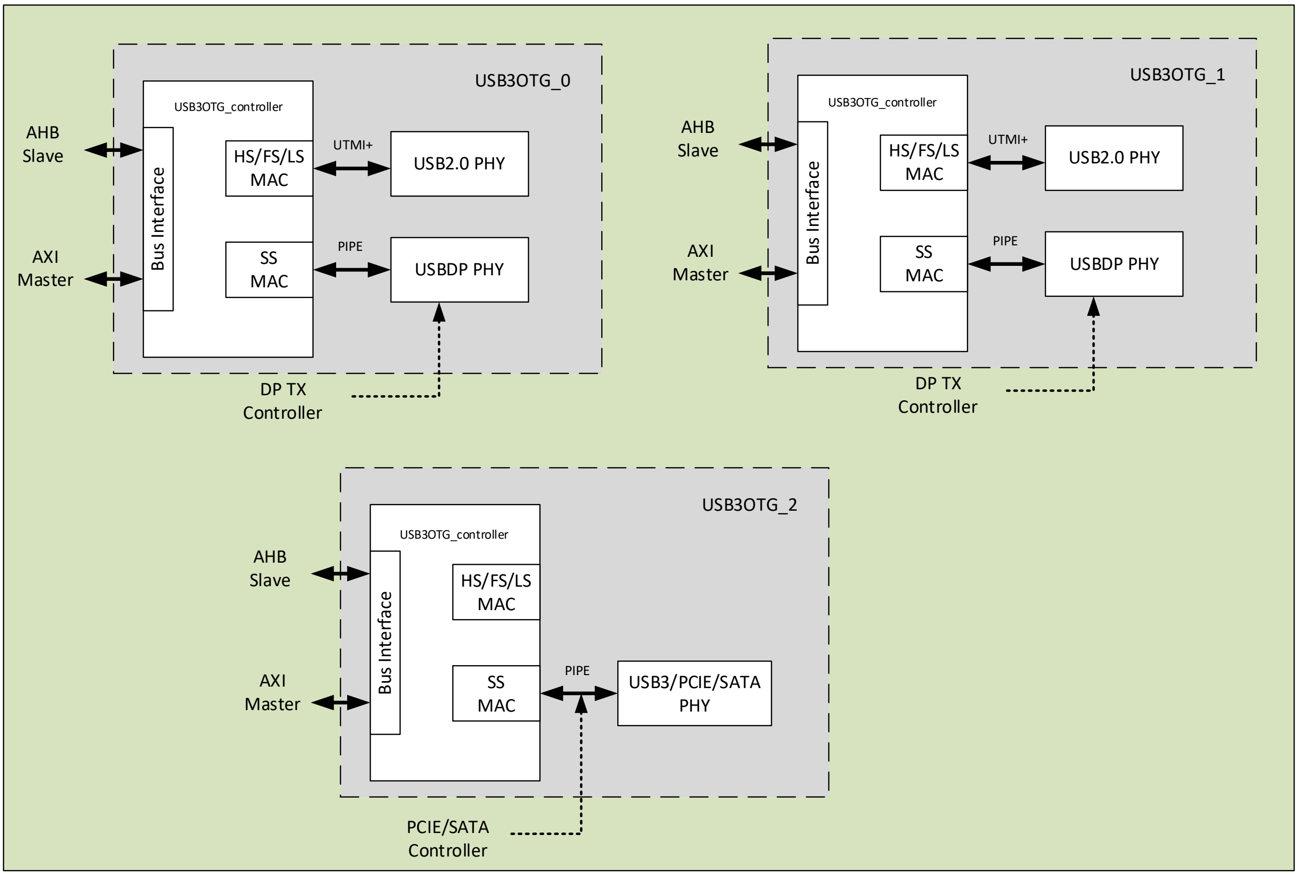

Fig. 13-1 USB3 Block Diagram

13.3 Function Description

As USB3OTG_0 or USB3OTG_1, it can act as static xHCI host controller, static device controller, USB3.0/2.0 OTG A device or B device basing on ID of USB2.0 PHY. As device controller, it can work on either USB2.0 speed or Super-Speed basing on speed of host attached to, and process USB transactions described in the descriptors (read back from external memory by AXI master) to/from UTMI+ interface and Pipe Interface of USBDP PHY. As host controller, it can work on USB2.0 speed, Super-Speed or both basing on speed or type of attached device, and process USB transactions described in the descriptors (read back from external memory by AXI master) to/from UTMI+ interface and Pipe Interface of USBDP PHY.
For USB3OTG_2, it only works in Super-Speed mode and process USB transactions described in the descriptors (read back from external memory by AXI master) to/from Pipe Interface of USB3/SATA/PCIE combo PHY.

13.4 Register Description

13.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 13-1 USB3 Address Mapping

Base Address	Device
0xFC000000~0xFC3FFFFF	USB3OTG_0 controller
0xFC4000000~xFC7FFFFF	USB3OTG_1 controller
0xFCD00000~0xFD0FFFFF	USB3OTG_2 controller
USB3.0 Controller Address Mapping	
Offset Address Range	**Register Type**
0x00000 ~ 0x07FFF	xHCI Registers, see xHCI spec.
0x0C100 ~ 0x0C6FF	Global Registers
0x0C700 ~ 0x0CBFF	Device Controller Registers

0x0CC00 ~ 0x0CFFF	Unused/Reserved
0x40000 ~ 0x7FFFF	Internal RAM0 – Debug Access (256KB)
0x80000 ~ 0xBFFFF	Internal RAM1 – Debug Access (256KB)
0xC0000 ~ 0xFFFFF	Internal RAM2 – Debug Access (256KB)

13.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
USB3OTG_GSBUSCFG0	0xC100	W	0x00000001	Global SoC Bus Configuration Register 0
USB3OTG_GSBUSCFG1	0xC104	W	0x00000300	Global SoC Bus Configuration Register 1
USB3OTG_GTXTHRCFG	0xC108	W	0x00000000	Global Tx Threshold Control Register
USB3OTG_GRXTHRCFG	0xC10C	W	0x00000000	Global Rx Threshold Control Register
USB3OTG_GCTL	0xC110	W	0x13512004	Global Core Control Register
USB3OTG_GSTS	0xC118	W	0x7E800000	Global Status Register
USB3OTG_GUCTL1	0xC11C	W	0x0004018A	Global User Control Register 1
USB3OTG_GSNPSID	0xC120	W	0x5533300A	Global SNPS ID Register
USB3OTG_GGPIO	0xC124	W	0x00000000	Global General Purpose Input/Output Register
USB3OTG_GUID	0xC128	W	0x20190520	Global User ID Register
USB3OTG_GUCTL	0xC12C	W	0x02008010	Global User Control Register
USB3OTG_GBUSERRADDRLO	0xC130	W	0x00000000	Global SoC Bus Error Address Register - Low
USB3OTG_GBUSERRADDRHI	0xC134	W	0x00000000	Global SoC Bus Error Address Register - High
USB3OTG_GPRTBIMAPLO	0xC138	W	0x00000000	Global SS Port to Bus Instance Mapping Register
USB3OTG_GHWPARAMS0	0xC140	W	0x2020400A	Global Hardware Parameters Register 0
USB3OTG_GHWPARAMS1	0xC144	W	0x0120C93B	Global Hardware Parameters Register 1
USB3OTG_GHWPARAMS2	0xC148	W	0x20190520	Global Hardware Parameters Register 2
USB3OTG_GHWPARAMS3	0xC14C	W	0x069CD084	Global Hardware Parameters Register 3
USB3OTG_GHWPARAMS4	0xC150	W	0x47822010	Global Hardware Parameters Register 4
USB3OTG_GHWPARAMS5	0xC154	W	0x04204018	Global Hardware Parameters Register 5
USB3OTG_GHWPARAMS6	0xC158	W	0x09D78020	Global Hardware Parameters Register 6
USB3OTG_GHWPARAMS7	0xC15C	W	0x00000000	Global Hardware Parameters Register 7
USB3OTG_GDBGFIFOSPACE	0xC160	W	0x000A0000	Global Debug Queue/FIFO Space Available Register
USB3OTG_GDBGLNMCC	0xC168	W	0x00000000	Global Debug LNMCC Register
USB3OTG_GDBGBMU	0xC16C	W	0x00000000	Global Debug BMU Register
USB3OTG_GDBGLSPMUX	0xC170	W	0x003F0000	Global Debug LSP MUX Register - Device
USB3OTG_GDBGLSP	0xC174	W	0x00000000	Global Debug LSP Register
USB3OTG_GDBGEPINFO0	0xC178	W	0x00000000	Global Debug Endpoint Information Register 0

Name	Offset	Size	Reset Value	Description
USB3OTG_GDBGEPINFO1	0xC17C	W	0x00800000	Global Debug Endpoint Information Register 1
USB3OTG_GPRTBIMAP_HSLO	0xC180	W	0x00000000	Global High-Speed Port to Bus Instance Mapping Register - Low
USB3OTG_GPRTBIMAP_FSLO	0xC188	W	0x00000000	Global Full-Speed Port to Bus Instance Mapping Register - Low
USB3OTG_GUSB2PHYCFG0	0xC200	W	0x40102400	Global USB2 PHY Configuration Register 0
USB3OTG_GUSB3PIPECTL0	0xC2C0	W	0x00000000	Global PIPE PHY Configuration Register 0
USB3OTG_GTXFIFOSIZn	0xC300	W	0x00000042	Global Transmit FIFO Size Register n, offset (0xc300 + 4*n), n=0~6
USB3OTG_GRXFIFOSIZn	0xC380	W	0x03340185	Global Receive FIFO Size Register n
USB3OTG_GEVNTADRLO0	0xC400	W	0x00000000	Global Event Buffer Address (Low) Register 0
USB3OTG_GEVNTADRHI0	0xC404	W	0x00000000	Global Event Buffer Address (High) Register 0
USB3OTG_GEVNTSIZ0	0xC408	W	0x00000000	Global Event Buffer Size Register 0
USB3OTG_GEVNTCOUNT0	0xC40C	W	0x00000000	Global Event Buffer Count Register 0
USB3OTG_GHWPARAMS8	0xC600	W	0x0000047C	Global Hardware Parameters Register 8
USB3OTG_GTXFIFOPRIDEV	0xC610	W	0x00000000	Global Device TX FIFO DMA Priority Register
USB3OTG_GTXFIFOPRIHST	0xC618	W	0x00000000	Global Host TX FIFO DMA Priority Register
USB3OTG_GRXFIFOPRIHST	0xC61C	W	0x00000000	Global Host RX FIFO DMA Priority Register
USB3OTG_GFIFOPRIDBC	0xC620	W	0x00000000	Global Host Debug Capability DMA Priority Register
USB3OTG_GDMAHLRATIO	0xC624	W	0x00000000	Global Host FIFO DMA High-Low Priority Ratio Register
USB3OTG_GFLADJ	0xC630	W	0x00000000	Global Frame Length Adjustment Register
USB3OTG_DCFG	0xC700	W	0x00080000	Device Configuration Register
USB3OTG_DCTL	0xC704	W	0x00F00000	Device Control Register
USB3OTG_DEVTEN	0xC708	W	0x00000000	Device Event Enable Register
USB3OTG_DSTS	0xC70C	W	0x00520000	Device Status Register
USB3OTG_DGCMDPAR	0xC710	W	0x00000000	Device Generic Command Parameter Register
USB3OTG_DGCMD	0xC714	W	0x00000000	Device Generic Command Register
USB3OTG_DALEPENA	0xC720	W	0x00000000	Device Active USB Endpoint Enable Register
USB3OTG_DEPnCMDPAR2	0xC800	W	0x00000000	Device Physical Endpoint-n Command Parameter 2 Register, offset (0xc800 + 4*n), n=0~12
USB3OTG_DEPnCMDPAR1	0xC804	W	0x00000000	Device Physical Endpoint-n Command Parameter 1 Register, offset (0xc804 + 4*n), n=0~12

Name	Offset	Size	Reset Value	Description
USB3OTG_DEPnCMDPAR0	0xC808	W	0x00000000	Device Physical Endpoint-n Command Parameter 0 Register, offset (0xc808 + 4*n), n=0~12
USB3OTG_DEPnCMD	0xC80C	W	0x00000000	Device Physical Endpoint-n Command Register, offset (0xc80c + 4*n), n=0~12

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

13.4.3 Detail Registers Description

USB3OTG_GSBUSCFG0

Address: Operational Base + offset (0xC100)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	datrdreqinfo AXI-cache for Data Read (DatRdReqInfo).
27:24	RW	0x0	desrdreqinfo AXI-cache for Descriptor Read (DesRdReqInfo).
23:20	RW	0x0	datwrreqinfo AXI-cache for Data Write (DatWrReqInfo).
19:16	RW	0x0	deswrreqinfo AXI-cache for Descriptor Write (DesWrReqInfo).
15:12	RO	0x0	reserved
11	RW	0x0	datbigend This bit controls the endian mode for data accesses. 1'b0: Little-endian (default) 1'b1: Big-endian
10	RW	0x0	desbigend This bit controls the endian mode for descriptor accesses. 1'b0: Little-endian (default) 1'b1: Big-endian
9:8	RO	0x0	reserved
7	RW	0x0	incr256brstena If software set this bit to 1, the AXI master uses INCR to do the 256-beat burst.
6	RW	0x0	incr128brstena If software set this bit to 1, the AXI master uses INCR to do the 128-beat burst.
5	RW	0x0	incr64brstena If software set this bit to 1, AXI master uses INCR to do the 64-beat burst.
4	RW	0x0	incr32brstena If software set this bit to 1, the AXI master uses INCR to do the 32-beat burst.
3	RW	0x0	incr16brstena If software set this bit to 1, the AXI master uses INCR to do the 16-beat burst.
2	RW	0x0	incr8brstena If software set this bit to 1, the AXI master uses INCR to do the 8-beat burst.
1	RW	0x0	incr4brstena When this bit is enabled the controller is allowed to do bursts of beat length 1, 2, 3, and 4. It is highly recommended that this bit is enabled to prevent descriptor reads and writes from being broken up into separate transfers.

Bit	Attr	Reset Value	Description
0	RW	0x1	incrbrstena This bit determines the set of burst lengths the master interface uses. It works in conjunction with the GSBUSCFG0[7:1] enables (INCR256/128/64/32/16/8/4). 0: INCRX burst mode ARLEN/AWLEN do not use INCR. They use only the following burst lengths: 4 (if GSBUSCFG0.INCR4BrstEna = 1); 8 (if GSBUSCFG0.INCR8BrstEna = 1); 16 (if GSBUSCFG0.INCR16BrstEna = 1); 32 (if GSBUSCFG0.INCR32BrstEna = 1); 64 (if GSBUSCFG0.INCR64BrstEna = 1); 128 (if GSBUSCFG0.INCR128BrstEna = 1); 256 (if GSBUSCFG0.INCR256BrstEna = 1); 1: INCR (undefined length) burst mode; ARLEN/AWLEN uses any length less than or equal to the largest-enabled burst length of INCR4/8/16/32/64/128/256. For cache line-aligned applications, this bit is typically set to 0 to ensure that the master interface uses only power-of-2 burst lengths (as enabled via GSBUSCFG0[7:0]).

USB3OTG_GSBUSCFG1

Address: Operational Base + offset (0xC104)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	en1kpage 1K Page Boundary Enable. By default (this bit is disabled) the AXI breaks transfers at the 4k page boundary. When this bit is enabled, the AXI master (DMA data) breaks transfers at the 1k page boundary.
11:8	RW	0x3	pipe_trans_limit AXI Pipelined Transfers Burst Request Limit. The field controls the number of outstanding pipelined transfer requests the AXI master pushes to the AXI slave. When the AXI master reaches this limit, it does not make any more requests on the AXI ARADDR and AWADDR buses until the associated data phases complete. This field is encoded as follows: 4’h0: 1 request 4’h1: 2 requests 4’h2: 3 requests 4’h3: 4 requests ... 4’hF: 16 requests
7:0	RO	0x00	reserved

USB3OTG_GTXTHRCFG

Address: Operational Base + offset (0xC108)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved

Bit	Attr	Reset Value	Description
29	RO	0x0	USBTxPktCntSel This field enables/disables the USB transmission multi-packet thresholding: 1'b0: USB transmission multi-packet thresholding is disabled; the core can only start transmission on the USB after the entire packet has been fetched into the corresponding TXFIFO. 1'b1: USB transmission multi-packet thresholding is enabled. The core can only start transmission on the USB after USB Transmit Packet Count amounts of packets for the USB transaction (burst) are already in the corresponding TXFIFO. This mode is only valid in the host mode. It is only used for SuperSpeed.
28	RO	0x0	reserved
27:24	RW	0x0	USBTxPktCnt This field specifies the number of packets that must be in the TXFIFO before the core can start transmission for the corresponding USB transaction (burst). This field is only valid when the USB Transmit Packet Count Enable field is set to one. Valid values are from 1 to 15. Note: This field must be less than or equal to the USB Maximum TX Burst Size field.
23:16	RW	0x00	USBMaxTxBurstSize When USBTxPktCntSel is one, this field specifies the Maximum Bulk OUT burst the core can do. When the system bus is slower than the USB, TX FIFO can underrun during a long burst. You can program a smaller value to this field to limit the TX burst size that the core can execute. Host mode: It only applies to SS Bulk, Isochronous, and Interrupt OUT endpoints. Device mode: This value is not used in device mode, but users need to program a value when using the TX threshold feature to make sure that the value programmed in USBTxPktCnt is less than this value. Valid values are from 1 to 16.
15:0	RO	0x0000	reserved

USB3OTG_GRXTHRCFG

Address: Operational Base + offset (0xC10C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	usb_rx_pkt_cntsel USB ReceivePacket Count Enable. This field enables/disables the USB reception multi-packet thresholding: 1'b0: The core can only start reception on the USB when the RX FIFO has space for at least one packet. 1'b1: Not applied. If you are using external buffer control (EBC) feature, disable this mode by setting USBRxPktCntSel to 0.
28:13	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
12:0	RW	0x0000	resvl_socout_spc Space reserved in rx fifo for ISOC OUT. In host mode, this field is not applicable and must be programmed to 0. In device mode, this value represents the amount of space to be reserved for ISOC OUT packets. The value to be programmed should be chosen so as to ensure that non ISOC packets are not completely dropped, If no space needs to be reserved for ISOC OUT packets, program this field to 0. This field is valid only in device mode. The maximum configurable depth of rx fifo is 8192. Therefore, this field is 13 bits wide. For HS/FS, the space reservation is the actual value.

USB3OTG_GCTL

Address: Operational Base + offset (0xC110)

Bit	Attr	Reset Value	Description
31:19	RW	0x026a	pwrdnscale Not applied.
18	RW	0x0	masterfiltbypass Master Filter Bypass When this bit is set to 1'b1, all the filters are bypassed. The double synchronizers to mac clk preceding the filters are also bypassed. For enabling the filters, this bit must be 1'b0.
17	RW	0x0	bypassetaddr Bypass SetAddress in Device Mode. When BYPSSETADDR bit is set, the device core uses the value in the DCFG[DevAddr] bits directly for comparing the device address in the tokens. For simulation, you can use this feature to avoid sending an actual SET ADDRESS control transfer on the USB, and make the device core respond to a new address. Note: You can set this bit for simulation purposes only. In the actual hardware, this bit must be set to 1'b0.
16	RW	0x1	u2rstecn Device controller on USB 2.0 reset checks for receiver termination eight times per attempt if this bit is set to zero, or only once per attempt if the bit is set to one. Note: This bit is applicable only in device mode.
15:14	RW	0x0	frmscldwn This field scales down device view of a SOF/USOF duration. For HS mode: Value of 2'h3 implements interval to be 15.625 us Value of 2'h2 implements interval to be 31.25 us Value of 2'h1 implements interval to be 62.5 us Value of 2'h0 implements interval to be 125us For FS mode, the scale-down value is multiplied by 8. This field also scales down the MaxPacketSize of the IN and OUT bulk endpoint to allow more traffic during simulation. It can only be changed from a non-zero value during simulation. 2'h0: 1024 bytes 2'h1: 512 bytes 2'h2: 256 bytes 2'h3: 128 bytes

Bit	Attr	Reset Value	Description
13:12	RW	0x2	prtcapdir PRTCAPDIR: Port Capability Direction (PrtCapDir) 2'b01: for Host configurations 2'b10: for Device configurations SW should base on IDDIG input to set usb controller as an OTG 2.0 device with A-device or B-device.

5	W1C	0x0	csr_timeout When this bit is 1'b1, it indicates that the software performed a write or read to a core register that could not be completed within DWC_USB3_CSR_ACCESS_TIMEOUT bus clock cycles (default: h1FFFF).
4	W1C	0x0	buserraddrvld us Error Address Valid Indicates that the GBUSERRADDR register is valid and reports the first bus address that encounters a bus error.
3:2	RO	0x0	reserved
1:0	RO	0x0	curmod Current Mode of Operation.

USB3OTG_GUCTL1

Address: Operational Base + offset (0xC11C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	filter_se0_fsls_eop 1'b0: Default behaviour, no change in Linestate check for SE0 detection in FS/LS. 1'b1: Feature enabled, FS/LS SE0 is filtered for 2 clocks for detecting EOP. This bit is applicable for FS/LS operation. If this feature is enabled, then SE0 on the Linestate is validated for 2 consecutive utmi/ulpi clock edges for EOP detection. This feature is applicable only in FS in device mode and FS/LS mode of operation in host mode. Device mode: FS - If GUCTL1.FILTER_SE0_FSLS_EOP is set, then for device LPM handshake, the core will ignore single SE0 glitch on the Linestate during transmit. Only 2 or more SE0 is considered as a valid EOP on FS. Host mode: FS/LS - If GUCTL1.FILTER_SE0_FSLS_EOP is set, then the core will ignore single SE0 glitch on the Linestate during transmit. Only 2 or more SE0 is considered as a valid EOP on FS/LS port. Enable this feature if the Linestate has SE0 glitches during transmission. This bit is quasi-static, i.e., should not be changed during device operation.

Bit	Attr	Reset Value	Description
28	RW	0x0	tx_ipgap_linecheck_dis 1'b0: Default behavior, no change in Linestate check. 1'b1: Feature enable, 2.0 MAC disables Linestate check during HS transmit. This bit is applicable for HS operation of u2mac. If this feature is enabled, then the 2.0 mac operating in HS ignores the UTMI/ULPI Linestate during the transmit of a token (during token-to-token and token-to-data IPGAP). When enabled, the controller implements a fixed 40-bit TxEndDelay after the packet is given on UTMI and ignores the Linestate during this time. This feature is applicable only in HS mode of operation. Device mode: If GUCTL1.TX_IPGAP_LINECHECK_DIS is set, then for device LPM handshake, the core will ignore the Linestate after TX and wait for a fixed clocks (40 bit times equivalent) after transmitting ACK on utmi. Host mode: If GUCTL1.TX_IPGAP_LINECHECK_DIS is set, then the ipgap between (tkn to tkn/data) is added by 40 bit times of TXENDDELAY, and linestate is ignored during this 40 bit times delay. Enable this bit if the LineState will not reflect the expected line state (J) during transmission. This bit is quasi-static, i.e., should not be changed during device operation.
27	RW	0x0	dev_trb_out_spr_ind 1'b0: Default behavior, no change in TRB status dword. 1'b1: Feature enable, OUT TRB status indicates Short Packet. This bit is applicable for device mode only (and ignored in host mode). If the device application (SW/HW) wants to know if a short packet was received for an OUT in the TRB status itself, then this feature can be enabled, so that a bit is set in the TRB writeback in the buf_size dword. Bit[26] - SPR of the trbstatus, RSVD, SPR,PCM1, bufsize dword will be set during an OUT transfer TRB write back if this is the last TRB used for that transfer descriptor. This bit is quasi-static, i.e., should not be changed during device operation.
26	RW	0x0	dve_force_20clk_for_30clk Not applied.
25	RW	0x0	p3_in_u2 Not applied.

Bit	Attr	Reset Value	Description
24	RW	0x0	dev_l1_exit_by_hw 1'b0: Default behavior, disables device L1 hardware exit logic. 1'b1: Feature enabled This bit is applicable for device mode (2.0) only. This field enables device controller sending remote wakeup for L1 if the device becomes ready for sending/accepting data when in L1 state. If the host expects the device to send remote wkp signaling to resume after going into L1 in flow controlled state, then this bit can be set to send the remote wake signal automatically when the device controller becomes ready. This HW remote wake feature is applicable only to bulk and interrupt transfers, and not for Isoch/Control When control transfers are in progress, the LPM will be rejected (NYET response). Only after control transfers are completed (either with ACK/STALL), LPM will be accepted For Isoch transfers, the host needs to do the wake-up and start the transfer. Device controller will not do remote-wakeup when Isoch endpoints get ready. The device SW needs to keep the GUSB2PHYCFG[EnblSlpM] reset in order to keep the PHY clock to be running for keeping track of SOF intervals. When L1 hibernation is enabled, the controller will not do automatic exit for hibernation requests thru L1. This bit is quasi-static, i.e., should not be changed during device operation.
23:21	RW	0x0	ip_gap_add_on This register field is used to add on to the default inter packet gap setting in the USB 2.0 MAC.
20	RW	0x0	dev_lsp_tail_lock_dis 1'b0: Default behaviour, enables device lsp lock logic for tail TRB update. 1'b1: Fix disabled This is a bug fix for STAR 9000716195 that affects the CSP mode for OUT endpoints in device mode. The issue is that tail TRB index is not synchronized with the cache Scratchpad bytecount update. If the fast-forward request comes in-between the bytecount update on a newly fetched TRB and the tail-index write update in TPF, the RDP works on an incorrect tail index and misses the byte count decrement for the newly fetched TRB in the fast-forwarding process. This fix needs to be present all the times.
19	RW	0x0	nak_per_enh_fs 1'b1: Enables performance enhancement for FS async endpoints in the presence of NAKs. 1'b0: Enhancement not applied. If a periodic endpoint is present, and if a bulk endpoint which is also active is being NAKed by the device, then this could result in a decrease in performance of other Full Speed bulk endpoint which is ACKed by the device. Setting this bit to 1, will enable the host controller to schedule more transactions to the async endpoints (bulk/ control) and hence will improve the performance of the bulk endpoint. This control bit should be enabled only if the existing performance with the default setting is not sufficient for your FullSpeed application. Setting this bit will only control, and is only required for Full Speed transfers.

Bit	Attr	Reset Value	Description
18	RW	0x1	nak_per_enh_hs 1'b1: Enables performance enhancement for HS async endpoints in the presence of NAKs. 1'b0: Enhancement not applied. If a periodic endpoint is present, and if a bulk endpoint which is also active is being NAKed by the device, then this could result in a decrease in performance of other High Speed bulk endpoint which is ACKed by the device. Setting this bit to 1, will enable the host controller to schedule more transactions to the async endpoints (bulk/ control) and hence will improve the performance of the bulk endpoint. This control bit should be enabled only if the existing performance with the default setting is not sufficient for your HighSpeed application. Setting this bit will only control, and is only required for High Speed transfers.
17	RW	0x0	parkmode_disbale_ss Not applied.
16	RW	0x0	parkmode_disable_hs This bit is used only in host mode. When this bit is set to 1 all HS bus instances park mode are disabled. To improve performance in park mode, the xHCI scheduler queues in three requests of 4 packets each for High Speed asynchronous endpoints in a micro-frame. But if a device is slow and if it NAKs more than 3 times, then it is rescheduled only in the next micro-frame. This could decrease the performance of a slow device even further. In a few High Speed devices (such as Sandisk Cruzer Blade 4GB VID: 1921, PID: 21863 and Flex Drive VID: 3744, PID: 8552) when an IN request is sent within 900ns of the ACK of the previous packet, these devices send a NAK. When connected to these devices, if required, the software can disable the park mode if you see performance drop in your system. When park mode is disabled, pipelining of multiple packet is disabled and instead one packet at a time is requested by the scheduler. This allows up to 12 NAKs in a micro-frame and improves performance of these slow devices.
15	RW	0x0	parkmod_disavale_fsls This bit is used only in host mode, and is for debug purpose only. When this bit is set to 1 all FS/LS bus instances in park mode disabled.
14:9	RO	0x00	reserved

Bit	Attr	Reset Value	Description
8	RW	0x1	l1_susp_thrld_en_for_host This bit is used only in host mode. The host controller asserts the utmi_l1_suspend_n and utmi_sleep_n output signals (see LPM Interface Signals table in the Databook) as follows: The controller asserts the utmi_l1_suspend_n signal to put the PHY into deep low-power mode in L1 when both of the following are true: The HIRD/BESL value used is greater than or equal to the value in L1_SUSP_THRLD_FOR_HOST field. The L1_SUSP_THRLD_EN_FOR_HOST bit is set to 1'b1. The controller asserts utmi_sleep_n on L1 when one of the following is true: The HIRD/BESL value used is less than the value in L1_SUSP_THRLD_FOR_HOST field. The L1_SUSP_THRLD_EN_FOR_HOST bit is set to 1'b0.
7:4	RW	0x8	l1_susp_thrld_for_host This field is effective only when the L1_SUSP_THRLD_EN_FOR_HOST bit is set to 1. For more details, refer to the description of the L1_SUSP_THRLD_EN_FOR_HOST bit.
3	RW	0x1	hc_errata_enable Not applied.
2	RW	0x0	hc_parchk_disable Host Parameter Check Disable. When this bit is set to 0 (by default), the xHC checks that the input slot/EP context fields comply to the xHCI Specification. Upon detection of a parameter error during command execution, the xHC generates an event TRB with completion code indicating PARAMETER ERROR. When the bit is set to 1, the xHC does not perform parameter checks and does not generate PARAMETER ERROR completion code.
1	RW	0x1	ovrld_l1_susp_com If this bit is set, the utmi_l1_suspend_com_n is overloaded with the utmi_sleep_n signal. This bit is usually set if the PHY stops the port clock during L1 sleep condition.
0	RW	0x0	loa_filter_en If this bit is set, the USB 2.0 port babble is checked at least three consecutive times before the port is disabled. This prevents false triggering of the babble condition when using low quality cables. Note: This bit is valid only in host mode.

USB3OTG_GSNPSID

Address: Operational Base + offset (0xC120)

Bit	Attr	Reset Value	Description
31:0	RO	0x5533300a	snpsid SNPSID[31:16] indicates Core Identification Number. 0x5533 is ASCII for U3 (DWC_usb3). SNPSID[15:0] indicates the release number. Current Release is 3.00a. Software uses this register to configure release-specific features in the driver.

USB3OTG_GGPIO

Address: Operational Base + offset (0xC124)

Bit	Attr	Reset Value	Description

31:0	RW	0x20190520	userid Application-programmable ID field.

USB3OTG_GUCTL

Address: Operational Base + offset (0xC12C)

Bit	Attr	Reset Value	Description
31:22	RW	0x008	refclkper This field indicates in terms of nano seconds the period of ref_clk. The default value of this register is set to 'h8 (8ns/125 MHz). This field needs to be updated during power-on initialization, if GCTL.SOFITPSYNC or GFLADJ.GFLADJ_REFCLK_LPM_SEL is set to 1. The programmable maximum value is 62ns, and the minimum value is 8ns. You must use a reference clock with a period that is an integer multiple, so that ITP can meet the jitter margin of 32ns. The allowable ref_clk frequencies whose period is not integer multiples are 16/17/19.2/24/39.7MHz. This field must not be set to 0 at any time. If you never plan to use this feature, then set this field to 'h8, the default value.
21	RW	0x0	no_extr_di No Extra Delay Between SOF and the First. Some HS devices misbehave when the host sends a packet immediately after a SOF. However, adding an extra delay between a SOF and the first packet can reduce the USB data rate and performance. This bit is used to control whether the host must wait for 2 microseconds before it sends the first packet after a SOF, or not. User can set this bit to one to improve the performance if those problematic devices are not a concern in the user's host environment. 1'b0: Host waits for 2 microseconds after a SOF before it sends the first USB packet. 1'b1: Host doesn't wait after a SOF before it sends the first USB packet.
20:18	RO	0x0	reserved
17	RW	0x0	sprs_ctrl_trans_en Sparse Control Transaction Enable. Some devices are slow in responding to Control transfers. Scheduling multiple transactions in one microframe/frame can cause these devices to misbehave. If this bit is set to 1'b1, the host controller schedules transactions for a Control transfer in different microframes/frames.

Bit	Attr	Reset Value	Description
16	RW	0x0	res_bw_hs_esp Reserving 85% Bandwidth for HS Periodic EPs. By default, HC reserves 80% of the bandwidth for periodic EPs. If this bit is set, the bandwidth is relaxed to 85% to accommodate two high speed, high bandwidth ISOC EPs. USB 2.0 required 80% bandwidth allocated for ISOC traffic. If two High-bandwidth ISOC devices (HD Webcams) are connected, and if each requires 1024-bytes X 3 packets per Micro-Frame, then the bandwidth required is around 82%. If this bit is set, then it is possible to connect two Webcams of 1024bytes X 3 payload per Micro-Frame each. Otherwise, you may have to reduce the resolution of the Webcams. This bit is valid in Host and DRD configuration and is used in host mode operation only. Ignore this bit in device mode.
15	RW	0x1	cm_dev_addr Compliance Mode for Device Address. When this bit is 1'b1, Slot ID may have different value than Device Address if max_slot_enabled < 128. 1'b1: Increment Device Address on each Address Device command. 1'b0: Device Address is equal to Slot ID. The xHCI compliance requires this bit to be set to 1. The 0 mode is for debug purpose only. This allows you to easily identify a device connected to a port in the Lecroy or Eliisys trace during hardware debug. This bit is valid in Host and DRD configuration and is used in host mode operation only. Ignore this bit in device mode.
14	RW	0x0	usb_host_in_auto_retry_en Host IN Auto Retry. 1'b0: Auto Retry Disabled 1'b1: Auto Retry Enabled Note: This bit is also applicable to the device mode.
13	RW	0x0	en_overlap_chk Not applied.

Bit	Attr	Reset Value	Description
12	RW	0x0	ext_cap_suppt_en External Extended Capability Support Enable When set, this field enables extended capabilities to be implemented outside the core. When the ExtCapSupEN is set and the Debug Capability is enabled, the Next Capability pointer in Debug Capability returns 16. A read to the first DWORD of the last internal extended capability (the "xHCI Supported Protocol Capability for USB 3.0" when the Debug Capability is not enabled) returns a value of 4 in the Next Capability Pointer field. This indicates to software that there is another capability four DWORDs after this capability (for example, at address N+16 where N is the address of this DWORD). If enabled, an external address decoder that snoops the xHC slave interface must be implemented. If it sees an access to N+16 or greater, the slave access is re-routed to a piece of hardware which returns the external capability pointer register of the new capability and also handles reads/writes to this new capability and the side effects. If disabled, a read to the first DWORD of the last internal extended capability returns 0 in the 'Next Capability Pointer' field. This indicates there are no more capabilities.
11	RW	0x0	insrt_extr_fsbodi Insert Extra Delay Between FS Bulk OUT. Some FS devices are slow to receive Bulk OUT data and can get stuck when there are consecutive Bulk OUT transactions with short inter-transaction delays. This bit is used to control whether the host inserts extra delay between consecutive Bulk OUT transactions to a FS Endpoint. 1'b0: Host doesn't insert extra delay between consecutive Bulk OUT transactions to a FS Endpoint. 1'b1: Host inserts about 12us extra delay between consecutive Bulk OUT transactions to a FS Endpoint to work around the device issue. Note: Setting this bit to one will reduce the Bulk OUT transfer performance for most of the FS devices.
10:9	RW	0x0	dtct Device Timeout Coarse Tuning. This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. The core first checks the DTCT value. If it is 0, then the timeout value is defined by the DTFT. If it is non-zero, then it uses the following timeout values: 2'b00: 0 usec -> use DTFT value instead 2'b01: 500 usec 2'b10: 1.5 msec 2'b11: 6.5 msec

Bit	Attr	Reset Value	Description
8:0	RW	0x010	ctft Device Timeout Fine Tuning. This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. For the DTFT field to take effect, DTCT must be set to 2'b00. The DTFT value is the number of 125 MHz clocks * 256 to count before considering a device timeout. The minimum value of DTFT is 2. For example, if the mac3_clk is 125 MHz clk (8 ns period), this is calculated as follows: (DTFT value) * 256 * (8 ns) Quick Reference: if DTFT = 0x2, 2*256*8 = 4usec timeout if DTFT = 0x5, 5*256*8 = 10usec timeout if DTFT = 0xA, 10*256*8 = 20usec timeout if DTFT = 0x10, 16*256*8 = 32usec timeout if DTFT = 0x19, 25*256*8 = 51usec timeout if DTFT = 0x31, 49*256*8 = 100usec timeout if DTFT = 0x62, 98*256*8 = 200usec timeout

Address: Operational Base + offset (0xC200)

Bit	Attr	Reset Value	Description
31	RW	0x0	physoftrst UTMI PHY Soft Reset. Causes the usb2phy_reset signal to be asserted to reset a UTMI PHY. Not applicable to ULPI because ULPI PHYs are reset via their FunctionControl. Reset register, and the core automatically writes to this register when the core is reset (vcc_reset_n, USBCMD.HCRST, DCTL.SoftReset, or GCTL.SoftReset).

Bit	Attr	Reset Value	Description
30	RW	0x1	u2_freeclk_exists Specifies whether your USB 2.0 PHY provides a free-running PHY clock, which is active when the clock control input is active. If your USB 2.0 PHY provides a free-running PHY clock, it must be connected to the utmi_clk[0] input. The remaining utmi_clk[n] must be connected to the respective port clocks. The core uses the Port-0 clock for generating the internal mac2 clock. 1'b0: USB 2.0 free clock does not exist 1'b1: USB 2.0 free clock exists Note: When the core is configured as device-only, do not set this bit to 1.
29:25	RO	0x00	reserved
24:22	RW	0x0	lstrd LS Turnaround Time. This field indicates the value of the Rx-to-Tx packet gap for LS devices. The encoding is as follows: 3'h0: 2 bit times 3'h1: 2.5 bit times 3'h2: 3 bit times 3'h3: 3.5 bit times 3'h4: 4 bit times 3'h5: 4.5 bit times 3'h6: 5 bit times 3'h7: 5.5 bit times Note: This field is applicable only in Host mode. For normal operation (to work with most LS devices), set the default value of this field to 3'h0 (2 bit times). The programmable LS device inter-packet gap and turnaround delays are provided to support some legacy LS devices that might require different delays than the default/fixed ones. For instance, the Open LS mouse requires 3 bit times of inter-packet gap to work correctly.
21:19	RW	0x2	lsipd LS Inter-Packet Time. This field indicates the value of Tx-to-Tx packet gap for LS devices. The encoding is as follows: 3'h0: 2 bit times 3'h1: 2.5 bit times 3'h2: 3 bit times 3'h3: 3.5 bit times 3'h4: 4 bit times 3'h5: 4.5 bit times 3'h6: 5 bit times 3'h7: 5.5 bit times Note: This field is applicable only in Host mode. For normal operation (to work with most LS devices), set the default value of this field to 3'h2 (3 bit times). The programmable LS device inter-packet gap and turnaround delays are provided to support some legacy LS devices that might require different delays than the default/fixed ones. For instance, the AOpen LS mouse requires 3 bit times of inter-packet gap to work correctly.
18:14	RO	0x00	reserved

Bit	Attr	Reset Value	Description
13:10	RW	0x9	usbtrdim USB 2.0 Turnaround Time. Sets the turnaround time in PHY clocks. Specifies the response time for a MAC request to the Packet FIFO Controller (PFC) to fetch data from the DFIFO (SPRAM). The following are the required values for the minimum SoC bus frequency of 60 MHz. USB turnaround time is a critical certification criteria when using long cables and five hub levels. The required values for this field: 4'h5: When the MAC interface is 16-bit UTMI+. 4'h9: When the MAC interface is 8-bit UTMI+/ULPI. If SoC bus clock is less than 60 MHz, and USB turnaround time is not critical, this field can be set to a larger value. Note: This field is valid only in device mode.
9	RW	0x0	xcvrdly Transceiver Delay. Enables a delay between the assertion of the UTMI/ULPI Transceiver Select signal (for HS) and the assertion of the TxValid signal during a HS Chirp. When this bit is set to 1, a delay (of approximately 2.5 us) is introduced from the time when the Transceiver Select is set to 2'b00 (HS) to the time the TxValid is driven to 0 for sending the chirp-K. This delay is required for some UTMI/ULPI PHYs. Note: If you enable the hibernation feature when the device core comes out of power-off, you must re-initialize this bit with the appropriate value because the core does not save and restore this bit value during hibernation. This bit is valid only in device mode.
8	RW	0x0	enblslpm Enable utmi_sleep_n and utmi_l1_suspend_n. The application uses this bit to control utmi_sleep_n and utmi_l1_suspend_n assertion to the PHY in the L1 state. 1'b0: utmi_sleep_n and utmi_l1_suspend_n assertion from the core is not transferred to the external PHY. 1'b1: utmi_sleep_n and utmi_l1_suspend_n assertion from the core is transferred to the external PHY. Note: This bit must be set high for Port0 if SNPS PHY is used. In Device mode - Before issuing any device endpoint command when operating in 2.0 speeds, disable this bit and enable it after the command completes. Without disabling this bit, if a command is issued when the device is in L1 state and if mac2_clk (utmi_clk/ulpi_clk) is gated off, the command will not get completed.
7	RO	0x0	physel USB 2.0 High-Speed PHY or USB 1.1 Full-Speed. 1'b0: USB 2.0 high-speed UTMI+ or ULPI PHY. 1'b1: USB 1.1 full-speed serial transceiver.

Bit	Attr	Reset Value	Description
6	RW	0x0	suspendusb20 Suspend USB2.0 HS/FS/LS PHY. When set, USB2.0 PHY enters Suspend mode if Suspend conditions are valid. If it is set to 1, then the application must clear this bit after power-on reset. Application needs to set it to 1 after the core initialization completes. For all other configurations, this bit can be set to 1 during core configuration. Note: In host mode, on reset, this bit is set to 1. Software can override this bit after reset. In device mode, before issuing any device endpoint command when operating in 2.0 speeds, disable this bit and enable it after the command completes. If you issue a command without disabling this bit when the device is in L2 state and if mac2_clk (utmi_clk/ulpi_clk) is gated off, the command will not get completed.
5	RO	0x0	reserved
4	RO	0x0	ulpi_utmi_sel ULPI or UTMI+ Select. 1'b0: UTMI+ Interface 1'b1: ULPI Interface
3	RW	0x0	phyif If UTMI+ is selected, the application uses this bit to configure the core to support a UTMI+ PHY with an 8- or 16-bit interface. 1'b0: 8 bits 1'b1: 16 bits
2:0	RW	0x0	tout_cal HS/FS Timeout Calibration. The number of PHY clocks, as indicated by the application in this field, is multiplied by a bit-time factor; this factor is added to the high-speed/full-speed interpacket timeout duration in the core to account for additional delays introduced by the PHY. This may be required, since the delay introduced by the PHY in generating the linestate condition may vary among PHYs. The USB standard timeout value for high-speed operation is 736 to 816 (inclusive) bit times. The USB standard timeout value for full-speed operation is 16 to 18 (inclusive) bit times. The application must program this field based on the speed of connection. The number of bit times added per PHY clock are: High-speed operation: One 30-MHz PHY clock = 16 bit times One 60-MHz PHY clock = 8 bit times Full-speed operation: One 30-MHz PHY clock = 0.4 bit times One 60-MHz PHY clock = 0.2 bit times

USB3OTG_GUSB3PIPECTL0

Address: Operational Base + offset (0xC2C0)

Bit	Attr	Reset Value	Description
31	RW	0x0	PHYSoftRst USB3 PHY Soft Reset After setting this bit to 1, the software needs to clear this bit.

Bit	Attr	Reset Value	Description
30	RW	0x0	HstPrtCmpl This feature tests the PIPE PHY compliance patterns without having to have a test fixture on the USB 3.0 cable. This bit enables placing the SS port link into a compliance state. By default, this bit must be set to 1'b0. In compliance lab testing, the SS port link enters compliance after failing the first polling sequence after power on. Set this bit to 0, when you run compliance tests. The sequence for using this functionality is as follows: 1. Disconnect any plugged in devices. 2. Perform USBCMD.HCRST or power-on-chip reset. 3. Set PORTSC.PP=0. 4. Set GUSB3PIPECTL. HstPrtCmpl=1. This places the link into compliance state. To advance the compliance pattern, follow this sequence (toggle the set GUSB3PIPECTL. HstPrtCmpl): 1. Set GUSB3PIPECTL.HstPrtCmpl=0. 2. Set GUSB3PIPECTL.HstPrtCmpl=1. This advances the link to the next compliance pattern. To exit from the compliance state perform USBCMD.HCRST or power-on-chip reset.
29	RW	0x0	U2SSInactP3ok 1’b0: During link state U2/SS.Inactive, put PHY in P2 (Default) 1’b1: During link state U2/SS.Inactive, put PHY in P3
28	RW	0x0	DisRxDetP3 Disabled receiver detection in P3 1’b0: If PHY is in P3 and Core needs to perform receiver detection, The core performs receiver detection in P3. (Default) 1’b1: If PHY is in P3 and Core needs to perform receiver detection, The core changes the PHY power state to P2 and then performs receiver detection. After receiver detection, the cores changes PHY power state to P3.
27	RW	0x0	Ux_exit_in_Px 1’b0: The core does U1/U2/U3 exit in PHY power state P0 (default behavior). 1’b1: The core does U1/U2/U3 exit in PHY power state P1/P2/P3 respectively.
26	RW	0x0	ping_enhancement_en Ping Enhancement Enable When set, the Downstream port U1 ping receive timeout becomes 500 ms instead of 300 ms. Minimum Ping.LFPS receive duration is 8 ns (one mac3_clk). This field is valid for the downstream port only.
25	RW	0x0	u1u2exitfail_to_recov U1U2exitfail to Recovery When set, and U1/U2 LFPS handshake fails, the LTSSM transitions from U1/U2 to Recovery instead of SS Inactive. If Recovery fails, then the LTSSM can enter SS.Inactive. This is an enhancement only. It prevents interoperability issue if the remote link does not do proper handshake.

Bit	Attr	Reset Value	Description
24	RW	0x0	request_p1p2p3 Always Request P1/P2/P3 for U1/U2/U3 When set, the core always requests PHY power change from P0 to P1/P2/P3 during U0 to U1/U2/U3 transition. If this bit is 0, and immediate Ux exit (remotely initiated, or locally initiated) happens, the core does not request P1/P2/P3 power state change.
23	RW	0x0	StartRxDetU3RxDet Start Receiver Detection in U3/Rx.Detect (StartRxdetU3RxDet) If DWC_USB3_GUSB3PIPECTL_INIT[22] is set, and the link is in either U3 or Rx.Detect state, the core starts receiver detection on the rising edge of this bit. This can only be used for Downstream ports. This bit must be set to '0' for Upstream ports. This feature must not be enabled for normal operation.
22	RW	0x0	DisRxDetU3RxDet Disable Receiver Detection in U3/Rx.Det When set, the core does not handle receiver detection in either U3 or Rx.Detect states. DWC_USB3_GUSB3PIPECTL_INIT[23] must be used to start receiver detection manually. This bit can only be used for the downstream port. This bit must be set to 0 for Upstream ports. This feature must not be enabled for normal operation. If you have to use this feature, contact SNPS.
21:19	RW	0x0	DelayP1P2P3 Delay P1P2P3 Delay P0 to P1/P2/P3 request when entering U1/U2/U3 until (DWC_USB3_GUSB3PIPECTL_INIT[21:19]*8) 8B10B error occurs, or Pipe3_RxValid drops to 0. DWC_USB3_GUSB3PIPECTL_INIT[18] must be 1 to enable this functionality.
18	RW	0x0	DELAYP1TRANS DELAYP1TRANS Delay PHY power change from P0 to P1/P2/P3 when link state changing from U0 to U1/U2/U3 respectively. 1'b1: When entering U1/U2/U3, delay the transition to P1/P2/P3 until the pipe3 signals, Pipe3_RxElecIlde is 1 and pipe3_RxValid is 0 1'b0: When entering U1/U2/U3, transition to P1/P2/P3 without checking for Pipe3_RxElecIlde and pipe3_RxValid. Note: This bit must be set to '1' for SNPS PHY. It is also used by third-party SS PHY.
17	RW	0x0	SUSPENDENABLE Suspend USB3.0 SS PHY (Suspend_en) When set, and if Suspend conditions are valid, the USB 3.0 PHY enters Suspend mode. Application needs to set it to '1' after the core initialization is completed.
16:15	RW	0x0	DATWIDTH 2'b00: 32 bits 2'b01: 16 bits 2'b10: 8 bits One clock after reset, these bits receive the value seen on the pipe3_DataBusWidth.

Bit	Attr	Reset Value	Description
14	RW	0x0	AbortRxDetInU2 Abort Rx Detect in U2 (AbortRxDetInU2) When set, and the link state is U2, then the core will abort receiver detection if it receives U2 exit LFPS from the remote link partner. This bit is for the downstream port only.
13	RW	0x0	SkipRxDet Skip Rx Detect: When set, the core skips Rx Detection if pipe3_RxElecIdle is low. Skip is defined as waiting for the appropriate timeout, then repeating the operation.
12	RW	0x0	LFPSP0Algn LFPS P0 Align When set: 1. The core deasserts LFPS transmission on the clock edge that it requests PHY power state 0 when exiting U1, U2, or U3 low power states. Otherwise, LFPS transmission is asserted one clock earlier. 2. The core requests symbol transmission two pipe3_rx_pclks periods after the PHY asserts PhyStatus as a result of the PHY switching from P1 or P2 state to P0 state. Currently, this bit is only used in USB 3.0 HUB with SNPS PHY. For other USB 3.0 Host, Device, and DRD cores, this bit is not required.
11	RW	0x0	P3P2TranOK P3 P2 Transitions OK (P3P2TranOK) When set, the core transitions directly from PHY power state P2 to P3 or from state P3 to P2. When not set, P0 is always entered as an intermediate state during transitions between P2 and P3, as defined in the PIPE3 Specification. According to the PIPE3 Specification, any direct transition between P3 and P2 is illegal.
10	RW	0x0	P3ExSigP2 P3 Exit Signal in P2 When this bit is set, the core always changes the PHY power state to P2, before attempting a U3 exit handshake. This bit is used only for some non-SNPS PHYs that cannot do LFPS in P3.
9	RW	0x0	LFPSFILTER LFPS Filter When set, filter LFPS reception with pipe3_RxValid in PHY power state P0, that is, ignore LFPS reception from the PHY unless both pipe3_Rxelecidle and pipe3_RxValid are deasserted.

Bit	Attr	Reset Value	Description
8	RW	0x0	RX_DETECT_to_Polling_L RX_DETECT to Polling.LFPS Control 1'b0 (Default): Enables a 400us delay to start Polling LFPS after RX_DETECT. This allows VCM offset to settle to a proper level. 1'b1: Disables the 400us delay to start Polling LFPS after RX_DETECT. During controller certification with third party PHY it is observed that the PHY is not able to meet the Tx AC common mode voltage active (VTX-CM-ACPP_ACTIVE <100mv) if the link starts polling within 80us from the time rx.detect is performed. To meet this VTX-CM-ACPP_ACTIVE specification, the polling must be delayed further. If the PHY does not have issue then they can set this bit to 1 which allows polling to start within 80us.
7	RO	0x0	reserved
6	RW	0x0	TX_SWING Tx Swing (TxSwing) Refer to the PIPE3 specification.
5:3	RW	0x0	TX_MARGIN Tx Margin[2:0] (TxMargin) Refer to Table 5-3 of the PIPE3 Specification.
2:1	RW	0x0	TX_DE_EPPHASIS Tx Deemphasis The value driven to the PHY is controlled by the LTSSM during USB3 Compliance mode.
0	RW	0x0	ELASTIC_BUFFER_MODE Elastic Buffer Mode (ElasticBufferMode) (Refer to Table 5-3 of the PIPE3 specification.)

Bit	Attr	Reset Value	Description
6:0	RW	0x00	gtxfifopridev Device TxFIFO priority. This register specifies the relative DMA priority level among the Device TXFIFOs (one per IN endpoint). Each register bit[n] controls the priority (1: high, 0: low) of each TXFIFO[n]. When multiple TXFIFOs compete for DMA service at a given time (that is, multiple TXQs contain TX DMA requests and their corresponding TXFIFOs have space available), the TX DMA arbiter grants access on a packet-basis in the following manner: 1. High-priority TXFIFOs are granted access using round-robin arbitration 2. Low-priority TXFIFOs are granted access using round-robin arbitration only after the high-priority TXFIFOs have no further processing to do (that is, either the TXQs are empty or the corresponding TXFIFOs are full). For scatter-gather packets, the arbiter grants successive DMA requests to the same FIFO until the entire packet is completed. When configuring periodic IN endpoints, software must set register bit[n]=1, where n is the TXFIFO assignment. This ensures that the DMA for isochronous or interrupt IN endpoints are prioritized over bulk or control IN endpoints. This register is present only when the core is configured to operate in the device mode. The register size corresponds to the number of Device IN endpoints.

USB3OTG_GTXFIFOPRIHST

Address: Operational Base + offset (0xC618)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RW	0x0	gtxfifoprihst Host TxFIFO priority. This register specifies the relative DMA priority level among the Host TXFIFOs (one per USB bus instance) within the associated speed group (HS/FSLS). Each register bit[n] controls the priority (1: high, 0: low) of TXFIFO[n] within a speed group. When multiple TXFIFOs compete for DMA service at a given time (i.e., multiple TXQs contain TX DMA requests and their corresponding TXFIFOs have space available), the TX DMA arbiter grants access on a packet-basis in the following manner: 1. Among the FIFOs in the same speed group (HS/FSLS): a. High-priority TXFIFOs are granted access using round-robin arbitration b. Low-priority TXFIFOs are granted access using round-robin arbitration only after the high-priority TXFIFOs have no further processing to do (that is, either the TXQs are empty or the corresponding TXFIFOs are full). 2. The TX DMA arbiter prioritizes the HS/FSLS speed group according to the ratio programmed in the GDMAHLRATIO register. For scatter-gather packets, the arbiter grants successive DMA requests to the same FIFO until the entire packet is completed. This register is present only when the core is configured to operate in the host mode (includes DRD and OTG modes). The register size corresponds to the number of configured USB bus instances; for example, in the default configuration, there are 2 USB bus instances (1 HS, and 1 FSLS).

USB3OTG_GRXFIFOPRIHST

USB3OTG_GDMAHLRATIO
Address: Operational Base + offset (0xC624)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:8	RW	0x0000	hstrxfifo Host RXFIFO DMA High-Low Priority.
7:5	RO	0x0	reserved
4:0	RW	0x00	hsttxfifo Host TXFIFO DMA High-Low Priority.

USB3OTG_GFLADJ
Address: Operational Base + offset (0xC630)

Bit	Attr	Reset Value	Description
31	RW	0x0	gfladj_refclk_240mhzdecr_pls1 This field indicates that the decrement value that the controller applies for each ref_clk must be GFLADJ_REFCLK_240MHZ_DECR and GFLADJ_REFCLK_240MHZ_DECR +1 alternatively on each ref_clk. Set this bit to a 1 only if GFLADJ_REFCLK_LPM_SEL is set to 1 and the fractional component of 240/ref_frequency is greater than or equal to 0.5. Examples: If the ref_clk is 24 MHz then 1. GUCTL.REF_CLK_PERIOD = 41 2. GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = (240/24) = 10 3. GFLADJ.GFLADJ_REFCLK_240MHZDECR_PLS1 = 0
30:24	RW	0x00	gfladj_refclk_240mhz_decr This field indicates the decrement value that the controller applies for each ref_clk in order to derive a frame timer in terms of a 240-MHz clock. This field must be programmed to a non-zero value only if GFLADJ_REFCLK_LPM_SEL is set to 1. The value is derived as follows: GFLADJ_REFCLK_240MHZ_DECR = 240/ref_clk_frequency Examples: If the ref_clk is 24 MHz then 1. GUCTL.REF_CLK_PERIOD = 41 2. GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = 240/24 = 10
23	RW	0x0	gfladj_refclk_lpm_sel This bit enables the functionality of running SOF counters on the ref_clk. This bit must not be set to 1 if GCTL.SOFITPSYNC bit is set to 1. Similarly, if GFLADJ_REFCLK_LPM_SEL set to 1, GCTL.SOFITPSYNC must not be set to 1. Note that the ref_clk frequencies supported in this mode are 16/17/19.2/20/24/39.7/40 MHz. The utmi_clk[0] signal of the core must be connected to the FREECLK of the PHY. Note: If you set this bit to 1, the GUSB2PHYCFG.U2_FREECLK_EXISTS bit must be set to 0.
22	RO	0x0	reserved
21:8	RW	0x0000	gfladj_refclk_fladj This field indicates the frame length adjustment to be applied when SOF counter is running on the ref_clk. SOF interval when GLADJ.GFLADJ_REFCLK_LPM_SEL is set to 1. This field must be programmed to a non-zero value only if GFLADJ_REFCLK_LPM_SEL is set to 1 or GCTL.SOFITPSYNC is set to 1. The value is derived as follows: FLADJ_REF_CLK_FLADJ=((125000/ref_clk_period_integer) - (125000/ref_clk_period)) * ref_clk_period where: 1. The ref_clk_period_integer is the integer value of the ref_clk period got by truncating the decimal (fractional) value that is programmed in the GUCTL.REF_CLK_PERIOD field. 2. The ref_clk_period is the ref_clk period including the fractional value. Examples: If the ref_clk is 24 MHz then 1. GUCTL.REF_CLK_PERIOD = 41 2. GFLADJ.GLADJ_REFCLK_FLADJ = ((125000/41) - (125000/41.6666)) * 41.6666 = 2032 (ignoring the fractional value).

Bit	Attr	Reset Value	Description
7	RW	0x0	gfladj_30mhz_sdbnd_sel This field selects whether to use the input signal fladj_30mhz_reg or the GFLADJ.GFLADJ_30MHZ to adjust the frame length for the SOF. When this bit is set to: 1'b1: the controller uses the register field GFLADJ.GFLADJ_30MHZ value 1'b0: the controller uses the input signal fladj_30mhz_reg value.
6	RO	0x0	reserved
5:0	RW	0x00	gfadj_30mhz This field indicates the value that is used for frame length adjustment instead of considering from the sideband input signal fladj_30mhz_reg. This enables post-silicon frame length adjustment in case the input signal fladj_30mhz_reg is connected to a wrong value or is not valid. For details on how to set this value, refer to section 5.2.4, "Frame Length Adjustment Register (FLADJ)," of the xHCI Specification.

USB3OTG_DCFG
Address: Operational Base + offset (0xC700)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23	RW	0x0	ignstrmpp This bit only affects stream-capable bulk endpoints. Not applied.
22	RW	0x0	lpmcap LPM Capable. Not applied.
21:17	RW	0x04	nump Number of Receive Buffers. Not applied.
16:12	RW	0x00	intrnum Interrupt number. Indicates interrupt/EventQ number on which non-endpoint-specific device-related interrupts (see DEVT) are generated.
11:10	RO	0x0	reserved
9:3	RW	0x00	devaddr Device Address. The application must perform the following: 1. Program this field after every SetAddress request. 2. Reset this field to zero after USB reset.
2:0	RW	0x0	devspd Device Speed. Indicates the speed at which the application requires the core to connect, or the maximum speed the application can support. However, the actual bus speed is determined only after the chirp sequence is completed, and is based on the speed of the USB host to which the core is connected. 3'b000: High-speed (USB 2.0 PHY clock is 30 MHz or 60 MHz) 3'b001: Full-speed (USB 2.0 PHY clock is 30 MHz or 60 MHz)

USB3OTG_DCTL
Address: Operational Base + offset (0xC704)

Bit	Attr	Reset Value	Description
31	RW	0x0	run_stop The software writes 1 to this bit to start the device controller operation. To stop the device controller operation, the software must remove any active transfers and write 0 to this bit. When the controller is stopped, it sets the DSTS.DevCtrlHlt bit when the core is idle and the lower layer finishes the disconnect process. The Run/Stop bit must be used in following cases as specified: 1. After power-on reset and CSR initialization, the software must write 1 to this bit to start the device controller. The controller does not signal connect to the host until this bit is set. 2. The software uses this bit to control the device controller to perform a soft disconnect. When the software writes 0 to this bit, the host does not see that the device is connected. The device controller stays in the disconnected state until the software writes 1 to this bit. The minimum duration of keeping this bit cleared is specified in the Note below. If the software attempts a connect after the soft disconnect or detects a disconnect event, it must set DCTL[8:5] to 5 before reasserting the Run/Stop bit. 3. When the USB is in a lower power state and the Two Power Rails configuration is selected, software writes 0 to this bit to indicate that it is going to turn off the Core Power Rail. After the software turns on the Core Power Rail again and re-initializes the device controller, it must set this bit to start the device controller. Note: The following is the minimum duration under various conditions for which the soft disconnect (SftDiscon) bit must be set for the USB host to detect a device disconnect: 10ms: For high-speed, when the device state is Suspended, Idle, or not Idle/Suspended (performing transactions); For full-speed/low-speed, when the device state is Suspended, Idle, or not Idle/Suspended (performing transactions). To accommodate clock jitter, it is recommended that the application add extra delay to the specified minimum duration.

Bit	Attr	Reset Value	Description
30	R/W SC	0x0	csftrst Core Soft Reset. Reset all clock domains as follows: 1. This bit clears the interrupts and all the CSRs except GSTS, GSNPSID, GGPIO, GUID, GUSB2PHYCFGn registers, GUSB3PIPECTLn registers, DCFG, DCTL, DEVTEN, and DSTS registers. 2. All module state machines (except the SoC Bus Slave Unit) are reset to the IDLE state, and all the TxFIFOs and the RxFIFO are flushed. 3. Any transactions on the SoC bus Master are terminated as soon as possible, after gracefully completing the last data phase of a SoC bus transfer. Any transactions on the USB are terminated immediately. The application can write this bit at any time to reset the core. This is a self-clearing bit; the core clears this bit after all necessary logic is reset in the core, which may take several clocks depending on the core's current state. Once this bit is cleared, the software must wait at least 3 PHY clocks before accessing the PHY domain (synchronization delay). Typically, software reset is used during software development and also when you dynamically change the PHY selection bits in the USB configuration registers listed above. When you change the PHY, the corresponding clock for the PHY is selected and used in the PHY domain. Once a new clock is selected, the PHY domain must be reset for proper operation.
29	RO	0x0	reserved
28:24	RW	0x00	hirdthres HIRD Threshold. The core asserts output signals utmi_l1_suspend_n and utmi_sleep_n on the basis of this signal: The core asserts utmi_l1_suspend_n to put the PHY into Deep Low-Power mode in L1 when both of the following are true: 1. HIRD value is greater than or equal to the value in DCTL.HIRD_Thres[3:0] 2. HIRD_Thres[4] is set to 1'b1. The core asserts utmi_sleep_n on L1 when one of the following is true: 1. If the HIRD value is less than HIRD_Thres[3:0] or 2. HIRD_Thres[4] is set to 1'b0. Note: This field must be set to '0' during SuperSpeed mode of operation.

Bit	Attr	Reset Value	Description
23:20	RW	0xf	lpm_nyet_thres LPM NYET Threshold Handshake response to LPM token specified by device application. Response depends on DCFG.LPMCap. DCFG.LPMCap is 1'b0 - The core always responds with Timeout (that is, no response). DCFG.LPMCap is 1'b1 - The core responds with an ACK on successful LPM transaction, which requires that all of the following are satisfied: 1. There are no PID or CRC5 errors in both the EXT token and the LPM token (if not true, inactivity results in a timeout ERROR). 2. No data is pending in the Transmit FIFO and OUT endpoints not in flow controlled state (else NYET). 3. The BESL value in the LPM token is less than or equal to LPM_NYET_thres[3:0].
19	RW	0x0	keep_connect When 1, this bit enables the save and restore programming model by preventing the core from disconnecting from the host when DCTL.RunStop is set to 0. The device core disconnects from the host when DCTL.RunStop is set to 0. This bit indicates whether to preserve this behavior (0), or if the core must not disconnect when RunStop is set to 0 (1).
18	RW	0x0	l1_hibernation_en When this bit is set along with KeepConnect, the device core generates a Hibernation Request Event if L1 is enabled and the HIRD value in the LPM token is larger than the threshold programmed in DCTL.HIRD_Thres. The core does not exit the LPM L1 state until software writes Recovery into the DCTL.ULStChngReq field. This prevents corner cases where the device is entering hibernation at the same time the host is attempting to exit L1.
17	RW	0x0	crs Controller Restore State. This command is similar to the USBCMD.CRS bit in host mode and initiates the restore process. When software sets this bit to 1, the controller immediately sets DSTS.RSS to 1. When the controller has finished the restore process, it sets DSTS.RSS to 0. Note: When read, this field always returns 0.
16	RW	0x0	css Controller Save State. This command is similar to the USBCMD.CSS bit in host mode and initiates the save process. When software sets this bit to 1, the controller immediately sets DSTS.SSS to 1. When the controller has finished the save process, it sets DSTS.SSS to 0. Note: When read, this field always returns 0.
15:13	RO	0x0	reserved
12	RW	0x0	initu2ena Not applied.
11	RW	0x0	acceptu2ena Not applied.
10	RW	0x0	initu1ena Not applied.
9	RW	0x0	acceptu1ena Not applied.

Bit	Attr	Reset Value	Description
8:5	RW	0x0	ulstchngreq Software writes this field to issue a USB state change request. A change in this field indicates a new request to the core. If software wants to issue the same request back-to-back, it must write a 0 to this field between the two requests. The result of the state change request is reflected in the USB State in DSTS. These bits are self-cleared on the MAC Layer exiting suspended state. If software is updating other fields of the DCTL register and not intending to force any link state change, then it must write a 0 to this field. In HS/FS/LS mode: Value: Requested USB state transition 8: Remote wakeup request Others: Reserved The Remote wakeup request must be issued 2us after the device goes into suspend state (DSTS[21:18] is 3). Note: After coming out of hibernation, software must write 8 (Recovery) into this field to confirm exit from the suspended state.

USB3OTG_DSTS

Address: Operational Base + offset (0xC70C)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved
29	RW	0x0	dcnrd Device Controller Not Ready. The bit indicates that the core is in the process of completing the state transitions after exiting from hibernation. To complete the state transitions, it takes 256 bus clock cycles from the time DCTL[31].Run/Stop is set. During hibernation, if the UTMI/ULPI PHY is in suspended state, then the 256-bus clock cycle delay starts after the PHY exited suspended state. Software must set DCTL[31].Run/Stop to 1 and wait for this bit to be de-asserted to zero before processing DSTS.USBLnkSt.
28:26	RO	0x0	reserved
25	RW	0x0	rss Restore State Status. This bit is similar to the USBSTS.RSS in host mode. When the controller finishes the restore process, it completes the command by setting DSTS.RSS to 0.
24	RO	0x0	sss Save State Status. This bit is similar to the USBSTS.SSS in host mode. When the controller has finished the save process, it completes the command by setting DSTS.SSS to 0.

Bit	Attr	Reset Value	Description
23	RO	0x0	coreidle Core Idle. The bit indicates that the core finished transferring all RxFIFO data to system memory, writing out all completed descriptors, and all Event Counts are zero. Note: While testing for Reset values, mask out the read value. This bit represents the changing state of the core and does not hold a static value.
22	RO	0x1	devctrlhlt Device Controller Halted. This bit is set to 0 when the Run/Stop bit in the DCTL register is set to 1. The core sets this bit to 1 when, after SW sets Run/Stop to 0, the core is idle and the lower layer finishes the disconnect process. When Halted=1, the core does not generate Device events. Note: The core does not set this bit to 1 if GEVNTCOUNTn has some valid value. Software needs to acknowledge the events that are generated (by writing to GEVNTCOUNTn) while it is waiting for this bit to be set to 1.
21:18	RO	0x4	usblnkst USB/Link State In SS mode: LTSSM State 4'h0: U0 4'h1: U1 4'h2: U2 4'h3: U3 4'h5: RX_DET 4'h6: SS_INACT 4'h7: POLL 4'h8: RECOV 4'h9: HRESET 4'ha: CMPLY 4'hb: LPBK 4'hf: Resume/Reset In HS/FS/LS mode: 4'h0: On state 4'h2: Sleep (L1) state 4'h3: Suspend (L2) state 4'h4: Disconnected state (Default state) 4'h5: Early Suspend state (valid only when Hibernation is disabled, GCTL[1].GblHibernationEn = 0) 4'he: Reset (valid only when Hibernation is enabled, GCTL[1].GblHibernationEn = 1) 4'hf: Resume (valid only when Hibernation is enabled, GCTL[1].GblHibernationEn = 1) The link state Resume/Reset indicates that the core received a resume or USB reset request from the host while the link was in hibernation. Software must write 8 (Recovery) to the DCTL.ULStChngReq field to acknowledge the resume/reset request. When Hibernation is enabled, GCTL[1].GblHibernationEn = 1, this field USBLnkSt is valid only when DCTL[31].Run/Stop set to 1 and DSTS[29].DCNRD = 0.
17	RO	0x1	rx_fifo_empty Rx Fifo Empty.

USB3OTG_DALEPENA

Address: Operational Base + offset (0xC720)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	usbactep USB Active Endpoints. This field indicates if a USB endpoint is active in the current configuration and interface. It applies to USB IN endpoints 0~15 and OUT endpoints 0~15, with one bit for each of the 32 possible endpoints. Even numbers are for USB OUT endpoints, and odd numbers are for USB IN endpoints, as follows: Bit[0]: USB EP0-OUT Bit[1]: USB EP0-IN Bit[2]: USB EP1-OUT Bit[3]: USB EP1-IN ... The entity programming this register must set bits 0 and 1 because they enable control endpoints that map to physical endpoints (resources) after USBReset. Hardware clears these bits for all endpoints (other than EP0-OUT and EP0-IN) after detecting a USB reset event. After receiving SetConfiguration and SetInterface requests, the application must program endpoint registers accordingly and set these bits.

USB3OTG_DEPnCMDPAR2

Address: Operational Base + offset (0xC800)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	parameter This register indicates the physical endpoint command Parameter 2. It must be programmed before issuing the command.

USB3OTG_DEPnCMDPAR1

Address: Operational Base + offset (0xC804)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	parameter This register indicates the physical endpoint command Parameter 1. It must be programmed before issuing the command.

USB3OTG_DEPnCMDPAR0

Address: Operational Base + offset (0xC808)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	parameter This register indicates the physical endpoint command Parameter 0. It must be programmed before issuing the command.

USB3OTG_DEPnCMD

Address: Operational Base + offset (0xC80C)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	commandparam Command Parameters or Event Parameters when this register is written: For Start Transfer command: The 16-bit StreamID assigned to this transfer. For Start Transfer command applied to an isochronous endpoint: StartMicroFramNum, Indicates the (micro) frame number to which the first TRB applies. For Update Transfer, End Transfer, and Start New Configuration commands: [22:16]: Transfer Resource Index (XferRscIdx). The hardware-assigned transfer resource index for the transfer, which was returned in response to the Start Transfer command. The application software-assigned transfer resource index for a Start New Configuration command. Event Parameters (EventParam), when this register is read.
15:12	RW	0x0	cmdstatus Command Completion Status. The information is in the same format as bits 15:12 of the Endpoint Command Complete event.
11	RW	0x0	hipri_forcerm HighPriority: Only valid for Start Transfer command. ForceRM: Only valid for End Transfer command. ClearPendIN: Only valid for Clear Stall command. Software sets this bit to clear any pending IN transaction (on that endpoint) stuck at the lower layers when a Clear Stall command is issued.
10	RW	0x0	cmdact Command Active. Software sets this bit to 1 to enable the device endpoint controller to execute the generic command. The device controller sets this bit to 0 when the CmdStatus field is valid and the endpoint is ready to accept another command. This does not imply that all the effects of the previously-issued command have taken place.
9	RO	0x0	reserved
8	RW	0x0	cmdioc Command Interrupt on Complete. When this bit is set, the device controller issues a generic Endpoint Command Complete event after executing the command. Note that this interrupt is mapped to DEPCFG.IntrNum. When the DEPCFG command is executed, the command interrupt on completion goes to the interrupt pointed by the DEPCFG.IntrNum in the current command. Note: This field must not set to 1 if the DCTL.RunStop field is 0.
7:4	RO	0x0	reserved

Bit	Attr	Reset Value	Description
3:0	RW	0x0	cmdtyp Command Type. 13.6 Application Notes

13.6.1 Some Settings About USB3OTG_0 and USB3OTG_1

- **USB3 mode initial sequence**

In this application USBDP PHY will use 24Mhz reference clock, some initial sequence should be set and USB mode should be configured before working. Please refer to USBDP PHY section.

- **Power Down Mode**

When no transfer happened, PD_USB can be power down in application. At this time the PowerDown signal to USBDP PHY PIPE interface will be clamped to 3'b3. But there is also a MUX near USBDP PHY which could choose form GRF. Also, RxTermination, TxElecIdle and TxDetectRxLoopbx can also be control by GRF, this could be found in USBDPGRF_CON3 in GRF section.
If USB and DP not be used, USBDPPHY could also be power down, and before power down, USBDPGRF_CON2[15] will use to clamp the PHY output signal.

- **PhyStatus in PIPE Interface for USB2 only**

If only USB2 is used and USBDP PHY initial sequence not correctly processes, the PIPE interface signal PhyStatus may be set to 1'b1, USB3OTG0/1_CON1[3:2] can be set to control PhyStatus.

13.6.2 USB3OTG_2 mode setting

In USB3OTG_2 subsystem, PHY is combo with PCIE and SATA, so you must set some GRF to set USB mode.

- Set PIPE_PHY_GRF_PIPE_CON0[3:2] to 1'b1 to select USB mode.
- Set PIPE_PHY_GRF_PIPE_CON2[12] and [15] to 1'b0. This will select TxElecidle and TxCompliance form controller.
- Set PIPE_PHY_GRF_PIPE_CON3[14:13] to 2'b01 to select pipe to USB3 controller.

13.6.3 Battery Charging Application

The USB2.0 PHY supports battery charger detection to enable device draw increased current from VBUS for charging and/or powering up from dedicated charging ports or charging downstream ports.
The related signals with GRF are following:

Table 13-5 USB2PHY Battery Charging GRF Description

GRF	Description
USB2PHYGRF_CON2[5]	CHRGSEL: This signal selects whether the Battery Charger circuit sets voltage sourcing on the DP line and sensing on the DM line or voltage sourcing on DM and sensing on DP.
USB2PHYGRF_CON2[6]	VDATDETENB: This signal activates the Battery Charger comparator and enables detection of the DP and DM lines according to the Battery Charging specification.
USB2PHYGRF_CON2[7]	VDATSRCENB: This signal activates the voltage sourcing on the DP or DM line.
USB2PHYGRF_STATUS0[0]	CHGDET: This signal is the battery charge detection (VDAT_REF) comparator output.
USB2PHYGRF_STATUS0[1]	FSVPLUS: This signal is the DP FS/LS single ended receiver output, which is also the VLGC output.

GRF	Description
USB2PHYGRF_STATUS0[2]	FSVMINUS: This signal is the DM FS/LS single ended receiver output, which is also the VLGC output.
USB2PHYGRF_STATUS0[11]	OTGSESSVLD0: This signal is the VBUS session valid detection and can be used by a portable device to detect the VBUS voltage from the host or charger port.

Table 1-6 lists the detection flow.

Table 13-6 USB2PHY Battery Charging Operations

Mode of Operation	Inputs			Outputs			
	CHRGSEL	VDATDETENB	VDATSRCENB	OTGSESSVLD	CHGDET	FSVPUS	FSVMINUS
Battery charging is disabled	X	0	0	X	0	X	X
PHY is operating as a portable device (PD) and is not attached to host nor charger port.	X	0	0	0	X	X	X
PHY is operating as a PD using the Dead Battery Provision (DBP) - Unconfigured Clause, while attached to a standard downstream port (SDP).	0	1	1	1	0	X	0
PHY is operating as a PD using the DBP - Unconfigured Clause, while attached to a special port (such as a PS2 or proprietary charger) that pulls D+/D– high.	0	1	1	1	1	X	1
PHY is operating as a PD using the DBP - Unconfigured Clause, while attached to a charging downstream port (CDP) or a dedicated charging port (DCP).	0	1	1	1	1	X	0
PHY is operating as a PD that is performing Primary Detection while attached to an SDP.	1	1	1	1	0	X	0
PHY is operating as a PD that is performing Primary Detection while attached to a special port (such as a PS2 or proprietary charger) that pulls D+/D– high.	0	1	1	1	1	X	1
PHY is operating as a PD that is performing Primary Detection while attached to a CDP or DCP.	0	1	1	1	1	X	0
PHY is operating as a PD that is performing Secondary Detection while attached to a CDP.	1	1	1	1	0	X	X
PHY is operating as a PD that is performing Secondary Detection while attached to a DCP.	1	1	1	1	1	X	X
PHY is operating as a host CDP with no PD detected.	1	1	0	X	0	0	X
PHY is operating as a host CDP that detects an attached PD, which supports the BC specification.	1	1	1	X	1	0	X
PHY is operating as a host CDP that detects a connect from the PD D+ pullup.	1	1	0	X	X	1	0

13.6.4 OTG Programming Model

When detect ID change event (see USB2PHY_GRF) or VBUS change event (see USB2PHY_GRF) after disconnect, it means a USB3/2 OTG A device or B device may connect, then check status of ID (see USB2PHY_GRF). If ID==0, it will work as A device, then follow host programming flow; if ID==1, it will work as B device, then it follows device

programming flow.
Note: USB3.0 OTG doesn’t support host/device mode swapping through HNP and RSP.

Chapter 14 USBDP COMBO PHY

14.1 Overview

This chapter describes an overview of USBDP Combo PHY. USBDP Combo PHY is a PMA hardmacro to support USB and DP interface. USB's PCS and DP Link must be used along with USBDP Combo PHY for successful operation.

14.2 Features

The supported features in USBDP Combo PHY are:

- USB Specification 3.0 and DP Specification 1.4 compliant
- 5Gb/s Serializer/Deserializer for USB
- 1.62 Gb/s, 2.7 Gb/s, 5.4 Gb/s and 8.1 Gb/s Serializer for DP
- USB Type-C and DP Alt Mode supported

14.3 Function Description

14.3.1 Block Diagram

Fig.1-1 illustrates a block diagram of USBDP Combo PHY. USBDP Combo PHY comprises one Common, two lanes of transceiver, two lanes of transmitter, one AUX channel for DP, and PMA digital.

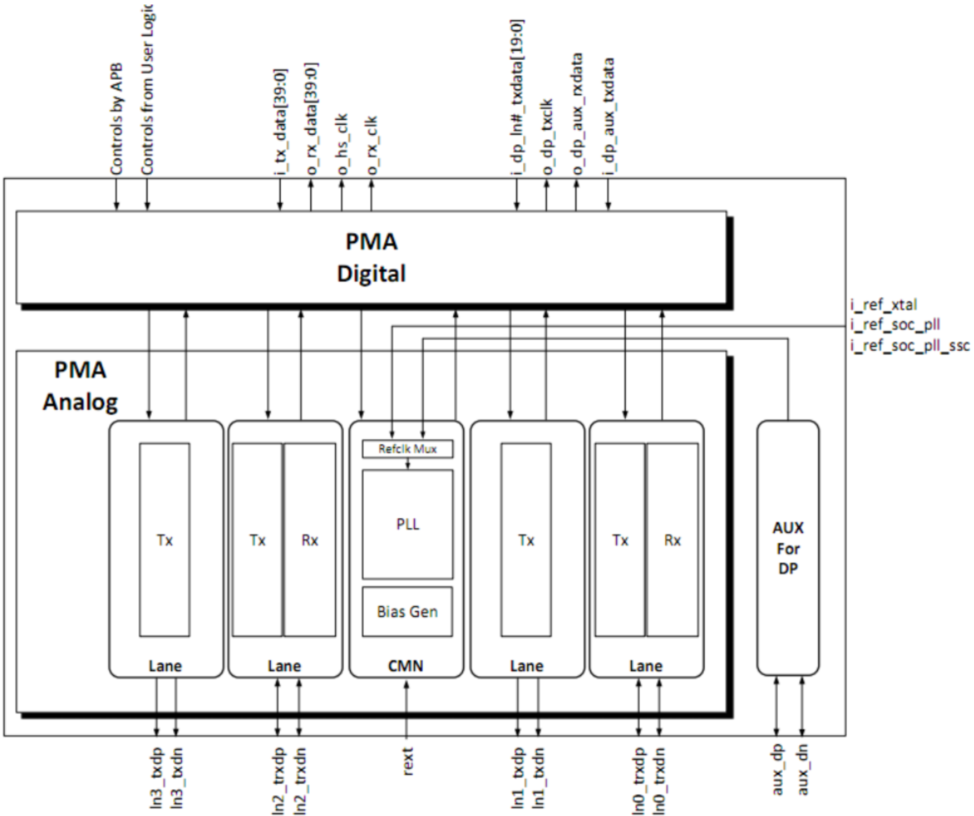

Fig. 14-1 USBDP Combo PHY Block Diagram

The following sections describe the various blocks and their functionalities. DPTX uses a 32 bit internal data path for the main link.

14.3.2 Function Overview

USBDP Combo PHY is used for Universal Serial Bus (USB) and DisplayPort (DP) applications. The transceiver in the core performs these functions:

- Serializes the 8b/10b encoded data for transmission for USB Gen1 and DP RBR/HBR/HBR2/HBR3 operations
- De-serializes the received code groups Input data coming is registered once before it goes through a 3-stage pipeline. The 3-stage pipeline is required to capture the three colors components in various input video formats.

When transmitting the data, the transceiver performs these functions:

- Accepts four 10-bit 8b/10b encoded transmit characters for USB Gen1
- Attaches and serializes the data to the TXP/TXN differential outputs to a maximum value of 5.0 Gb/s for USB. Accepts two 10-bit 8b/10b encoded transmit characters for DP

- Attaches and serializes the data to the TXP/TXN differential outputs to a maximum value of 8.1 Gb/s for DP

When receiving the data, the transceiver performs these functions:

- Samples the received serial data on the RXP/RXN differential inputs
- De-serializes it into four 10-bit (or 8-bit) received characters

14.3.3 PMA Analog

USBDP Combo PHY comprises of a PMA analog and PMA digital. The PMA consists of:

- One CMN block
- One AUX block for DP
- Two lanes including TX (lane1/3)
- Two lanes including TX and RX (lane0/2)
- One SSC ROPLL for DP
- One SSC LCPLL for USB

To support display alter mode, lane0 and lane2 work as TX in DP mode and as RX in USB mode. TX and RX are sharing bump in lane0 and lane2.
In the DP transmitter side, the PMA analog executes these actions:

- PMA Analog receives parallel data from PMA digital
- The data is serialized and transmitted through ln0/2_trxdp/n and ln1/3_txdp/n pads by hybrid-mode driver
- The TX driver characteristics, such as amplitude and 2-tap FIR filter, are user-controllable

In the USB transmitter side, the PMA analog executes these actions:

- PMA Analog receives parallel data from PMA digital
- The data is serialized and transmitted through ln1/3_txdp/n pads by hybrid-mode driver
- The TX driver characteristics, such as amplitude and 3-tap FIR filter, are either pre-settable or user-controllable

In the USB receiver side, the PMA analog executes these actions:

- The data is received through ln0/2_trxdp/n pads with 50Ω termination resistance
- Distortion on received signal due to channel loss is compensated by Continuous Time Linear Equalizer (CTLE) and Decision Feedback Equalizer (DFE)
- Clock and Data Recovery (CDR) generates frequency- and phase-aligned clock and equalized signal is deserialized to parallel data which is delivered to the PMA digital

14.3.4 CMN

The CMN consists of a band-gap reference (BGR), bias generator and PLL.
The BGR circuit generates high-accuracy reference voltage of 820mV across PVT variation. A bias generator makes two kinds of current, external- and internal-resistor (RMRES)-referred current, and these currents are distributed to each block in CMN and lanes. The external resistor-referred (REXT) current is generated using an8.2KΩ resistor which is connected between the rext pad and ground outside the chip. On the other hand, the internal resistor-referred current is generated using internally integrated replica resistor to compensate resistance error across PVT variation.
The PLL in the CMN synthesizes high-speed clock, which is used for TX serializer and RX CDR lock, from a reference clock.
The following are the main features of the PLL:

- Wide-range LC VCO from 8GHz to 10GHz
- Wide-range RO VCO from 4GHz to 8.1GHz
- Pre-defined or programmable divider setting for each USBDP Type-C specification
- Spread spectrum clocking (SSC) with sigma-delta modulated fractional divider
- Automatic Frequency Calibrated (AFC) oscillator setting for the desired frequency of operation
- Programmable charge pump current and loop filter resistance allowing for wide range of programmable loop bandwidth and peaking

14.3.5 AUX

The AUX is 1Mbps half-duplex bidirectional channel used for link management and device control. The AUX block does not support upstream detection feature.

14.4 Register Description

14.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 14-1 USB3 Address Mapping

Base Address	Device
0xFED70000~0xFED7FFFF	USBDPPHY 0
0xFED80000~0xFED8FFFF	USBDPPHY 1
USB3.0 Controller Address Mapping	
Offset Address Range	**Register Type**
0x8000 ~ 0xFFFF	USBDPPHY PMA

14.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description

14.4.3 Detail Registers Description

USBDPPHY_CMM_REG0024

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x60	ana_lcpll_pms_mdiv PLL main divider setting. Divider value = Setting code.

USBDPPHY_CMM_REG0025

Address: Operational Base + offset (0x0094)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x60	ana_lcpll_pms_mdiv PLL main divider setting for AFC counter. Divider value = Setting code.

USBDPPHY_CMN_REG004A

Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:3	RW	0x7	ropll_ana_cpi_ctrl_coarse PLL integral path charge-pump current contorl. 3'b0xx: half current (not used) 3'b100: 1.25uA 3'b101: 1.5625uA 3'b110: 20833uA 3'b111: 3.125uA
2:0	RW	0x4	ropll_ana_cpi_ctrl_fine PLL integral path charge-pump current contorl. 3'b0xx: half current (not used) 3'b100: 1.25uA 3'b101: 1.5625uA 3'b110: 20833uA 3'b111: 3.125uA

USBDPPHY_CMN_REG004B

Address: Operational Base + offset (0x012C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:4	RW	0xf	ropll_ana_cpp_ctrl_coarse PLL proportional path charge-pump current contorl. 3'b000: 66.7uA 3'b001: 75uA 3'b010: 85.7uA 3'b011: 100uA 3'b100: 120uA 3'b101: 150uA 3'b110: 200uA 3'b111: 300uA
3:0	RW	0x4	ropll_ana_cpp_ctrl_fine PLL proportional path charge-pump current contorl. 3'b000: 66.7uA 3'b001: 75uA 3'b010: 85.7uA 3'b011: 100uA 3'b100: 120uA 3'b101: 150uA 3'b110: 200uA 3'b111: 300uA

USBDPPHY_CMN_REG004C

Address: Operational Base + offset (0x0130)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:3	RW	0x1	ropll_ana_lpf_c_sel_coarse PLL loop filter capacitor control. 3'b000: 0pF 3'b001: 1pF 3'b010: 2pF 3'b011: 3pF 3'b100: 4pF 3'b101: 5pF 3'b110: 6pF 3'b111: 7pF
2:0	RW	0x7	ropll_ana_lpf_c_sel_fine PLL loop filter capacitor control. 3'b000: 0pF 3'b001: 1pF 3'b010: 2pF 3'b011: 3pF 3'b100: 4pF 3'b101: 5pF 3'b110: 6pF 3'b111: 7pF

USBDPPHY_CMN_REG004D

Address: Operational Base + offset (0x0134)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:4	RW	0xf	ropll_ana_lpf_r_sel_coarse PLL loop filter resistor control. 4'b0000: 2K 4'b0001: 4K 4'b0010:6K ~ 4'b1111: 32K
3:0	RW	0x4	ropll_ana_lpf_r_sel_fine PLL loop filter resistor control. 4'b0000: 2K 4'b0001: 4K 4'b0010:6K 4'b1111: 32K

USBDPPHY_CMN_REG0057

Address: Operational Base + offset (0x015C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x4e	ropll_pms_mdiv_rbr PLL main divider setting. Divider value = Setting code.

USBDPPHY_CMN_REG0058

Address: Operational Base + offset (0x0160)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x34	ropll_pms_mdiv_hbr PLL main divider setting. Divider value = Setting code.

USBDPPHY_CMN_REG0059

Address: Operational Base + offset (0x0164)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x34	ropll_pms_mdiv_hbr2 PLL main divider setting. Divider value = Setting code.

USBDPPHY_CMN_REG005A

Address: Operational Base + offset (0x0168)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x4e	ropll_pms_mdiv_hbr3 PLL main divider setting. Divider value = Setting code.

USBDPPHY_CMN_REG005D

Address: Operational Base + offset (0x0174)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x4e	ropll_pms_mdiv_afc_rbr PLL main divider setting. Divider value = Setting code.

USBDPPHY_CMN_REG005E

Address: Operational Base + offset (0x0178)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x34	ropll_pms_mdiv_afc_hbr PLL main divider setting. Divider value = Setting code.

USBDPPHY_CMN_REG005F

Address: Operational Base + offset (0x017C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x34	ropll_pms_mdiv_afc_hbr2 PLL main divider setting. Divider value = Setting code.

USBDPPHY_CMN_REG0060

Address: Operational Base + offset (0x0180)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x4e	ropll_pms_mdiv_afc_hbr3 PLL main divider setting. Divider value = Setting code.

USBDPPHY_CMN_REG0063

Address: Operational Base + offset (0x018C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:4	RW	0x4	ropll_pms_sdiv_rbr PLL post divider setting (N-1, except /7). 3'b000: /1 3'b001: /2 3'b010: /3 3'b011: /4 3'b100: /5 3'b101: /6 3'b110: X 3'b111: /8
3:0	RW	0x1	ropll_pms_sdiv_hbr PLL post divider setting (N-1, except /7). 3'b000: /1 3'b001: /2 3'b010: /3 3'b011: /4 3'b100: /5 3'b101: /6 3'b110: X 3'b111: /8

USBDPPHY_CMN_REG0064

Address: Operational Base + offset (0x0190)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	ropll_pms_sdiv_hbr3 PLL post divider setting (N-1, except /7). 3'b000: /1 3'b001: /2 3'b010: /3 3'b011: /4 3'b100: /5 3'b101: /6 3'b110: X 3'b111: /8
3:0	RW	0x0	ropll_pms_sdiv_hbr2 PLL post divider setting (N-1, except /7). 3'b000: /1 3'b001: /2 3'b010: /3 3'b011: /4 3'b100: /5 3'b101: /6 3'b110: X 3'b111: /8

USBDPPHY_CMN_REG0065
Address: Operational Base + offset (0x0194)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	ana_ropll_iqdiv_bypass VCO clock bypass IQ divider enable.
6	RW	0x0	ovrd_ropll_pms_iqdiv_rstn Override enable flag for ropll_pms_iqdiv_rstn
5	RW	0x0	ropll_pms_iqdiv_rstn IQ divider resetn.
4:3	RW	0x0	ana_ropll_ref_bypass_clk_sel PLL Bypass clock selection. 2'b00: XO 2'b01: IO 2'b10: PIXEL or LC_OUT_CLK 2'b11: System PLL clock
2	RW	0x1	ana_ropll_ref_chopper_clk_en Chopper clk enable. 1'b0: Disable 1'b1: Enable
1	RW	0x0	ovrd_ropll_ref_chopper_clk_div_rstn Override enable flag for ropll_ref_chopper_clk_div_rstn.
0	RW	0x1	ropll_ref_chopper_clk_div_rstn Chopper clk divider reset. 1'b0: Reset. 1'b1: Released.

14.5 Application Notes

14.5.1 Signal Controlled by GRF and CRU

There are two USBDP PHY (USBDPPHY 0 and USBDPPHY 1) in system. The signals need to be controlled by CRU or GRF are list below:

USBDPPHY 0:
i_rx_lfps_en: USB3PHY0_GRF_CON1[14]
i_init_rstn: CRU_SOFTRST_CON02[8]
i_apb_presetn: CRU_SOFTRST_CON72[2]
i_pcs_apb_presetn: CRU_SOFTRST_CON02[11]
i_cmn_rstn: CRU_SOFTRST_CON02[9]
i_lane_rstn: CRU_SOFTRST_CON02[10]

USBDPPHY 1:
i_rx_lfps_en: USB3PHY1_GRF_CON1[14]
i_init_rstn: CRU_SOFTRST_CON02[15]
i_apb_presetn: CRU_SOFTRST_CON72[4]
i_pcs_apb_presetn: CRU_SOFTRST_CON03[2]
i_cmn_rstn: CRU_SOFTRST_CON03[0]
i_lane_rstn: CRU_SOFTRST_CON03[1]

14.5.2 Power Sequence Guide

14.5.2.1 Power-Up Sequence

Sequential power-up of 1.8V and 0.85V must be provided to USBDP Combo PHY for proper SerDes operation. Supply voltage of 0.85V must be ramped up first, and supply voltage of 1.8V must be started ramping up after 0.85V supply is completely settled down. Signals i_init_rstn and i_apb_presetn must be asserted after power is fully turned on. Following the release of i_init_rstn, you can access some registers through APB if need and the primary inputs i_cmn_rstn should be set low until the APB programming is finished from initial. After the APB is programmed, the i_cmn_rstn should be released. The signal i_cmn_rstn=0 will cause the PMA's COMMON to turn on. And, the primary input i_lane_rstn will be controlled by Link sub-controller and will be reset in abnormal situation like link-down.
PLL locks within 60us after i_cmn_rstn is asserted and o_pll_lock_done goes to high when the PLL achieves lock. Fig.1-2 illustrates the timing restrictions for RESET signals and the typical timing information for the related output signals.

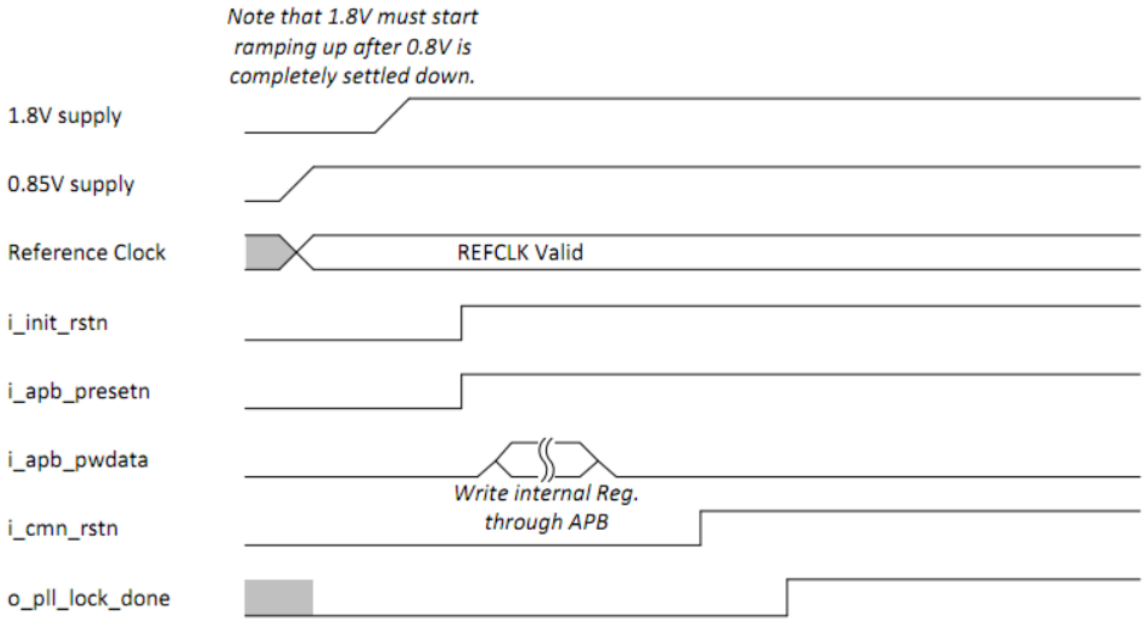

Fig. 14-2 USBDP PHY Power Up Sequence

14.5.2.2 Power-Down Sequence

During power-down (Turning-off supply voltage), supply voltage of 0.85V must start ramping down after supply voltage of 1.8V is completely discharge.

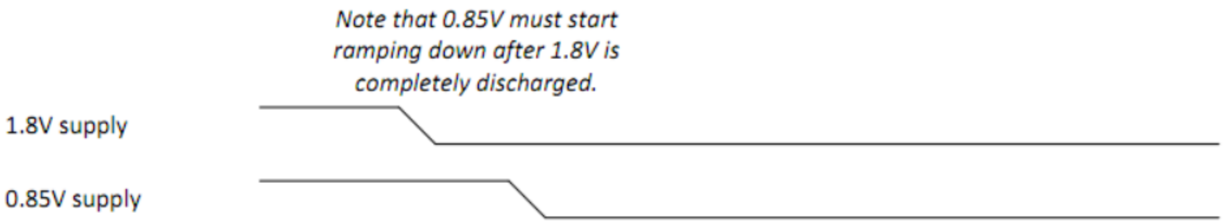

Fig. 14-3 USBDP PHY Power Down Sequence

14.5.3 PHY Initialization Guide

14.5.3.1 USBDP APB Reset Sequence

The USBDP PHY has USB part and DP part. And both parts share the APB Reset. The APB Reset sequence is needed to initialize the USBDP PHY.

Please de-assert USBDP PHY APB Reset when the USBDP PHY is needed to re-initialize like POR (Power-On-Reset, Alt-mode configuration changing).

Please do not de-assert i_apb_presetn when only USB part or DP part initialized.

14.5.3.2 USB LANE0/1, DP LANE2/3 Setting Sequence

When USBDP PHY works, some initial setting should be applicated. The following shows the initialization sequence.

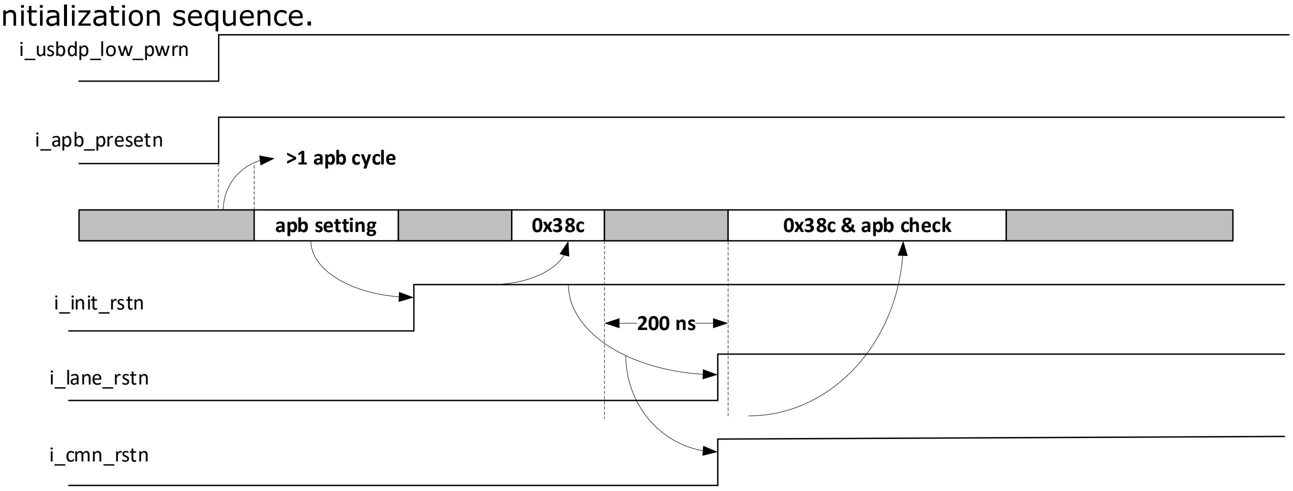

Fig. 14-4 USBDP PHY Power Down Sequence

14.5.4 SFR Setting for Transmitter

14.5.4.1 Amplitude

Tx amplitude is defined as a differential swing of low-frequency (DC) signal, which is less dependent on off-chip environment, at ln[N]_txdp, ln[N]_txdn, ln[N]_trxdp and ln[N]_trxdn as shown in Fig.1-4. Tx driver amplitude is controlled by two tuning parameters; voltage-mode and current-mode driver amplitude control, respectively.

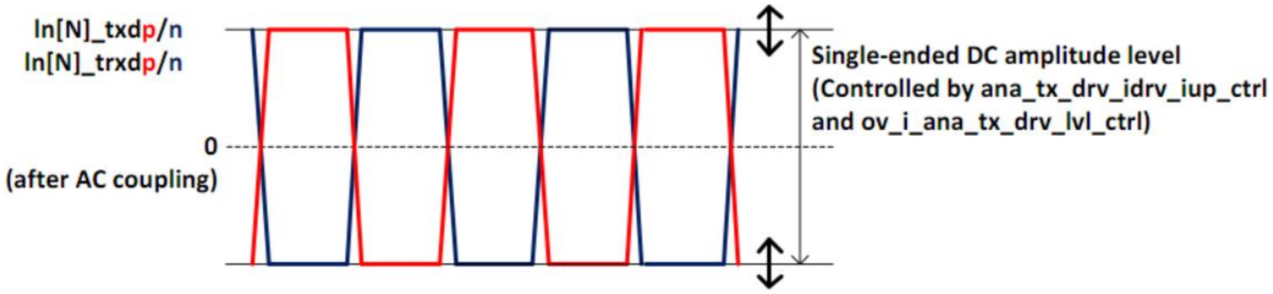

Fig. 14-5 TX DC Amplitude Control

The amplitude of voltage-mode driver can be controlled by either PCS or PMA SFR setting. As shown in Table1-3, SFR fields for control consist of override enable and input bits. When override enable is set to high, all following input bits for override are directly applied to Tx voltage mode driver circuit. Due to its own characteristic of voltage-mode driver, the maximum single-ended amplitude of the driver cannot exceed the supply voltage level, VDD (Assuming well-matched Tx impedance). Note that the register field for voltage-mode driver swing control is separated into four rate-specific registers and one matched register value is automatically applied according to the data rate under operation. A current-mode driver is implemented to achieve higher voltage swing beyond the limit of voltage-mode drive. In order to activate the current-mode driver, ln_tx_drv_idrv_en must be set to high and ana_tx_drv_idrv_iup_ctrl must be set When the current-mode driver is enabled, extra higher swing can be achieved over VDD.

Table 14-3 Amplitude Control of Voltage-Mode Driver

Name	Address	Code	Description
Override enable for TX Amplitude Contorl	0x0810 0x1010 0x1810 0x2010 Bit[5]	0x1	Override enable for tx_drv_idrv_en
TX Differential Output (TXDP/TXDN) Amplitude Control ln0/1/2/3_tx_drv_lvl_ctrl	0x0810 0x1010 0x1810 0x2010 Bit[4:0]	0xa	1200mV (Max)
		0x0	400 mV
TX Differential Output (TXDP/TXDN)	0x0818 0x1018	0x10	Disable current driver

Name	Address	Code	Description
Amplitude Control ln0/1/2/3_tx_drv_idrv_en	0x1818 0x2018 Bit[0]	0x11	enable current driver
TX Differential Output (TXDP/TXDN) Amplitude Control ln0/1/2/3_ana_tx_drv_idrv_iup_ctrl	0x081C 0x101C 0x181C 0x201C Bit[7:5]	0x0	1200mV (Max)
		0x7	850mV (Min)

14.5.4.2 Equalization

USBDP Combo PHY has 3 tap FIR filter in Tx. De-emphasis function is implemented to reduce the swing of driver when there is no transition (bit change) between current and previous data bit as shown in Fig.1-5.

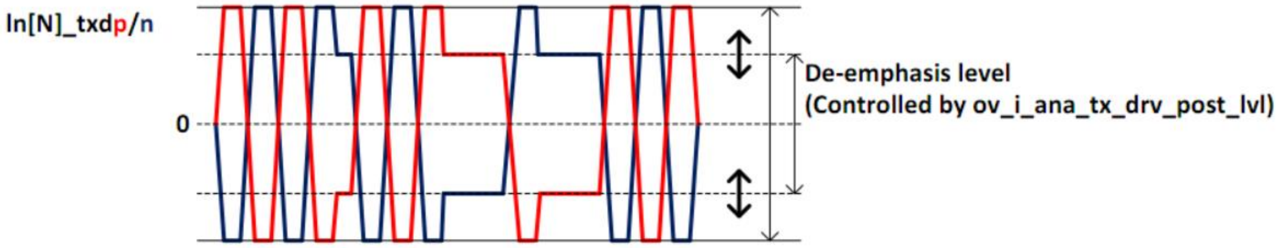

Fig. 14-6 TX De-emphasis Level Control

Table 14-4 SFR Setting for De-emphasis Level Control

Name	Address	Code	Description
TX De-Emphasis Level Control ln0/1/2/3_tx_drv_post_lvl_ctrl	0x0814 0x1014 0x1814 0x2014 Bit[4:0]	00000	-0.5 dB
		00100	– 1.5 dB.
		0100	– 2.8 dB.
		01000	– 4.2 dB.

Preshoot function is implemented to reduce the swing of driver when there is no transition (bit change) between current and next data bit as shown in Fig.1-6

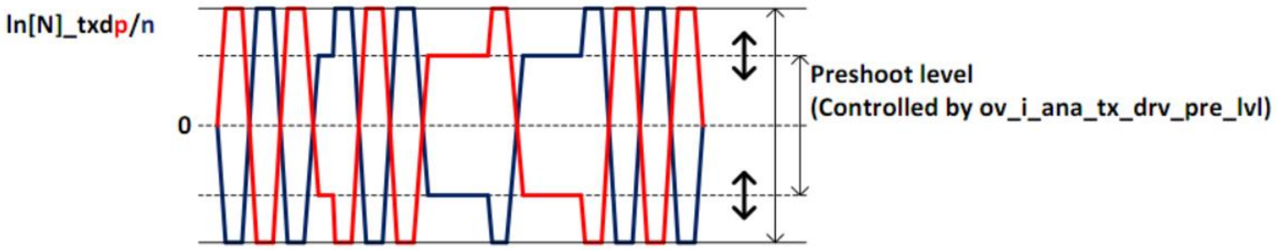

Fig. 14-7 TX Preshoot Level Control

Table 14-5 SFR Setting for Preshoot Level Control

Name	Address	Code	Description
TX Pre-shoot Level Control ln0/1/2/3_tx_drv_pre_lvl_ctrl	0x0818 0x1018 0x1818 0x2018 Bit[5:2]	0000	0 dB Recommend to use over 5 Gbps speed
		0110	– 1.6 dB. Recommend to use over 10 Gbps speed.
		1001	– 6.9 dB. Not recommend to use because main amplitude level is also aggressively

Name	Address	Code	Description
			reduced.

14.5.4.3 Slew Rate

Slew rate of Tx waveform is able to be controlled by SFR shown in Table 1-6. In order to enable slew-rate control, ana_tx_drv_accdrv_en bit must be set to high. Polarity of slew-rate control is controlled by ana_tx_drv_accdrv_pol_sel_* for each data rate. Tx driver has faster slew rate when this bit is set to high, while slower rate when set to low. Amount of slew rate control is determined by ana_tx_drv_accdrv_ctrl_* for each data rate. Higher value makes Tx driver to have faster slope when ana_tx_drv_accdrv_pol_sel_* is set to high, while higher value makes Tx driver to have slower slope when ana_tx_drv_accdrv_pol_sel_* is set to low.

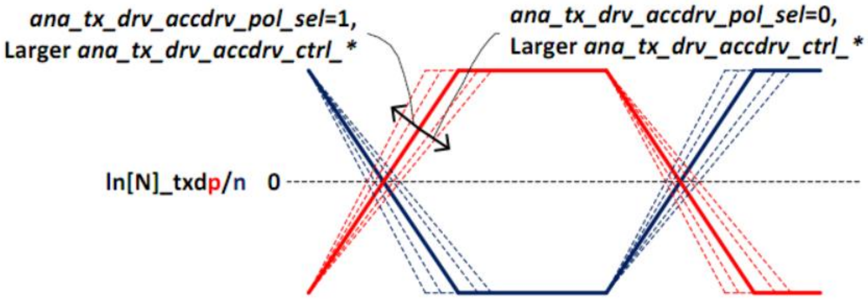

Fig. 14-8 TX Slew-Rate Control

Table 14-6 SFR Setting for Slew Rate Level Control

Name	Address	Code	Description
accdrv_en ln0/1/2/3_ana_tx_drv_accdrv_en	0x081C 0x101C 0x181C 0x201C Bit[1]	0x0	TX AC-coupled driver enable for slew rate control Disable
		0x1	TX AC-coupled driver enable for slew rate control Enable
accdrv_pol_sel ln0/1/2/3_ana_tx_drv_accdrv_pol_sel	0x081C 0x101C 0x181C 0x201C Bit[0]	0x1	Faster slew rate
		0x0	Slower slew rate
drv_accdrv_ctrl ln0/1/2/3_ana_tx_ drv_accdrv_ctrl	0x0820 0x1020 0x1820 0x2020 Bit[5:3]	0x7	TX AC-coupled driver Max Strength
		0x0	TX AC-coupled driver Min Strength

Chapter 15 SATA Host

15.1 Overview

SATA Host implements the Serial Advanced Technology Attachment (SATA) storage interface for physical storage devices.
SATA Host supports the following features:

- Include 3 ports, and each port can connect up to 5 devices using PM switching
- SATA 1.5Gb/s, SATA 3.0Gb/s, SATA 6.0Gb/s speeds
- eSATA
- Compliant with Serial ATA 3.3 specifications
- Compliant with AHCI Revision 1.3.1
- OOB signaling detection and generation
- Digital support of Mechanical presence switch and cold presence detect
- Activity LED support
- Digital support of device hot-plugging
- Output port to indicate speed that is negotiated after COMRESET for power optimization
- Memory Data Protection (ECC) and Error Correction (ECC)
- Memory Data Protection Diagnostic Error Injection
- SATA 1.5Gb/s, SATA 3.0Gb/s, and SATA 6.0Gb/s speed negotiation
- Asynchronous signal recovery, including retry polling
- Power management features including automatic partial-to-slumber transition
- BIST loopback modes
- Hardware-assisted Native Command Queuing for up to 32 entries
- Port Multiplier with FIS-based switching
- Disabling RX and TX Data clocks during power down modes
- Any sector sizes
- AXI interface used for configuration only support single
- AXI interface used to fetch data from memory

15.2 Block Diagram

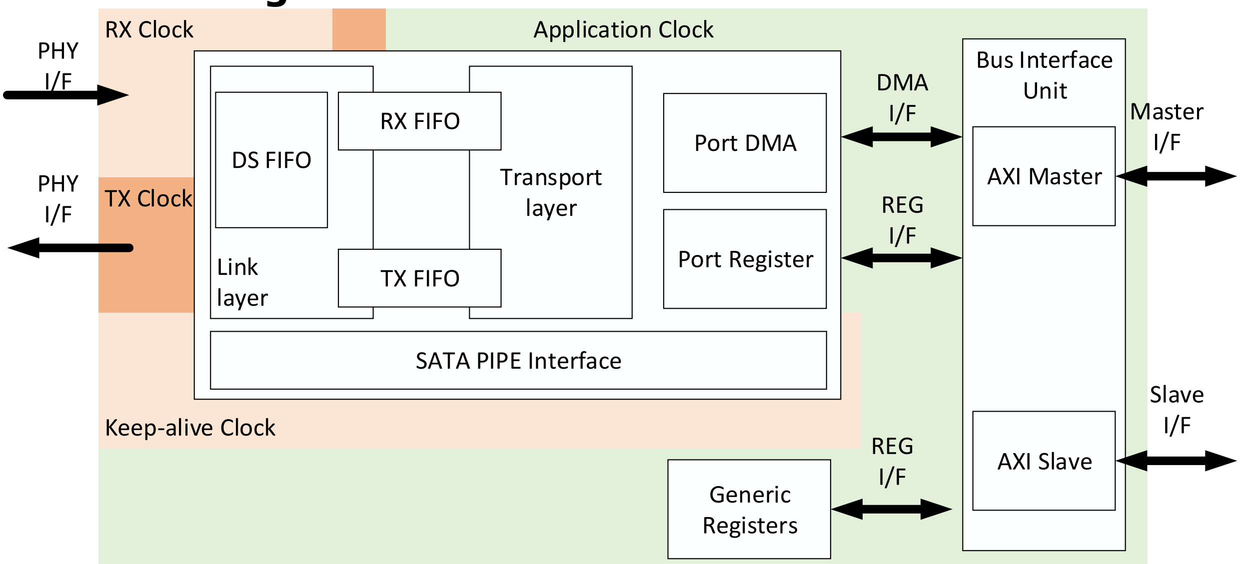

Fig. 15-1 SATA host Architecture

15.3 Function Description

15.3.1 Bus Interface Unit (BIU)

The Bus Interface Unit provides two interfaces:
AXI Master - This interface enables the SATA AHCI DMA engine to read and write to an AXI slave connected to AXI BIU.
AXI Slave - This interface enables an AXI master to read and write through the AXI BIU to the SATA AHCI registers.

15.3.2 Generic Registers (GCSR)

This module implements all global registers and provides the following functions:
- Generic configuration and control
- Global interrupt support
- BIST operation

15.3.3 Port Registers (PCSR)

The port registers module implements all Port-specific registers:
- Command list and FIS Based address
- Interrupt status/ enable
- Port command / status
- Task file data/signature /serial ATA
- DMA status/control

15.3.4 Port DMA(PDMA)

This module performs the following functions:
- Monitors commands posted by system software using the CI register
- Control data transfer between the Transport layer FIFOs and system memory using Physical Region Descriptor Table (PRDT)
- Transfers non-Data FISes received from the device to system memory using Received FIS Structure

Most of the communication between the PDMA and software is done using two system memory descriptors that are constructed by software prior to initiating the transfer: FIS descriptor, which contains FISes received from that device; and the command list, which contains a list of 1 to 32 commands available for Port to execute and the pointers for data transfers. Some additional communication is done by registers located in the GCSR and PCSR modules.
System memory structures are described in the SATA AHCI specification and are not repeated in this document.
The PDMA module operates in the application clock(aclk) domain.

15.3.5 Port Transport layer

The transport layer block provides FIS reception and transmission functions of the SATA transport layer. It operates in two clock domains: transmit and application. During reception, the transport layer receives a new FIS from the link layer through the RX FIFO, decodes the FIS type, and instructs the PDMA to route the FIS payload data to the appropriate location in system memory. During transmission, the transport layer instructs the PDMA to construct the appropriate FIS, and then passes it to the link layer through the TX FIFO. The transport layer block receives all the PHY/Link errors from the link layer, detects transport errors and passes them to the PCSR for setting the corresponding error bits.
The transport layer processes one FIS at time on the transmit side, meaning only one FIS is allowed in the TX FIFO at a time. On the receive side, RX FIFO can potentially contain more than one FIS at a time. For example, when the device transmits several DMA data FISes back-to-back with minimal delay, the RX FIFO still has the previous Data FIS while the next FIS is being received. The transport layer also contains a small internal eight-DWORD RX FIFO1 that is used for non-data FISes and FIS "End Status."

15.3.6 Port Link layer

This module optional OOB signaling, system initialization, speed negotiation, frame negotiation and arbitration, envelope framing/de-framing, CRC calculating, insertion and checking, flow control, frame acknowledgement and status reporting, data scrambling/de-scrambling for EMI reduction, repeat primitive data transmission and reception handling, ALIGN primitive detection, dropping and data alignment and power management.

15.4 Register Description

15.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

15.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
SATA_CAP	0x0000	W	0x6737FF80	This register indicates basic capabilities of the SATA Host to the software.
SATA_GHC	0x0004	W	0x80000000	This register controls various global actions of the SATA Host.
SATA_IS	0x0008	W	0x00000000	This register indicates which of the ports within the SATA Host have an interrupt pending and require service
SATA_PI	0x000C	W	0x00000000	This register indicates which ports are exposed by the SATA Host and are available for the software to use. It is loaded by the BIOS.
SATA_VS	0x0010	W	0x00010300	This register indicates the major and minor version of the AHCI specification that the SATA Host implementation supports. The SATA Host supports version 1.3.0
SATA_CCC_CTL	0x0014	W	0x00010108	This register is used to configure the command completion coalescing (CCC) feature for the SATA Host.
SATA_CCC_PORTS	0x0018	W	0x00000000	This register specifies the ports that are coalesced as part of the command completion coalescing (CCC) feature.
SATA_CAP2	0x0024	W	0x00000000	This register indicates capabilities of the SATA Host to the software.
SATA_BISTAFR	0x00A0	W	0x00000000	This register contains the pattern definition and data pattern fields of the received BIST Activate FIS.
SATA_BISTCR	0x00A4	W	0x00000000	This register is used in BIST initiator modes and for general PHY/Link control. It is loaded by the host software prior to sending BIST Activate FIS to the device.
SATA_BISTFCTR	0x00A8	W	0x00000000	This register contains the received BIST FIS count in the loopback initiator Far-end Retimed, Far-end Analog and Near-end Analog modes.
SATA_BISTSR	0x00AC	W	0x00FFFFFF	This register contains errors detected in the received BIST FIS in the loopback initiator Far-end Retimed, Far-end Analog and Near-end Analog modes. It is updated each time a new BIST FIS is received.

Name	Offset	Size	Reset Value	Description
SATA_BISTDECR	0x00B0	W	0xFFFFF000	This register contains the number of DWORD errors detected in the received BIST frame in the loopback initiator Far-end Retimed, Far-end Analog and Near-end Analog modes. It is updated each time a new BIST frame is received.
SATA_MEMEDFBSERRDATA	0x00B4	W	0x00000000	This is read-only per-port FBS RAM Data Ecc/Parity error location (address) and syndrome register.
SATA_MEMEDADDRERRINJ	0x00B8	W	0x00000000	This per-port register controls the ECC/Parity error injection functionality. Single-bit and double-bit pseudo-random errors can be injected in each of the three memory interfaces (RX FIFO RAM, TX FIFO RAM, FBS RAM). The register allows for just one memory element to be injected with an error or for continuous error injection in each memory element.
SATA_OOBR	0x00BC	W	0x00000000	This register controls the Link layer OOB detection counters. The default values, MIN_COMWAKE, MAX_COMWAKE, MIN_COMINIT and MAX_COMINIT are calculated based on the RXOOB_CLK_FREQ parameter and loaded on power-up or asynchronous SATA Host reset.
SATA_MEMEDTXFERRDATAU	0x00C0	W	0x00000000	When the TX FIFO RAM Data parity error syndrome width excess the range of the register MEMEDTXFERRDATA.mem_txf_err_synd, extra bits are logged in this register. If the upper syndrome bits are not enough for filling all the bits of this register, redundancy bits filled with 0.
SATA_DIAGNR3	0x00C4	W	0x00000000	DIAGNR3
SATA_TIMER1MS	0x00E0	W	0x00000000	This register is used to generate a 1-ms tick for the command completion coalescing (CCC) or DevSleep logic, based on the AMBA bus clock frequency.
SATA_MEMDPCR	0x00E4	W	0x00000000	This register is used to control the various options associated with the Data protection (ECC/Parity) and Address protection (Parity) functionality.

Name	Offset	Size	Reset Value	Description
SATA_TESTR	0x00F4	W	0x00000000	This register is used to put the SATA Host slave interface into a test mode and to select a Port for BIST operation.
SATA_VERSION	0x00F8	W	0x00000000	This 32-bit read-only register contains hard-coded hexadecimal SATA Host component version value.
SATA_IDR	0x00FC	W	0x00000000	This register contains a hard-coded hexadecimal SATA Host identification value, as determined by the configuration parameter External User Core ID Port.
SATA_P0CLB	0x0100	W	0x00000000	Port Command List Base Address Register
SATA_P0FB	0x0108	W	0x00000000	Port FIS Base Address Register
SATA_P0IS	0x0110	W	0x00000000	Port Interrupt Status Register.
SATA_P0IE	0x0114	W	0x00000000	Port Interrupt Enable Register.
SATA_P0CMD	0x0118	W	0x00000000	Port Command Register. This register contains bits controlling various Port functions.
SATA_P0TFD	0x0120	W	0x00000000	Port Task File Data Register. This register contains Error and Status registers updated every time a new Register FIS, PIO Setup FIS, or Set Device Bits FIS is received from the device.
SATA_P0SIG	0x0124	W	0x00000000	Port Signature Register
SATA_P0SSTS	0x0128	W	0x00000000	Port Serial ATA Status (SStatus) Register. This 32-bit register conveys the current state of the interface and host. The Port updates it continuously and asynchronously. When the Port transmits a COMRESET to the device, this register is updated to its reset values (such as, Global reset, Port reset, or device disconnect ('PHY Ready' negation)).
SATA_P0SCTL	0x012C	W	0x00000000	Port Serial ATA Control Register. This 32-bit read-write register is used by the software to control SATA interface capabilities. Writes to this register result in an action being taken by the Port PHY interface. Reads from the register return the last value written to it. Reset on Global reset.
SATA_P0SERR	0x0130	W	0x00000000	Port Serial ATA Error Register. This 32-bit register represents all the detected interface errors accumulated since the last time it was cleared.

Name	Offset	Size	Reset Value	Description
SATA_P0SACT	0x0134	W	0x00000000	Port Serial ATA Active Register
SATA_P0CI	0x0138	W	0x00000000	Port Command Issue Register
SATA_P0SNTF	0x013C	W	0x00000000	Port Serial ATA Notification Register. This register is used to determine when asynchronous notification events have occurred for directly connected devices and devices connected to a Port Multiplier.
SATA_P0FBS	0x0140	W	0x00000000	Port FIS-Based Switching Control Register. This register is used to control and obtain status for Port Multiplier FIS-based switching.
SATA_P0DMACR	0x0170	W	0x00000000	Port DMA Control Register. This register contains bits for controlling the Port DMA engine. The software can change the fields of this register only when P0CMD.ST=0. This register is reset to its default value on power-up (system reset) only.

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

15.4.3 Detail Registers Description

SATA_CAP

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31	RO	0x0	s64a Supports 64-bit addressable data structures by utilizing P0FBU and P0CLBU registers.
30	RO	0x1	sncq Supports SATA native command queuing by handing DMA Setup FIS natively.
29	RO	0x1	ssntf Supports P0SNTF (SNotification) register and its associated functionality.
28	RW	0x0	smps This bit is set by the system firmware/BIOS when platform supports mechanical presence for hot plug operation.
27	RW	0x0	sss This bit is set by the system firmware/BIOS to indicate platform support for staggered devices' spin-up. SATA Host supports this feature through the P0CMD.SUD bit functionality.
26	RO	0x1	salp Supports auto-generating Link Layer requests to the PARTIAL or SLUMBER power management states when there are no commands to process.
25	RO	0x1	sal Supports activity indication using signal P0_act_led.
24	RO	0x1	sclo Supports the P0CMA.CLO bit functionality for Port Multiplier devices' enumeration.

Bit	Attr	Reset Value	Description
23:20	RO	0x3	iss Supports SATA 1.5Gb/s, SATA 3Gb/s, SATA 6Gb/s interface speeds.
19	RO	0x0	snzo This feature is not supported.
18	RO	0x1	sam Supports AHCI mode only and does not supports legacy, task-file based register interface.
17	RO	0x1	spm Supports command-based switching Port Multiplier on any of its ports.
16	RO	0x1	fbss FIS-Based Switching supported.
15	RO	0x1	pmd Supports multiple DRQ block data transfer for the PIO command protocol.
14	RO	0x1	ssc Supports transitions to the interface SLUMBER power management state.
13	RO	0x1	psc Supports transitions to the interface PARTIAL power management state.
12:8	RO	0x1f	ncs Supports 32 command slots per Port.
7	RO	0x1	cccs Command Completion Coalescing Supported
6	RO	0x0	ems SATA Host does not support enclosure management.
5	RO	0x0	sxs The options for this field are: 1'h0: Indicates that the SATA Host has no ports that have a signal only connector externally accessible; 1'h1: Indicates that the SATA Host has one or more ports that has a signal only connector (power is not part of that connector) that is externally accessible. When this bit is set to 1, the software can refer to the P0CMD.ESP bit to determine whether a specific Port has its signal connector externally accessible.
4:0	RO	0x00	np Indicating the numbers of ports supported by the SATA Host.

SATA_GHC

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31	RO	0x1	ae This bit is always set since SATA Host supports only AHCI mode as indicated by the CAP.SAM=1.
30:2	RO	0x00000000	reserved
1	RW	0x0	ie This global bit enables interrupts from the SATA Host. When cleared, all interrupt sources from all the ports are disabled. When set, interrupts are enabled and ant SATA Host interrupt event caused interrupt assertion.

Bit	Attr	Reset Value	Description
0	WO	0x0	hr When set by the software, this bit causes an internal Global reset of the SATA Host. All state machines that relate to data transfers and queuing return to and idle state, and all the ports are re-initialized by sending COMRESET when staggered spin-up is not supported. When staggered spin-up is supported, then the software must spin-up each port after this reset has complete.

SATA_IS

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x0	ips When set, this bit indicates that the corresponding Ports or Command Completion Coalescing logic has an interrupt pending. The software can use this information to determine which ports require service after an interrupt. The bits of this field are set by the ports that have interrupt events pending in the P0IS bits and enabled by the P0IE or CCC interrupt is generated. Set bits are cleared by the software writing 1 to all bits to clear.

SATA_PI

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	pi This register is bit significant. 1'h0: The Port is not available for the software to use; 1'h1: The corresponding Port is available for the software to use.

SATA_VS

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:16	RO	0x0001	mjr Indicates that the major AHCI version is 1.
15:0	RO	0x0300	mnr Indicates that the minor AHCI version is 30 or 31.

SATA_CCC_CTL

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:16	RO	0x0001	tv This field specifies the CCC time-out value in 1ms intervals. The software loads this value prior to enabling CCC.
15:8	RW	0x01	cc This field specifies the number of command completions that are necessary to cause a CCC interrupt. The value 8'h00 for this field disables CCC interrupts being generated based on the number of commands completed. In this case, CCC interrupts are only generated based on the timer.
7:3	RO	0x01	intr_int This field specifies the interrupt used by the ccc feature, using the number of ports configured for the core.
2:1	RO	0x0	reserved

Bit	Attr	Reset Value	Description
0	RW	0x0	en The options for this field are: 1'h0: CCC feature is disabled and no CCC interrupts are generated; 1'h1: CCC feature is enabled and CCC interrupts may be generated based on the time-out or command completion conditions.

SATA_CCC_PORTS

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	prt This field is bit significant. Each bit corresponds to a particular Port, where bit 0 corresponds to Port0.The options for this field are: 1'h0: The corresponding Port is not part of the CCC feature. 1'h1: The corresponding Port is part of the CCC feature. Bits set in this register must also have the corresponding bit set in the PI (Ports Implemented Register).

SATA_CAP2

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RO	0x0	deso SATA Host supports DevSleep entrance from any Link state (active, Partial, or Slumber).
4	RO	0x0	sadm SATA Host supports hardware assertion of the P0_phy_devslp output after the idle timer expires.
3	RO	0x0	sds SATA Host supports hardware assertion of the P0_phy_devslp output after the idle timer expires.
2	RO	0x0	apst Automatic Partial to Slumber Transitions
1	RO	0x0	nvmp SATA Host does not support NVMHCI.
0	RO	0x0	bph SATA Host does not support BOH.

SATA_BISTAFR

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:8	RO	0x00	ncp Least significant byte of the received BIST Activate FIS second DWORD (bits [7:0]). This value defines the required pattern for Far-end transmit only mode (BISTAFR.PD=0xC0 or 0xE0): 8'h4A: High frequency test pattern (HFTP); 8'h78: Mid frequency test pattern (MFTP); 8'h7E: Low frequency test pattern (LFTP); 8'h7F: Simultaneous switching outputs pattern (SSOP); 8'hAB: Low frequency spectral component pattern (LFSCP); 8'hB5: High transition density pattern (HTDP); 8'hF1: Low transition density pattern (LTDP). When none of these values is decoded, the Lone bit pattern (LBP) is transmitted by default.
7:0	RO	0x00	pd Indicates the pattern definition field of the received BIST Activate FIS - bits [23:16] of the first DWORD. It is used to put the SATA Host in one of the following BIST modes: 8'h08: Far-end Analog (when PHY supports this mode); 8'h10: Far-end Retimed; 8'hC0: Far-end Transmit only; 8'hE0: Far-end Transmit only with scrambler bypassed. All other values should not be used by the device, otherwise, the FIS is negatively acknowledged with R_ERRp. For Far-end Transmit only modes BISTAFR.NCP field contains the required data pattern.

SATA_BISTCR

Address: Operational Base + offset (0x00A4)

Bit	Attr	Reset Value	Description
31:26	RO	0x00	reserved
25	RO	0x0	old_phy_ready Old phy_ready
24	RO	0x0	late_phy_ready When set, this bit changes monitoring of phy_ready to be the "OR" of phy_ready or phy_rx_data_vld so that a "late arriving", or even "never asserting" phy_ready. This requires that phy_rx_data_vld does not become valid until after the PHY has locked onto post OOB incoming ALIGNs, and the ALIGNs are valid from the PHY. This will not work if phy_rx_data_vld is asserted during OOB data bursts. This behavior is intended for PHYs that assert phy_ready late, but will also work if phy_ready never asserts or is not present.
23:21	RO	0x0	reserved
20	WO	0x0	ferlb When set, this bit is used to put the SATA Host Link into Far-end Retimed mode, without the BIST Activate FIS, regardless whether the device is connected or disconnected (Link in NOCOMM state). This field is one-shot type and reads returns 0.
19	RO	0x0	reserved
18	WO	0x0	txo This bit is used to initiate transmission of one of the non-compliant patterns defined by the BISTCR.PATTERN value when the device is disconnected.

Bit	Attr	Reset Value	Description
17	WO	0x0	cntclr This bit clears BIST error count registers. This field is one-shot type and reads returns 0. 1'h1: Clear BISTFCTR, BISTSR, and BISTDECR registers.
16	WO	0x0	nearlb This bit places the Port PHY into Near-end Analog loopback mode. This field is one-shot type and reads returns 0. 1'h0: Near-end Analog loopback disabled; 1'h1: Near-end Analog loopback request. BISTCR.PATTERN field contains the appropriate pattern. This mode should be initiated either in the PARTIAL or SLUMBER power mode, or with the device disconnected from the Port PHY (Link NOCOMM state). BIST Activate FIS is not sent to the device in this mode.
15	RW	0x0	llb When set, masks out phy_sig_det from the OOB Detector in BIST Loopback Mode, and the only way to exit BIST Loopback mode is to clear the register bit (requires access to the Device AMBA register interface), then issue COMRESET or receive COMINIT as normal. Alternately, a power on reset will automatically clear the BIST Loopback Mode register bit.
14	RO	0x0	qphyinit When set, this bit enables quick PHY initialization feature. The Link does not require any ALIGNs to transition from OOB to normal operation.
13	RW	0x0	errlossen This bit is cleared until it is set via programming.
12	RW	0x0	sdfe This bit is cleared until it is set via programming. It is not affected by a Global reset or COMRESET.
11	RO	0x0	reserved

Bit	Attr	Reset Value	Description
10:8	RW	0x0	llc This field controls the Port Link Layer functions: scrambler, de-scrambler, and repeat primitive drop. Note the different meanings for normal and BIST modes of operation: Bit 8 - SCRAM The options for this field are: 1'h0: Scrambler disabled in normal mode, enabled in BIST mode; 1'h1: Scrambler enabled in normal mode, disabled in BIST mode. Bit 9 - DESCRAM The options for this field are: 1'h0: Descrambler disabled in normal mode, enabled in BIST mode; 1'h1: Descrambler enabled in normal mode, disabled in BIST mode. Bit 10 - RPD The options for this field are: 1'h0: Repeat primitive drop function disabled in normal mode, NA in BIST mode; 1'h1: Repeat primitive drop function enabled in normal mode, NA in BIST mode. The SCRAM bit is cleared (enabled) by the Port when the Port enters a responder far-end transmit BIST mode with scrambling enabled (BISTAFR.PD=0xC0). In normal mode, the functions scrambler, descrambler, or RPD can be changed only during Port reset (P0SCTL.DET=0x1)
7	RO	0x0	reserved
6	RW	0x0	erren This bit is used to allow or filter (disable) PHY internal errors outside the FIS boundary to set corresponding P0SERR bits. The options for this field are: 1'h0: Filter errors outside the FIS, allow errors inside the FIS; 1'h1: Allow errors outside or inside the FIS.
5	RW	0x0	flip This bit is used to change disparity of the current test pattern to the opposite every time its state is changed by the software.
4	RW	0x0	pv This bit is used to select either short or long version of the SSOP, HTDP, LTDP, LFSCP, COMP patterns. The options for this field are: 1'h0: Short pattern version; 1'h1: Long pattern version.

Bit	Attr	Reset Value	Description
3:0	RW	0x0	pattern This field defines one of the following SATA-compliant patterns for Far-end Retimed/Far-end Analog/Near-end Analog initiator modes, or non-compliant patterns for Transmit-only responder mode when initiated by the software writing to the BISTCR.TXO bit. The options for this field are: 4'h0: Simultaneous switching outputs pattern (SSOP); 4'h1: High transition density pattern (HTDP); 4'h2: Low transition density pattern (LTDP); 4'h3: Low frequency spectral component pattern (LFSCP); 4'h4: Composite pattern (COMP); 4'h5: Lone bit pattern (LBP); 4'h6: Mid frequency test pattern (MFTP); 4'h7: High frequency test pattern (HFTP); 4'h8: Low frequency test pattern (LFTP). All other values are reserved and should not be used. If the value is none of the listed previously, Composite pattern (COMP) is transmitted by default.

SATA_BISTFCTR

Address: Operational Base + offset (0x00A8)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	count Received BIST FIS Count

SATA_BISTSR

Address: Operational Base + offset (0x00AC)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RO	0xff	brsterr This field contains the burst error count. It is accumulated each time a burst error condition is detected: DWORD error is detected in the received frame and 1.5 seconds (27,000 frames) passed since the previous burst error was detected.
15:0	RO	0xffff	framerr This field contains the frame error count. It is accumulated (new value is added to the old value) each time a new BIST frame with a CRC error is received.

SATA_BISTDECR

Address: Operational Base + offset (0x00B0)

Bit	Attr	Reset Value	Description
31:0	RO	0xfffff000	dwerr This field contains the DWORD error count. It is accumulated (new value is added to the old value) each time a new BIST frame is received.

SATA_MEMEDFBSERRDATA

Address: Operational Base + offset (0x00B4)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	mem_fbs_err_synd This field logs the error syndrome of the RAM Data Ecc/Parity error, if the syndrome with excess the range of the filed MEMEDFBSERRDATA.mem_fbs_err_synd, extra bits is logged in another register MEMEDFBSERRDATAU.mem_fbs_err_synd_u.
11:0	RO	0x000	mem_fbs_err_addr This filed logs the error location (the address of which the RAM data Ecc/Parity error detected)

SATA_MEMEDADDRERRINJ

Address: Operational Base + offset (0x00B8)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17	RW	0x0	ued Indicates a single bit uncorrected, or multiple bit error was detected. Cleared by writing '1' to this field.
16	RW	0x0	ced Indicates a single bit error was corrected. Cleared by writing '1' to this field.
15:5	RO	0x000	reserved
4	RW	0x0	oneB_2B When MEM_DP_TYPE=1 (Parity), only single-bit error injection is allowed in Parity mode and hence the value programmed in this bit is 'don't care'.
3	RW	0x0	cont Selects 'one-shot' (0) or 'continuous' (1) errors
2:1	RW	0x0	mem_sel 2'h0: All three memory interfaces; 2'h1: RX FIFO Memory; 2'h2: TX FIFO Memory; 2'h3: FBS RAM.
0	RW	0x0	err_inj_valid The values in the rest of the fields of this register are valid only when this bit is set to 1.

SATA_OOBR

Address: Operational Base + offset (0x00BC)

Bit	Attr	Reset Value	Description
31	RW	0x0	we The options for this field are: 1'h0: OOBR bits [30:0] are read-only; 1'h1: OOBR bits [30:0] can be written. This bit is cleared when COMRESET is detected.
30:24	RW	0x00	cwMin This field is RW when WE=1 and RO when WE=0.
23:16	RW	0x00	cwMax This field is RW when WE=1 and RO when WE=0.
15:8	RW	0x00	ciMin This field is RW when WE=1 and RO when WE=0.
7:0	RW	0x00	ciMax This field is RW when WE=1 and RO when WE=0.

SATA_MEMEDTXFERRDATAU

Address: Operational Base + offset (0x00C0)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	mem_txf_err_synd_u When the TX FIFO RAM Data parity error syndrome width excess the range of the register MEMEDTXFERRDATA.mem_tx_err_synd, extra bits is logged in this field.

SATA_DIAGNR3
Address: Operational Base + offset (0x00C4)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	fbcsw_cnt FIS-based context switching counter

SATA_TIMER1MS
Address: Operational Base + offset (0x00E0)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:0	RW	0x00000	timv This field contains the following value for the internal timer to generate 1-ms tick: Famba*1000, where Famba = AMBA clock frequency in MHz. The options for this field are: RW when CCC_CTL.EN=0 and CCC_SUPPORT = Include RO when CCC_CTL.EN=1 and CCC_SUPPORT = Include RW when CCC_SUPPORT=Exclude and DEVSLP_SUPPORT=Include

SATA_MEMDPCR
Address: Operational Base + offset (0x00E4)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9	RO	0x0	mem_par_even This value is derived from the MEM_PAR_EVEN parameter. The options for this field are as follows: 1'h0: Generate odd type of parity for data (if parity type protection selected) and address; 1'h1: Generate even type of parity for data (if parity type protection selected) and address.
8	RW	0x0	mem_err_inj_loc The options for this field are as follows: 1'h0: Inject error on data bits; 1'h1: Inject error on data check bits.
7	RW	0x0	mem_ed_log_clr_en 1'h0: All error detection and correction logging registers are cleared by Global or COMRESET. 1'h1: All error detection and correction logging registers are cleared only when MEMDPCR.EM_ED_LOG_CLR is set.
6	WO	0x0	mem_ed_log_clr This field clears all error detection and correction logging registers when written. This bit clears itself one cycle after written.
5	RW	0x0	mem_ed_log_dis This field disables error detection and correction logging when set.
4	RW	0x0	mem_ed_ce_en This field enables correctable error detection interrupt (INFS). (For diagnostic purposes only)

Bit	Attr	Reset Value	Description
3	RW	0x0	mem_ed_pdmaf_dis This field disables PDMA from entering a fatal error state when an incorrect error is detected. (For diagnostic purposes only)
2	RW	0x0	mem_ed_ifs_dis This field disables setting the IFS interrupt register bit (interface fatal error status interrupt) when an incorrect error is detected when MEM_DP_TYPE selects ECC, or a Parity error is detected when MEM_DP_TYPE selects Parity.
1	RW	0x0	mem_ec_dis When set, disables the single error correcting features everywhere, and all errors are reported as incorrect. This field has no effect when MEM_DP_TYPE = Parity or when MEM_DP_EN = 0.
0	RW	0x0	mem_ed_dis All ECC/Parity error detection, correction, interrupt generation and Fatal error state transitions are disabled when this bit is set to 1. This field has no effect when the hardware parameter MEM_DP_EN = 0.

SATA_TESTR

Address: Operational Base + offset (0x00F4)

Bit	Attr	Reset Value	Description

SATA_P0CLB

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:10	RW	0x000000	clb Indicates the 32-bit base physical address for the command list for this Port. This base is used when fetching commands to execute. The structure pointed to by this address range is 1 KB in length. This address must be 1-KB-aligned as indicated by bits [9:0] being read only.
9:0	RO	0x000	reserved

SATA_P0FB

Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	fb Indicates the 32-bit base physical address for received FISes. The structure pointed to by this address range is 256 bytes in length. This address must be 256byte-aligned as indicated by bits [7:0] being read only.
7:0	RO	0x00	reserved

SATA_P0IS

Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31	RW	0x0	cpds This bit is set when the P0_cp_det input changes its state due to the insertion or removal of the device. This bit is only valid when the Port supports cold presence detect as indicated by the P0CMD.CPD set to 1.
30	RW	0x0	tfes This bit is set whenever the P0TFD.STS register is updated by the device and the error bit [0] is set.
29	RW	0x0	hbfs This bit is set when SATA Host AMBA Master detects an ERROR response from the slave. Port DMA transitions to a fatal state until the software clears P0CMD.ST bit or resets the interface by way of Port or Global reset.
28	RW	0x0	hbds This bit is always cleared to 0.
27	RW	0x0	ifs This bit is set when any of the following conditions are detected: SYNC escape is received from the device during non-Data or Data FIS transmission or reception (P0SERR.DIAG_S and ERR_P are set); One or more of the following errors are detected during Data FIS transfer: Protocol (P0SERR.ERR_P) CRC (P0SERR.DIAG_C) Handshake (P0SERR.DIAG_H) PHY Not Ready (P0SERR.ERR_C) Unknown FIS is received with good CRC, but the length exceeds 64 bytes; PRD table byte count is zero; DMA Setup FIS is received with a TAG corresponding to inactive (P0SACT bit is cleared) command slot; RAM address protection error detected (when hardware configuration parameter MEM_AP_SUPPORT is set to Include, and the MEM_AP_ERRFB_EN is set to Include, and the MEMDPCR.MEM_ADDR_ED_IFS_DIS register bit is set to 0); and/or Uncorrected error detected (when hardware configuration parameter MEM_DP_SUPPORT is set to Include, and the MEMDPCR.MEM_ED_IFS_DIS register bit is set to 0). Port DMA transitions to a fatal state until the software clears PCMD.ST bit or resets the interface by way of Port or Global reset.

Bit	Attr	Reset Value	Description
26	RW	0x0	infs This bit is set when any of the following conditions are detected: One or more of the following errors are detected during non-data FIS transfer: Protocol (P0SERR.ERR_P) CRC (P0SERR.DIAG_C) Handshake (P0SERR.DIAG_H) PHY Not Ready (P0SERR.ERR_C) Command list underflow during read operation (such as, DMA read) when the software builds command table that has more total bytes than the transaction given to the device Corrected error detected (when hardware configuration parameter MEM_DP_SUPPORT is set to Include, MEM_DP_TYPE is set to ECC, and the MEMDPCR.MEM_ED_CE_EN register bit is set to 1) In both cases Port operation continues normally. When error is detected during non-data FIS transmission, this FIS is retransmitted continuously until it succeeds, or until the software times out and resets the interface.
25	RO	0x0	reserved
24	RW	0x0	ofs This bit is set when command list overflow is detected during read or write operation when the software builds command table that has fever total bytes than the transaction given to the device. Port DMA transitions to a fatal state until the software clears P0CMD.ST bit or resets the interface by way of Port or Global reset.
23	RW	0x0	ipms Indicates that the HBA received a FIS from a device whose Port Multiplier field did not match what was expected. This bit may be set during enumeration of devices on a Port Multiplier due to the normal Port Multiplier enumeration process. The software must use the IPMS bit only after enumeration is complete on the Port Multiplier.
22	RW	0x0	prcs This bit reflects the state of the P0SERR.DIAG_N bit. When set to 1, indicates the internal P0_phy_ready signal changed state. To clear this bit, the software must clear the P0SERR.DIAG_N bit to 0.
21:8	RO	0x0000	reserved
7	RW	0x0	dmps This bit is set when the P0_mp_switch input changes its state as a result of a mechanical switch attached to this Port opening or closing. This bit is valid only when both CAP.SMPS and P0CMD.MPSP are set.
6	RO	0x0	pcs This bit reflects the state of the P0SERR.DIAG_X bit: 1'h0: No change in Current Connect Status; 1'h1: Change in Current Connect Status. This bit is cleared only when P0SERR.DIAG_X is cleared.
5	RW	0x0	dps A PRD with the I bit set has transferred all of its data.

Bit	Attr	Reset Value	Description
4	RO	0x0	ufs When set to 1, indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by the software clearing the P0SERR.DIAG_F bit to 0.
3	RW	0x0	sdbs A Set Device Bits FIS has been received with the 'I' bit set and has been copied into system memory.
2	RW	0x0	dss A DMA Setup FIS has been received with the 'I' bit set and has been copied into system memory.
1	RW	0x0	pss A PIO Setup FIS has been received with the 'I' bit set, it has been copied into system memory, and the data related to that FIS has been transferred.
0	RW	0x0	dhrs A Device-to-Host Register FIS has been received with the 'I' bit set, and has been copied into system memory.

SATA_P0CMD
Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	icc This field is used to control power management states of the interface. When the Link layer is currently in the L_IDLE state or L_NoCommPower state, writes to this field cause the Port to initiate a transition to the interface power management state requested. When the Link layer is not currently in the L_IDLE state or L_NoCommPower, writes to this field have no effect. 4'h1: Active. This causes the Port to request a transition of the interface into the active state; 4'h2: Partial. This causes the Port to request a transition of the interface to the Partial state. The SATA device can reject the request and the interface remains in its current state; 4'h6: Slumber. This causes the Port to request a transition of the interface to the Slumber state. The SATA device can reject the request and the interface remains in its current state; Else: Reserved.

Bit	Attr	Reset Value	Description
27	RW	0x0	asp The options for this field are: When set to 1, and P0CMD.ALPE=1, the Port aggressively enters the SLUMBER state when one of the following conditions is true: The Port clears the P0CI and the P0SACT register is cleared. The Port clears the P0SACT register and P0CI is cleared. When cleared to 0, and P0CMD.ALPE=1, the Port aggressively enters the PARTIAL state when one of the following conditions is true: The Port clears the P0CI register and the P0SACT register is cleared. The Port clears the P0SACT register and P0CI is cleared.
26	RW	0x0	alpe When set to 1, the Port aggressively enters a lower link power state (PARTIAL or SLUMBER) based on the setting of the P0CMD.ASP bit. When cleared to 0, aggressive power management state transition is disabled.
25	RW	0x0	dlae When set to 1, P0CMD.ATAPI=1, and commands are active, the Port asserts P0_act_led output.
24	RW	0x0	atapi This bit is used by the Port to control whether to assert P0_act_led output when commands are active. The options for this field are: 1'h0: Non-ATAPI device; 1'h1: ATAPI device.
23	RW	0x0	apste When this bit is set and the SATA Host Link layer negotiates Partial power management state with the device, it transitions into the Slumber state directly, regardless whether it was host software-, Port (aggressive)-, or device-initiated.
22	RW	0x0	fbscp When set to 1, indicates that this Port supports Port Multiplier FIS-based switching. When cleared to 0, indicates that this Port does not support FIS-based switching.
21	RW	0x0	esp When set to 1, indicates that this Port's signal only connector is externally accessible. When set to 1, CAP.SXS is also set to 1. When cleared to 0, indicates that this Port's signal only connector is not externally accessible.
20	RW	0x0	cpd The options for this field are: 1'h0: Platform does not support cold presence detection on this Port; 1'h1: Platform supports cold presence detection on this Port. When this bit is set to 1, P0CMD.HPCP must also be set to 1.
19	RW	0x0	mpsp To enable the SATA Host mechanical presence detection feature. The options for this field are: 1'h0: Indicates the platform does not support a mechanical presence switch attached to this Port. When this bit is set to 1, P0CMD.HPCP should also be set to 1; 1'h1: Indicates the platform supports a mechanical presence switch attached to this Port.

Bit	Attr	Reset Value	Description
18	RW	0x0	hpcp The options for this field are: 1'h0: Indicates that this Port's signal and power connectors are not externally accessible; 1'h1: Indicates that this Port's signal and power connectors are externally accessible via a joint signal-power connector for blind mate device hot plug.
17	RO	0x0	pma The software is responsible for detecting whether a Port Multiplier is present; the SATA Host Port does not auto-detect the presence of a Port Multiplier. The options for this field are: 1'h0: A Port Multiplier is not attached to this Port; 1'h1: A Port Multiplier is attached to this Port.
16	RO	0x0	cps This bit reports whether a device is currently detected on this Port as indicated by the P0_cp_det input state. The options for this field are: 1'h0: No device attached to this Port; 1'h1: Device is attached to this Port.
15	RO	0x0	cr When this bit is set to '1', the command list DMA engine for this Port is running.
14	RO	0x0	fr When set to '1', the FIS Receive DMA engine for the Port is running.
13	RO	0x0	mpss The software must use this bit only when both CAP.SMPS and P0CMD.MPSP are set. This bit reports the state of a mechanical presence switch attached to this Port as indicated by the P0_mp_switch input state. The options for this field are: 1'h0: Switch is closed; 1'h1: Switch is open. When CAP.SMPS=0 then this bit is cleared to 0.
12:8	RW	0x00	ccs This field is set to the command slot value of the command that is currently being issued by the Port. When P0CMD.ST transitions from 1 to 0, this field is cleared again to 5'h0. After P0CMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is P0CMD.CCS+1.
7:5	RO	0x0	reserved

Bit	Attr	Reset Value	Description
4	RW	0x0	fre When set to 1, the Port may post received FISes into the FIS receive area pointed to by P0FB. When cleared, received FISes are not accepted by the Port, except for the first D2H register FIS after the initialization sequence, and no FISes are posted to the FIS receive area. The software must not set this bit until P0FB has been programmed with a valid pointer to the FIS receive area. When the software wishes to move the base, this bit must first be cleared, and the software must wait for the P0CMD.FR bit to be cleared.
3	RW	0x0	clo Setting this bit to 1 cause P0TFD.STS.BSY and P0TFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the P0TFD.STS register. This bit is cleared to 0 when P0TFD.STS.BSY and P0TFD.STS.DRQ have been cleared to 0. A write to this register with a value of '0' has no effect. This bit should only be set to 1 immediately prior to setting P0CMD.ST bit to 1 from a previous value of 0. Setting this bit to 1 at any other time is not supported and results in indeterminate behaviors.
2	RW	0x0	pod This bit is read/write when cold presence detection is supported on this Port as indicated by P0CMD.CPD=1. This bit is read-only 1 when cold presence detection is not supported and P0CMD.CPD=0. When set, the Port asserts the P0_cp_pod output pin so that it may be used to provide power to a cold-presence detectable Port.
1	RW	0x0	sud This bit is read/write when staggered spin-up is supported as indicated by the CAP.SSS=1. This bit is read-only 1 when staggered spin-up is not supported and CAP.SSS=0. On an edge detect from 0 to 1, the Port starts a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface.
0	RW	0x0	st When set to 1, the Port processes the command list. When cleared, the Port does not process the command list. Whenever this bit is changed from a 0 to a 1, the Port starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the P0CI register is cleared by the Port upon transition into an idle state.

SATA_P0TFD

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RO	0x00	err This field contains the latest copy of the task file error register.

Bit	Attr	Reset Value	Description
7:0	RO	0x00	sts This field contains the latest copy of the task file status register. The bits that affect SATA Host operation are: Bit [7] BSY: Indicates the interface is busy; Bits [6:4] cs: Command specific; Bit [3] DRQ: Indicates a data transfer is requested; Bits [2:1] cs: Command specific; Bit [0] ERR: Indicates an error during the transfer.

SATA_P0SIG

Address: Operational Base + offset (0x0124)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	sig This field contains the signature received from a device on the first D2H Register FIS. The bit order as follows: Bits [31:24]: LBA High (Cylinder High) Register; Bits [23:16]: LBA Mid (Cylinder Low) Register; Bits [15:8]: LBA Low (Sector Number) Register; Bits [7:0]: Sector Count Register. This field is updated once after a reset sequence (cause by asynchronous, port, or soft reset). Reset on Global or Port reset.

SATA_P0SSTS

Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	RO	0x0	ipm Indicates the current interface state. The options for this field are: 4'h0: Device not present or communication not established; 4'h1: Interface in Active state; 4'h2: Interface in Partial power management state; 4'h6: Interface in Slumber power management state; 4'h8: Interface in DevSleep power management state.
7:4	RO	0x0	spd Indicates the negotiated interface communication speed. The options for this field are: 4'h0: Device not present or communication not established; 4'h1: 1.5 Gb/s communication rate negotiated; 4'h2: 3.0 Gb/s communication rate negotiated; 4'h3: 6.0 Gb/s communication rate negotiated.
3:0	RO	0x0	det Indicates the interface device detection and PHY state. The options for this field are: 4'h0: No device detected and PHY communication not established; 4'h1: Device presence detected but PHY communication not established (COMINIT is detected); 4'h3: Device presence detected and PHY communication established ('PHY Ready' is detected); 4'h4: PHY in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved.

SATA_P0SCTL

Address: Operational Base + offset (0x012C)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9:8	RW	0x0	ipm This field indicates which power states the Port PHY interface is allowed to transition to. When an interface power management state is disabled, the Port does not initiate that state and any request from the device to enter that state is rejected via PMNAKp. The options for this field are: 2'h0: No interface power management state restrictions; 2'h1: Transitions to the Partial state disabled; 2'h2: Transitions to the Slumber state disabled; 2'h3: Transitions to both Partial and Slumber states disabled.
7:6	RO	0x0	reserved
5:4	RW	0x0	spd This field indicates the highest allowable speed of the Port PHY interface. The options for this field are: 2'h0: No speed negotiation restrictions 2'h1: Limit speed negotiation to SATA 1.5 Gb/s communication rate 2'h2: Limit speed negotiation to SATA 3.0 Gb/s communication rate 2'h3: Limit speed negotiation to a rate not greater than SATA 6.0 Gb/s communication rate.
3	RO	0x0	reserved
2:0	RW	0x0	det Controls the Port's device detection and interface initialization. The options for this field are: 3'h0: No device detection or initialization action requested 3'h1: Perform interface initialization sequence to establish communication. This results in the interface being reset and communication re initialized. The SATA Host asserts the corresponding P0_phy_reset(_n) output when DET=0x1. It negates P0_phy_reset(_n) and sends COMRESET OOB sequence when DET=0x0. 3'h4: Disable the Serial ATA interface and put the Port PHY in offline mode.

SATA_P0SERR

Address: Operational Base + offset (0x0130)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26	RW	0x0	diag_x This bit is set to 1 when PHY COMINIT signal is detected. This bit is reflected in the P0IS.PCS bit.
25	RW	0x0	diag_f This bit indicates that one or more FISes were received by the Transport layer with good CRC, but had a type field that was not recognized/known and the length was less than or equal to 64 bytes.
24	RW	0x0	diag_t This bit indicates that a Transport Layer protocol violation was detected since the last time this bit was cleared.

Bit	Attr	Reset Value	Description
23	RW	0x0	diag_s This bit indicates that one or more Link state machine error conditions was encountered. One of the conditions that cause this bit to be set is device doing SYNC escape during FIS transmission.
22	RW	0x0	diag_h This bit indicates that one or more R_ERRp was received in response to frame transmission. Such errors may be the result of a CRC error detected by the device, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame.
21	RW	0x0	diag_c This bit indicates that one or more CRC errors were detected by the Link layer during FIS reception.
20	RO	0x0	diag_d This bit is always cleared to 0 since it is not used by the AHCI specification.
19	RW	0x0	diag_b This bit indicates errors were detected by 10b/8b decoder.
18	RW	0x0	diag_w This bit is set when PHY COMWAKE signal is detected.
17	RW	0x0	diag_i This bit is set when the PHY detects some internal error as indicated by the assertion of the P0_phy_rx_err input.
16	RW	0x0	diag_n This bit indicates that the PHY Ready signal changed state. This bit is reflected in the P0IS.PRCS bit.
15:12	RO	0x0	reserved
11	RW	0x0	err_e This bit is set to 1 when one or more AMBA bus ERROR responses are detected on the master interface.
10	RW	0x0	err_p This bit is set to 1 when any of the following conditions are detected. Transport state transition error (DIAG_T) Link sequence error (DIAG_S) RX FIFO overflow Link bad end error (WTRM instead of EOF is received).
9	RW	0x0	err_c This bit is set to 1 when PHY Ready signal is negated due to the loss of communication with the device or problems with interface, but not after transition from active to Partial or Slumber power management state.
8	RW	0x0	err_t This bit is set when any of the following P0SERR register bits are set during Data FIS transfer: ERR_P (Protocol) DIAG_C (CRC) DIAG_H (Handshake) ERR_C ('PHY Ready' negation)
7:2	RO	0x00	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	err_m This bit is set to 1 when the PHY Ready condition is asserted under the following conditions: At any time except when there is a transition from power-down mode to Active state After interface initialization (after power on or COMRESET)
0	RW	0x0	err_i This bit is set when any of the following P0SERR register bits is set during non-Data FIS transfer: ERR_P (Protocol) DIAG_C (CRC) DIAG_H (Handshake)

SATA_P0SACT

Address: Operational Base + offset (0x0134)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ds This field is bit significant. Each bit corresponds to the TAG and command slot of a native queued command, where bit 0 corresponds to TAG 0 and command slot 0. Software sets this field prior to issuing a native queued command for a particular command slot. Prior to writing P0CI[TAG] to 1, the software sets DS[TAG] to 1 to indicate that a command with that TAG is outstanding. This field is cleared to 0 when: The software writes P0CMD.ST from a 1 to a 0. The device sends a Set Device Bits FIS to the Port. The Port clears bits in this field that are set in the SActive field of the Set Device Bits FIS. The Port clears only bits that correspond to native queued commands that have completed successfully. This field is not cleared by the following: Port reset (COMRESET). Software reset.

SATA_P0CI

Address: Operational Base + offset (0x0138)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	ci This field is bit significant. Each bit corresponds to a command slot, where bit 0 corresponds to command slot 0. This field is set by the software to indicate to the Port that a command has been built in system memory for a command slot and may be sent to the device. When the Port receives a FIS which clears the BSY, DRQ, and ERR bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field can only be set to 1 by the software when P0CMD.ST is set to 1.

SATA_P0SNTF

Address: Operational Base + offset (0x013C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	pmn This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the SATA Host Port with the Notification bit set: PM Port 0 sets bit 0. PM Port 1 sets bit 1. ... PM Port 15 sets bit 15. Individual bits are cleared by the software writing 1s to the corresponding bit positions. This field is reset on Global reset, but it is not reset by Port reset (COMRESET) or software reset.

SATA_P0FBS

Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:20	RO	0x000	reserved
19:16	RO	0x0	dwe This field is set by the SATA Host core to the value of the Port Multiplier port number of the device that experienced a fatal error condition. This field is only valid when P0FBS.SDE=1.
15:12	RW	0x0	ado This field is hard-wired to the FBS_PMPN_MAX value.
11:8	RW	0x0	dev Software sets this field to the Port Multiplier port value of the next command to issue. This field enables the SATA Host core to know the port the command to be issues to without fetching the command header. Software should not issue commands to multiple Port Multiplier ports on the same write of the P0CI register. This bit is reset on Global reset.
7:3	RO	0x00	reserved
2	RW	0x0	sde When this field is set to 1 and a fatal error condition has occurred, the SATA Host core believes the error is localized to one device such that software's first error recovery step should be to utilize the P0FBS.DEC functionality. When cleared to 0 and a fatal error condition has occurred, the error applies to the entire Port. To clear the error, software should clear P0CMD.ST to 0. This bit is cleared on P0FBS.DEC being set to 1 or on P0CMD.ST being cleared to 0. This bit is reset on Global reset.
1	RW	0x0	dec When set to 1 by software, the SATA Host core clears the device-specific error condition. It flushes any commands outstanding for the device that experienced the error, including clearing P0CI and P0SACT bits for that device to 0. The SATA Host core clears this bit to 0 when it completes error recovery actions. When software writes a 0 to this bit, there is no effect. Software should only set this bit to 1 if P0FBS.EN=1 and P0FBS.SDE=1. This bit is reset on Global reset.

Bit	Attr	Reset Value	Description
0	RW	0x0	en 1'h0: FIS-based switching is not being used (command-based switching is used instead). Software should only change the value of this bit when P0CMD.ST=0; 1'h1: A Port Multiplier is attached and the SATA Host uses FIS-based switching to communicate with it. This bit is reset on Global reset.

SATA_P0DMACR

Address: Operational Base + offset (0x0170)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:4	RW	0x0	rxts This field defines the Port DMA transaction size in FIFO words for receive (system bus write, device read) operation. The options for this field are: 4'h0: 1 4'h1: 2 4'h2: 4 4'h3: 8 4'h4: 16 4'h5: 32 4'h6: 64 4'h7: 128 4'h8: 256 4'h9: 512 4'hA: 1024 All other values are reserved and should not be used. This field is read-write when P0CMD.ST=0 and read-only when P0CMD.ST=1.
3:0	RW	0x0	txts This field defines the DMA transaction size in FIFO words for transmit (system bus read, device write) operation. The options for this field are: 4'h0: 1 4'h1: 2 4'h2: 4 4'h3: 8 4'h4: 16 4'h5: 32 4'h6: 64 4'h7: 128 4'h8: 256 4'h9: 512 4'hA: 1024 All other values are reserved and should not be used. This field is read-write when P0CMD.ST=0 and read-only when P0CMD.ST=1.

15.6 Application Notes

15.6.1 Data transfer

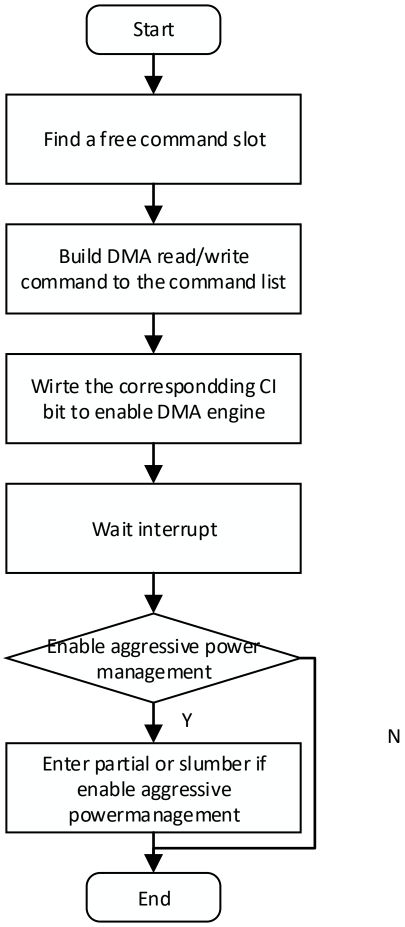

Fig. 1- 1 Data transfer flow

15.6.2 Port multiple support

When a port is connected to a Port Multiplier, software must first enumerate it by issuing software reset to Port 0xF (control Port) on the Port Multiplier. When the signature returned corresponds to a Port Multiplier, then a Port Multiplier is attached. When the signature returned corresponds to another device type, then a Port Multiplier is not attached.

The SATA host provides command list override feature via CMD.CLO to help software reliably enumerate the Port Multiplier:

- software ensures that CMD.ST bit is 0;
- software constructs the two register FISes required for a software reset in the command list, where the PM port field value in the register FIS is set to 0xF;
- software set CMD.CLO to 1 to force the BSY and DRQ bits in the TFD register to be cleared;
- software sets CMD.ST bit to 1 and set appropriate CI bits in order to begin execution of the software reset command.

15.6.3 Interrupt

The SATA host uses two-tiered interrupt structure.

First tier (GIS register)

The first tier is identified by the GIS and GHC registers. GHC.IE bit enables interrupts for the entire host: when it is cleared, interrupt output is not asserted regardless of any bits set in the GIS register. GHC.IE bit acts as a mask and does not affect the setting of any interrupt status bits.

Second tier (PIS registers)

The second tier is identified in each port through the PIS (status) and PIE (interrupt enable) register. The PIS register has various interrupt bits that can be individually enabled or disabled by setting the corresponding bit in the PIE. The status bit in the PIS is always set regardless of the setting of the corresponding PIE bit.

15.6.4 reset condition

System reset
System bus resets SATA host by asserting aresetn=0. It is usually initiated on power-up or during system bus failure. All components of the host are initialized, including ports, Generic registers, BIU.
Global reset
Software may globally reset host by setting GHC.HR to 1. When software sets the GHC.HR bit to 1, the host performs an internal reset action, then clears this bit to 0 when the reset is complete. A software writes of 0 to GHC.HR has no affect.
Port reset (COMRESET)
Software causes a Port reset by writing 1h to the SCTL.DET field to invoke COMRESET on the interface and start a re-establishment of the PHY Layer communication. Software should wait at least 1ms before clearing SCTL.DET to 0h. After clearing SCTL.DET to 0h, software should wait for communication to be re-established as indicated by 0 of SSTS.DET being set to 1. Then software should write all ones to SERR register to clear any bits that were set as part of the Port reset.
Software reset
Software builds two H2D register FISes in the command list. The first register FIS has the SRST bit set to 1 in the control field of the register FIS, the “C” bit is cleared to “0” in the register FIS, and the command table has the CH[R] (reset) and CH[C] (clear BSY ON R_OK) bits set to “1”. The CH[R] bit causes the Port to perform a SYNC escape when necessary to put the device into an idle condition before sending the software reset. The CH[C] bit needs to be set for the first register FIS to clear the BSY bit and proceed to issue the next register FIS since the device does not send a response to the first register FIS in a software reset sequence. The second register FIS has SRST=”0” in the control field of the register FIS, the “C” bit is cleared to “0” in the register FIS, and the command tables has the CH[R] and CH[C] bits cleared to “0”. When issuing a software reset sequence, there should not be other commands in the command list. Before issuing the software reset, software must clear CMD.ST, wait for the Port to be idle, and then re-set CMD.ST. TFD.STS.BSY and TFD.STS.DRQ must be cleared prior to issuing the reset. When TFD.STS.BSY or TFD.STS.DRQ is still set based on the failed command, then a Port reset should be attempted or command list override should be used.

15.6.5 Staggered spin-up

The CMD.SUD bit is used to manipulate the PHY behavior. SCTL.DET and CMD.SUD must be set correctly in order to avoid illegal combinations of the two values. Table 1-1 describes interaction between the CMD.SUD and SCTL.DET bits.

Table 15-1 CMD.SUD and SCTL.DET interaction

SCTL.DET	CMD.SUD	Mode	Behavior
0	0		Interface is in a reduced power state. When COMINIT is received then SERR.DIAG_X is set and no response is sent to the device COMWAVE is ignored. The application must place the Port into this state only when no device is detected as connected to this Port. In this mode, the Port forces the PHY into a low power state without requesting a SLUMBER transition on the link.
0	0->1		Port sends COMRESET, begins initialization sequence.
0	1		Normal operating state when the Port is performing data transfer.
1	0	Illegal	This combination is prohibited in hardware, i.e. CMD.SUD can’t be cleared when SCTL/DET=1, and SCTL.DET can’t be set to 1 when CMD.SUD=0.
1	1	Reset	Port continuously transmits COMRESET and does not listen for COMINIT. When COMINIT is received in this state, the SERR.DIAG_X bit is set.

SCTL.DET	CMD.SUD	Mode	Behavior
1->0	1	Initialize	Port stops sending COMRESET, being initialization sequence
4	N/A	Off	Port PHY is off.

Software must only clear CMD.SUD when it believes that no device is attached. In listen mode, the Port PHY enters a reduced power state, equivalent to the SLUMBER power management state. The Port PHY enters this state without negotiating a transition to SLUMBER on the link, as asking for a transition to SLUMBER when no device is attached fails, and therefore the PHY remains in a high power state. To avoid this software should ensure that SSTS.DET=0x0 indicating that no device is present before clearing CMD.SUD.

15.6.6 Activity LED

The CAP.SAL=1 indicates that the activity LED feature is enabled to software.
Act_led outputs is used to drive an external LED based upon activity of the Port:

- 1 - LED On
- 0 - LED Off

The port drives the LED active if:

- (CI!=0 or SACT!=0) and CMD.ATAPI = 0
- (CI!=0 or SACT!=0) and CMD.ATAPI = 1 and CMD.DLAE = 1

The Port drives the LED off when CI and SACT are both cleared to 0.

15.6.7 Asynchronous notification

The SATA host supports asynchronous notification feature as indicated by the CAP.SSNT=1. This feature allows an ATAPI device to send a signal to the host when media is inserted or removed and avoid polling the device for media changes. The signal sent to the host is Set Device Bits FIS with the "I" and "N" bits set to "1".
To use asynchronous notification, software should set the IS.SDBS bit to enable interrupt notification on a Set Device Bits FIS. When accesses to the ATAPI device are idle, software should place the device in a low power state. When the device has media change, it signals this to the host with a Set Device Bits FIS. In response to receiving a IS.SDBS interrupt on an idle Port, the software should interrogate the device to determine the cause of the interrupt.
The first DWORD of any FIS received by the host contains a 4-bit Port Multiplier field. The PM port field indicates which Port behind the Port Multiplier issued the FIS to the host. When a set device bits FIS is received by the host and "N" bit is set, the bit position in the SNTF register corresponding to the PM Port field is set. The host sets the IS.SDBS to "1" when the "I" bit is set in the set device bits FIS. This causes an interrupt to be generated when that interrupt is enabled.

15.6.8 BIST operation

1.6.8.1 Loopback responder

Software must ensure that the CMD.ST bit is set, the Port is in idle state, and there are no outstanding commands by checking CI and SACT registers are both cleared, TFD.STS register BSY, DRQ and ERR bits are all cleared.
The host enters one of the BIST loopback responder modes when a corresponding BIST Activate FIS is successfully received from the device and is supported by the host. SSTS.DET field return 4h when read. Since BIST registers' locations are shared between all the active ports, software must first select the Port for BIST operation by writing the Port number to the TESTR.PSEL field before accessing BISTAFR.
The following loopback responder modes are supported by the host:

- Far-end Retimed
  - The Port receives BIST activate FIS with pattern definition field=0x10 from the RX FIFO and stores it in the BIST AFR.PD field
  - All the data received from the device in the form of a SATA-compliant pattern is retimed in the Link Layer and transmitted back to the device.
  - Alternately, this mode can be initiated with device disconnected from the Port PHY

when software writes BISTCR.FERLB=1. After the device is connected to the host, the device must transmit the number of ALIGNs required for the PHY to sync.

- Far-end Analog
  - The Port receives BIST active FIS with pattern definition field =0x08 from the RX FIFO and stores it in the BISTAFR.PD field
  - The Port asserts phy_farafelb signal to the PHY to put it to the Far-end analog loopback mode. The PHY receives and retransmits the raw data without retiming
- Far-end Transmit only
  - The Port receives BIST activate FIS with pattern definition field = 0xC0(scrambling is enabled) or 0xE0 (scrambling is bypassed) from the RX FIFO and stores it in the BISTAFR.PD field. The second DWORD of the BIST activate FIS least significant byte is stored in the BISTAFR.NCP field.
  - The Port transmits corresponding a SATA non-compliant test pattern to the device based on the BISTAFR.NCP value:
    - 0xF1: Low transition density pattern (LTDP)
    - 0xB5: High transition density pattern (HTDP)
    - 0xAB: Low frequency spectral component pattern (LFSCP)
    - 0x7F: Simultaneous switching outputs pattern (SSOP)
    - 0x78: Mid frequency test pattern (MFTP)
    - 0x4A: High frequency test pattern (HFTP)
    - 0x7E: Low frequency test pattern (LFTP)

  If none of the previous pattern is decoded, the Lone bit pattern (LBP) is transmitted by default.
  - Alternately, this mode can be initiated with the device disconnected from the Port PHY when software writes a one to BISTCR.TXO bit. Host transmits non-compliant BIST pattern defined by the value in the BISTCR.PATTERN field.

Loopback responder BIST modes can be exited either when the device signals COMINIT OOB condition, or when the software initiates Port reset.

1.6.8.2 Loopback initiator

The software first selects the Port for BIST operation by writing the Port number to the TESTR.PSEL field, then the required pattern by writing to the BISTCR.PATTERN field.

The software builds a BIST FIS with the required mode in the commands list and sets CTBAz[B]. Once a BIST command is placed into the list, software is not allowed to build any more commands until it clears CMD.ST. After the Port successfully transmits this FIS, it enters this mode and generates/receives the compliant test pattern selected by the BISTCR.PATTERN field.

SSTS.DET return 4h when read. BISTCR and BISTFCTR registers are updated with error/FIS count information for each received BIST FIS.

The following BIST initiator modes can be requested by the software:

- Far-end Retimed
  - The host software writes the BISTCR.PATTERN field to select one of the SATA-defined compliant patterns:
    - 0x0: Simultaneous switching outputs pattern (SSOP)
    - 0x1: High transition density pattern (HTDP)
    - 0x2: Low transition density pattern (LTDP)
    - 0x3: Low frequency spectral component pattern (LFSCP)
    - 0x4: Composite pattern (COMP)
    - 0x5: Lone bit pattern (LBP)
    - 0x6: Mid frequency test pattern (MFTP)
    - 0x7: High frequency test pattern (HFTP)
    - 0x8: Low frequency test pattern (LFTP)
  - The software prepares BIST Activate FIS with bits [23:16] = 8’h10 of the first DWORD in the command list. The Port sends this BIST Activate FIS to the device.
  - After successful transmission of the BIST Activate FIS the Port generates the requested compliant pattern in the form of BIST frames continuously and checks for errors on the receive side.

- BISTCTR register is updated with received BIST frame count and BISTSR - with frame /burst error count. SERR register is updated with CRC, disparity and 10B8B errors for each frame. BISTFCTR, BISTSR, and BISTDECR registers can be cleared by writing 1 to the BISTCR.CNTCLR bit.
- To change the pattern, the software issues a Port Reset, write to the BISTCR.PATTERN field to select a new pattern and re-issues the command by setting the CI bit.

- Far-end Analog
  - The software prepares BIST Activate FIS with bits [23:16] = 8’h8 of the first DWORD in the command list. The Port sends this BIST Activate FIS to the device.
  - The operation proceeds as described in the Far-end retimed test above.

- Near-end Analog
  - This mode can be initiated either in the PARTIAL power management mode or with the device disconnected from the Port PHY. The software issues a PARTIAL power state request to the device via CMD.ICC field and sets the BISTCR.NEALB bit. The BISTCR.PATTERN field selects the required BIST pattern.
  - The Port asserts phy_nearfelb to the PHY. The PHY loops the data from its transmitter to its receiver and ignores any data coming from the device.

- Far-end Transmit only
  - The software prepares BIST Activate FIS in the command list with the second and third DWORDs containing the required pattern, and the first DWORD - with the Pattern definition value corresponding to the required mode - Bit 23 is set, bits 20,19,17 cleared and bits 22,21 and 18 are used to enable the following options:
    - Bit 22 is set - Bypass ALIGN
    - Bit 21 is set - Bypass scrambling
    - Bit 18 is set - primitive bit
  - The Port sends this BIST Activate FIS to the device.
  - After the device acknowledges the reception of this FIS with R_OKp, the Port disables the PHY receiver and transmitter.

Loopback initiator BIST modes can be terminated either by the device when it signals COMINIT OOB condition (except the near-end analog mode), or when the software initiates Port reset.

15.6.9 command completion coalescing

A command completion coalescing (CCC) feature is used to reduce the interrupt and command completion overhead in a heavily-loaded system. The host generates an interrupt to allow software to process completed commands when either of these conditions is true:

- A software-specified number of commands have completed
- A software-specified time-out has expired

This feature applies to all ports selected to be in the CCC set by software via the CCC_PORTS register.

CCC logic used specific register TIMERIMS to generate 1ms interval based on the application clock frequency. Software must load this register with the required value before enabling the CCC feature:

Fappclk*1000, where Fappclk = aclk frequency, in MHz.

Additional Command completion coalescing details and examples can be found in the AHCI specification.

Chapter 16 Multiple Protocol PHY Subsystem

16.1 Overview

The subsystem contains two types of PHY. One is dedicated for PCIe 3.0 protocol with aggregation and bifurcation feature. The other one is a combo of multiple protocol including the PCIe, SATA, USB and QSGMII.

16.1.1 Combo PIPE PHY Overview

The Combo PHY supports physical layer of multiple protocol including USB3.0 Super Speed (5GT/s), PCIe Gen1/Gen2(2.5GT/s and 5GT/s), SATA Gen1/Gen2/Gen3 (1.5GT/3GT/6GT) and QSGMII(1.25GT/5GT). QSGMII mode is not used in current chip.

The key features of the Combo PIPE PHY core include:

- Compatible with PCIe/USB3/SATA/QSGMII base Specification
- Fully compatible with PIPE 4.3 interface specification
- Data rate configurable to 1.25G/1.5G/2.5G/3G/5G/6G for different application
- Support 16-bit or 32-bit parallel interface when encode/decode enabled
- Support 20-bit parallel interface when encode/decode bypassed
- Support flexible reference clock frequency
- Support 100MHz differential reference clock input or output (optional with SSC) in PCIe Mode
- Support Spread-Spectrum clock (SSC) generation and receiving from -5000ppm to 0ppm
- Support programmable transmit amplitude and De-emphasis
- Support TX detect RX function in PCIE and USB3.0 Mode
- Support Beacon signal generation and detection in PCIE Mode
- Support Low Frequency Periodic Signaling (LFPS) generation and detection in USB3.0 Mode
- Support COMWAKE, COMINIT and COMRESET (OOB) generation and detection in SATA Mode
- Support L1 sub-state power management
- Support RX low latency mode in SATA operation mode
- Support Loopback BERT and Multiple Pattern BIST Mode

16.1.2 PCIe 3.0 PHY Overview

The PHY provides the following features:

- Standard PIPE 4 interface to upper layers of protocol stack (MAC layer and above)
- PCIe: 8b/10b (Gen 1/2) and 128b/130b (Gen3) encoding and decoding
- Translation of PIPE 4 power states (P0, P1, and so on) into the appropriate PHY controls, including any PHY-specific intermediate state sequencing
- Clock-rate compensation via SKP ordered sets and an elasticity buffer
- Each PCS lane can be independently configured to operate as follows:
  - PCIe (1.1, 2.1, and 3.0) modes
- PIPE4.3- or PIPE4.2-compliant PCIe 1.1, 2.1, or 3.0 controllers
  - Highly customizable physical medium attachment (PMA) configuration PCIe data rates: 2.5 Gbps (PCIe 1.1), 5 Gbps (PCIe 2.1), 8 Gbps (PCIe 3.0)
  - Single, dual and quad channel macros configurations lanes Extensive PMA debug capability through read/write and read-only registers in PCS
  - Register-based control of all PCS-to-PMA signals
  - Adaptive and configurable RX continuous time linear equalizer (CTLE) and decision feedback equalizer (DFE)
  - Programmable TX equalization
- PCIe 3.0 aggregation and bifurcation up to x4 PHY configuration
- Supports PCIe L1-substate power managements
- Built-in Self-Test (BIST) features for production; at-speed testing on any digital tester

- Advanced, built-in diagnostics including on-chip sampling scope
- Visibility and controllability of hard macro functions through programmable registers in the design:
  - Overrides on all ASIC side functional control inputs for easy debug
  - Access register space through a parallel interface
  - Access register space through a JTAG port
- Configurable PCS with extensive debug options:
  - Independent TX and RX control per lane
  - Configurable TX and RX power modes
  - Pseudo-random bit sequence (PRBS) generation and checker (PRBS31, PRBS23, PRBS16, PRBS15, PRBS11, PRBS9, PRBS7)
  - Programmable 10-bit pattern generation with error injection capability

16.2 Block Diagram

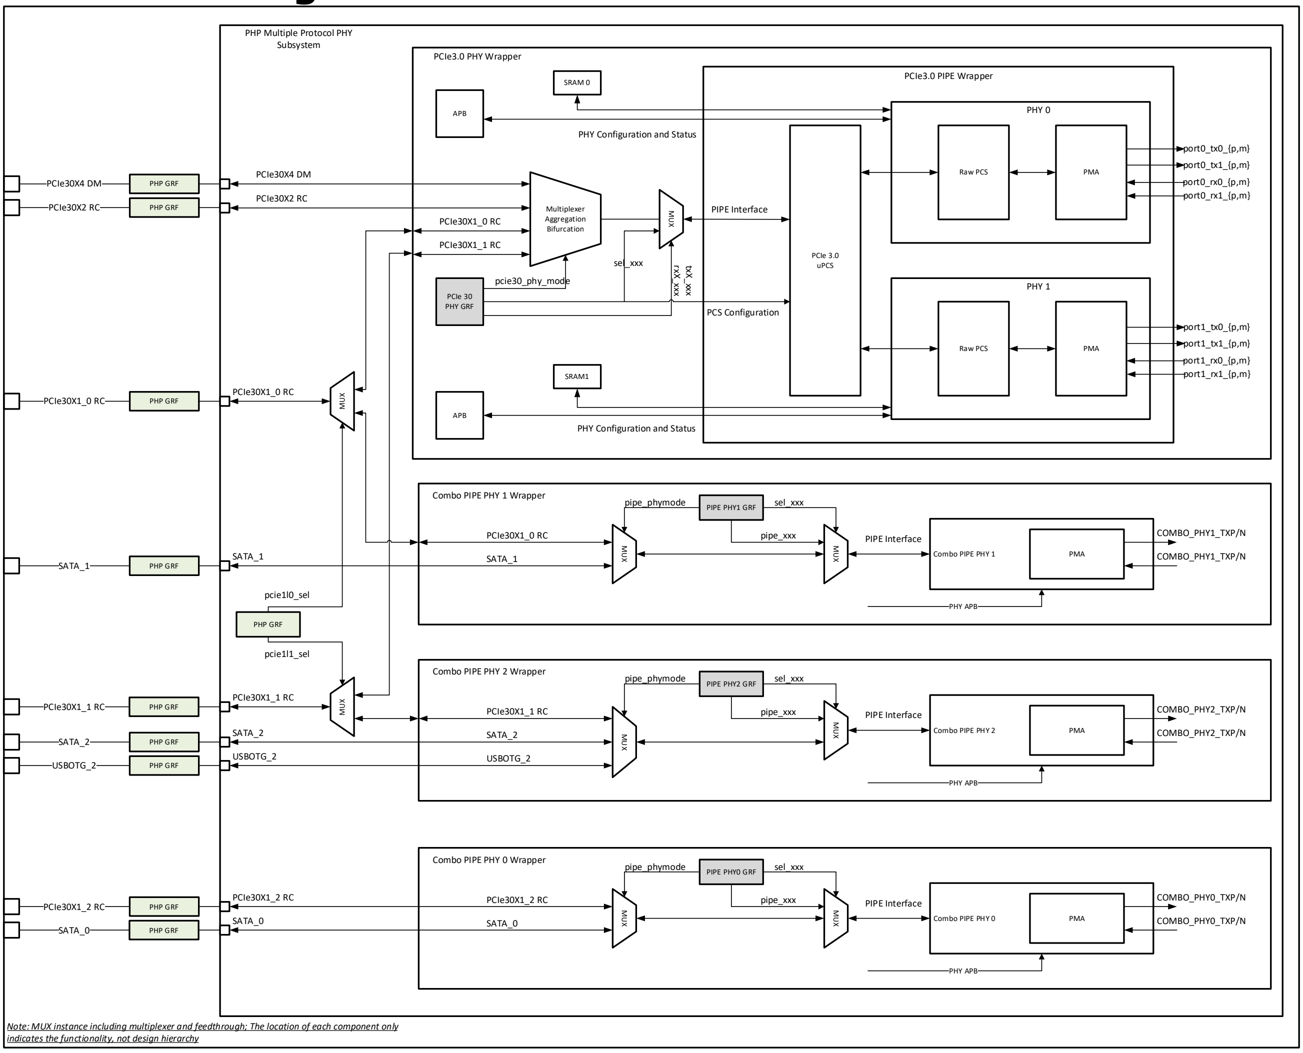

Fig. 16-1 Diagram of Multiple Protocol PHY Subsystem Architecture

There are three Combo protocol PHYs illustrated above. The pipe_phymode is used to select the target protocol controller. The PIPE PHYn GRF module is used to generate common control signals and override some PIPE interface signal in specific cases, PIPE interface bus is connected with the selected protocol controller by default. The PHY APB can config the PHY internal register to adjust the trims of CDR, PLL, etc. Please refer to PIPE PHY GRF and for detail description.

The PCIe 3.0 PHY is consist of two PHY Marco and interfacing with a X4 uPCS. PHY0 and PHY1 can be aggregated as one X4 Link, and both can be bifurcated into two X1 Link. Each PHY has individual PHY configuration and status space, the PCIe 30 PHY GRF is used to control the multiplexers and PCS configuration, it is also used override some PIPE interface signal in some specific scenarios. APB is in charge of accessing the internal control register and status of each PHY. Two external SRAM 0/1 are included for the purpose of updating the IP firmware, it can be updated by APB bus access. The aggregation and bifurcation of the PHYs are controlled by pcie30_phy_mode.

The multiplex function table is listed in section Subsystem Protocol Link Mapping.

16.2.1 Combo PHY Function Description

16.2.1.1 Block Diagram and Description

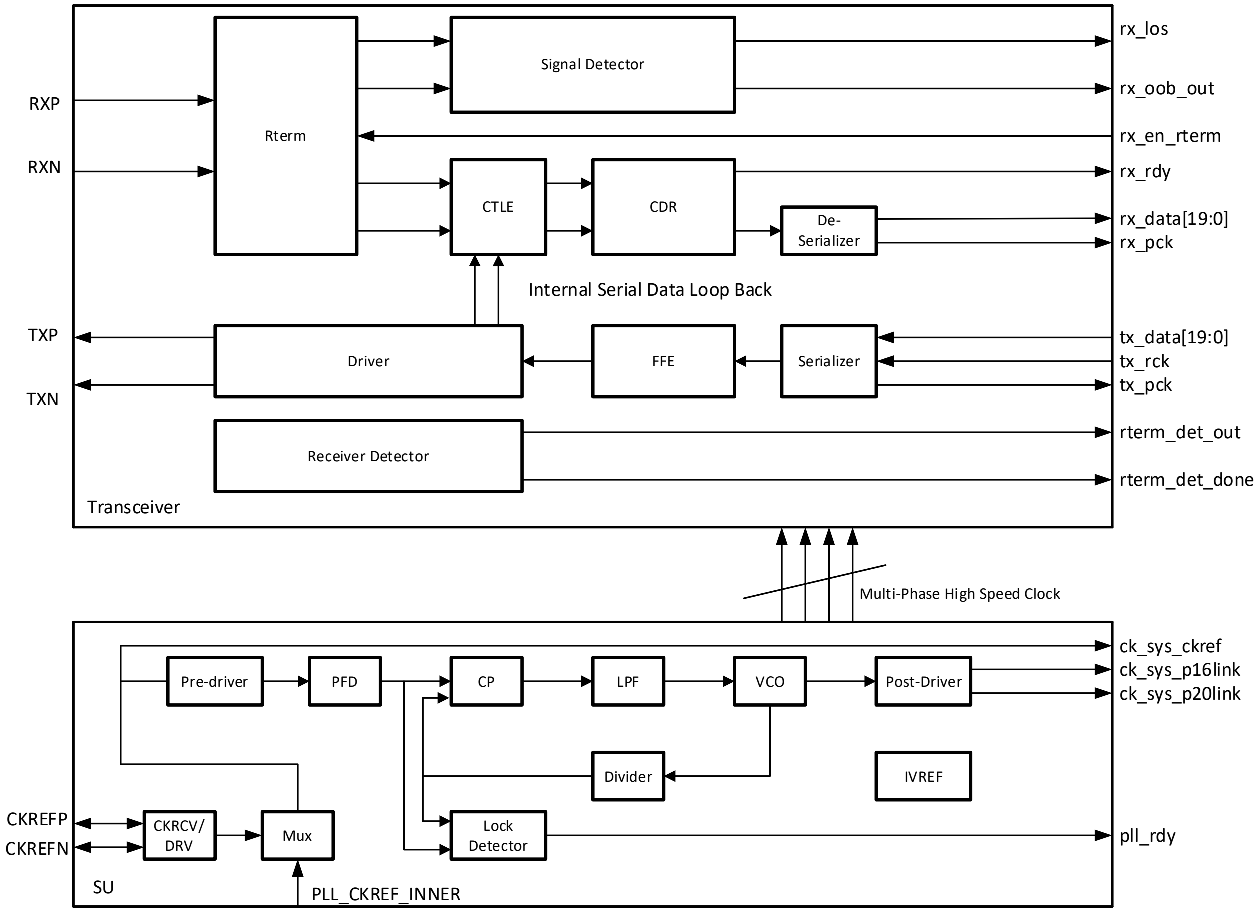

Fig. 16-2 PMA Block Diagram of Multi-PHY

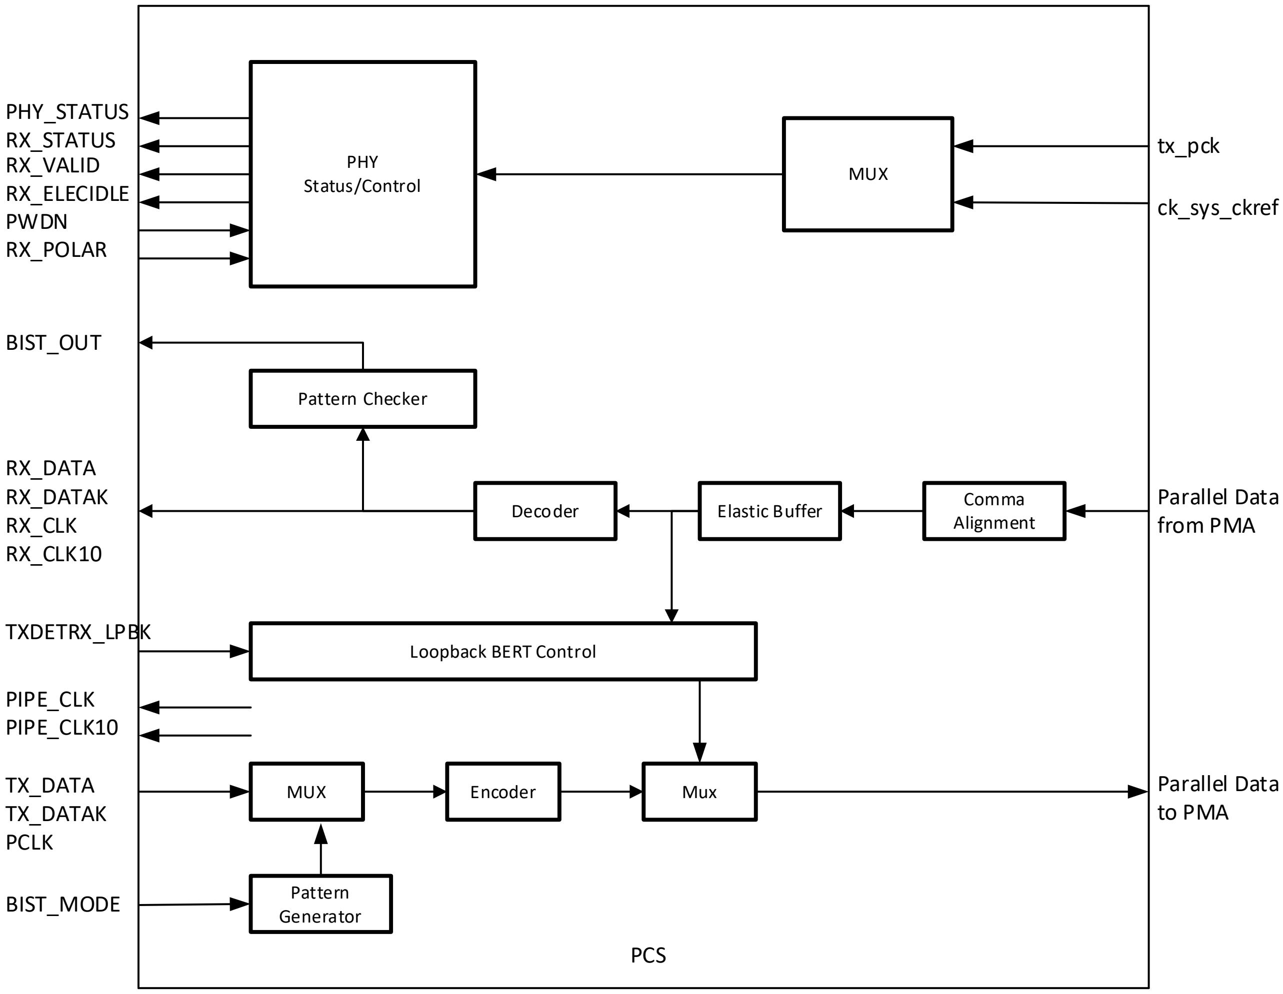

Fig. 16-3 PCS Block Diagram of Multi-PHY

Combo PIPE PHY includes two major blocks, PMA and PCS. PMA is an analog macro to perform serial to parallel and parallel to serial conversion. PMA includes three blocks, Transmitter, Receiver and SU(includes PLL, IVREF, etc.). PCS is a digital synthesis macro to perform PHY coding sub-layer function like 8bit/10bit code and decode, elastic buffer, comma alignment and BERT loopback, it also includes a register interface to access internal control registers with APB interface.

16.2.1.2 SHARED UNIT (SU)

PLL takes reference clock input from CKREFP/N and PLL_CKREF_INNER, to generate a high-speed clock for data transmission and clock data recovery. The high-speed clock generated by PLL could be SSC (spectrum spread clock) modulated if SSC mode is turned on. When SSC is enabled, the PHY is transmitting spread-spectrum serial data with frequency offset in 31.5KHz periodically.

IVREF includes a voltage and current reference generator, which comprises a Bandgap Reference and a Voltage Regulator. Reference voltage and current are generated for internal circuit usage. IVREF block is always on as long as IP power up, it will consume ~170uA static current all the time.

CKDRV is an input/output differential clock buffer, when it is used as input, it can receive a wide range differential reference clock. When used as output, CKDRV can drive a 100MHz differential clock for PCIE host application.

16.2.1.3 TRANSMITTER (TX)

The Serializer block converts parallel data from PHY PCS to high-speed serial data by using high speed clock generated by PLL. A feed forward equalizer (FFE) is implemented to compensate channel ISI.

Driver will convert the serial data to differential signal on TXP/TXM, also the driver will transmit Beacon Signal (PCIE2.0), OOB(SATA) or LFPS(USB3.0) signaling. The differential output amplitude and Deemphasis level can be programmed via setting PIPE3 control pins TX_SWING, TX_DEEMPH[2:0] and TX_MARGIN[2:0].

The receiver detector will be used to detect the far-end receiver present or not.

16.2.1.4 RECEIVER (RX)

The CTLE (Continuous Time Linear Equalizer) is used to compensate channel loss and cancel ISI of the input signals by boosting high frequency gain. The CTLE can be set to adaptive mode or manual setting mode.

The CDR (Clock and Data Recover) tracks input data stream and generate recovered clock for data de-serializer. De-Serializer converts incoming serial bit stream recovered by CDR into a synchronized parallel data bus and forward it to PHY PCS block.

The Signal Detector detects OOB/LFPS on the RX input pair.

16.2.1.5 PCS

PCS module is a pure digital synthesis module, it works as an interface between PMA and MAC, it accomplishes functions including comma alignment, 8bit/10bit code/decode, elastic buffer, power control and IP testing. This module also includes an APB interface for accessing PHY control registers. PCS is fully compatible with the PIPE3 interface of “PHY interface for PCI express and USB3.0 architecture by intel”.

16.2.2 PCIe 3.0 PHY Function Description

16.2.2.1 uPCS Transmit and Receive Datapath

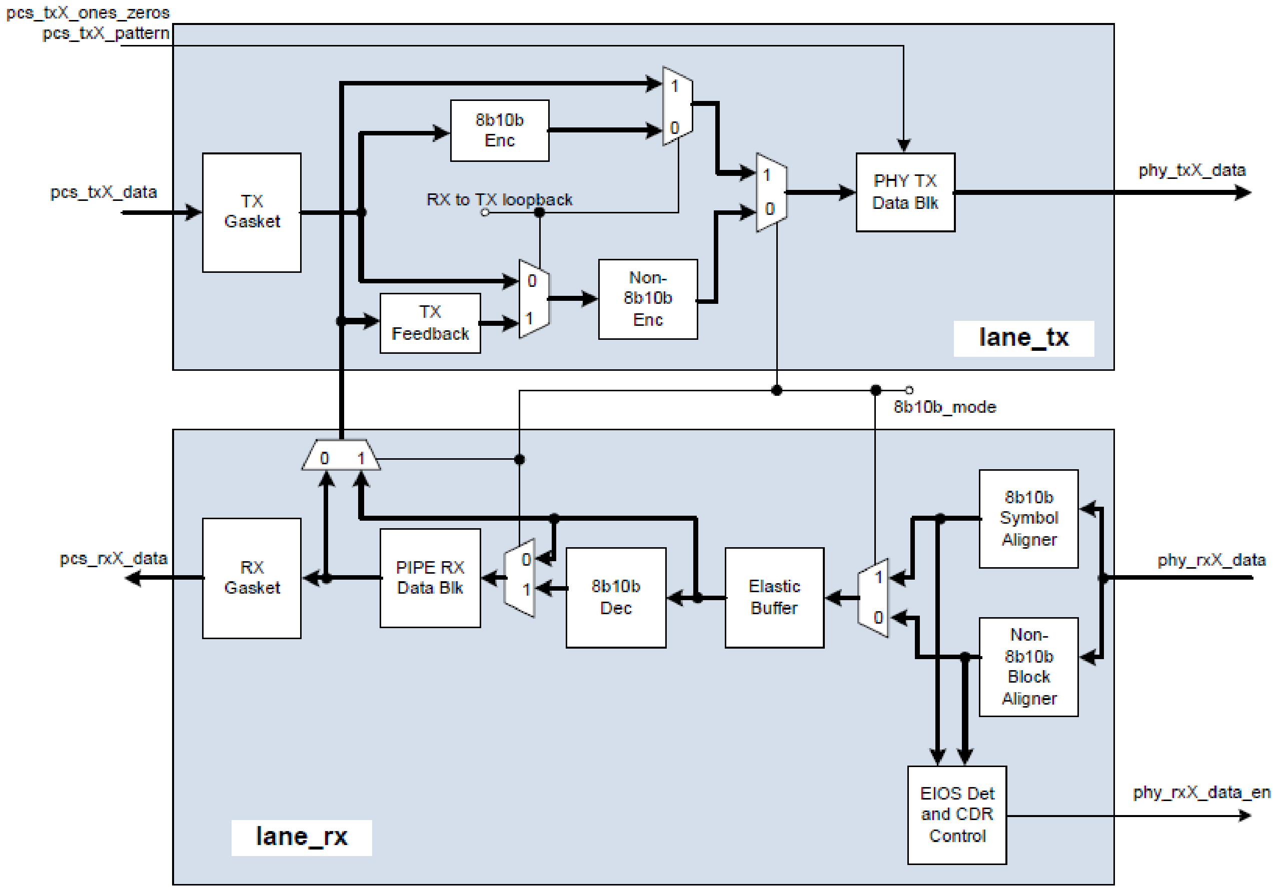

Fig. 16-4 Transmit and Receive Datapath

The pcs_txX_data transmit data and controls are converted from the PIPE interface clock to the internal pcs_clk in the TX gasket. The fixed data-path-width data at the output of the TX gasket is encoded as follows:

- 8b10b-encoded for 8b10b protocols
- 128b-130b-encoded for PCIe Gen3

To support RX-to-TX loopback mode as specified in the PIPE specification, the RX recovered data is multiplexed into the TX Datapath. Note that for 8b10b mode, the non-decoded 8b10b received data is sent to the transmitter. For non-8b10b data, the received data is decoded first; that is, the header is extracted from the data, then looped back into the TX Datapath, where it is encoded before being transmitted to the PHY. The encoded TX data goes through override logic where fixed patterns are inserted into the TX data-stream controller by the pcs_txX_ones_zeros and pcs_txX_pattern[1:0] PIPE signals.

Data received from the PHY is processed to find symbol alignment for 8b10b data and block alignment for non-8b10b data. The aligned data is monitored for EIOS ordered sets (PCIe) to detect end-of-packets and to infer entry into electrical idle condition. After detecting EIOSs, the Consumer PCIe 3.0 PCS de-asserts phy_rxX_data_en to the PHY lane, causing the lane CDR to stop monitoring input data transitions and to switch to reference clock tracking mode. The aligned data is passed to the elastic buffer, where compensation for frequency drift is performed by adding or removing SKP (PCIe) ordered sets. The frequency-compensated data is 8b10b-decoded for 8b10b data, then passed through the PIPE RX processing block where data and status signals are cycle-aligned. The RX data and status signals pass through the RX gasket that maps the internal fixed-width data to variable interface widths supported by the PIPE interface.

16.2.2.2 Physical Medium Attachment (PMA)

Each PMA comprises a full duplex transceiver for each lane. On the transmit (TX) side, the PMA receives parallel data from the relevant lane of the PCS. The data is serialized and sent to the TX driver, which is a high-speed, hybrid-mode (voltage and current), differential-output driver. TX driver characteristics, such as amplitude, 3-tap feed-forward equalization, and termination, are user controllable. The TX driver output is sent to a pair of external pads.

On the receive (RX) side, the PMA receives differential serial data from a pair of external pads. Receiver characteristics, such as equalization and termination, are user controllable. A continuous-time linear equalizer (CTLE) is first used to compensate for channel loss. A decision feedback equalizer (DFE) is also implemented after the CTLE to further equalize the signal for high-speed data rates. A clock and data recovery (CDR) circuit is implemented, which recovers the clock from the data. A dedicated VCO is implemented as the source of the recovering clock. The CDR loop adjusts the VCO clock frequency and phase until the frequency matches incoming data and the phase is aligned with incoming data. This recovered clock is used to retime received data and send it to the de-serializer, which produces parallel data and a parallel data clock for the relevant PCS lane.

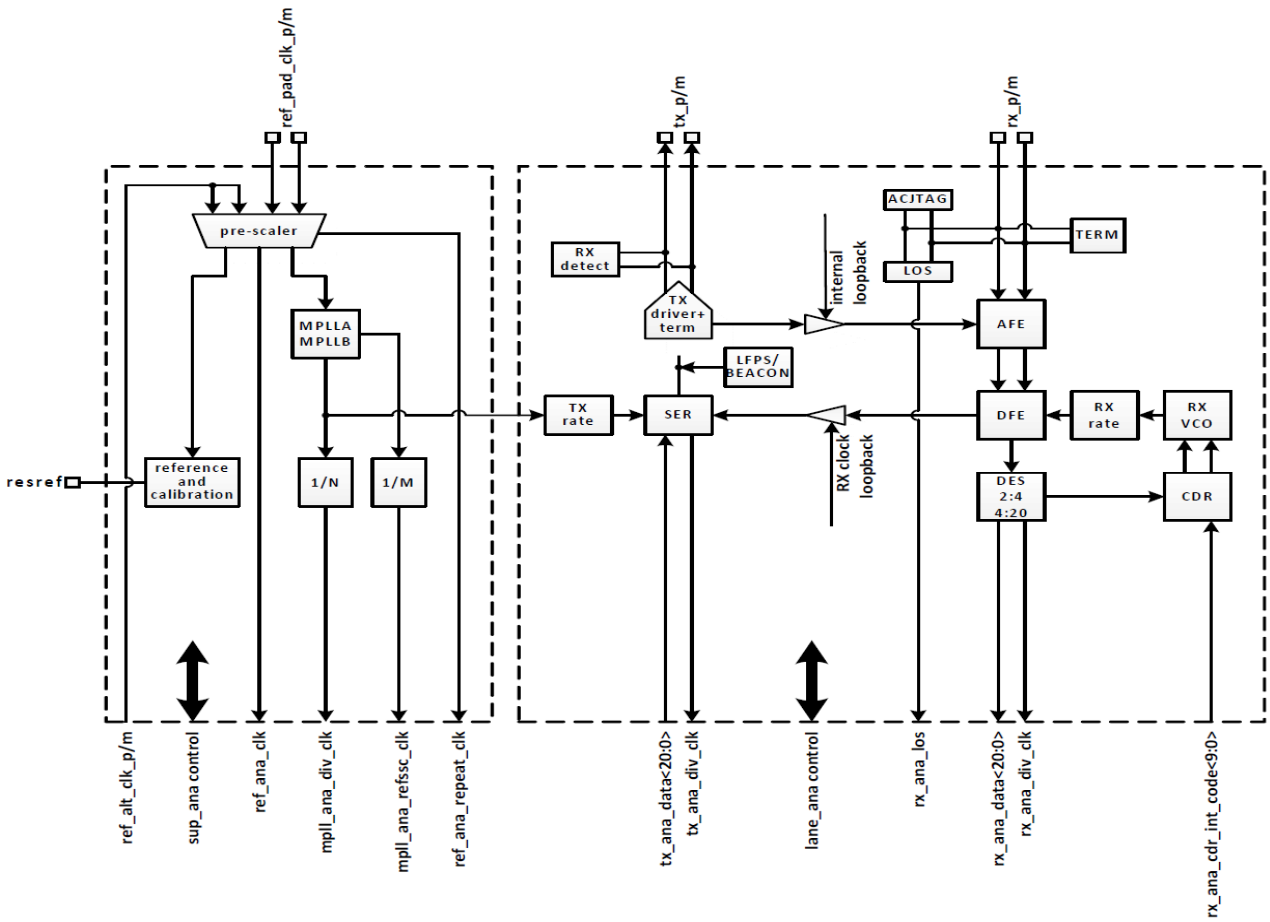

Fig. 16-5 PMA Analog Architecture(Single Lane)

16.2.2.3 Raw PCS

The PMA PCS features listed below:

- Power-up calibration algorithms for the PMA analog front-end, for example, RX AFE

offset cancellation, RX slicer calibration, MPLL calibrations, and RX VCO calibrations
- Controls for the adaptation routines in the PMA for modes when adaptation is enabled
- MPLL power-up and power-down control based upon txX_pstate and txX_mpllb_sel inputs
- JTAG Tap controller for serial register access
- Register access arbitration between JTAG/CR Parallel access, and the internal power-up and adaptation routines

The selection between JTAG and CR Parallel interfaces is controlled using primary input cr_para_sel, which means that both of these interfaces cannot operate simultaneously. A round-robin arbitration mechanism exists to provide equal priority to different sources requesting access to the shared internal register bus. These sources include multiple internal state machines as well as external register access interfaces (JTAG/CR-Parallel).

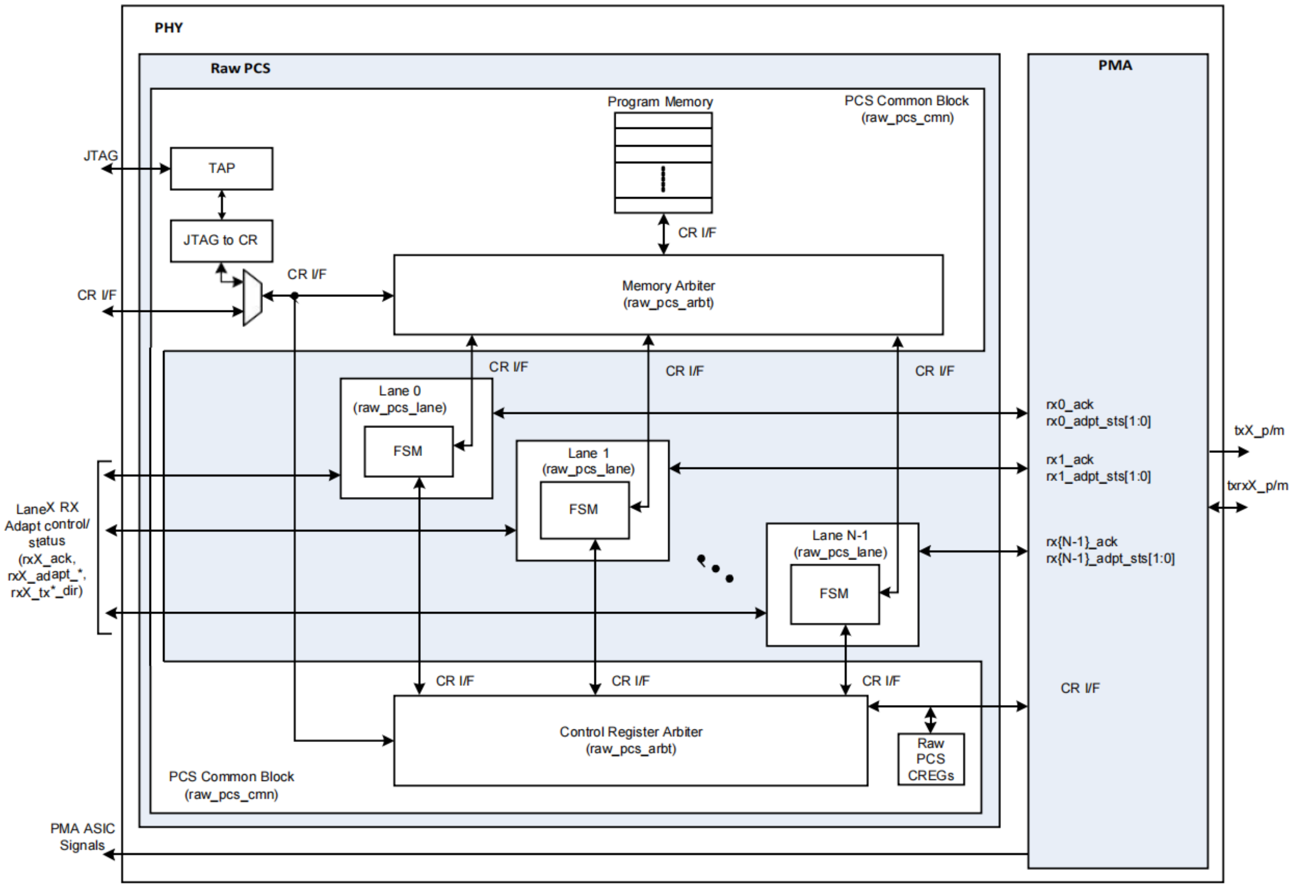

Fig. 16-6 PMA Analog Architecture(Single Lane)

Each lane module (raw_pcs_lane) contains finite state machines (FSMs) to execute the power-up calibration and run-time adaptation algorithms. The algorithms are stored in a register bank located in a common module (raw_pcs_cmn). The design includes two register access arbiters. The Memory arbiter is used for accessing the register bank whereas the Control Register Arbiter is used to access all other registers in the PMA PCS and the PMA. This mechanism provides efficient use of the registers and state machines within each lane where each lane can independently execute a different portion of the algorithm while reducing the register access bottleneck.

All control registers in the PMA PCS and PMA can be externally accessed using JTAG or CR Parallel Interfaces, with only one interface at any given time.

16.3 Register Description

16.3.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 16-1 Combo PHY Address Mapping Table

Name	Address Base	Size
Combo PIPE PHY0	0xFEE00000	0x10000(64KB)
Combo PIPE PHY1	0xFEE10000	0x10000(64KB)
Combo PIPE PHY2	0xFEE20000	0x10000(64KB)
Combo PIPE PHY0 GRF	0xFD5BC000	0x4000(16KB)
Combo PIPE PHY1 GRF	0xFD5C0000	0x4000(16KB)
Combo PIPE PHY2 GRF	0xFD5C4000	0x4000(16KB)

Table 16-2 PCIe 3.0 PHY Address Mapping Table

Name	Address Base	Size
PCIe 3.0 PHY 0	0xFEE80000	0x40000(256KB)
PCIe 3.0 PHY 1	0xFEEC0000	0x40000(256KB)
PCIe 3.0 PHY GRF	0xFD5B8000	0x4000(16KB)

Note: The offset of the each PCIe 3.0 PHY's SRAM begins at 0x18000(Base 0xFEE80000/0xFEEC0000), ends up at 0x1BFFC.

Note：

①：The pcie_30_phy_mode is ignored by the tagged Configuration, it is only decided by {pcie_1ln_sel,pipe_phymode}.

②: The tagged link is down width of an upper link width.

③: In this configuration, if the link width down to X2 or X1, both of the reference clocks still need to be driven and should be from the same clock generator.

*④: If this link is active and regarded as Endpoint function, then this *PORT0* can’t be bifurcated.*

⑤: The pcie_1ln_sel stands for pcie_1l0_sel and pcie_1l1_sel located in PD PHP GRF, and for COMBO PHY 0, the pcie_1l2_sel is reserved. The pcie_1ln_sel is only valid in PCIe scenario.

⑥: In X4 link, the PORT 1 Lane0 aka Lane2, and PORT 1 Lane1 aka Lane3

Table 16-9 Name Mapping of Controller

16.5.2 Combo PHY Application Note

16.5.2.1 Operation Mode Support

The following mode are supported for IP operation, IP configuration other than this list are not supported

Table 16-11 PHY operation mode

PHY_MODE	RATE	BUS_WIDTH	PHY Operation Mode
00	00	00	PCIe Gen1, 32bit, PCLK=62.5M
		01	N/A
	01	00	PCIe Gen2, 32bit, PCLK=125M
		01	N/A

PHY_MODE	RATE	BUS_WIDTH	PHY Operation Mode
01	00	00	USB3.0, 32bit, PCLK=125M
01	00	01	N/A
10	00	00	N/A
		01	SATA Gen1, 16bit, PCLK=75M
	01	00	N/A
		01	SATA Gen2, 16bit, PCLK=150M
	10	00	N/A
		01	SATA Gen3, 16bit, PCLK=300M

- PHY_MODE is configured by PIPE_PHY_GRF_PIPE_CON0.pipe_phymode
- RATE is controlled by protocol controller or can be configured PIPE_PHY_GRF_PIPE_CON0.pipe_rate when override is enabled
- BUS_WIDTH is controlled by protocol controller or can be configured PIPE_PHY_GRF_PIPE_CON0.pipe_databuswidth when override is enabled

16.5.2.2 Power Down Mode

Power down control signals to individual analog modules are generated based on PWDN[1:0] setting from PIPE inputs as shown in below table. An override function is provided for debug purpose, see Multi-PHY register list. (√ – active; ╳– power down)

Table 16-12 PCIE power down mode

PWDN[3:0]	TX_ELECIDLE	TX_Buffer	RX_Buffer	CDR	TX_PLL
0000	--	√	√	√	√
0001	0(illegal)	√	√	√	√
	1	╳	√	√	√
0010	0(illegal)	√	╳	╳	√
	1	╳	╳	╳	√
0011	0	√	╳	╳	╳
	1	╳	╳	╳	╳
1---	0(illegal)	√	╳	╳	╳
	1	╳	╳	╳	╳

In PCIe mode, power for IVREF and PCIe idle detector are always on, while power for LFPS, 1.5G SATA idle and 3G/6G SATA idle detectors are always off, and power of Rx buffer is off when RX_STANDBY is high.

Note: If TX_ELECIDLE(pipe_txelecidle) and TX_COMPLIANCE(pipe_txcompliance) is both asserted, all powers are off.

Table 16-13 USB3 power down mode

PWDN[3:0]	TX_ELECIDLE	TX_Buffer	RX_Buffer	CDR	TX_PLL
0000	--	√	√	√	√
0001	0	√	√	╳	√
	1	√	√	╳	√
0010	0	√	√	╳	√
	1	√	√	╳	√
0011	0	√	√	╳	╳
	1	╳	√	╳	╳

In USB3.0 mode, power for IVREF and LFPS detector are always on, while power for PCIe idle, 1.5G SATA idle and 3G/6G SATA idle detectors are always off, and power of LFPS detector and power of Rx buffer are turned off if termination is not on.

Table 16-14 SATA power down mode

PWDN[3:0]	TX_ELECIDLE	TX_Buffer	RX_Buffer	CDR	TX_PLL
0000	--	√	√	√	√
0001	0(illegal)	√	×	√	√
	1	×	×	√	√
0011	0(illegal)	√	×	×	√
	1	×	×	×	√
0101	0(illegal)	√	×	√	√
	1	×	×	√	√
0111	0(illegal)	√	×	×	×
	1	×	×	×	×

In SATA mode, power for IVREF and 1.5G SATA idle detector are always on, while power for LFPS and PCIE idle detectors are always off, and power of Rx buffer is off when RX_STANDBY is high.

The PWDN is controlled by protocol controller default, it also can be controlled by PIPE_PHY_GRF_PIPE_CON0.pipe_powerdown when override is enabled.

16.5.2.3 Reference Clock

Combo PIPE PHY's reference clock source can be selected from either PLL_CKREF_INNER or CKREFP/CKREFN, according to the status CKREF_SRC[1:0] after the PHY de-asserted reset.

The differential pair CKREFP/N can be configured as either reference clock input or reference clock output, according to CKREF_SRC[1]

Configure the register signal su_trim[29] to select reference clock(ckref) or 100MHz clock (ck100m_pcie) from PLL to drive to CKREFP/N

The CKREF_SRC is controlled by PIPE_PHY_GRF_PIPE_CON3.phy_clk_ref_src, and the PIPE_PHY_GRF_PIPE_CON3.phy_clk_sel is used to set the frequency of the selected reference clock.

The PLL_CKREF_INNER is derived by SoC internal CRU, refers to CRU for detail configurations to generate the appropriate reference clock.

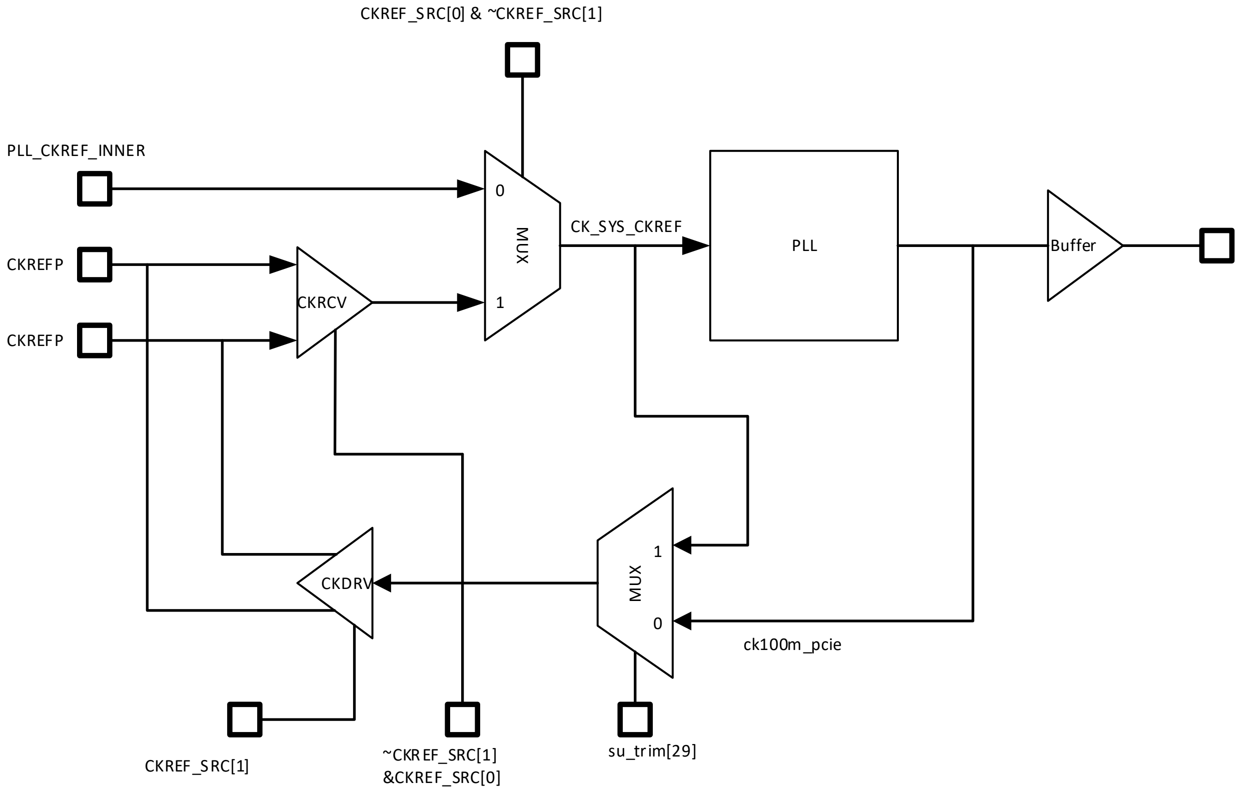

Fig. 16-7 Reference Clock Structure of Combo PIPE PHY

16.5.3 PCIe 3.0 PHY Application Note

16.5.3.1 Aggregation and Bifurcation

The PCIe 3.0 PCS can be connected to up to 2 PHYs, so that the number of lanes on the PCIe 3.0 PCS equals the cumulative number of lanes on the PHYs. This feature is referred to as PHY aggregation.

The PCIe 3.0 PCS lanes can be configured to operate as one or more links with each link configured to operate at a different rate (pipe_laneX_rate) and in a different protocol (pipe_laneX_protocol), provided the PHY supports such a bifurcation configuration. Each PCIe 3.0 PCS lane can be independently configured to be part of a particular link using the pipe_laneX_phy_src_sel input.

In current design subsystem, aggregation and bifurcation is automatically implemented by configuring the pcie30_phy_mode, it is no necessary do other configuration by default.

The pipe_laneX_phy_src_sel changed depends on the pcie30_phy_mode, so any changes to pcie30_phy_mode must be followed by phy_reset (PHPTOPSOFTRST_CON00.resetn_pcie30_phy) assertion.

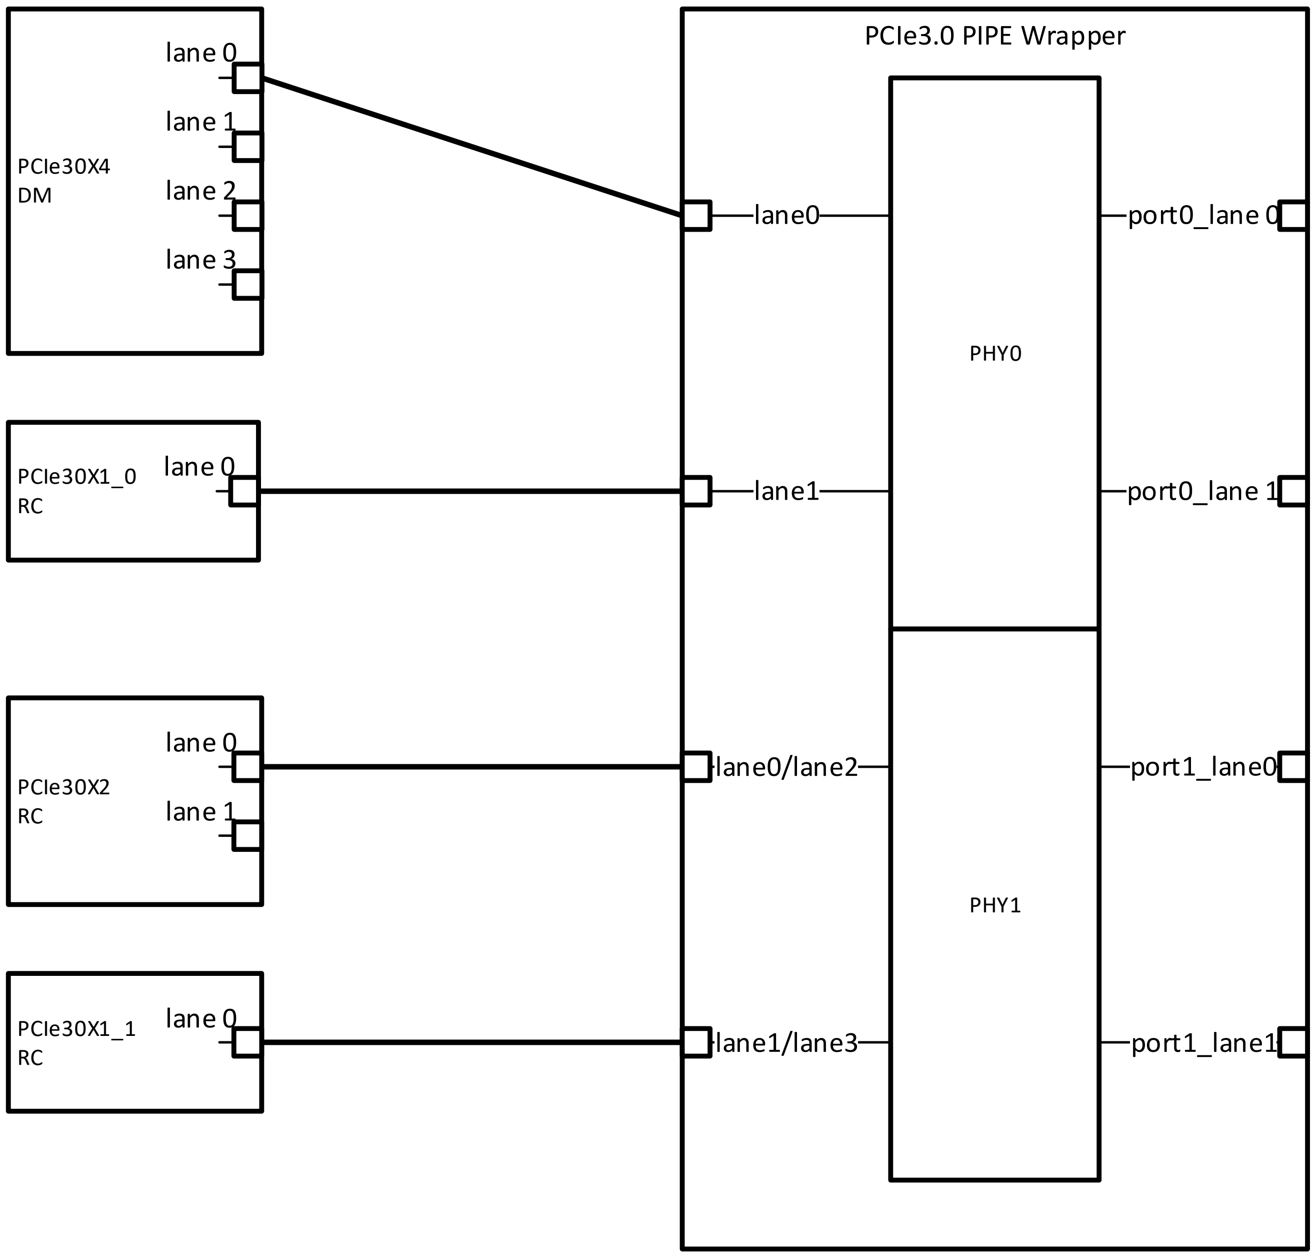

Fig. 16-11 Config3 -- Bifurcation for Both PHY0 and PHY1

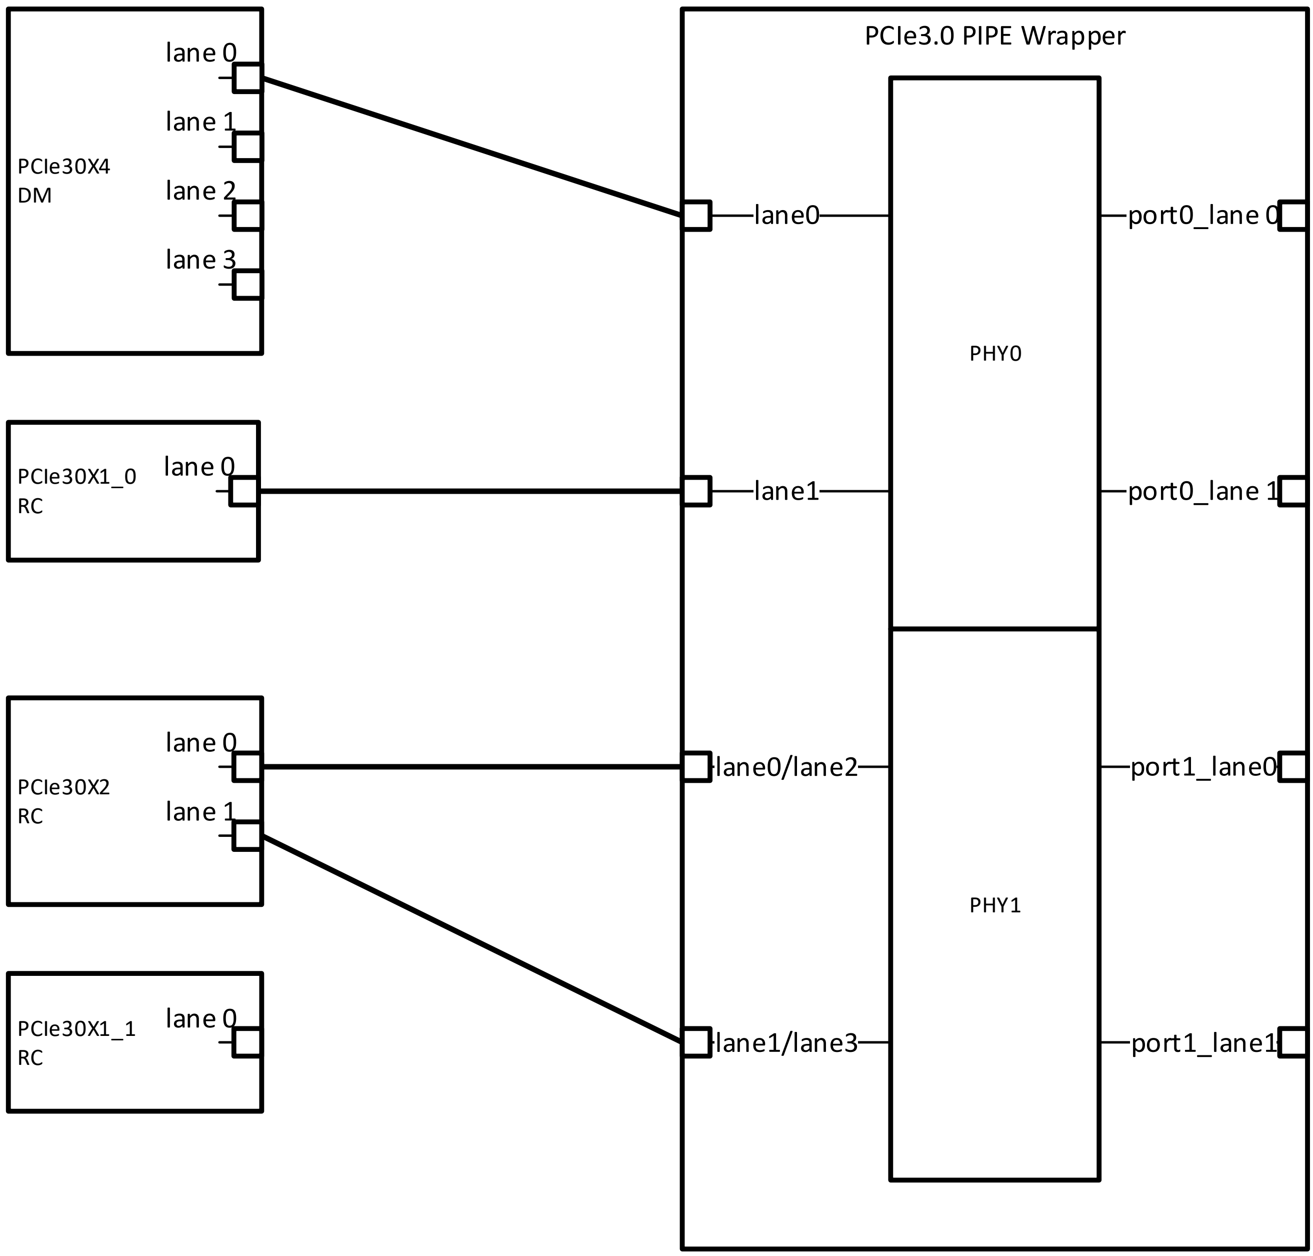

Fig. 16-12 Config4 -- Only PHY0 Bifurcation

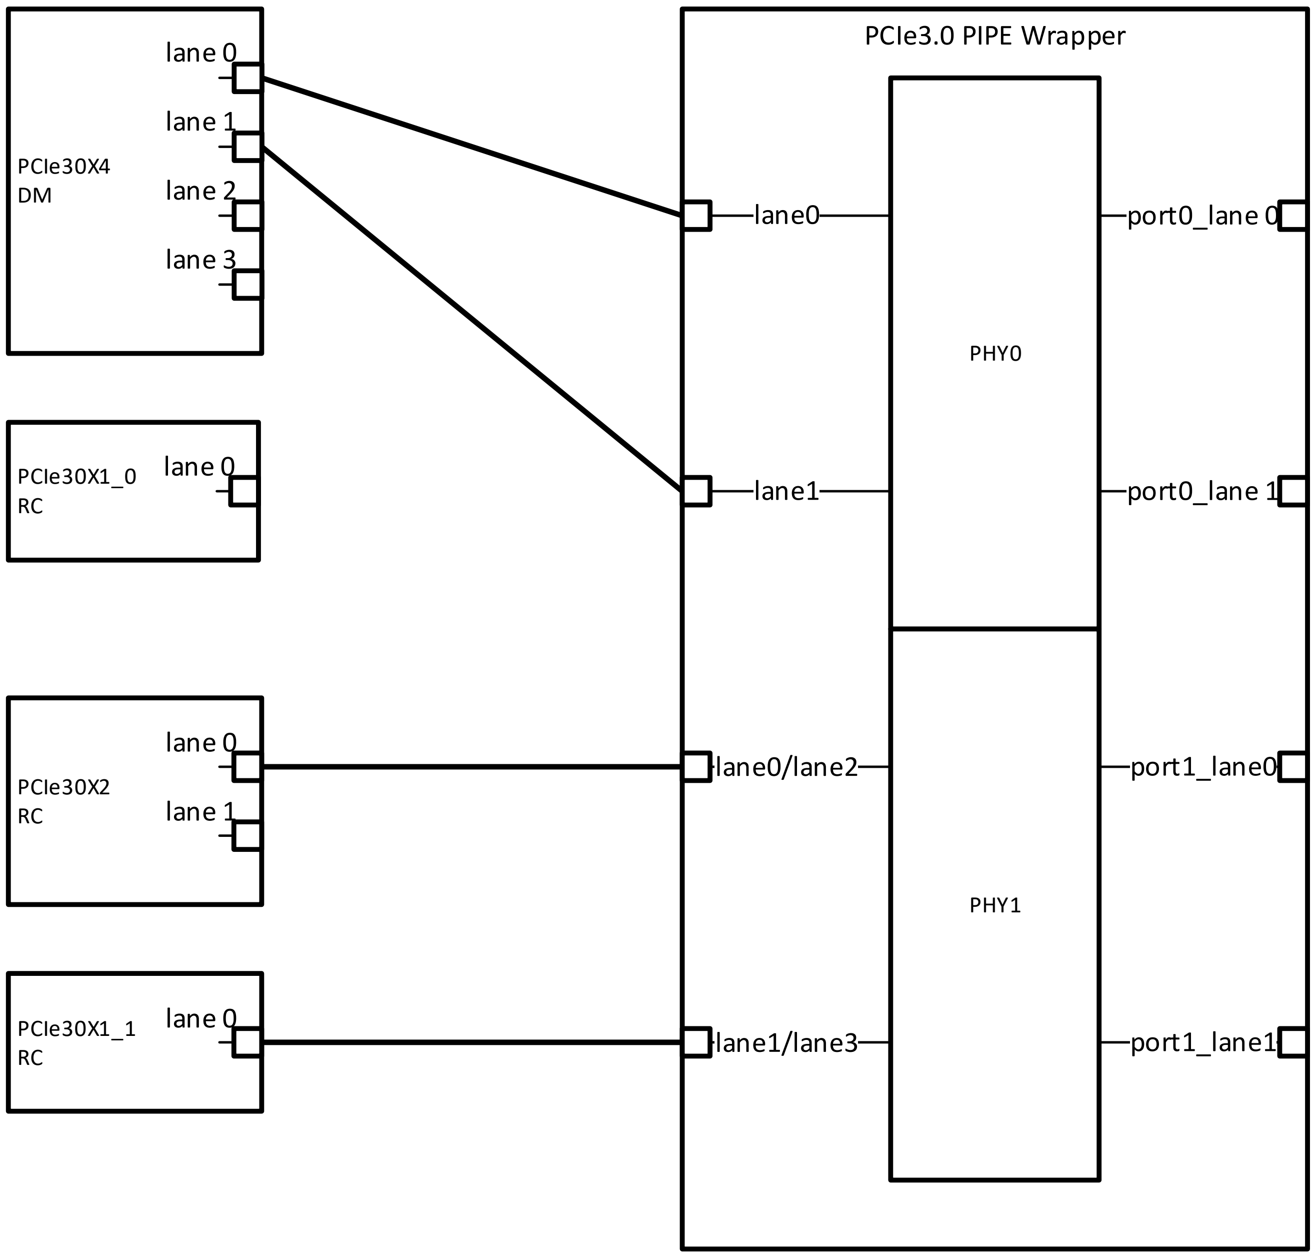

Fig. 16-13 Config5 -- Only PHY1 Bifurcation

16.5.3.2 PHY Power-Up

Power up the vp* and vph power supplies in any order and then proceed with the PHY reset and initialization sequence (vp* indicates the grouping of all core supplies; vp, vpdig, and vptxX).

- The state of the PHY is unknown after power up but before assertion of reset. The PHY may exhibit unwanted behavior such as TX enabled, or RX terminations activated.
- While the unknown state is undesirable, the PHY has been designed to prevent damage if it is left in this state.
- Use a ramp time of no faster than 10 μs and a rate no faster than (supply voltage)/10 us. The ramp requirement is set based on our ESD clamp triggering time.

16.5.3.3 PHY Initialization and Reset Sequences

During PHY reset and initialization sequence, the PHY performs power up circuit calibrations and enters the configuration mode defined by the primary inputs. The PHY does not require any clocks to be supplied to enter the reset state (assertion of phy_reset). Exit from the reset state is indicated by de-assertion of txX_ack/rxX_ack and requires a reference clock to be supplied and ref_clk_en input to be asserted.

When phy_reset is asserted, the TX and RX terminations are disabled and txX_p/m are tri-stated for all lanes of the PHY. In addition to global phy_reset, txX_reset/rxX_reset inputs can be used to reset individual lanes in the PHY. When txX_reset is asserted, the txX_pstate is similar to P2, the TX terminations are disabled and txX_p/m are tri-stated for lane X. When rxX_reset is asserted, the rxX_pstate is similar to P2, the RX terminations are disabled for lane X. TxX_reset/rxX_reset are ignored when phy_reset is asserted. Asserting either txX_reset or rxX_reset during phy_reset assertion stalls the Raw_PCS FSM operation before internal registers are updated for lane X after phy_reset is de-asserted.

16.5.3.4 Lane Disabling and Up/Down-Configuration

16.5.3.4.1 RX Standby Mode

A lane in an active link can be disabled by setting pcs_txX_elecidle = 1 and pcs_rxX_standby = 1 while keeping pcs_laneX_powerdown set to P0. This setting maintains the TX common mode on the lane while turning off the transmit driver and disabling the CDR—keeping the rest of receiver circuitry on. The disabled lanes can be enabled again with minimal supported wake-up time by setting pcs_txX_elecidle = 0 and pcs_rxX_standby = 0.

16.5.3.4.2 PIPE Lane Disable

A lane in an active link can be disabled by setting pcs_txX_elecidle = 1 and pcs_tx1_compliance = 1. In this state, the PHY’s TX and RX are placed in a P2-equivalent state (TX and RX circuits off). This state is a significantly lower power state as compared to disabling the lane using pcs_txX_elecidle = 1 and pcs_rxX_standby = 1. The disabled lanes can be enabled again according to the requirements defined in the PIPE 4.3 specification, “Multi-lane PIPE – PCI Express Mode” section. Therefore, the MAC must either assert pcs_laneX_reset_n or set pcs_laneX_powerdown to P1 at the same time as exiting the disabled state

16.5.3.4.2.1 Exception

The PIPE 4.3 specification states that the PHY should ignore the PIPE signals when a lane is disabled using pcs_txX_elecidle = 1 and pcs_tx1_compliance = 1.
When in such a disabled state, the Consumer PCIe 3.0 PCS supports the following two modes:

- upcs_pipe_config[0] = 0: The Consumer PCIe 3.0 PCS ignores PIPE interface signals. In this mode, the pcs_laneX_pcs_clk output is gated.
- upcs_pipe_config[0] = 1: The Consumer PCIe 3.0 PCS monitors the PIPE interface signal, pcs_laneX_powerdown. Therefore, if pcs_laneX_powerdown is set to P0/P0s/P1 , the pcs_laneX_pcs_clk output is available. This mode enables the MAC to continue using the pcs_laneX_pcs_clk output from a particular lane in a link to sample/launch PIPE signals for other active lanes in the same link, resulting in a simpler clock architecture in the MAC. Without this mode, the MAC would be required to use the pcs_laneX_pcs_clk output of each lane to sample/launch data of the same lane.

16.5.3.4.3 P1.2 State

A lane can also be disabled by placing the lane in a P1.2 state. If all other lanes in the link and all lanes on one PHY are in a P1.2 state, this mode is the most power-efficient mode, because in this case the reference clock for that PHY can be turned off.

16.5.3.5 Configuration for a Disabled PHY

There are several methods to disable a PHY, if the PHY is not being used in application (one or more PHYs are disabled). To disable a PHY, follow the methods outlined in below table.

Table 16-15 Signal Connections if the PHY is Not Used

Signal	Method 1: All Power Supplies (vp, vph, vptxX, vpdig, gd) at Nominal Voltage and IDDQ = 1	Method 2: All Power Supplies (vp, vph, vptxX, vpdig, gd) Connected to Ground	Method 3: All Power Supplies (vp, vph, vptxX, vpdig, gd) Left Unconnected (Floating)
PMA inputs from Raw PCS	Automatically engaged isolation	Tie all inputs to ground—	Tie all inputs to ground—

Signal	Method 1: All Power Supplies (vp, vph, vptxX, vpdig, gd) at Nominal Voltage and IDDQ = 1	Method 2: All Power Supplies (vp, vph, vptxX, vpdig, gd) Connected to Ground	Method 3: All Power Supplies (vp, vph, vptxX, vpdig, gd) Left Unconnected (Floating)
	cells	recommended	recommended
PMA outputs to Raw PCS	Insert isolation gate-recommended	Insert isolation gate	Insert isolation gate
rxX_p, rxX_m	Leave floating or tie low	Leave floating or tie low	Leave floating or tie low
txX_p, txX_m	Leave floating	Leave floating	Leave floating
resref	Leave floating	Leave floating	Leave floating
ref_pad_clk_p, ref_pad_clk_m	Tie low	Tie low	Tie low
ref_alt_clk_p, ref_alt_clk_m	Tie low	Tie low	Tie low

- For methods 2 and 3, to ensure that the outputs do not float high nor drive any active logic, you must use isolation gates on PHY outputs, this is achieved by set pcie30_clamp_n to "0" . Furthermore, to prevent the PHY circuitry from inadvertently toggling, it is good practice to tie all the inputs to the ground.
- If REXT is being shared with other PHYs, use only method 1. For REXT sharing, the request and ack handshake logic within each PHY must be powered and should allow the handshake signals from other PHYs to propagate through.
- If clock is being repeated, ensure that you do not power down the PMAs in the chain.
- For more information about IDDQ mode, set test_burnin =0 && test_powerdown =1

16.5.3.6 Reference Clock Implementation

The PHY supports a differential reference clock source. The source may be driven through either external pads or internal pins. The reference clock must meet specific requirements for signal swing and jitter. The clock frequency supported by current PHY is 100M.

There are two types of reference clock implementations:

- External off-chip reference clocks using ref_pad_clk_p/ref_pad_clk_m
- On-chip reference clocks using ref_alt_clk_p/ref_alt_clk_m, from internal CRU

The external off-chip reference clock implementation support either a differential clock or a CMOS single ended clock. The external off-chip reference clock input is an unterminated, AC coupled input. If the reference clock is a single-ended CMOS clock, one of the clock inputs (such as ref_pad_clk_p) must be a full-swing CMOS clock, and the other input (such as ref_pad_clk_m) should be tied to either high or low. If the reference clock is differential, it may be CML or LVDS, or any differential specification that meets the specification. Any reference clock inputs that are not being used should be tied to ground.

The on-chip reference clock implementation supports only a CMOS level clock implementation. The on-chip reference clock can we input either differentially or single-ended. If the on-chip reference clock is sent in single-ended then ref_alt_clk_p must be used and ref_alt_clk_m should be tied to ground.

16.5.3.6.1 External Off-Chip Clock Sources

When routing reference clocks in from off-chip, a signal integrity (SI) analysis should be performed using a model of the clock input, package, board traces, and clock source. This analysis should confirm that the reference clock input specification is being met across the external on-chip reference clock input (ref_pad_clk_p/ref_pad_clk_m).

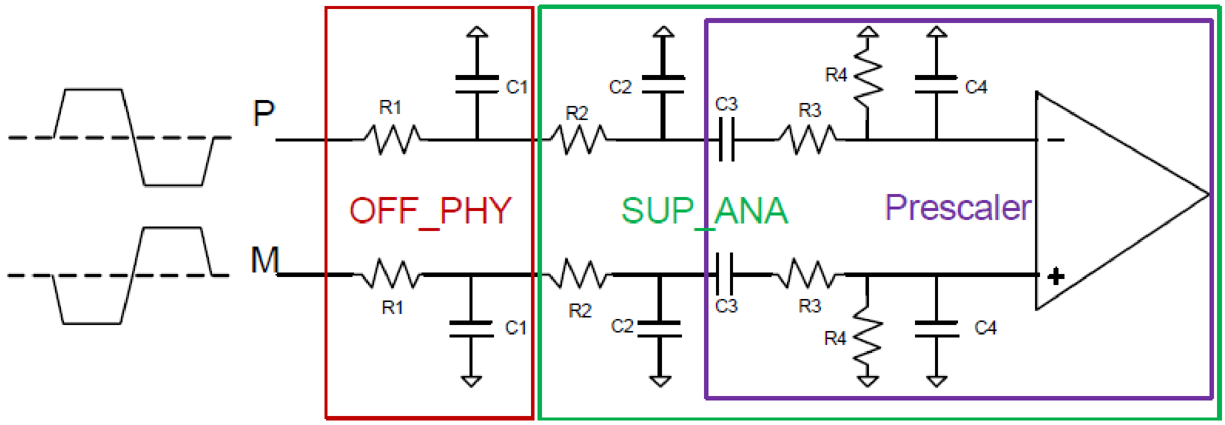

Fig. 16-14 Model of Reference Clock Pad Input Load

Table 16-16 Reference Clock External Pad Input Parasitics

Location	Parasitic Device	Value	Unit
OFF PHY	R1	≤50	Ohm
OFF PHY	C1	≤1	pF
Within PHY: Bump to prescaler input	R2	≤50	Ohm
Within PHY: Bump to prescaler input	C2	≤1	pF
Within prescaler: 2nd ESD Prot resistor	R3	400	Ohm
Within prescaler: AC cap	C3	840	fF
Within prescaler: DC Bias resistor	R4	456k	Ohm
Within prescaler: Input cap of prescaler input RX	C4	50	fF

To improve common-mode rejection ratio (CMRR), differential traces should be as well matched as possible

The reference clock inputs are not terminated. This is to allow for connection of reference clocks to multiple PHYs at the same time. If termination is used, it should be placed on your board as close to the chip as possible. For PCIe, see the PCIe CEM specification for detail on how to implement the on-board termination

16.5.3.6.2 On-Chip Clock Sources

Many applications require an on-chip reference clock. The challenge is getting the reference clock to the PHY without adding supply-noise-induced jitter to the clock. The ref_alt_clk_p/ref_alt_clk_m is supplied by PHP PLL which powered by PMU VDD to get cleaner clock.

16.5.3.7 External SRAM Support

The Raw PCS stores the instruction code to execute the calibration and adaptation algorithms. In order to minimize the area of the Raw PCS, this pre-optimized and pre-validated code is stored in the form of hardcoded lookup table. An external SRAM must be included for the purpose of updating the IP firmware. This provides flexibility for future and post-silicon product enhancements.

After de-assertion of phy_reset, the boot loader in the Raw PCS loads the code from the internal lookup table to the external SRAM and asserts output signal, sram_init_done. After initialization of SRAM, user can change the SRAM contents (or access any PHY register) using either the JTAG or the CR Parallel Interface by addressing the SRAM address space in the register map. After external access to the SRAM (or any other PHY register) is complete, input sram_ext_ld_done should be set high, allowing the FSMs in the Raw PCS to start executing the code from SRAM.

When sram_bypass is asserted, the access to the SRAM is bypassed and the lane FSMs execute the code from the hard-coded lookup table in the Raw PCS. This signal is meant to be used only for debugging purposes and must not change after phy_reset is negated.

The offset of the each PHY’s SRAM begins at 0x18000, ends at 0x1BFFC.

Chapter 17 Process-Voltage-Temperature Monitor (PVTM)

17.1 Overview

The Process-Voltage-Temperature Monitor (PVTM) is used to monitor the chip performance variance caused by chip process, voltage and temperature.
PVTM supports the following features:

- A clock oscillation ring is integrated and used to generate a clock like signal, the frequency of this clock is determined by the cell delay value of clock oscillation ring circuit.
- A calculation logic is used to measure the frequency of the clock oscillation ring.
- Follow PVTM blocks are supported:
  - BIGCORE0_PVTM, used near A76_0/1
  - BIGCORE1_PVTM, used near A76_2/3
  - LITCORE_PVTM, used near DSU and A55_0/1/2/3
  - NPU_PVTM, used near NPU
  - GPU_PVTM, used near GPU
  - PMU_PVTM, used near PMU

17.2 Block Diagram

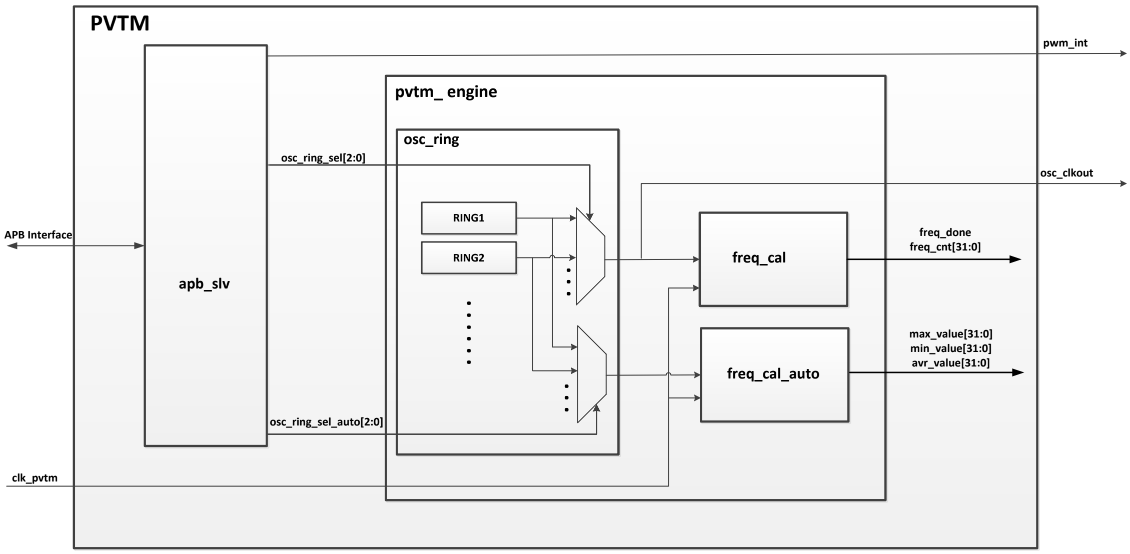

Fig. 17-1 PVTM Block Diagram

The PVTM include two main blocks:

- apb_slv

APB slave interface with 32-bit bus width.

- pvtm_engine

It is composed with inverters with odd number, which is used to generate a clock.
BIGCORE0/BIGCORE1/LITCORE_PVTM/GPU/NPU_PVTM supports several clock oscillation-rings, and finally selects one. PMU_PVTM only supports one clock oscillation rings.
The frequency calculation logic of BIGCORE0/BIGCORE1/LITCORE_PVTM/GPU/NPU_PVTM support manual mode and auto mode, and these two modes can be used at simultaneously.
The PMU_PVTM only support manual mode.

17.3 Function Description

17.3.1 Frequency Calculation

A clock is generated by the oscillation ring and a frequency fixed clock clk_pvtm is used to calculate the cycles of the clock. Supposing the time period is 1s, then the clock period of oscillation ring clock is T= 1/clock_counter(s), the cell delay value is T/2.
For manual mode, user can only get one frequency result for a calculation.
For auto mode, user can set the calculation times, and get the maximum, minimum and average frequency during calculation. It also supports to generate an interrupt when the minimum or average frequency below a threshold. The threshold can be configured.

17.3.2 Low power mode usage

A clock divided from PMU_PVTM oscillation ring is used in low power mode, which can replace the function of 32KHz clock source

17.4 Register Description

17.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
PVTM_VERSION	0x0000	W	0x00000203	PVTM version register
PVTM_CON0	0x0004	W	0x00000000	PVTM control register0
PVTM_CON1	0x0008	W	0x00000000	PVTM control register 1
PVTM_CON2	0x000C	W	0x00000000	PVTM control register 2
PVTM_CON3	0x0010	W	0x00000000	PVTM control register 3
PVTM_CON4	0x0014	W	0x00000000	PVTM control register 4
PVTM_CON5	0x0018	W	0x00000000	PVTM control register 5
PVTM_CON6	0x001C	W	0x00000000	PVTM control register 6
PVTM_INT_EN	0x0070	W	0x00000000	PVTM Interrupt Enable Register
PVTM_INTSTS	0x0074	W	0x00000000	PVTM Interrupt Status Register
PVTM_STATUS0	0x0080	W	0x00000000	PVTM status register0
PVTM_STATUS1	0x0084	W	0x00000000	PVTM status register1
PVTM_STATUS2	0x0088	W	0x00000000	PVTM status register2
PVTM_STATUS3	0x008C	W	0x00000000	PVTM status register3
PVTM_STATUS4	0x0090	W	0x00000000	PVTM status register4
PVTM_STATUS5	0x0094	W	0x00000000	PVTM status register5
PVTM_STATUS6	0x0098	W	0x00000000	PVTM status register6
PVTM_STATUS7	0x009C	W	0x00000000	PVTM status register7

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

17.4.2 Detail Register Description

PVTM_VERSION

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RU	0x0203	version PVTM version

PVTM_CON0

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15:6	RO	0x000	reserved
5	RW	0x0	pvtm_rnd_seed_en Set high to enable the round seed in PVTM.

Bit	Attr	Reset Value	Description
4:2	RW	0x0	pvtm_osc_sel Oscillation ring selection For CPU_PVTM: 3'b000: oscillation ring 0 3'b001: oscillation ring 1 3'b010: oscillation ring 2 3'b100: oscillation ring 4 3'b101: oscillation ring 5 3'b110: oscillation ring 6 others: Reserved For GPU/NPU/TOP_PVTM: 3'b000: oscillation ring 0 3'b001: oscillation ring 1 others: Reserved For PMU_PVTM: 3'b000: oscillation ring 0 others: Reserved
1	RW	0x0	pvtm_osc_en Set high to enable the oscillation ring in the PVTM.
0	RW	0x0	pvtm_start Set high to start PVTM.

PVTM_CON1

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	pvtm_cal_cnt PVTM calculation counter

PVTM_CON2

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:16	WO	0x0000	write_enable write_enable Write enable for lower 16 bits, each bit is individual. 1'b0: Write access disable 1'b1: Write access enable
15:8	RW	0x00	pvtm_osc_ring_autosel_en PVTM oscillation ring auto select enable control. It will take turns the oscillation ring (enabled by pvtm_osc_ring_autosel_en[7:0]) in order and then loop back. When none of them is enabled, use the oscillation ring selected by pvtm_osc_sel_auto. For example, when set pvtm_osc_ring_autosel_en[7:0]=8'b00000111, it will take turns oscillation ring 0, oscillation ring 1 and oscillation ring 2 in order to test and then loopback, other rings will not be tested.

Bit	Attr	Reset Value	Description
7	RW	0x0	pvtm_avr_cal_mode PVTM average value calculate mode 1'b0: The average value = (summary_value-max_value-min_value) /(measurement_number-2) 1'b1: The average value = summary_value /measurement_number
6	RW	0x0	pvtm_avr_update_mode PVTM average value update mode 1'b0: Only when the number of measurements arrive pvtm_avr_period, the average value is updated. 1'b1: When the number of measurements is equal to or greater than 3, the average value is updated gradually.
5	RW	0x0	pvtm_start_auto_mode PVTM start mode 1'b0: When the number of measurements arrive pvtm_cal_period, calculate stop and pvtm_start_auto is cleared. 1'b1: When the number of measurements arrive pvtm_cal_period, calculate don't stop and pvtm_start_auto is not cleared.
4:2	RW	0x0	pvtm_osc_sel_auto Oscillation ring selection for auto mode For CPU_PVTM: 3'b000: oscillation ring 0 3'b001: oscillation ring 1 3'b010: oscillation ring 2 3'b100: oscillation ring 4 3'b101: oscillation ring 5 3'b110: oscillation ring 6 others: Reserved For GPU/NPU/TOP_PVTM: 3'b000: oscillation ring 0 3'b001: oscillation ring 1 others: Reserved For PMU_PVTM: 3'b000: oscillation ring 0 others: Reserved
1	RW	0x0	pvtm_osc_en_auto Set high to enable the oscillation ring in the PVTM for auto mode.
0	RW	0x0	pvtm_start_auto Set high to start PVTM for auto mode.

PVTM_CON3
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	pvtm_cal_cnt_auto PVTM calculation counter for auto mode

PVTM_CON4

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	pvtm_avr_period PVTM average calculation period
15:0	RW	0x0000	pvtm_cal_period PVTM calculation period

PVTM_CON5

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	pvtm_min_threshold PVTM minimum value threshold

PVTM_CON6

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	pvtm_avr_threshold PVTM average value threshold

PVTM_INT_EN

Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RW	0x0	cal_done_Int_en 1'b0: Calculation done Interrupt disabled 1'b1: Calculation done Interrupt enabled
1	RW	0x0	avr_value_Int_en 1'b0: Average value Interrupt disabled 1'b1: Average value Interrupt enabled
0	RW	0x0	min_value_Int_en 1'b0: Minimum value Interrupt disabled 1'b1: Minimum value Interrupt enabled

PVTM_INTSTS

Address: Operational Base + offset (0x0074)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	W1C	0x0	cal_done_IntSts 1'b0: Calculation done Interrupt not generated 1'b1: Calculation done Interrupt generated

Bit	Attr	Reset Value	Description
1	W1C	0x0	avr_value_IntSts 1'b0: Average value Interrupt not generated 1'b1: Average value Interrupt generated
0	W1C	0x0	min_value_IntSts 1'b0: Minimum value Interrupt not generated 1'b1: Minimum value Interrupt generated

PVTM_STATUS0

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	pvtm_freq_done Indicates PVTM frequency count done.

PVTM_STATUS1

Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	pvtm_freq_cnt Indicates the cycle counts of the OSC_RING clock.

PVTM_STATUS2

Address: Operational Base + offset (0x0088)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	pvtm_rnd_seed_low_bits Indicates low 32bits of the cycle count of round seed.

PVTM_STATUS3

Address: Operational Base + offset (0x008C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	pvtm_rnd_seed_high_bits Indicates high 32bits of the cycle count of round seed.

PVTM_STATUS4

Address: Operational Base + offset (0x0090)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	pvtm_min_value PVTM minimum value

PVTM_STATUS5

Address: Operational Base + offset (0x0094)

Bit	Attr	Reset Value	Description
