31:0	RO	0x00000000	pvtm_avr_value PVTM average value

PVTM_STATUS6

Address: Operational Base + offset (0x0098)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	pvtm_max_value PVTM maximum value

PVTM_STATUS7

Address: Operational Base + offset (0x009C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	pvtm_avr_cnt PVTM average calculation current count
15:0	RO	0x0000	pvtm_cal_cnt PVTM calculation current counter

17.5 Application Notes

17.5.1 PVTM Manual mode Usage Flow

1. Enable the frequency fixed clock clk_pvtm.
2. Reset the PVTM.
3. Set pvtm_osc_en to enable the generated clock.
4. Set pvtm_osc_sel to select the clock oscillation ring.
5. Set the pvtm_cal_cnt to an appropriate value.
6. Set pvtm_start to calculate the cycles of the generated clock.
7. Wait the pvtm_freq_done is asserted, then get the value of pvtm_freq_cnt. The period OSC_RING clock is T= cal_cnt*(Period of clk_pvtm clock)/freq_cnt, the cell delay value is T/2.

17.5.2 PVTM Auto mode Usage Flow

1. Enable the frequency fixed clock clk_pvtm.
2. Reset the PVTM.
3. Set pvtm_osc_en_auto to enable the generated clock.
4. Set pvtm_osc_sel_auto to select the clock oscillation ring.
5. Set pvtm_cal_cnt_auto to an appropriate value.
6. Set pvtm_cal_period to configure all the calculation times.
7. Set pvtm_avr_period to configure the average times.
8. Set cal_done_Int_en to enable the interrupt.
9. Set pvtm_start_auto to calculate the cycles of the generated clock.
10. Wait the interrupt is asserted, then get the value of pvtm_min_value/pvtm_max_value/ pvtm_avr_value. The minimum period OSC_RING clock is T= cal_cnt_auto*(Period of clk_pvtm clock)/pvtm_min_value, the minimum cell delay value is T/2. The frequency calculation of average and maximum value is same with minimum value.

Chapter 18 PVTPLL

18.1 Overview

PVTPLL is used to monitor the chip performance variance caused by chip process, voltage and temperature, and generate a set of reference signals for adjusting the voltage of the chip.
PVTPLL supports the following features:

- A clock oscillation ring is integrated and used to generate a clock like signal (osc_clk), the frequency of this clock is determined by the cell delay value of clock oscillation ring circuit
- A frequency counter(osc_cnt) is used to measure the frequency of 'osc_clk'
- A externally input clock (ref_clk) is used as a reference clock for detecting the frequency of 'osc_clk'
- A calculation counter uses 'ref_clk' to generate a configurable periodic timing window
- The time-counter is used to measure the frequency of 'osc_clk'
- Support for dividing the ref_clk and osc_clk
- Support for configuring the effective polarity of the voltage regulator signal 'OUT'
- Six PVTPLL are instantiated in RK3588: PVTPLL_BIGCORE0, PVTPLL_BIGCORE1, PVTPLL_LITCORE, PVTPLL_DSU, PVTPLL_GPU and PVTPLL_NPU
- PVTPLL_BIGCORE0, PVTPLL_BIGCORE1, PVTPLL_LITCORE, PVTPLL_DSU
  - Support 6 different types of inverter cell selection
- PVTPLL_GPU and PVTPLL_NPU
  - Support 2 different types of inverter cell selection
- Support 64 levels of different length inverter osc_ring selection

18.2 Block Diagram

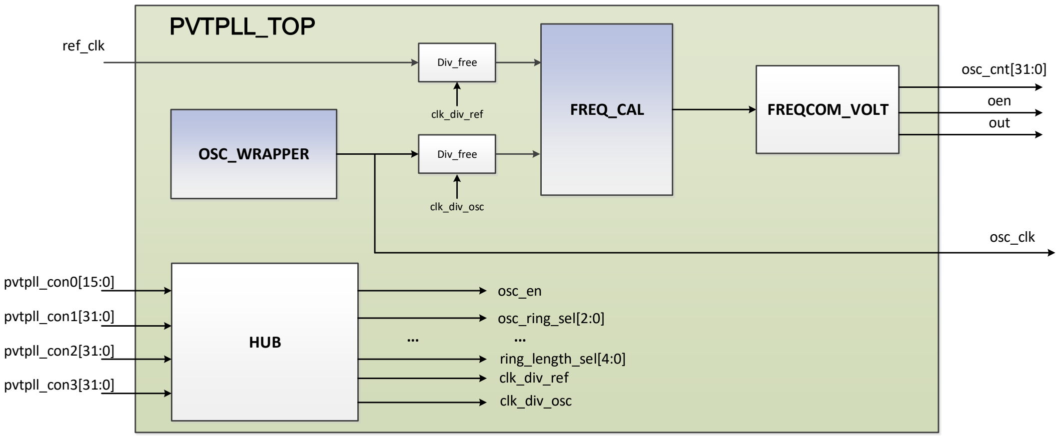

Fig. 18-1 VTPLL Block Diagram

The PVTPLL include four main blocks:
(1)OSC_RING: it is composed with inverters with odd number, which is used to generate a clock. And PVTPLL support multiple type clock oscillation ring and different length osc_ring.
(2)FREQ_CAL: it is used to measure the frequency of clock which generated from the RING_OSC block.
(3)FREQCOMP_VOLT: it is used to generate a set of reference signals for adjusting the voltage of the chip.
(4)HUB: it is used to split GRF signals into internal functional signals.

18.3 Function Description

18.3.1 Interfaces

The PVTPLL is controlled by GRF and CRU, and the monitoring results are obtained by GRF.

Table 18-1 PVTPLL Interfaces

Clock and Reset			
ref_clk	I		Reference Clock
resetn	I		LOW : active
DFT Signals			
soc_scan_mode	I		SOC scan mode control

scan_clk_pvtpll	I		Scan Clock
soc_test_mode	I		SOC test mode enable
tm_pvtpll_oen	O		Test mode
tm_pvtpll_out	O		Test mode
tm_pvtpll_osc_cnt_valid	O		Test mode
Control Signals			
pvtpll_con0[31:0]	I	pvtpll_con0[0]	pvtpll_start PVT_PLL monitor start control
		pvtpll_con0[1]	osc_en osc_ring enable
		pvtpll_con0[2]	out_polar 0: ‘out=1’ when need to increase volt 1: ‘out=0’ when need to increase volt
		pvtpll_con0[7:3]	Reserved
		pvtpll_con0[10:8]	osc_ring_sel[2:0] osc_ring channel select
		pvtpll_con0[12:11]	clk_div_ref[1:0] Frequency division factor for ref_clk
		pvtpll_con0[14:13]	clk_div_osc[1:0] Frequency division factor for osc_clk
		pvtpll_con0[15]	bypass 0: Support glitch-free frequency switching 1: Not support
		pvtpll_con0[21:16]	ring_length_sel[5:0] osc_ring inverter length select
		pvtpll_con0[31:22]	Reserved
pvtpll_con1[31:0]	I		cal_cnt[31:0] Frequency measurement period
pvtpll_con2[31:0]	I	pvtpll_con2[15:0]	threshold[15:0] Count difference threshold value
		pvtpll_con2[31:16]	ckg_val[15:0] Clk-gating interval control count value
pvtpll_con3[31:0]	I		ref_cnt[31:0] Target reference frequency value
Output Signals			
oen	O		Voltage regulation enable signal Low active
out	O		Voltage regulation indication signal
osc_cnt[31:0]	O		osc_clk counter value
osc_cnt_avg[31:0]	O		osc_clk counter average
osc_clk	O		osc_ring output clock

Table 18-2 The Registers used to control PVTPLL

18.3.2 OSC RING

Each PVTPLL contains multiple OSC_RINGs that use different types of inverter cell. The number of OSC_RING is defined according to the requirements of each item. “osc_ring_sel[2:0]” is used to select which OSC_RING to use. The correspondence between “osc_ring_sel[2:0]” and the type of inverter cell is shown in the following table 1-2. The number of inverters in each OSC_RING can also be selected by the interface signal “ring_legth_sel[4:0]”. The correspondence between “ring_length_sel[5:0]” and the number of inverters is shown in the following table 1-3.

Table 18-3 Inverter Cell Type

Instance	osc_ring_sel	Inverter Cell Type
PVTPLL_BIGCORE0 PVTPLL_BIGCORE1 PVTPLL_LITCORE PVTPLL_DSU	0	HDBLVT20_INV_S_4
	1	HDBLVT22_INV_S_4
	2	Reserved
	3	HDBSVT22_INV_S_4
	4	HDBLVT20_INV_SHSDB_4

	n	(n+20)*2
	...	...
	61	162

Instance	ring_length_sel	Number of Inverters
	62	164
	63	166

18.3.3 Frequency Measurement

'osc_clk' is generated by the internal OSC_RING. The time-counter is used to measure the frequency of 'osc_clk', and the time-counter uses ref_clk as counting clock. PVTPLL generates a signal for frequency stabilization by comparing the count values of osc_cnt and ref_cnt in the same time period.

The measurement period is configured through the interface signal cal_cnt[31:0]. At the end of each measurement period, the value of osc_cnt is equivalent to the frequency of osc_clk. The osc_cnt value is compared with the reference value ref_cnt to generate a signal(out) for external voltage regulation.

18.3.4 Voltage Regulation Signal

After starting the auto-regulation function, if osc_cnt[31:0] > (ref_cnt[31:0]+threshold[31:0]) or osc_cnt[31:0] < (ref_cnt[31:0]-threshold[31:0]), the voltage regulation enable signal 'oen' is set to 0, and the value of the voltage adjustment signal 'out' changes according to the set voltage regulation polarity signal 'out_polar', and the corresponding relationship is as shown below:

Out_polar=0: 'out=1' when need to increase voltage; 'out=0' when need to reduce voltage.

Out_polar=1: 'out=0' when need to increase voltage; 'out=1' when need to reduce voltage.

18.4 Application Notes

1. Configure osc_ring_sel and ring_length_sel.
2. Set osc_en to 1 to enable the generated clock.
3. Configure cal_cnt, ref_cnt and threshold, and set out_polar to appropriate value.
4. Set pvtpll_start to 1 to start automatic detection of the frequency and output voltage regulation signal 'out'.

Chapter 19 MIPI CSI HOST

19.1 Overview

The CSI-2 Host Controller is designed to receive data from a CSI-2 compliant camera sensor. A D-PHY configured as a Slave acts as the physical layer.
The MIPI CSI-2 Host Controller supports the following features:

- Compliant with MIPI Alliance Specification for CSI-2, Version 1.01.00-9 November 2010
- Interface with MIPI D-PHY v1.2/D-PHY v2.0/C-PHY v1.1
- Up to four D-PHY RX data lanes or three C-PHY RX data lanes.
- Dynamically configurable multi-lane merging
- Long and Short packet decoding
- Timing accurate signaling of Frame and Line synchronization packets
- Several Frame formats
  - General Frame or Digital Interlaced Video with or without accurate sync timing
  - Data Type (Packet or Frame Level) and Virtual Channel interleaving
- 32-bit Image Data Interface delivering data formatted as recommended in CSI-2 Specification
- All primary and secondary data formats
  - RGB, YUV, and RAW color space definitions
  - From 24-bit down to 6-bit per pixel
  - Generic or user-defined byte-based data types
- Error detection and correction
  - PHY level
  - Packet level
  - Line level
  - Frame level
- Support DSI video mode/command mode

19.2 Block Diagram

The following diagram shows the MIPI CSI-2 Host Controller architecture.

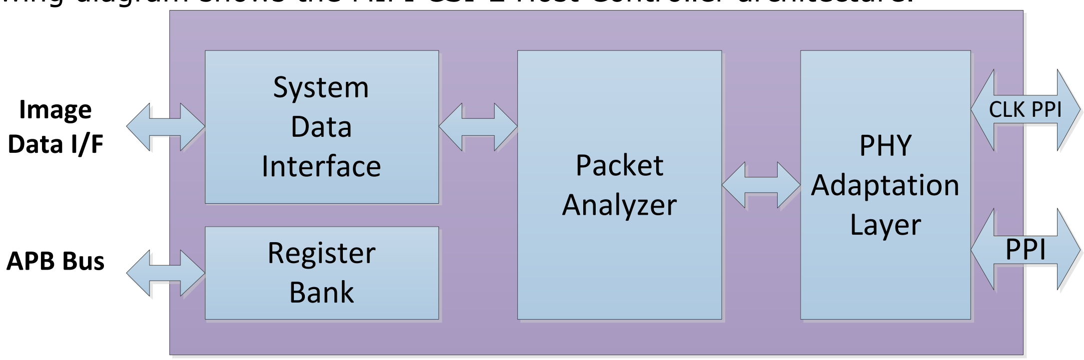

Fig. 19-1 MIPI CSI-2 Host Controller Architecture

- **PHY Adaptation Layer**: Manages the D-PHY PPI interface
- **Packet Analyzer**: Merges the data from the different lanes
- **Image Data Interface**: Reorders pixels into 32-bit data for memory storage and generates timing accurate video synchronization signals
- **AMBA-APB Register Bank**: Provides access to configuration and control registers

19.3 Function Description

19.3.1 Supported Resolutions and Frame Rates

The CSI-2 specification does not define the supported standard resolutions or frame rates. Camera sensor resolution, blanking periods, synchronization events, frame rates, and pixel color depth play a fundamental role in the required bandwidth. All these variables make it difficult to define a standard procedure to estimate the minimum lane rate and the minimum number of lanes that support a specific CSI-2 device.
Following table presents some predefined and supported camera settings, assuming the following:

- Clock lane frequency is 500 MHz or 750 MHz that results in a bandwidth of 1 Gbps or 1.5 Gbps respectively, for each data lane.
- No significant control/reserved traffic is present on the link when pixel data is being transmitted.

The last column of following table presents the minimum number of lanes required for each configuration.

Table 19-1 Supported Camera Settings

Mega Pixels	Mega Pixels with Overhead	Refresh Rate (Hz)	Color Depth (bpp)	CSI2 BW (Mbits)	D-PHY at 1 Gbps Number of Lanes	D-PHY at 1.5Gbps Number of Lanes
2MP	2560000	15	24	922	1	1
2MP	2560000	30	24	1843	2	2
3MP	3840000	15	16	922	1	1
3MP	3840000	30	16	1843	2	2
3MP	3840000	30	24	2765	3	2
5MP	6400000	15	16	1536	2	2
5MP	6400000	15	24	2304	3	2
5MP	6400000	30	16	3072	4	3

16MP	20480000	15	12	3686	4	3
Video Formats						
1280x720 pixels(720p)	921600	30	24	664	1	1
1280x720 pixels(720p)	921600	60	24	1327	2	1
1920x1080 pixels(1080p)	2073600	60	24	2986	3	2

19.3.2 Error Detection

The CSI-2 Host Controller analyzes the received packets and determines if there are protocol errors. It is possible to monitor the following errors:

- Frame errors such as incorrect Frame sequence, reception of a CRC error in the most recent frame, and the mismatch between Frame Start and Frame End
- Line errors such as incorrect line sequence and mismatch between Line Start and Line End
- Packet errors such as ECC or CRC mismatch
- D-PHY errors such as synchronization pattern mismatch

Following table shows all the errors that CSI-2 Host Controller can identify.

Table 19-2 Errors Identified by the CSI-2 Host Controller

Error	Description	Level	Action
phy_errsotsynchs_*	Start of transmission error on data lane* with no synchronization achieved	PHY	Packets with this error are not delivered in IDI interface
phy_erresc_*	Escape entry error (ULPM) on data lane*	PHY	Informative only. Error is acknowledged in the register and the interrupt pin is raised.
phy_errsoths_*	Start of transmission	PHY	Informative only since

	error on data lane* but synchronization can still be achieved		PHY can recover from this error. Error is acknowledged in register and the interrupt pin is raised.
vc*_err_crc	Checksum error detected on virtual channel*	Packe t	Informative only. Error is acknowledged in the register and Interrupt pin is raised.
vc*_err_crc	Header ECC contains one error detected on virtual channel*	Packe t	Informative only since controller can recover the correct header. Error is acknowledged in the register and the interrupt pin is raised.
err_ecc_double	Header ECC contains two errors. Unrecoverable.	Packe t	Packets with this error are not delivered in IDI.s
err_id_vc*	Unrecognized or unimplemented data type detected in virtual channel*	Packe t	Informative only. Error is acknowledged in the register and the interrupt pin is raised
err_f_bndry_matc h_vc*	Error matching Frame Start with Frame End for virtual channel*	Fram e	Informative only. Error is acknowledged in register and the interrupt pin is raised if not masked.
err_f_seq_vc*	Incorrect Frame Sequence detected in virtual channel*	Fram e	Informative only. Error is acknowledged in register and the interrupt pin is raised if not masked.
err_frame_data_v c*	Last received frame, in virtual channel*, had at least one CRC error	Fram e	Informative only. Error is acknowledged in the register and the interrupt pin is raised.

19.4 Register Description

19.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
CSI2HOST_VERSION	0x0000	W	0x00000000	Controller version identification
CSI2HOST_N_LANES	0x0004	W	0x00000000	Number of active data lanes
CSI2HOST_CSI2_RESETN	0x0010	W	0x00000000	CSI2 controller reset
CSI2HOST_PHY_STATE	0x0014	W	0x00000000	General settings for all blocks
CSI2HOST_ERR1	0x0020	W	0x00000000	Error state register 1
CSI2HOST_ERR2	0x0024	W	0x00000000	Error state register 2
CSI2HOST_MSK1	0x0028	W	0x00000000	Masks for errors 1
CSI2HOST_MSK2	0x002C	W	0x00000000	Masks for errors 2
CSI2HOST_CONTROL	0x0040	W	0x0C204000	Control

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

19.4.2 Detail Registers Description

CSI2HOST_VERSION

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	version Version of the csi2host.

CSI2HOST_N_LANES

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x0	n_lanes Number of active data lanes. 2'b00: 1 data lane(lane 0) 2'b01: 2 data lanes(lane0 and 1) 2'b10: 3 data lanes(lane0,1,and 2) 2'b11: 4 data lanes(ALL) Can only be updated when the D-PHY lane is in the Stop state.

CSI2HOST_CSI2_RESETN

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	csi2_resetn CSI2 controller reset output. Active low.

CSI2HOST_PHY_STATE

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31	RW	0x0	bypass_2ecc_tst Payload Bypass test mode for double ECC errors.
30:15	RO	0x0000	reserved
14	RO	0x0	phy_rxactivehs_3 Lane3 high-speed receive active. Active high.
13	RO	0x0	phy_rxactivehs_2 Lane2 high-speed receive active. Active high.
12	RO	0x0	phy_rxactivehs_1 Lane1 high-speed receive active. Active high.
11	RO	0x0	phy_rxactivehs_0 Lane0 high-speed receive active. Active high.
10	RO	0x0	phy_stopstateclk Clock lane in Stop state.

Bit	Attr	Reset Value	Description
9	RO	0x0	phy_rxulpsclknot This signal indicates that the clock lane module has entered the Ultra Low Power state. Active low.
8	RO	0x0	phy_rxclkactivehs Indicates that the clock lane is actively receiving a DDR clock.
7	RO	0x0	phy_stopstatedata_3 Data lane 3 in Stop state.
6	RO	0x0	phy_stopstatedata_2 Data lane 2 in Stop state.
5	RO	0x0	phy_stopstatedata_1 Data lane 1 in Stop state.
4	RO	0x0	phy_stopstatedata_0 Data lane 0 in Stop state.
3	RO	0x0	phy_rxulpsesc_3 Lane module0 has entered the Ultra Low Power mode.
2	RO	0x0	phy_rxulpsesc_2 Lane module2 has entered the Ultra Low Power mode.
1	RO	0x0	phy_rxulpsesc_1 Lane module1 has entered the Ultra Low Power mode.
0	RO	0x0	phy_rxulpsesc_0 Lane module0 has entered the Ultra Low Power mode.

CSI2HOST_ERR1

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31	RW	0x0	err_ph_crc_lane2 Packet crc error of lane2 when sw_cphy_en=1.
30	RW	0x0	err_ph_crc_lane1 Packet crc error of lane1 when sw_cphy_en=1.
29	RW	0x0	err_ph_crc_lane0 Packet crc error of lane0 when sw_cphy_en=1.
28	RO	0x0	err_ecc_double Header ECC contains 2 errors, unrecoverable.
27	RO	0x0	vc3_err_crc Checksum error detected on virtual channel 3.
26	RO	0x0	vc2_err_crc Checksum error detected on virtual channel 2.
25	RO	0x0	vc1_err_crc Checksum error detected on virtual channel 1.
24	RO	0x0	vc0_err_crc Checksum error detected on virtual channel 0.
23:16	RO	0x00	reserved

Bit	Attr	Reset Value	Description
15	RO	0x0	err_frame_data_vc3 Last received frame, in virtual channel 3, had at least one CRC error.
14	RO	0x0	err_frame_data_vc2 Last received frame, in virtual channel 2, had at least one CRC error.
13	RO	0x0	err_frame_data_vc1 Last received frame, in virtual channel 1, had at least one CRC error.
12	RO	0x0	err_frame_data_vc0 Last received frame, in virtual channel 0, had at least one CRC error.
11	RO	0x0	err_f_seq_vc3 Incorrect frame sequence detected in virtual channel 3.
10	RO	0x0	err_f_seq_vc2 Incorrect frame sequence detected in virtual channel 2.
9	RO	0x0	err_f_seq_vc1 Incorrect frame sequence detected in virtual channel 1.
8	RO	0x0	err_f_seq_vc0 Incorrect frame sequence detected in virtual channel 0.
7	RO	0x0	err_f_bndry_match_vc3 Error matching frame start with frame end for virtual channel 3.
6	RO	0x0	err_f_bndry_match_vc2 Error matching frame start with frame end for virtual channel 2.
5	RO	0x0	err_f_bndry_match_vc1 Error matching frame start with frame end for virtual channel 1.
4	RO	0x0	err_f_bndry_match_vc0 Error matching frame start with frame end for virtual channel 0.
3	RO	0x0	phy_errsotsynchs_3 Start of transmission error on data lane 3.
2	RO	0x0	phy_errsotsynchs_2 Start of transmission error on data lane 2.
1	RO	0x0	phy_errsotsynchs_1 Start of transmission error on data lane 1.
0	RO	0x0	phy_errsotsynchs_0 Start of transmission error on data lane 0(no synchronization achieved).

CSI2HOST_ERR2

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:28	RO	0x0	reserved
27	RW	0x0	cphy_errcodehs_3 Lane 3 receive invalid code whensw_cphy_en=1.

Bit	Attr	Reset Value	Description
26	RW	0x0	cphy_errcodehs_2 Lane 2 receive invalid code whensw_cphy_en=1.
25	RW	0x0	cphy_errcodehs_1 Lane 1 receive invalid code whensw_cphy_en=1.
24	RW	0x0	cphy_errcodehs_0 Lane 0 receive invalid code whensw_cphy_en=1.
23:16	RO	0x00	reserved
15	RW	0x0	err_id_vc3 Unrecognized or unimplemented data type detected in virtual channel 3.
14	RW	0x0	err_id_vc2 Unrecognized or unimplemented data type detected in virtual channel 2.
13	RW	0x0	err_id_vc1 Unrecognized or unimplemented data type detected in virtual channel 1.
12	RW	0x0	err_id_vc0 Unrecognized or unimplemented data type detected in virtual channel 0.
11	RW	0x0	vc3_err_ecc_corrected Header error detected and corrected on virtual channel 3.
10	RW	0x0	vc2_err_ecc_corrected Header error detected and corrected on virtual channel 2.
9	RW	0x0	vc1_err_ecc_corrected Header error detected and corrected on virtual channel 1.
8	RW	0x0	vc0_err_ecc_corrected Header error detected and corrected on virtual channel 0.
7	RW	0x0	phy_errsoths_3 Start of transmission error on data lane 3(synchronization can still be achieved).
6	RW	0x0	phy_errsoths_2 Start of transmission error on data lane 2(synchronization can still be achieved).
5	RW	0x0	phy_errsoths_1 Start of transmission error on data lane 1(synchronization can still be achieved).

CSI2HOST_CONTROL

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:26	RW	0x03	sw_datatype_le The datatype of line end.
25:20	RW	0x02	sw_datatype_ls The datatype of line start.
19:14	RW	0x01	sw_datatype_fe The datatype of frame end.
13:8	RW	0x00	sw_datatype_fs The datatype of frame start.
7:5	RO	0x0	reserved
4	RW	0x0	sw_dsi_en 1'b0: For csi2 1'b1: For dsi
3:1	RO	0x0	reserved
0	RW	0x0	sw_cphy_en 1'b0: For dphy 1'b1: For cphy

19.5 Application Notes

- The most important step is configuring the right CSI2HOST_N_LANES before pulling up csi_resetn. If the host is used to receive DSI data, the sw_dsi_en must be enabled, and the sw_datatype_fs, sw_datatype_fe, sw_datatype_ls, sw_datatype_le must be configured correctly. When the sw_dsi_en is enabled, those debug or error detection registers are useless.
- There are six MIPI CSI HOST in RK3588 SOC, CSI HOST0 is connected to MIPI CD Combo PHY0, CSI HOST1 is connected to MIPI CD Combo PHY1, CSI HOST2/3 are connected to MIPI DPHY0, CSI HOST4/5 are connected to MIPI DPHY1.
- When MIPI DPHY0 works in full mode, the SYS_GRF SOC_CON2[6] should be set to 0, and the CSI HOST2/3 are both connected to MIPI DPHY0 4 lanes. In this case CSI HOST3 is suggested not to use.
- When MIPI DPHY0 works in split mode, the SYS_GRF SOC_CON2[6] should be set to 1,

and CSI HOST2/3 could be connected to MIPI DPHY0 lane0/1 or lane2/3 according to the SYS_GRF SOC_CON2[8]/[9].

- When MIPI DPHY1 works in full mode, the SYS_GRF SOC_CON2[7] should be set to 0, and the CSI HOST4/5 are both connected to MIPI DPHY1 4 lanes. In this case CSI HOST5 is suggested not to use.
- When MIPI DPHY1 works in split mode, the SYS_GRF SOC_CON2[7] should be set to 1, and CSI HOST4/5 could be connected to MIPI DPHY1 lane0/1 or lane2/3 according to the SYS_GRF SOC_CON2[10]/[11].

Chapter 20 MIPI CSI DPHY

20.1 Overview

The features of MIPI CSI DPHY are as follow:

- Analog mixed-signal hard-macro LP/HS Receiver solution
- Designed to MIPI v1.2 Specifications
- Integrated PHY Protocol Interface(PPI) interfaces to DSI/CSI and UniPro MIPI protocols
- 2.5 Gbps maximum data transfer rate per lane
- Expandable to support 4 data lanes, providing up to 10 Gbps transfer rate
- HS-RX, LP-RX, LP-TX and Calibration supported
- 10Mbps per lane in low-power mode
- Unidirectional and bi-directional modes supported
- Automatic termination control for HS and LP modes
- Buffers with tunable On-Die-Termination
- Includes embedded ESD, boundary scan and BIST
- Dual clock lanes mode supported

20.2 Block Diagram

MIPI D-PHY configuration contains one Clock Lane Module and four Data Lane Modules. Each of these PHY Lane Modules communicates via two Lines to a complementary part at the other side of the Lane Interconnect. Figure below shows a Universal Lane Module Diagram with a global overview of internal functionality of the CIL function. This Universal Module can be used for all Lane types. The requirements for the ‘Control and Interface Logic’(CIL) function depend on the Lane type and Lane side.

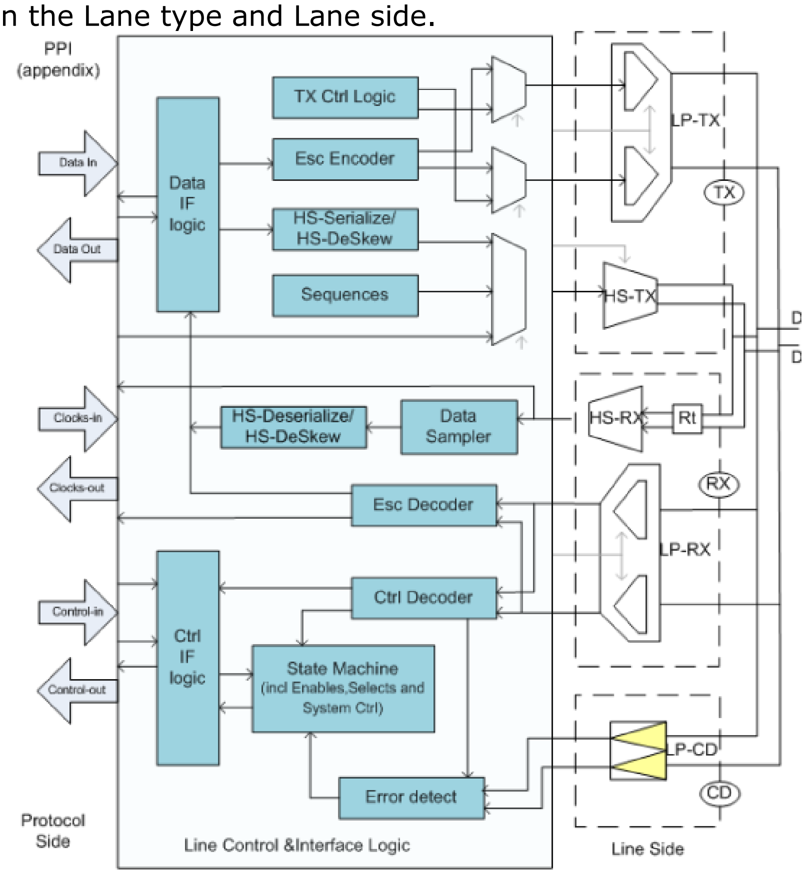

Fig. 20-1 MIPI CSI DPHY Block Diagram

20.3 Register Description

20.3.1 Registers Summary

Name	Offset	Size	Reset Value	Description
CSI_DPHY_LANE_EN	0x0000	W	0x00000001	Clk/data lane enable
CSI_DPHY_LANE_CK1_EN	0x002C	W	0x0000001E	Clk1 lane enable

Name	Offset	Size	Reset Value	Description
CSI_DPHY_DIGITAL_CLK_PHASE	0x0034	W	0x000000C0	Digital clock phase
CSI_DPHY_LANE_CLK_3_PHASE	0x0038	W	0x00000036	Lane clock/3 phase
CSI_DPHY_LANE_2_1_0_PHASE	0x003C	W	0x000000DB	Data lane 2/1/0 phase
CSI_DPHY_DIGITAL_CLK_REVERSE	0x0048	W	0x00000010	Digital clock reverse
CSI_DPHY_DUAL_CLK_ENABLE	0x0080	W	0x0000001F	MIPI/LVDS enable
CSI_DPHY_LANE_CLK1_PHASE	0x00CC	W	0x00000030	Lane clock1 phase
CSI_DPHY_LANE_CK_MODE	0x0128	W	0x0000000F	Clock lane mode
CSI_DPHY_LANE_CK_MSB	0x0138	W	0x00000086	MSB enable
CSI_DPHY_LANE_CK_TTAGO	0x0140	W	0x00000004	The value of counter for Tta-go of turnaround
CSI_DPHY_LANE_CK_TTASURE	0x0144	W	0x00000001	The value of counter for Tta-sure of turnaround
CSI_DPHY_LANE_CK_TTAWAIT	0x0148	W	0x00000032	The value of counter for Tta-wait of turnaround
CSI_DPHY_LANE_CK_THSSETTLE	0x0160	W	0x0000001B	The count time of the THS-SETTLE by protocol
CSI_DPHY_LANE_CK_CAL_EN	0x0168	W	0x0000007F	Calibration reception enable
CSI_DPHY_LANE_0_MSB	0x01B8	W	0x00000086	MSB enable
CSI_DPHY_LANE_0_TTAGO	0x01C0	W	0x00000004	The value of counter for Tta-go of turnaround
CSI_DPHY_LANE_0_TTASURE	0x01C4	W	0x00000001	The value of counter for Tta-sure of turnaround
CSI_DPHY_LANE_0_TTAWAIT	0x01C8	W	0x00000032	The value of counter for Tta-wait of turnaround

20.3.2 Detail Registers Description

CSI_DPHY_LANE_EN

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	lane_en_ck Enable D-PHY clock lane:active high.
5	RW	0x0	lane_en_3 Enable D-PHY lane3:active high.
4	RW	0x0	lane_en_2 Enable D-PHY lane2:active high.
3	RW	0x0	lane_en_1 Enable D-PHY lane1:active high.
2	RW	0x0	lane_en_0 Enable D-PHY lane0:active high.
1:0	RW	0x1	reserved Reserved

CSI_DPHY_LANE_CK1_EN

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	reserved1 Reserved
6	RW	0x0	lane_en_ck1 Enable D-PHY clock1 lane:active high.
5:0	RW	0x1e	reserved Reserved

CSI_DPHY_DIGITAL_CLK_PHASE

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:3	RW	0x18	reserved Reserved
2:0	RW	0x0	digital_clk_phase 3'b000: Phase 0(default value) 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.

CSI_DPHY_LANE_CLK_3_PHASE

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:4	RW	0x3	lane_clk_phase 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.
3:1	RW	0x3	lane_3_phase 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.
0	RW	0x0	lane_2_phase_msb See lane_2_phase for the details of the register.

CSI_DPHY_LANE_2_1_0_PHASE
Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:6	RW	0x3	lane_2_phase {lane_2_phase_msb,lane_2_phase} 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.

2:0	RW	0x3	lane_0_phase 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.

CSI_DPHY_DIGITAL_CLK_REVERSE
Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	digital_clk_reverse 1'b0: Make the digital sample clock positive(default value) 1'b1: Reverse the digital sample clock
6:0	RW	0x10	reserved Reserved

CSI_DPHY_DUAL_CLK_ENABLE
Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	dual_clk_mode_en 1'b0: Enable single clock lane mode 1'b1: Enable dual clock lanes mode

Bit	Attr	Reset Value	Description
5:1	RW	0x0f	reserved Reserved
0	RW	0x1	reg_dig_rstn 1'b0: Reset 1'b1: Normal

CSI_DPHY_LANE_CLK1_PHASE
Address: Operational Base + offset (0x00CC)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:4	RW	0x3	lane_clk1_phase 3'b000: Phase 0 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3(default value) 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.
3	RO	0x0	reserved
2:0	RW	0x0	digital_clk1_phase 3'b000: Phase 0(default value) 3'b001: Phase 1 3'b010: Phase 2 3'b011: Phase 3 3'b100: Phase 4 3'b101: Phase 5 3'b110: Phase 6 3'b111: Phase 7 Phase 0 is earliest and phase 7 is latest. Each step between the adjacent phase is about 40ps.

CSI_DPHY_LANE_CK_MODE
Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:4	RW	0x0	lane_ck_mode 2'b00: Disable continuous clock mode 2'b11: Enable continuous clock mode
3:0	RW	0xf	reserved Reserved

CSI_DPHY_LANE_CK_MSB
Address: Operational Base + offset (0x0138)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x1	reserved1 Reserved
6	RW	0x0	lane_ck_msb MSB enable for pin_rxdatahs_* 1'b0: Disable 1'b1: Enable

Bit	Attr	Reset Value	Description
5:0	RW	0x06	reserved Reserved

CSI_DPHY_LANE_CK_TTAGO

Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x04	lane_ck_ttago The value of counter for Tta-go of turnaround. Tta-go = Ttxclkesc*value.

CSI_DPHY_LANE_CK_TTASURE

Address: Operational Base + offset (0x0144)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x01	lane_ck_ttasure The value of counter for Tta-sure of turnaround. Tta-sure = Ttxclkesc*value.

CSI_DPHY_LANE_CK_TTAWAIT

Address: Operational Base + offset (0x0148)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x32	lane_ck_ttawait The value of counter for Tta-wait of turnaround. Interval from receiving ppi turnaround request to sending esc request. Tta-wait = Ttxclkesc*value.

CSI_DPHY_LANE_CK_THSSETTLE

Address: Operational Base + offset (0x0160)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
5:0	RW	0x1b	lane_ck_thssettle The count time of the THS-SETTLE by protocol. After the count done, D-PHY will begin to receive the high speed data. Frequency(1/UI) Value(HEX) 80-110MHz 02 110-150MHz 03 150-200MHz 06 200-250MHz 06 250-300MHz 06 300-400MHz 08 400-500MHz 0b 500-600MHz 0e 600-700MHz 10 700-800MHz 12 800-1000MHz 16 1000-1200MHz 1e 1200-1400MHz 23 1400-1600MHz 2d 1600-1800MHz 32 1800-2000MHz 37 2000-2200MHz 3c 2200-2400MHz 41 2400-2500MHz 46

CSI_DPHY_LANE_CK_CAL_EN

Address: Operational Base + offset (0x0168)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	lane_ck_cal_en Calibration reception enable. 1'b0: Disable calibration reception 1'b1: Enable calibration reception
6:0	RW	0x7f	reserved Reserved

CSI_DPHY_LANE_0_MSB

Address: Operational Base + offset (0x01B8)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x1	reserved1 Reserved
6	RW	0x0	lane_0_msb MSB enable for pin_rxdatahs_*. 1'b0: Disable 1'b1: Enable
5:0	RW	0x06	reserved Reserved

CSI_DPHY_LANE_0_TTAGO

Address: Operational Base + offset (0x01C0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
5:0	RW	0x04	lane_0_ttago The value of counter for Tta-go of turnaround. Tta-go = Ttxclkesc*value.

CSI_DPHY_LANE_0_TTASURE

Address: Operational Base + offset (0x01C4)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x01	lane_0_ttasure The value of counter for Tta-sure of turnaround. Tta-sure = Ttxclkesc*value.

CSI_DPHY_LANE_0_TTAWAIT

Address: Operational Base + offset (0x01C8)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x32	lane_0_ttawait The value of counter for Tta-wait of turnaround. Interval from receiving ppi turnaround request to sending esc request. Tta-wait = Ttxclkesc*value.

20.4 Application Notes

20.4.1 MIPI SINGLE CLOCK LANE Mode Application

step1: send 0x7d to register LANE_EN. Enable the D-PHY.
step2: send 0x01f001f0 to register CSIDPHY_GRF_CON0.Enable the clock lane and 4 data lanes.
step3: According to data rate, write corresponding value to Ths-settle registers for lanes. If TX skew calibration function is on, send 0xff to register LANE_*_CAL_EN.

20.4.2 MIPI DUAL CLOCK LANES MODE Application

step1: send 0x7d to register CSI_DPHY_LANE_EN. Enable the D-PHY.
step2: send 0x5f to register CSI_DPHY_DUAL_CLK_ENABLE.Enable dual clock lanes mode.
step3: send 0x05f005f0 to register CSIDPHY_GRF_CON0.Enable 2 clock lanes and 4 data lanes.
step4: According to data rate, write corresponding value to Ths-settle registers for lanes. If TX skew calibration function is on, send 0xff to register LANE_*_CAL_EN.

Chapter 21 MIPI DSI-2 Host Controller

21.1 Overview

The Display Serial Interface 2 (DSI-2) is part of a group of communication protocols defined by the MIPI Alliance. The MIPI DSI-2 Host Controller is a digital core that implements all protocol functions defined in the MIPI DSI-2 Specification.
There are two DSI2 host controllers in PD_VOP subsystem, which provide an interface between the Video Output Process and MIPI D-PHY/C-PHY Combo PHY, allowing the communication with a DSI-2-compliant display.

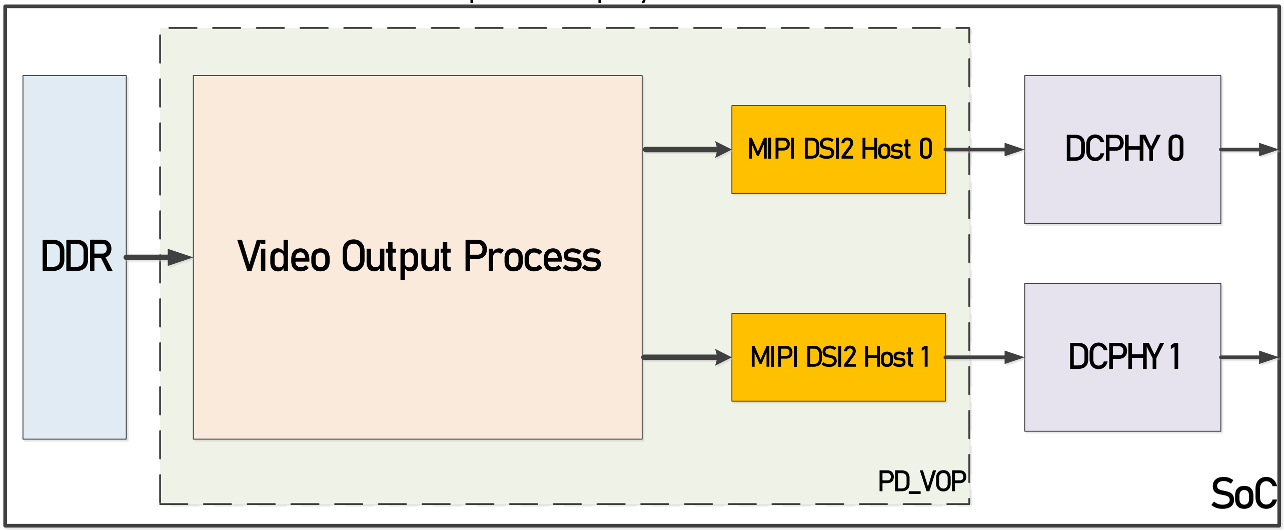

Fig. 21-1 DSI2 Host Controller In SoC

21.2 Features

- Compliant with MIPI Alliance standards
  - MIPI® Alliance Specification for Display Serial Interface 2 (DSI-2) Version 1.1
  - MIPI® Alliance Specification for Display Command Set (DCS) Version 1.4
  - MIPI® Alliance Specification for D-PHY v2.0
  - MIPI® Alliance Specification for C-PHY v1.1
  - AMBA 3.0 Specification (APB)
- Interface with MIPI D-PHY and MIPI C-PHY following PHY Protocol Interface (PPI), as defined in MIPI Alliance Specifications
- All commands defined in the MIPI Alliance specification for Display Command Set (DCS)
  - Request of command packets through the APB interface
  - Low-power and high-speed transmission in Video, Data Stream, and Command modes
- Up to 4.5 Gbps per lane in D-PHY
- Up to 2.0 Gsps per trio in C-PHY
- Four data lanes on D-PHY and three data trios on C-PHY
- Bidirectional communication and escape mode through data lane 0
- Continuous and non-continuous clock modes on D-PHY and non-continuous clock mode on C-PHY
- Packet header ECC/CRC and packet payload CRC Checksum capabilities
- End of Transmission packet (EoTp)
- Fault recovery schemes
- Scrambling

21.2.1 Limitations

- The minimum region size (HAS,HBP,HACT,HFP) is 4 pixels
- The minimum value for the max_pix_pkt field of the IPI_PIX_PKT_CFG register should be 48 pixels. This applies to DataStream and Video Mode operating modes (except for Burst-Mode)
- Automatic Tear Effect is not supported, but can through I/O
- When changing from Video Mode, CRI busy must be cleared

● High-Speed clock period must be different from SYS clock period in the CPHY mode

21.2.2 Unsupported features

● Video pattern generator
● CPHY does not support the non-continuous clock mode
● EoTp is not supported in DataStream mode
● PRI calibration is not supported in CPHY
● PRI is not supported in CPHY

21.3 Function Description

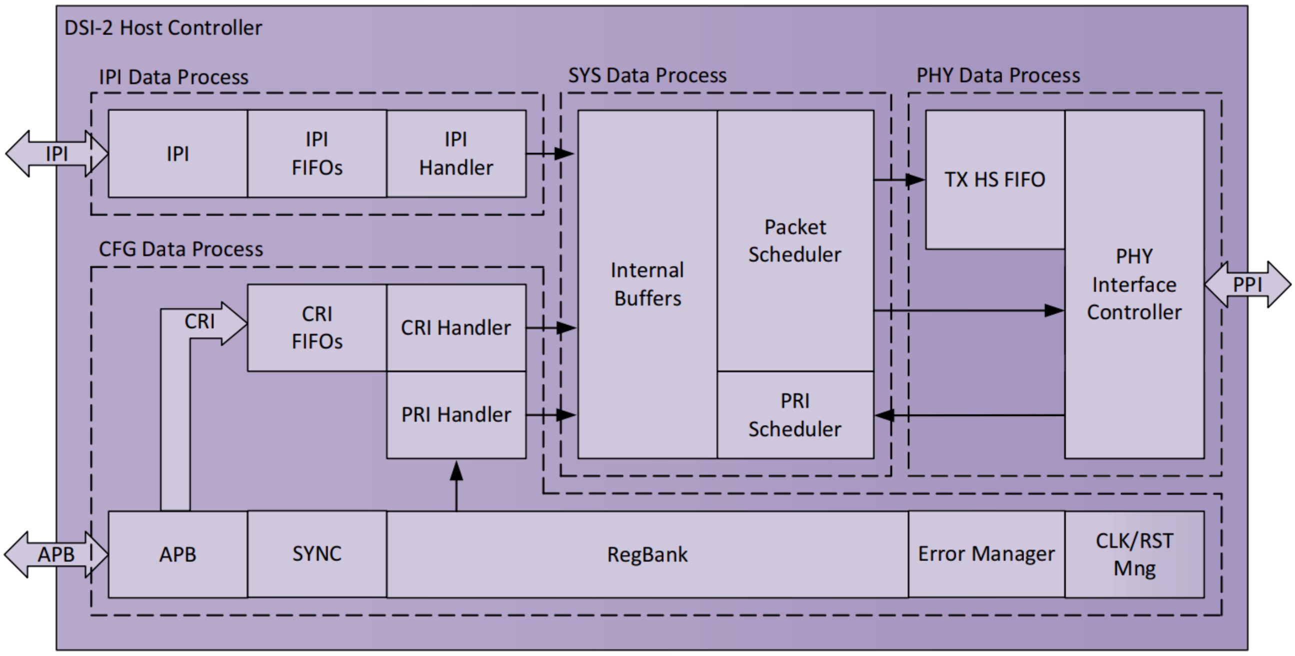

Fig. 21-2 The Architecture of MIPI DSI2 Host Controller

There are four main blocks inside MIPI DSI2 Host Controller:

● CFG Data Process
  1. Handles the AMBA APB 3 interface synchronization to sys_clk domain
  2. Stores and distributes DSI-2 Host configurations across the controller
  3. Manages clocks and resets
  4. Controls the changes between the controller operating modes and the routines for auto calculation
  5. Performs error processing
  6. Handles the CRI and PRI functional interfaces
● IPI Data Process
  1. Handles the Image Pixel Interface (IPI)
  2. Stores IPI events and IPI data into FIFOs to minimize Clock Domain Crossing (CDC) between ipi_clk and sys_clk
  3. Reorganizes IPI pixel data to DSI-2 pixel format
  4. Captures timing information
● SYS Data Process
  1. Contains the main FSMs for the different modes of operation
  2. Defines packet priorities and transmission modes
  3. Constructs the packets to be sent (header, payload, and associated ECC and CRC)
  4. Applies scrambling to the generated packets
● PHY Data Process
  1. Handles the PHY Protocol Interface (PPI)
  2. Sends high-speed data
  3. Sends and receives the low-power data
  4. Monitors PHY related timeouts

21.3.1 Controller Operating Mode

MIPI_DSI2_Host Controller has the following modes of operation:

- Idle Mode: In the Idle mode of operation
  - The controller stops data reception from the IPI, CRI, and PRI interfaces.
  - All the FIFOs are empty.
  - All the FSMs are in the INIT state.
  - There are no pending packets being transmitted or received.
- Auto-Calculation Mode: In the Auto-Calculation mode of operation, the controller
  - Stops the data reception from the IPI, CRI, and PRI interfaces.
  - Starts to calculate all the required PHY related timings.
  - Enters into the Idle mode when the procedure is complete.
- Video mode: In Video mode of operation
  - The controller accepts the IPI and CRI interfaces with IPI generating video frames.
  - The CRI interface requests are transmitted inside the video frame if there is enough time.
- Data Stream mode: In the Data Stream mode of operation, the controller
  - Accepts the IPI, CRI, and PRI interfaces with IPI generating data stream frames.
  - Prioritizes CRI over PRI and sends up to one packet from them at the end of each line from IPI.
- Command mode: In the Command mode of operation, the controller
  - Blocks the data reception from IPI.
  - Accepts CRI and PRI requests prioritizing the CRI requests

21.3.1.1 Idle Mode

Idle mode ensures that the controller is in a known and stable status with no pending packets to send, and ready to work in another operating mode. While changing the operating mode, the controller ensures that the new operating mode is preceded by the Idle mode even without explicitly requesting the Idle mode.
When an operating mode change is requested, or when Idle mode is directly requested, the controller immediately ignores any new request from the CRI and PRI interfaces, and blocks the data reception from IPI at the end of the current frame. Then, it waits until all the remaining packets from these sources are sent, and their respective FIFOs are empty. While in the Idle mode, it blocks the data reception from the IPI, CRI, and PRI interfaces, maintaining all controller FIFOs empty and all FSMs in an INIT state.

21.3.1.2 Video Mode

Video mode transmits the video frames received from IPI. These video frames are transformed in sync events and video packets. The controller attends requests from CRI or Display commands during BLLP (Blanking or low-power) region. MIPI DSI-2 protocol specifies the following video modes:

- Burst Mode
- on-Burst Mode with Sync Pulses
- on-Burst Mode with Sync Events

21.3.1.2.1 Burst Mode

In Burst mode, pixel transmission is time-compressed and the blanking regions are typically bigger. As the pixel transmission is time compressed, pixel data is sent in a single packet. The IPI_PIX_PKT_CFG register has no effect when the controller uses the Burst mode.

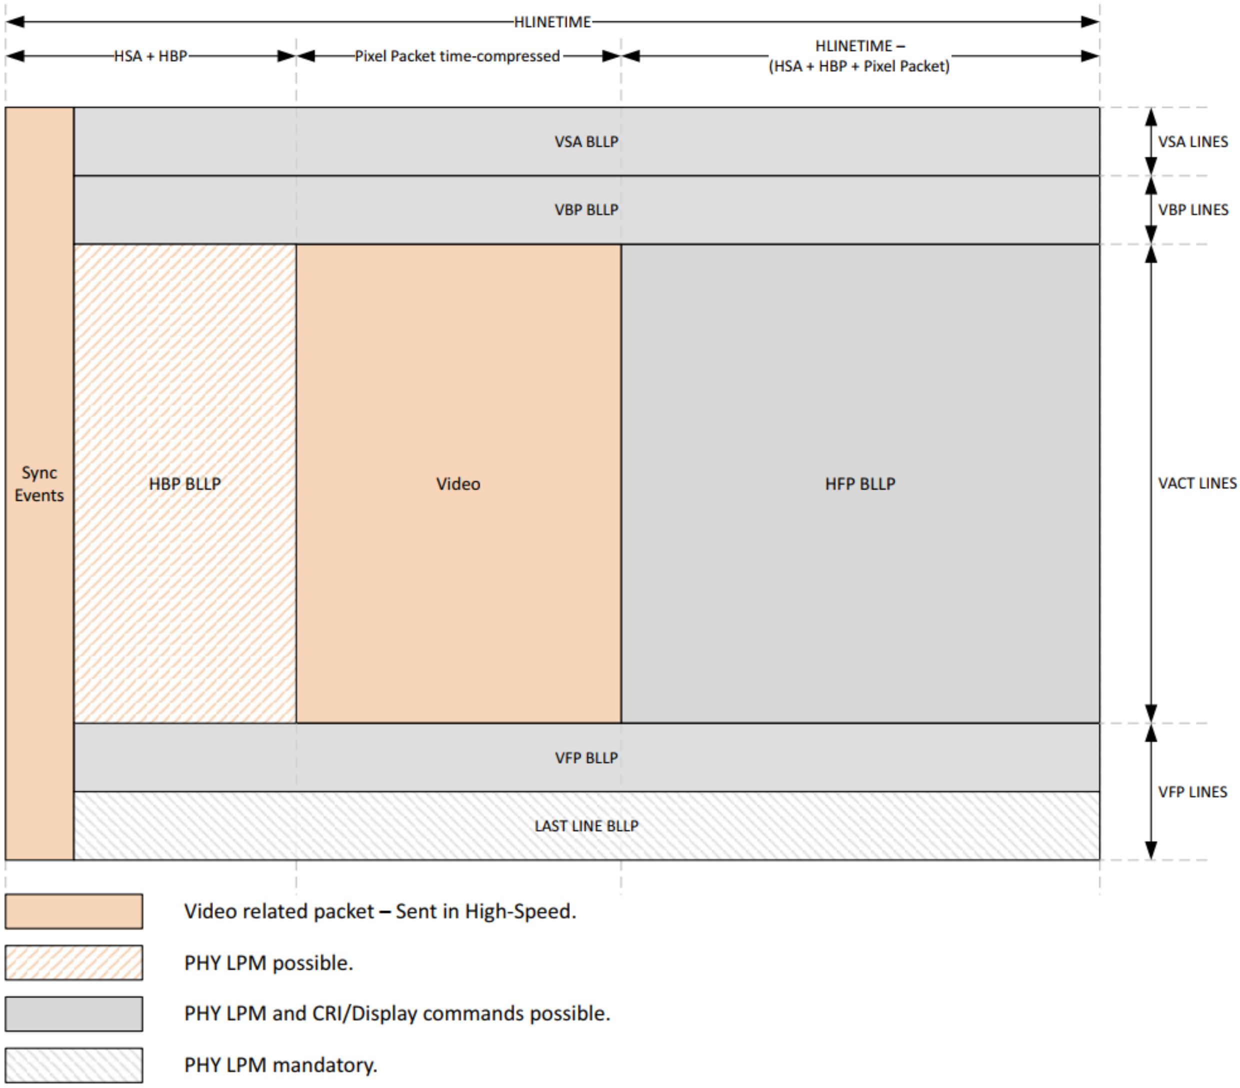

Fig. 21-3 Burst Mode Frame Behavior

21.3.1.2.2 Non-Burst Mode with Sync Pulses

Non-Burst mode with sync pulses enables the controller to accurately reconstruct original video timing and sync pulse widths. The Figure shows a DSI-2 frame transmitted in non-burst mode with sync pulses through PHY Protocol Interface (PPI).

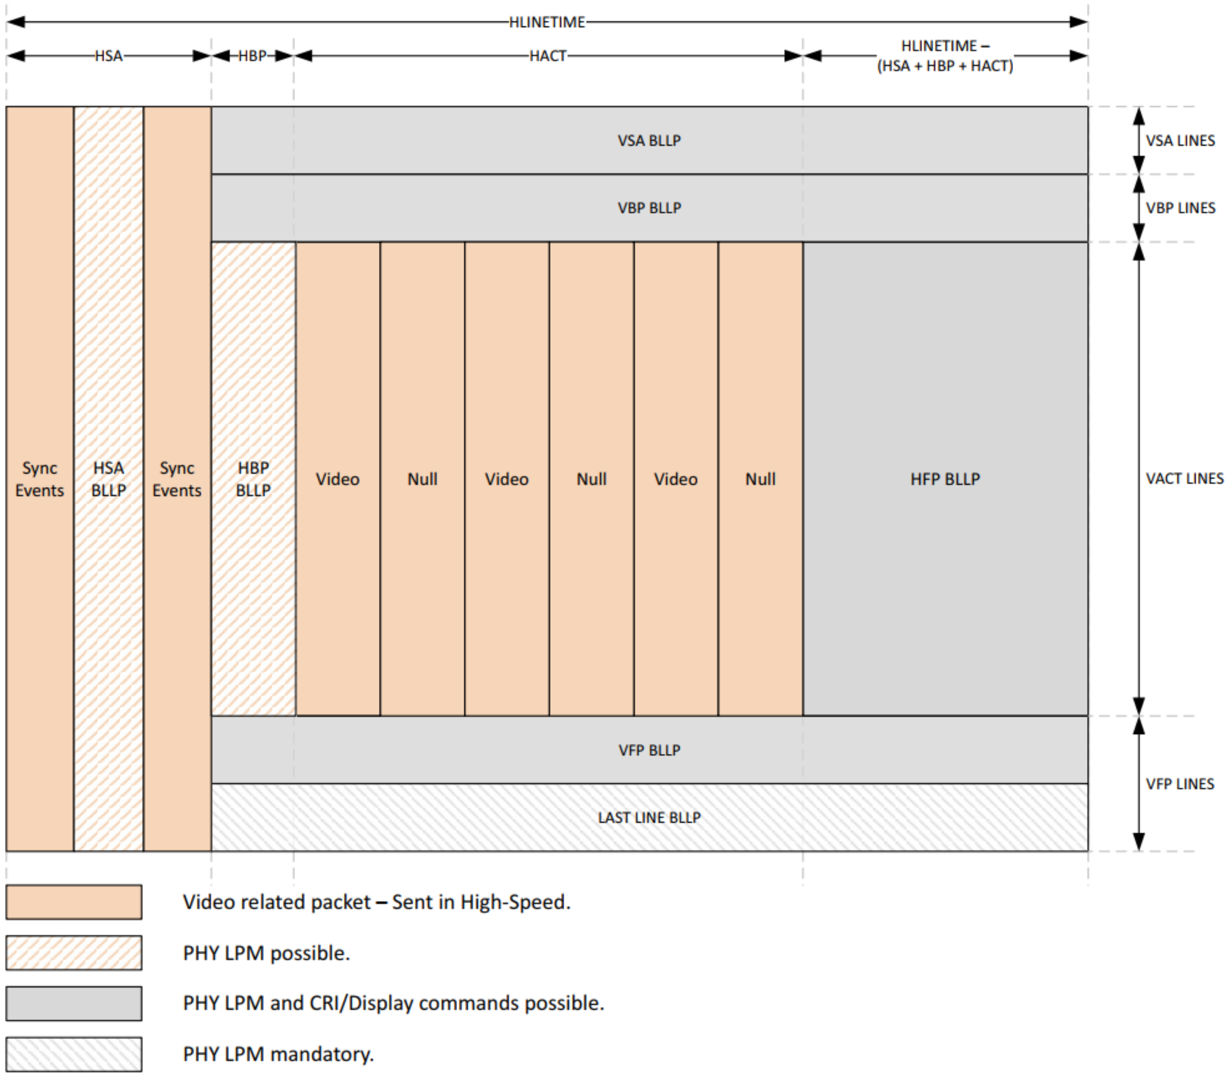

Fig. 21-4 Non-Burst With Sync Pulse Mode Frame Behavior

To adhere to the HACT timing coming from IPI interface, MIPI_DSI2_Host Controller splits the pixel stream in chunks. Each chunk is composed of a pixel packet, and an associated null packet. The number of chunks and pixel packets size depend on the programmed value in the IPI_PIX_PKT_CFG register.

21.3.1.2.3 Non-Burst Mode with Sync Events

The Non-Burst mode with sync events is similar to the Non-Burst mode with sync pulses, but accurate reconstruction of sync pulse widths is not required. The Figure shows a DSI-2 frame transmitted in non-burst mode with sync events through PHY Protocol Interface (PPI).

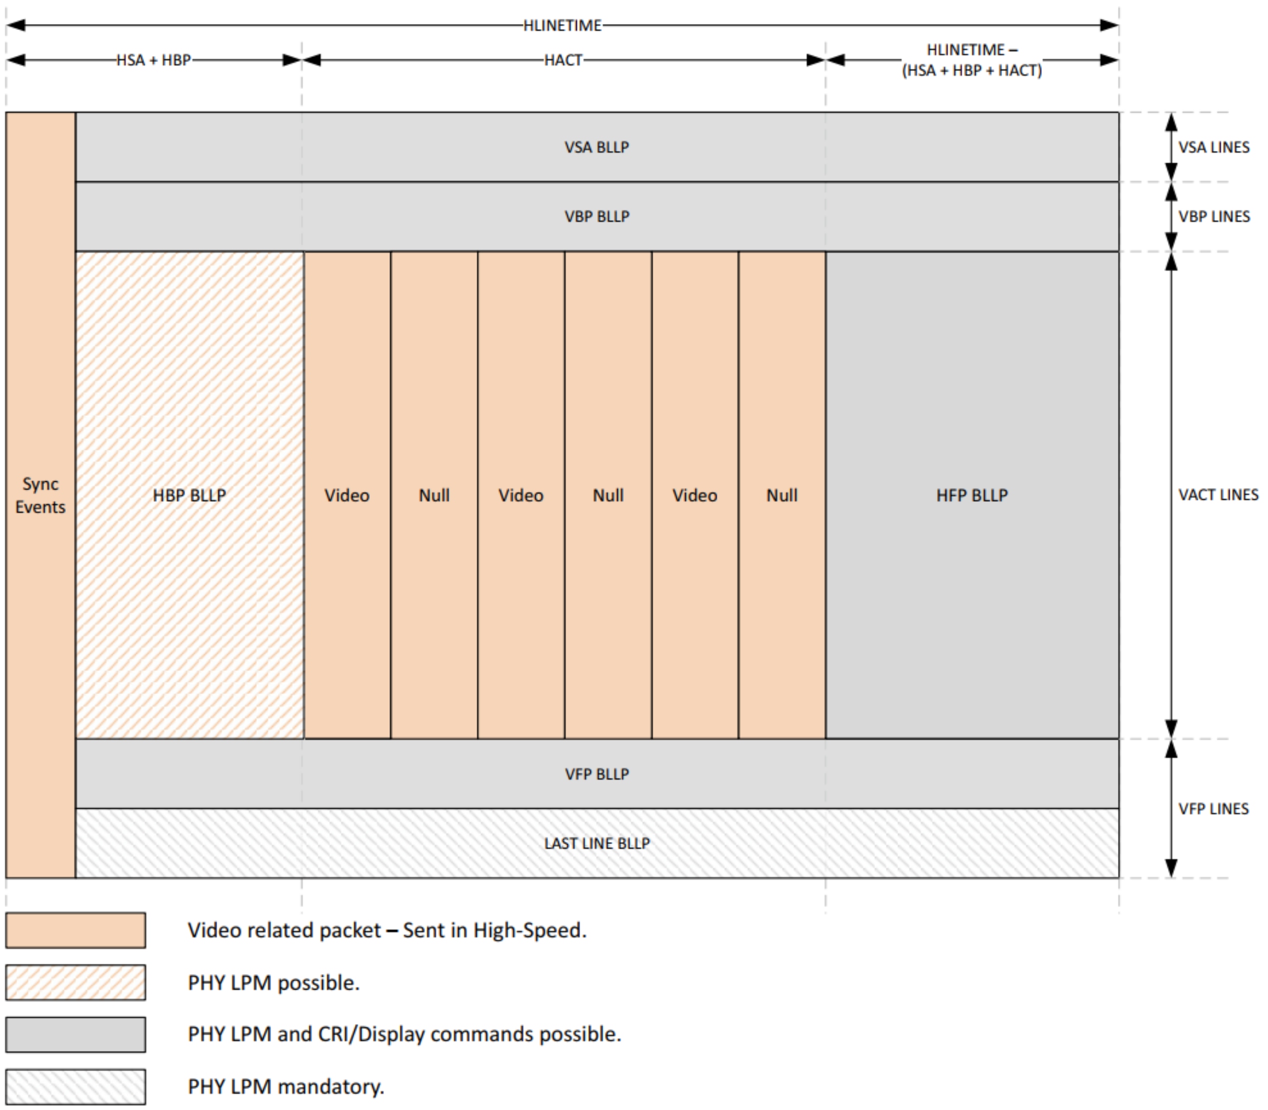

Fig. 21-5 Non-Burst With Sync Event Mode Frame Behavior

21.3.1.3 Data Stream Mode

Data Stream mode is an operating mode that transmits the data stream frames coming from IPI. These frames are transformed in DCS write packets using the Write Memory Start (WMS) and Write Memory Continue (WMC) commands, attending all pending requests from CRI or PRI after the last IPI related packet.

The controller processes the traffics in the following way:

- Start processing the IPI data stream traffic using a WMS command.
- Continue the IPI data stream traffic processing using WMC commands.
- After the last WMS/WMC command from the current frame is sent, process all pending CRI requests.
- Process all pending PRI requests

21.3.1.4 Command Mode

Command mode completely ignores IPI. The controller does not process any traffic that arrives through IPI interface. Instead, it processes requests coming from CRI or PRI interfaces on a first come, first served basis. If the requests are accumulated in the FIFOs of both interfaces, the controller prioritizes CRI traffic over PRI requests.

21.3.2 DSI-2 Options

MIPI_DSI2_Host Controller has a subset of programmable values related to the DSI-2 protocol.

MIPI_DSI2_Host Controller supports the following features:

- Virtual Channels
- Scrambling
- Video Transmission

- Device Compliance

21.3.2.1 Virtual Channels

To be able to transmit or receive packets, MIPI_DSI2_Host controller must be programmed with the virtual channel identifier. Use the DSI_VCID_CFG register:

- To program a virtual channel identifier for all transmitted packets
- To identify the read-back packets to process
- For CRI packet transmissions, virtual channel identifier is programmed in the virtual_channel field of the CRI_TX_HDR register and virtual channel for responses is made available in the virtual_channel field of the CRI_RX_HDR register

21.3.2.2 Scrambling

Data scrambling can be used to mitigate the effects of electromagnetic interferences on the transmissions using a data randomization technique described in DSI-2 specification. Scrambling is applied only on the data payload, and the footer of long packets transmitted in high speed.

Scrambling can be enabled through the DSI_SCRAMBLING_CFG[0] bit. By default, scrambling seed is 0xFFFF as recommended in DSI-2 specification. This value can be changed using the SI_SCRAMBLING_CFG [31:16] bits.

21.3.2.3 Video Transmission

In the Video mode, the transmission of video frames and related details can be programmed through the DSI_VID_TX_CFG register. The vid_mode_type field of the DSI_VID_TX_CFG register controls the video mode transmission type, between burst, non-burst with sync pulses, and non-burst with sync events. This originates different packet sequences in PPI, as described in DSI-2 specification, to precisely replicate the characteristics of each horizontal region. With respect to the horizontal active region data and timing:

- In Burst mode, the controller creates just one video packet which is sent as soon as possible.
- In Non-burst mode, the controller creates multiple video packets, interlacing each one with a null packet as per the IPI_PIX_PKT_CFG register programming.

The size of the null packets is calculated such that the duration of the horizontal active region is preserved in PPI as well.

The controller follows the defined behavior for each video region when the controller has no packets to send. The controller tries to go in low-power (if time allows) unless the option to fill that region with Blanking packets is set.

Display commands mentioned in DSI-2 specification (Turn On, Turn Off, Color Mode On, and Color Mode Off) can be programmed to be transmitted in low-power.

21.3.2.4 Device Compliance

To match the compatibility requirements of the coupled DSI-2 Device, MIPI_DSI2_Host Controller enables or disables some general features. This ensures that both Host and Device can communicate effectively. Following are the features that can be programmed through the DSI_GENERAL_CFG register:

- BTA enable: Determines whether the controller should send Bus Turnaround requests or disable them.
- EoTp transmission: Determines whether the controller should send EoTp in high-speed or not sent at all.

21.3.2.5 DSI-2 Host Controller Timeouts

MIPI_DSI2_Host Controller allows the configuration of several configurable timeouts. All timeouts are measured using phy_lptx_clk. Because it is a clock divided from sys_clk, it is always available to the controller.

When a given timeout period is violated, an interrupt will be triggered in INT_ST_TO register to inform which timeout is breached.

The timeouts measurement on the PPI interface can be divided in three main categories: high-speed transmission, low-power data transmission, and Turnaround.

21.3.3 Debug Capabilities

FIFOs control and status, and FSMs control and status are available through AMBA APB 3 interface to identify the possible error scenarios.

21.3.3.1 FIFO Control and Status

The status of the various FIFOs present on MIPI_DSI2_Host Controller can be read for debug purposes through the OBS_FIFO_STATUS register. This register reports one of the following statuses:

- Empty
- Almost empty - two positions from empty
- Half full
- Almost full - two positions from full
- Full
- Current Word Count

Manual FIFO flush control is provided through the OBS_FIFO_CTRL register, and automatic FIFO flush control is provided using the OBS_FIFO_CFG register.

21.3.3.2 FSM Control and Status

The status of the main FSM present on MIPI_DSI2_Host Controller can be read for debug purposes through the OBS_FSM_STATUS register. This register reports the following statuses:

- Current state
- Previous state
- Current state counter: Counts the number of cycles in the current state

Manual FSM initialization control is provided through the OBS_FSM_CTRL register, and automatic FSM initialization control is provided through the OBS_FSM_CFG register.

21.4 Register Description

21.4.1 Registers Summary

Name	Offset	Size	Reset Value	Description
DSI2_CORE_ID	0x0000	W	0x3130302A	Core identification represented in ASCII
DSI2_VERSION	0x0004	W	0x1A020100	Core version number
DSI2_PWR_UP	0x000C	W	0x00000000	Controls the power up of the core
DSI2_SOFT_RESET	0x0010	W	0x00000007	Controls the soft-reset of individual parts of the IP
DSI2_INT_ST_MAIN	0x0014	W	0x00000000	Contains the status of individual interrupt sources
DSI2_MODE_CTRL	0x0018	W	0x00000000	Controller operating mode change request
DSI2_MODE_STATUS	0x001C	W	0x00000000	Controller operating mode status
DSI2_CORE_STATUS	0x0020	W	0x00000000	Core status
DSI2_MANUAL_MODE_CFG	0x0024	W	0x00000000	Manual mode for setting all timings.
DSI2_OBS_FSM_STATUS_SEL	0x0028	W	0x00000000	FSM selection for status reporting and debug
DSI2_OBS_FSM_STATUS	0x002C	W	0x00000000	Status of the selected FSM
DSI2_OBS_FSM_CFG	0x0030	W	0x00000000	Controls automatic FSM re-initialization options
DSI2_OBS_FSM_CTRL	0x0034	W	0x00000000	Controls manual FSM re-initialization options in case of an FSM stuck.
DSI2_OBS_FIFO_STATUS_SEL	0x0038	W	0x00000000	FIFO selection for status reporting and debugging
DSI2_OBS_FIFO_STATUS	0x003C	W	0x00000000	Status of the selected FSM
DSI2_OBS_FIFO_CFG	0x0040	W	0x00000000	Controls automatic FSM re-initialization options
DSI2_OBS_FIFO_CTRL	0x0044	W	0x00000000	Manual FIFOs flush

Name	Offset	Size	Reset Value	Description
DSI2_TIMEOUT_HSTX_CFG	0x0048	W	0x00000000	Configures the counter for high-speed TX timeout
DSI2_TIMEOUT_HSTXRDY_CFG	0x004C	W	0x00000000	Configures the counter for high-speed TX Ready timeout
DSI2_TIMEOUT_LPRX_CFG	0x0050	W	0x00000000	Configures the counter for low power RX timeout
DSI2_TIMEOUT_LPTXRDY_CFG	0x0054	W	0x00000000	Configures the counter for low-power TX DATA timeout
DSI2_TIMEOUT_LPTXTRIG_CFG	0x0058	W	0x00000000	Configures the counter for low power TX TRIGGER timeout
DSI2_TIMEOUT_LPTXULPS_CFG	0x005C	W	0x00000000	Configures the counter for low power TX ULPS timeout
DSI2_TIMEOUT_BTA_CFG	0x0060	W	0x00000000	Configures the counter for bus turnaround direction timeout
DSI2_PHY_MODE_CFG	0x0100	W	0x00000030	Configures the PHY interface
DSI2_PHY_CLK_CFG	0x0104	W	0x00000000	Configures the clock running type, and the division factor of the phy_lptx_clk clock
DSI2_PHY_STATUS	0x0108	W	0x00000000	Reports the status of PHY
DSI2_PHY_LP2HS_MAN_CFG	0x010C	W	0x00000000	Configures PHY transition time from low-power to high-speed transmission
DSI2_PHY_LP2HS_AUTO_CFG	0x0110	W	0x00000000	Reports measured value for PHY transition time from low-power to high-speed transmission
DSI2_PHY_HS2LP_MAN_CFG	0x0114	W	0x00000000	Configures PHY transition time from low-power to high-speed transmission
DSI2_PHY_HS2LP_AUTO_CFG	0x0118	W	0x00000000	Reports measured value for PHY transition time from low-power to high-speed transmission
DSI2_PHY_MAX_RD_T_MAN_CFG	0x011C	W	0x00000000	Configures the maximum read time
DSI2_PHY_MAX_RD_T_AUTO	0x0120	W	0x00000000	Reports the maximum read time, when in auto-mode
DSI2_PHY_ESC_CMD_T_MAN_CFG	0x0124	W	0x00000000	Configures PHY trigger time
DSI2_PHY_ESC_CMD_T_AUTO	0x0128	W	0x00000000	Reports PHY trigger time, when in auto-mode
DSI2_PHY_ESC_BYTE_T_MAN_CFG	0x012C	W	0x00000000	Configures PHY trigger time
DSI2_PHY_ESC_BYTE_T_AUTO	0x0130	W	0x00000000	Reports PHY trigger time, when in auto-mode
DSI2_PHY_IPI_RATIO_MAN_CFG	0x0134	W	0x00000000	Configures ratio between frequencies of HSTX clock and IPI clock
DSI2_PHY_IPI_RATIO_MAN_AUTO	0x0138	W	0x00000000	Reports the calculated ratio between frequencies of HSTX clock and IPI clock
DSI2_PHY_SYS_RATIO_MAN_CFG	0x013C	W	0x00000000	Configures ratio between frequencies of HSTX clock and SYS clock.

Name	Offset	Size	Reset Value	Description
DSI2_PHY_SYS_RATIO_MAN_AUTO	0x0140	W	0x00000000	Reports the calculated ratio between frequencies of HSTX clock and SYS clock
DSI2_PRI_TX_CMD	0x01C0	W	0x00000000	This register is used for transmitting all available PHY requests
DSI2_PRI_RX_CMD	0x01C4	W	0x00000000	This register contains calibration required time
DSI2_PRI_CAL_CTRL	0x01C8	W	0x00000000	This register contains calibration required time
DSI2_PRI_ULPS_CTRL	0x01CC	W	0x00000000	This register defines different modes for ULPS entry and exit
DSI2_DSI_GENERAL_CFG	0x0200	W	0x00000000	Configures the general options to meet the characteristics of the peripheral.
DSI2_DSI_VCID_CFG	0x0204	W	0x00000000	Configures the virtual channel for transmission
DSI2_DSI_SCRAMBLING_CFG	0x0208	W	0xFFFF0000	Configures data scrambling
DSI2_DSI_VID_TX_CFG	0x020C	W	0x00000000	Configures the video transmission options
DSI2_DSI_MAX_RPS_CFG	0x0210	W	0x00000000	Configures the maximum payload size that a received packet can contain
DSI2_CRI_TX_HDR	0x02C0	W	0x00000000	Header for packets to be sent in command mode
DSI2_CRI_TX_PLD	0x02C4	W	0x00000000	Payload for packets to be sent in command mode
DSI2_CRI_RX_HDR	0x02C8	W	0x00000000	Header of packets received from device side
DSI2_CRI_RX_PLD	0x02CC	W	0x00000000	Payload of packets received from device side
DSI2_IPI_COLOR_MAN_CFG	0x0300	W	0x00000000	Configures the color coding for the IPI interface in manual mode
DSI2_IPI_VID_HSA_MAN_CFG	0x0304	W	0x00000000	Configures the Horizontal Sync Active period
DSI2_IPI_VID_HSA_AUTO	0x0308	W	0x00000000	Reports the Horizontal Sync Active period, when in auto-mode
DSI2_IPI_VID_HBP_MAN_CFG	0x030C	W	0x00000000	Configures the Horizontal Back Porch period
DSI2_IPI_VID_HBP_AUTO	0x0310	W	0x00000000	Reports the Horizontal back porch period, when in auto-mode
DSI2_IPI_VID_HACT_MAN_CFG	0x0314	W	0x00000000	Configures the Horizontal Active line time HACT
DSI2_IPI_VID_HACT_AUTO	0x0318	W	0x00000000	Reports the Horizontal Active period, when in auto-mode
DSI2_IPI_VID_HLINE_MAN_CFG	0x031C	W	0x00000000	Configures the total line time
DSI2_IPI_VID_HLINE_AUTO	0x0320	W	0x00000000	Reports the total line time, when in auto-mode
DSI2_IPI_VID_VSA_MAN_CFG	0x0324	W	0x00000000	Configures the Vertical Sync Active period

Name	Offset	Size	Reset Value	Description
DSI2_IPI_VID_VSA_AUTO	0x0328	W	0x00000000	Reports the Vertical Sync Active period in auto-mode
DSI2_IPI_VID_VBP_MAN_CFG	0x032C	W	0x00000000	Configures the Vertical Back Porch period
DSI2_IPI_VID_VBP_AUTO	0x0330	W	0x00000000	Reports the Vertical Back Porch period in auto-mode
DSI2_IPI_VID_VACT_MAN_CFG	0x0334	W	0x00000000	Configures the Vertical Active region period
DSI2_IPI_VID_VACT_AUTO	0x0338	W	0x00000000	Reports the Vertical Active region period when in auto-mode
DSI2_IPI_VID_VFP_MAN_CFG	0x033C	W	0x00000000	Configures the Vertical Front Porch period
DSI2_IPI_VID_VFP_AUTO	0x0340	W	0x00000000	Reports the Vertical Front Porch period in auto-mode
DSI2_IPI_PIX_PKT_CFG	0x0344	W	0x00000000	Configures the number of pixels per packet
DSI2_INT_ST_PHY	0x0400	W	0x00000000	Groups the interrupt sources related to PHY
DSI2_INT_MASK_PHY	0x0404	W	0x00000000	Configures masks for the interrupt sources of the INT_ST_PHY register
DSI2_INT_FORCE_PHY	0x0408	W	0x00000000	Forces the interrupt sources of the INT_ST_PHY register
DSI2_INT_ST_TO	0x0410	W	0x00000000	Groups the interrupt sources related to PHY
DSI2_INT_MASK_TO	0x0414	W	0x00000000	Configures masks for the interrupt sources of the INT_ST_PHY register
DSI2_INT_FORCE_TO	0x0418	W	0x00000000	Forces the interrupt sources of the INT_ST_PHY register
DSI2_INT_ST_ACK	0x0420	W	0x00000000	Groups the interrupt sources related to Acknowledge and Error Report packet
DSI2_INT_MASK_ACK	0x0424	W	0x00000000	Configures masks for the interrupt sources of the INT_ST_ACK register
DSI2_INT_FORCE_ACK	0x0428	W	0x00000000	Forces the interrupt sources of the INT_ST_ACK register
DSI2_INT_ST_IPI	0x0430	W	0x00000000	Groups the interrupt sources related to IPI
DSI2_INT_MASK_IPI	0x0434	W	0x00000000	Configures masks for the interrupt sources of the INT_ST_PHY register
DSI2_INT_FORCE_IPI	0x0438	W	0x00000000	Forces the interrupt sources of the INT_ST_IPI register
DSI2_INT_ST_FIFO	0x0440	W	0x00000000	Groups the interrupt sources related to FIFOs
DSI2_INT_MASK_FIFO	0x0444	W	0x00000000	Configures masks for the interrupt sources of the INT_ST_FIFO register
DSI2_INT_FORCE_FIFO	0x0448	W	0x00000000	Forces the interrupt sources of the INT_ST_FIFO register
DSI2_INT_ST_PRI	0x0450	W	0x00000000	Groups the interrupt sources related to PRI

Name	Offset	Size	Reset Value	Description
DSI2_INT_MASK_PRI	0x0454	W	0x00000000	Configures masks for the interrupt sources of the INT_ST_PHY register
DSI2_INT_FORCE_PRI	0x0458	W	0x00000000	Forces the interrupt sources of the INT_ST_PRI register
DSI2_INT_ST_CRI	0x0460	W	0x00000000	Groups the interrupt sources related to CRI
DSI2_INT_MASK_CRI	0x0464	W	0x00000000	Configures masks for the interrupt sources of the INT_ST_CRI register
DSI2_INT_FORCE_CRI	0x0468	W	0x00000000	Forces the interrupt sources of the INT_ST_CRI register

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

21.4.2 Detail Registers Description

DSI2_CORE_ID

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RO	0x3130302a	core_id Core identification. Byte-wise representation of ASCII characters containing the version of the IP.

DSI2_VERSION

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:0	RO	0x1a020100	core_version Core version number.

DSI2_PWR_UP

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	pwr_up Configures the core either to power-up or to reset. 1'b0: Reset 1'b1: Power-up

DSI2_SOFT_RESET

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2	RW	0x1	sys_rstn Soft-reset for SYS data process. Active low and used synchronously.
1	RW	0x1	phy_rstn Soft-reset for PHY data process. Active low and used synchronously.
0	RW	0x1	ipi_rstn Soft-reset for IPI data process. Active low and used synchronously.

DSI2_INT_ST_MAIN

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RC	0x0	int_st_cri Status of the INT_ST_CRI register
5	RC	0x0	int_st_pri Status of the INT_ST_PRI register
4	RC	0x0	int_st_fifo Status of the INT_ST_FIFO register
3	RC	0x0	int_st_ipi Status of the INT_ST_IPI register
2	RC	0x0	int_st_ack Status of the INT_ST_DSI register
1	RC	0x0	int_st_to Status of the INT_ST_TO register
0	RC	0x0	int_st_phy Status of the INT_ST_PHY register

DSI2_MODE_CTRL

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	WO	0x0	mode_ctrl Requested operating mode: 3'b000: Idle mode 3'b001: AutoCalculation mode 3'b010: Command mode 3'b011: Video mode 3'b100: Data Stream mode Others: Reserved

DSI2_MODE_STATUS

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	RO	0x0	mode_status Current operating mode: 3'b000: Idle mode 3'b001: AutoCalculation mode 3'b010: Command mode 3'b011: Video mode 3'b100: Data Stream mode Others: Reserved

DSI2_CORE_STATUS

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:27	RO	0x00	reserved
26	RO	0x0	pri_rd_data_avail PRI has new read data available.
25	RO	0x0	pri_fifos_not_empty At least one PRI WR FIFO is not empty.
24	RO	0x0	pri_busy PRI interface is busy: - At least one PRI FIFO is not empty - [or] At least one PRI packet is being transmitted or processed.
23:19	RO	0x00	reserved

Bit	Attr	Reset Value	Description
18	RO	0x0	cri_rd_data_avail CRI has new read data available.
17	RO	0x0	cri_fifos_not_empty At least one CRI WR FIFO is not empty.
16	RO	0x0	cri_busy Command Interface is busy: - At least one CRI FIFO (internal and external) is not empty - [or] At least one CRI packet is being transmitted or processed.
15:10	RO	0x00	reserved
9	RO	0x0	ipi_fifos_not_empty At least one IPI FIFO (internal and external) is not empty.
8	RO	0x0	ipi_busy Image Pixel Interface is busy: - At least one IPI FIFO (internal and external) is not empty - [or] At least one IPI packet is being transmitted or processed.
7:2	RO	0x00	reserved
1	RO	0x0	core_fifos_not_empty At least one FIFO (internal and external) is not empty.
0	RO	0x0	core_busy mipidsi2_host is busy: - At least one FIFO (internal and external) is not empty - [or] At least one packet is being transmitted or processed.

DSI2_MANUAL_MODE_CFG

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	manual_mode_en Enables manual mode for setting all timings. When unset, timings are automatically calculated by measuring times and lines in the next frame. When set, all timing parameters need to be programmed through the register bank.

DSI2_OBS_FSM_STATUS_SEL

Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	fsm_selector FSM selection for reporting and debugging. Current word count of the selected FSM: 4'b0000: ipi_vid_fsm 4'b0001: ipi_auto_calc_fsm 4'b0010: sys_main_fsm 4'b0011: sys_cmd_fsm 4'b0100: sys_pkt_build_fsm 4'b0101: phy_tx_ready_fsm Others: Reserved

DSI2_OBS_FSM_STATUS

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	current_state_cnt Number of clock cycles that the FSM has been in this state.
15:13	RO	0x0	reserved

Bit	Attr	Reset Value	Description
12:8	RO	0x00	previous_state Previous state.
7:6	RO	0x0	reserved
5	RO	0x0	stuck Flag to indicate that the FSM is stuck.
4:0	RO	0x00	current_state Current state.

DSI2_OBS_FSM_CFG

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	fsm0_auto_init Enables automatic re-initialization of FSM 0.

DSI2_OBS_FSM_CTRL

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x0	fsm0_auto_init Manual re-initialization of FSM 0.

DSI2_OBS_FIFO_STATUS_SEL

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	fsm_selector FIFO selection for reporting and debugging. Current status of the selected FIFO: 4'b0000: cmd_rd_pld_fifo 4'b0001: cmd_wr_hdr_fifo 4'b0010: cmd_wr_pld_fifo 4'b0011: ipi_data_fifo 4'b0100: ipi_event_fifo 4'b0101: phy_txhs_fifo Others: Reserved

DSI2_OBS_FIFO_STATUS

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	current_word_count Current word count of the selected FIFO.
15:5	RO	0x000	reserved
4	RO	0x0	full Indicates that the selected FIFO is full.
3	RO	0x0	almost_full Indicates that the selected FIFO is almost full
2	RO	0x0	half_full Indicates that the selected FIFO is half full.
1	RO	0x0	almost_empty Indicates that the selected FIFO is almost empty.
0	RO	0x0	empty Indicates that the selected FIFO is empty.

DSI2_OBS_FIFO_CFG

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	ipi_fifo_auto_flush Enables automatic flush for the IPI FIFO.
2	RW	0x0	cmd_wr_hdr_fifo_auto_flush Enables automatic flush for the cmd_wr_hdr FIFO.
1	RW	0x0	cmd_wr_pld_fifo_auto_flush Enables automatic flush for the cmd_wr_pld FIFO.
0	RW	0x0	cmd_rd_pld_fifo_auto_flush Enables automatic flush for the cmd_rd_pld FIFO.

DSI2_OBS_FIFO_CTRL

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	ipi_fifo_maual_flush Enables manual flush for the IPI FIFO.
2	RW	0x0	cmd_wr_hdr_fifo_maual_flush Enables manual flush for the cmd_wr_hdr FIFO.
1	RW	0x0	cmd_wr_pld_fifo_maual_flush Enables manual flush for the cmd_wr_pld FIFO.
0	RW	0x0	cmd_rd_pld_fifo_maual_flush Enables manual flush for the cmd_rd_pld FIFO.

DSI2_TIMEOUT_HSTX_CFG

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	to_hstx_value Configures the counter that triggers a high-speed transmission timeout (measured in phy_lptx_clk cycles)

DSI2_TIMEOUT_HSTXRDY_CFG

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	to_hstxrdy_value Configures the counter that triggers a high-speed transmission ready timeout (measured in phy_lptx_clk cycles)

DSI2_TIMEOUT_LPRX_CFG

Address: Operational Base + offset (0x0050)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	to_lprxrdy_value Configures the counter that triggers a low-power reception timeout (measured in phy_lptx_clk cycles).

DSI2_TIMEOUT_LPTXRDY_CFG

Address: Operational Base + offset (0x0054)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	to_lptxrdy_value Configures the counter that triggers a low-power data transmission timeout (measured in phy_lptx_clk cycles).

DSI2_TIMEOUT_LPTXTRIG_CFG

Address: Operational Base + offset (0x0058)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	to_lptxtrig_value Configures the counter that triggers a low-power trigger transmission timeout (measured in phy_lptx_clk cycles)

DSI2_TIMEOUT_LPTXULPS_CFG

Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	to_lptxulps_value Configures the counter that triggers a low-power ULPS entry timeout (measured in phy_lptx_clk cycles)

DSI2_TIMEOUT_BTA_CFG

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	to_bta_value Configures the counter that triggers a bus turnaround direction timeout (measured in phy_lptx_clk cycles)

DSI2_PHY_MODE_CFG

Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9:8	RW	0x0	ppi_width 2'b00: 8 bits 2'b01: 16 bits 2'b10: 32 bits 2'b11: Reserved
7:6	RO	0x0	reserved
5:4	RW	0x3	phy_lanes Configures the number of active lanes. 2'b00: 1 lane 2'b01: 2 lanes 2'b10: 3 lanes 2'b11: 4 lanes
3:1	RO	0x0	reserved
0	RW	0x0	phy_type Configures which PHY interface to be used: 1'b0: DPHY 1'b1: CPHY

DSI2_PHY_CLK_CFG

Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description

31:29	RO	0x0	reserved
28:0	RW	0x00000000	phy_esc_cmd_time Configures the time measured in cycles of phy_hstx_clk that is necessary for the PHY to transmit an escape mode command. This is a fixed-point value with 13 integral bits and 16 fractional bits.

DSI2_PHY_ESC_CMD_T_AUTO

Address: Operational Base + offset (0x0128)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:0	RO	0x00000000	phy_esc_cmd_time_auto Indicates the time measured in cycles of phy_hstx_clk that is necessary for the PHY to transmit an escape mode command. This is a fixed-point value with 13 integral bits and 16 fractional bits.

DSI2_PHY_ESC_BYTE_T_MAN_CFG

Address: Operational Base + offset (0x012C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:0	RW	0x00000000	phy_esc_byte_time Configures the time measured in cycles of phy_hstx_clk that is necessary for the PHY to transmit a byte in low-power data transmission. This is a fixed-point value with 13 integral bits and 16 fractional bits.

DSI2_PHY_ESC_BYTE_T_AUTO

Address: Operational Base + offset (0x0130)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28:0	RO	0x00000000	phy_esc_byte_time_auto Indicates the time measured in cycles of phy_hstx_clk that is necessary for the PHY to transmit a byte in low-power data transmission. This is a fixed-point value with 13 integral bits and 16 fractional bits.

DSI2_PHY_IPI_RATIO_MAN_CFG

Address: Operational Base + offset (0x0134)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21:0	RW	0x000000	phy_ipi_ratio Configures the ratio calculated as HSTX clock frequency / IPI clock frequency. This is a fixed-point value with 6 integral bits and 16 fractional bits

DSI2_PHY_IPI_RATIO_MAN_AUTO

Address: Operational Base + offset (0x0138)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved

Bit	Attr	Reset Value	Description
21:0	RO	0x000000	phy_ipi_ratio_auto Indicates the ratio calculated as HSTX clock frequency / IPI clock frequency. This is a fixed-point value with 6 integral bits and 16 fractional bits

DSI2_PHY_SYS_RATIO_MAN_CFG
Address: Operational Base + offset (0x013C)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RW	0x00000	phy_sys_ratio Configures Ratio calculated as HSTX clock frequency / SYS clock frequency. This is a fixed-point value with 1 integral bit and 16 fractional bits.

DSI2_PHY_SYS_RATIO_MAN_AUTO
Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16:0	RO	0x00000	phy_sys_ratio_auto Ratio calculated as HSTX clock frequency / SYS clock frequency. This is a fixed-point value with 1 integral bit and 16 fractional bits.

DSI2_PRI_TX_CMD
Address: Operational Base + offset (0x01C0)

Bit	Attr	Reset Value	Description
31:17	RO	0x0000	reserved
16	W1C	0x0	phy_bta Enables PHY bus turnaround request.
15:14	RO	0x0	reserved
13	W1C	0x0	phy_ulps_exit Enables PHY ULPS exit request. Note that this request is valid only if the previous one was a phy_ulps_entry, and if it was successfully transmitted.
12	W1C	0x0	phy_ulps_entry Enables PHY ULPS entry request. Note that two consecutives phy_ulps_entry requests (and when first is successful sent by controller) will result in an interrupt.
11:9	RO	0x0	reserved
8	W1C	0x0	phy_cal Enables PHY calibration request
7:4	RO	0x0	reserved
3	W1C	0x0	phy_tx_trigger_3 Requests sending a trigger 3
2	W1C	0x0	phy_tx_trigger_2 Requests sending a trigger 2
1	W1C	0x0	phy_tx_trigger_1 Requests sending a trigger 1
0	W1C	0x0	phy_tx_trigger_0 Requests sending a trigger 0

DSI2_PRI_RX_CMD
Address: Operational Base + offset (0x01C4)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RC	0x0	phy_rx_trigger_3 This bit indicates that a trigger 3 has been received.
2	RC	0x0	phy_rx_trigger_2 This bit indicates that a trigger 2 has been received.
1	RC	0x0	phy_rx_trigger_1 This bit indicates that a trigger 1 has been received.
0	RC	0x0	phy_rx_trigger_0 This bit indicates that a trigger 0 has been received.

DSI2_PRI_CAL_CTRL

Address: Operational Base + offset (0x01C8)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:0	RW	0x00000	phy_cal_time Time needed to complete deskew calibration, given in cycles of sys_clk.

DSI2_PRI_ULPS_CTRL

Address: Operational Base + offset (0x01CC)

Bit	Attr	Reset Value	Description
31:16	RW	0x0000	phy_wakeup_time Configures the PHY wakeup time that controller will consider when performing an ULPS exit request. This time is measured in cycles of phy_lptx_clk and shall represent at least 1 ms, to meet the twakeup time requirement found in D-PHY and C-PHY specifications.
15:5	RO	0x000	reserved
4	RW	0x0	phy_ulps_clk_lane ULPS request command is active for the clock lane
3:1	RO	0x0	reserved
0	RW	0x0	phy_ulps_data_lanes ULPS request command is active for all active data lanes

DSI2_DSI_GENERAL_CFG

Address: Operational Base + offset (0x0200)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	bta_en Enables Bus Turn Around (BTA) procedures.
0	RW	0x0	eotp_tx_en Enables the EoTp transmission in high-speed.

DSI2_DSI_VCID_CFG

Address: Operational Base + offset (0x0204)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1:0	RW	0x0	tx_vcid Identifies virtual channel for transmitted packets.

DSI2_DSI_SCRAMBLING_CFG

Address: Operational Base + offset (0x0208)

Bit	Attr	Reset Value	Description
31:16	RW	0xffff	scrambling_seed Scrambling seed.
15:1	RO	0x0000	reserved
0	RW	0x0	scrambling_en Scrambling enable.

DSI2_DSI_VID_TX_CFG

Address: Operational Base + offset (0x020C)

Bit	Attr	Reset Value	Description
31:21	RO	0x000	reserved
20	RW	0x0	lpdt_display_cmd_en Enables the transmission of commands to be done only in low-power mode.
19:15	RO	0x00	reserved
14	RW	0x0	blk_vfp_hs_en Enables filling the VFP period with blanking packets. If unset and time allows, controller returns to the low-power mode
13	RW	0x0	blk_vbp_hs_en Enables filling the VBP period with blanking packets. If unset and time allows, controller returns to the low-power mode
12	RW	0x0	blk_vsa_hs_en Enables filling the VSA period with blanking packets. If unset and time allows, controller returns to the low-power mode
11:7	RO	0x00	reserved
6	RW	0x0	blk_hfp_hs_en Enables filling the HFP period with blanking packets. If unset and time allows, controller returns to the low-power mode
5	RW	0x0	blk_hbp_hs_en Enables filling the HBP period with blanking packets. If unset and time allows, controller returns to the low-power mode
4	RW	0x0	blk_hsa_hs_en Enables filling the HSA period with blanking packets. If unset and time allows, controller returns to the low-power mode
3:2	RO	0x0	reserved
1:0	RW	0x0	vid_mode_type Configures the video mode transmission type. 2'b00: Non-burst with sync pulses 2'b01: Non-burst with sync events Others: Burst mode

DSI2_DSI_MAX_RPS_CFG

Address: Operational Base + offset (0x0210)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	max_rt_pkt_sz Maximum payload size that a received packet can contain, in bytes.

DSI2_CRI_TX_HDR

Address: Operational Base + offset (0x02C0)

Bit	Attr	Reset Value	Description
31:30	RO	0x0	reserved

Bit	Attr	Reset Value	Description
29	WO	0x0	cmd_hdr_long Configures the packet as a long packet. This is used only when the programmed data type is a reserved value
28	WO	0x0	cmd_hdr_rd Configures the packet as a read request command. This is used only when the programmed data type is a reserved value.
27:25	RO	0x0	reserved
24	WO	0x0	cmd_tx_mode Configures the transmission mode of the packet. 1'b0: High-speed transmission 1'b1: Low-power transmission
23:16	WO	0x00	wc_msb Configures the most significant byte for the word count field of long packets, or data 1 for short packets.
15:8	WO	0x00	wc_lsb Configures the least significant byte for the word count field of long packets, or data 0 for short packets.
7:6	WO	0x0	virtual_channel Configures the virtual channel for the packet.
5:0	WO	0x00	data_type Configures the data type for the packet.

DSI2_CRI_TX_PLD
Address: Operational Base + offset (0x02C4)

Bit	Attr	Reset Value	Description
31:24	WO	0x00	byte_3 The fourth byte of current word of payload.
23:16	WO	0x00	byte_2 The third byte of current word of payload.
15:8	WO	0x00	byte_1 The second byte of current word of payload.
7:0	WO	0x00	byte_0 The first byte of current word of payload.

DSI2_CRI_RX_HDR
Address: Operational Base + offset (0x02C8)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	reserved
23:16	RC	0x00	wc_msb The most significant byte for the word count field of long packets, or data 1 for short packets.
15:8	RC	0x00	wc_lsb The least significant byte for the word count field of long packets, or data 0 for short packets.
7:6	RC	0x0	virtual_channel The virtual channel for the packet.
5:0	RC	0x00	data_type The data type for the packet.

DSI2_CRI_RX_PLD
Address: Operational Base + offset (0x02CC)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	byte_3 The fourth byte of current word of payload.

Bit	Attr	Reset Value	Description
23:16	RO	0x00	byte_2 The third byte of current word of payload.
15:8	RO	0x00	byte_1 The second byte of current word of payload.
7:0	RO	0x00	byte_0 The first byte of current word of payload.

0	W1C	0x0	force_err_to_hstx Forces the interrupt sources

DSI2_INT_ST_ACK

Address: Operational Base + offset (0x0420)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RC	0x0	err_ack_rpt_15 Retrieves the DSI Protocol Violation error bit from the Acknowledge error report.
14	RC	0x0	err_ack_rpt_14 Retrieves the Reserved (specific to device) error bit from the Acknowledge error report.
13	RC	0x0	err_ack_rpt_13 Retrieves the Invalid Transmission Length error bit from the Acknowledge error report.
12	RC	0x0	err_ack_rpt_12 Retrieves the DSI VC ID Invalid error bit from the Acknowledge error report.
11	RC	0x0	err_ack_rpt_11 Retrieves the DSI Data Type not recognized error bit from the Acknowledge error report.
10	RC	0x0	err_ack_rpt_10 Retrieves the Payload Checksum error bit (long packet only) from the Acknowledge error report.
9	RC	0x0	err_ack_rpt_9 Retrieves the header ECC/SSDC/Checksum multi-bit (detected, not corrected) error bit from the Acknowledge error report.
8	RC	0x0	err_ack_rpt_8 Retrieves the header ECC/SSDC/Checksum single-bit (detected and corrected) error bit from the Acknowledge error report.
7	RC	0x0	err_ack_rpt_7 Retrieves the Contention Detected error bit from the Acknowledge error report.

Bit	Attr	Reset Value	Description
6	RC	0x0	err_ack_rpt_6 Retrieves the False Control error bit from the Acknowledge error report.
5	RC	0x0	err_ack_rpt_5 Retrieves the Peripheral Timeout error bit from the Acknowledge error report.
4	RC	0x0	err_ack_rpt_4 Retrieves the Low-Power Transmit Sync error bit from the Acknowledge error report.
3	RC	0x0	err_ack_rpt_3 Retrieves the Escape Mode Entry Command error bit from the Acknowledge error report.
2	RC	0x0	err_ack_rpt_2 Retrieves the EoT Sync error bit from the Acknowledge error report.
1	RC	0x0	err_ack_rpt_1 Retrieves the SoT Sync error bit from the Acknowledge error report.
0	RC	0x0	err_ack_rpt_0 Retrieves the SoT error bit from the Acknowledge error report.

21.5 Application Notes

21.5.1 System-level Interaction

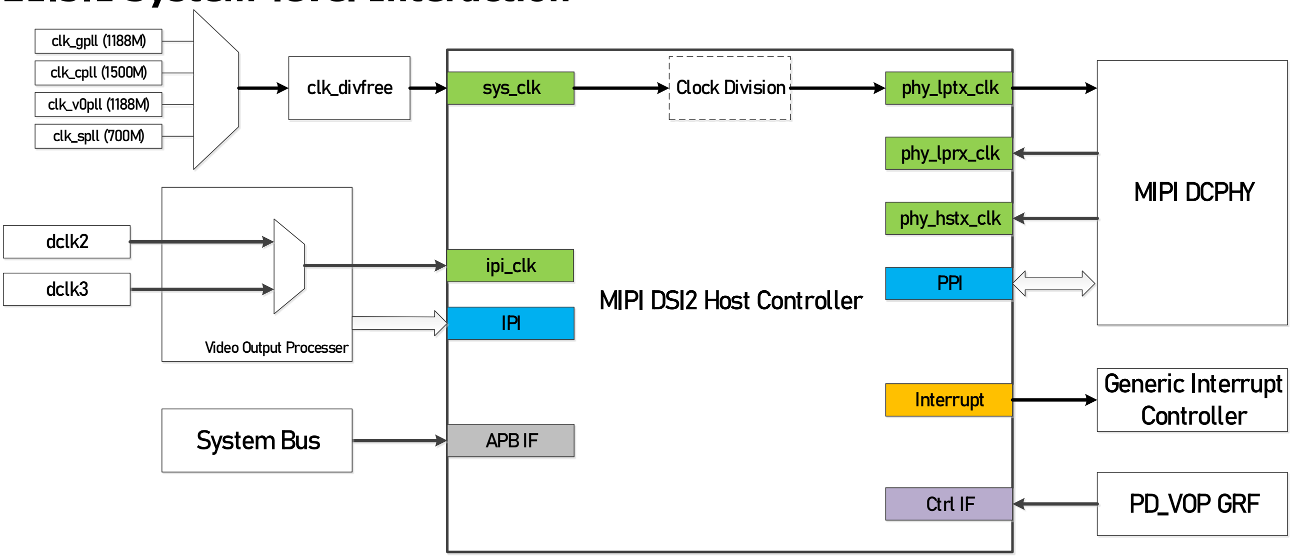

Fig. 21-6 System Level Overview

21.5.1.1 Clock

- **ipi_clk**: Image Pixel Interface clock. It's generated in VOP internal clock generation unit, used to synchronize IPI sync and pixel data.
- **sys_clk**: Always On system core clock. Used for phy_lptx_clk generation. Should be the

clock with the highest frequency inside DSI2 host controller. It could be configured the source and frequency by *CRU_CLKSEL_CON114* and *CRU_CLKSEL_CON115* register in CRU block. The default frequency of sys_clk = 350Mhz selecting clk_spll source and clk_divfree = 1.

- **phy_hstx_clk**: The PHY High-Speed Transmit Word Clock. The frequency of phy_hstx_clk is dependent upon the PPI width, which is fixed to 16 bits in DCPHY, so in DPHY mode, the High-Speed Transmit Word Clock (phy_hstx_clk) is exactly 1/16 the Lane high-speed data rate; In CPHY mode, the High-Speed Transmit Word Clock (phy_hstx_clk) is exactly 1/7 the trio high speed symbol rate.
- **phy_lptx_clk**: PHY low-power TX clock
- **phy_lprx_clk**: PHY low-power RX clock

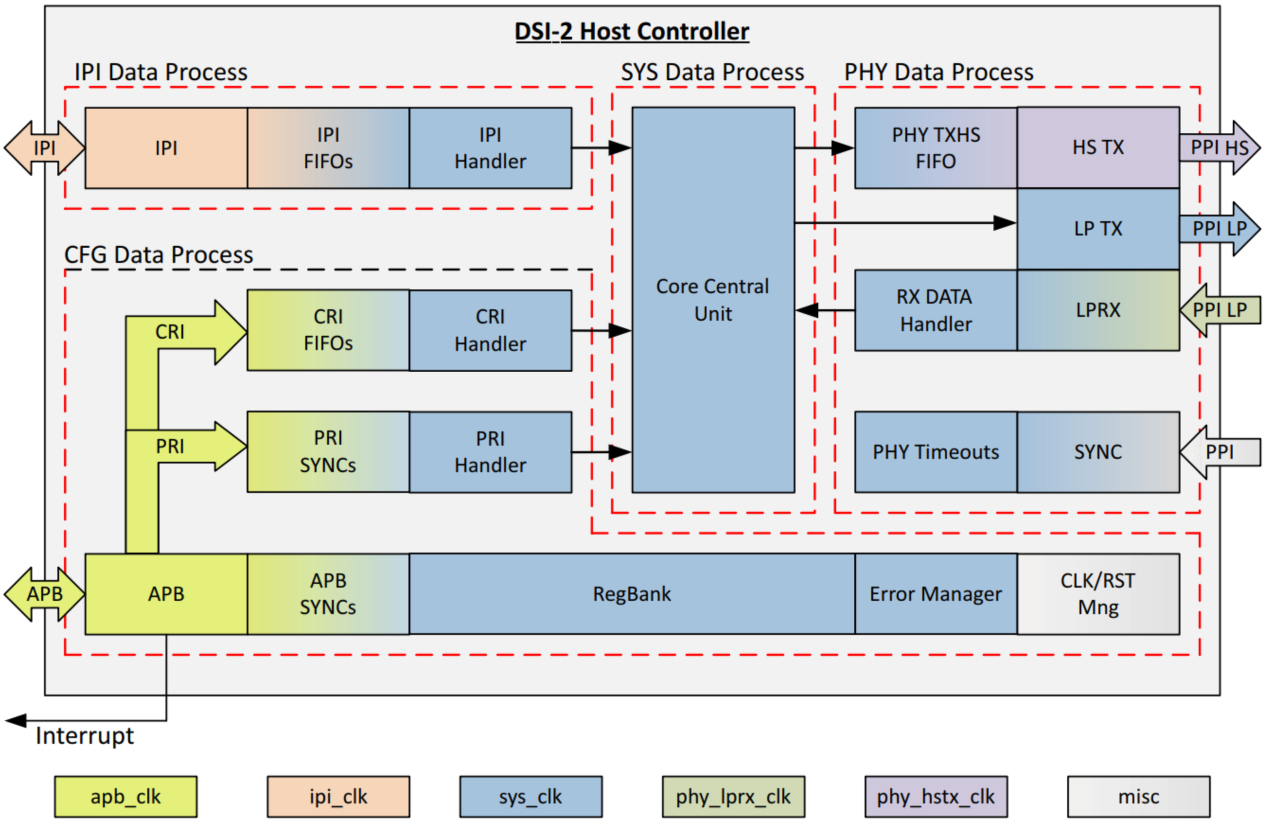

Fig. 21-7 Internal Clock Domain Architecture

21.5.1.2 AMBA APB 3 Interface

The AMBA APB 3 interface in MIPI DSI2 host controller is used to configure the controller, to control operating modes, and to obtain various statuses. The AMBA APB 3 interface is also used to complement the interrupt interface, and is a physical support for the Command Request Interface (CRI) and PHY Request Interface (PRI).

Table 21-1 DSI2 Host Controller Register Base Address

IP	Base Address
MIPI_DSI2HOST_0	0xFDE20000
MIPI_DSI2HOST_1	0xFDE30000

21.5.1.3 Interrupt Interface

There is a single interrupt pin connected to the GIC.

Table 21-2 DSI2 Host Controller Interrupt Number

IP	IRQ number
MIPI_DSI2HOST_0	32+167
MIPI_DSI2HOST_1	32+168

The implementation sets the interrupt pin and the applicable Interrupt Status registers at same time. The default value of the INT_MASK_<group> (Interrupt Mask) registers is 0, and this corresponds to masking the interrupts. By default, the interrupt pin is disabled.

The INT_ST_MAIN register indicates the names of the INT_ST_<group> (Interrupt Status) registers that have triggered the interrupt. The INT_ST_<group> (Interrupt Status) registers contain the status of the individual interrupt sources, regardless of the contents of the associated INT_MASK_<group> registers. So, it is possible to service the INT_ST_<group> (Interrupt Status) registers by polling. The INT_ST_<group> (Interrupt Status) registers are cleared when read. Reading the INT_ST_MAIN register also clears the interrupt pin.
The INT_FORCE_<group> (Interrupt Force) registers are used for testing purpose. These registers allow triggering interrupt events individually, without activating the conditions that trigger the interrupt sources. This feature also facilitates the development and testing of the software associated with the interrupt events. The INT_FORCE_<group> registers are auto-cleared. The circuitry minimizes the gate count overhead because it does not need the Interrupt Force registers.

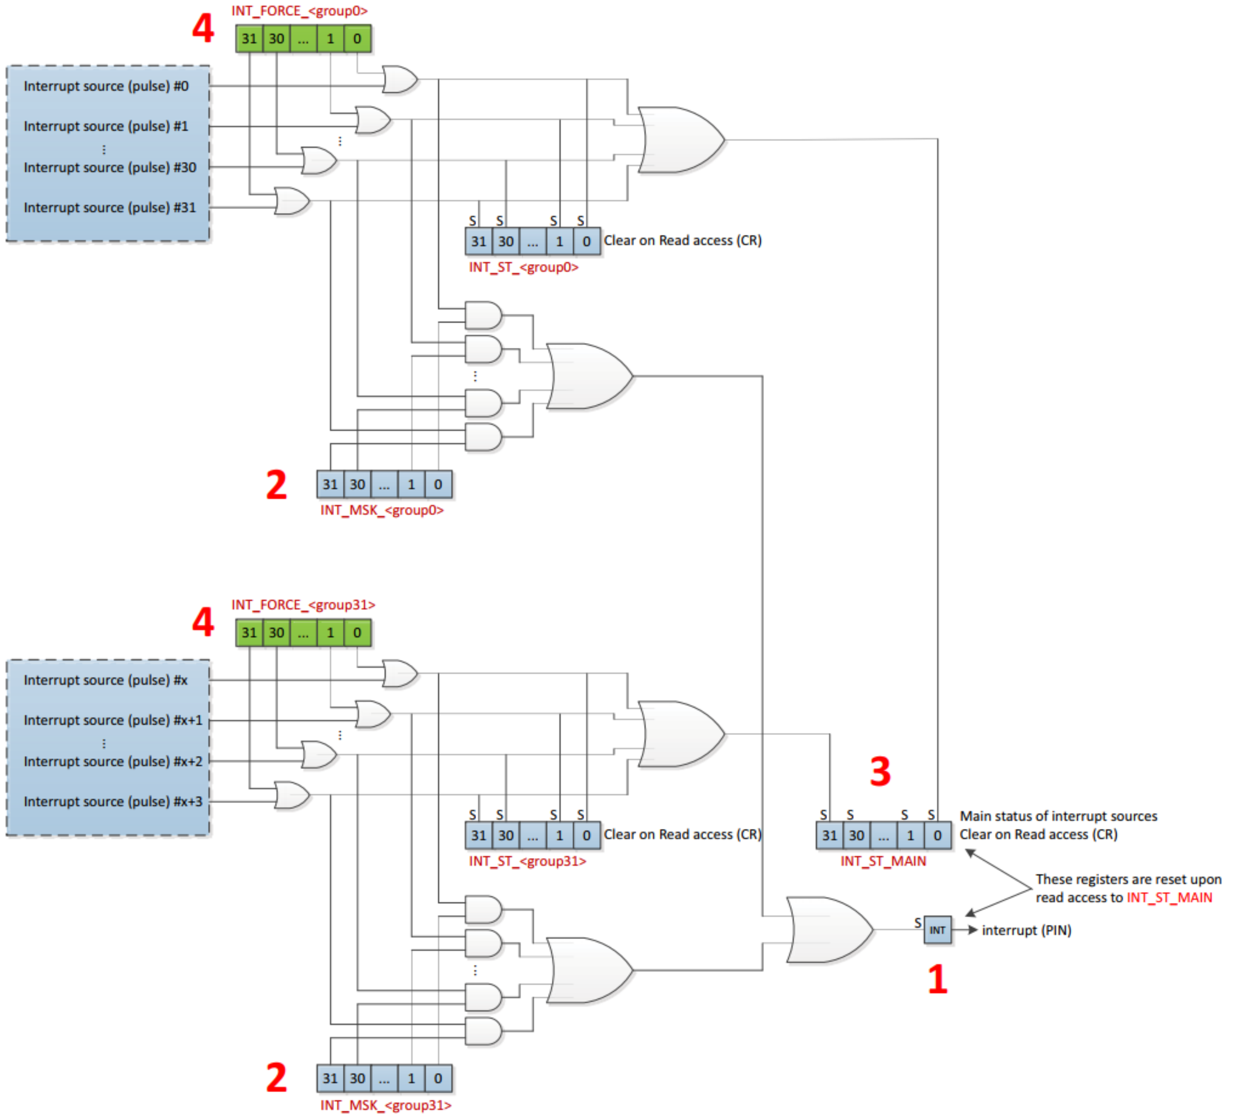

Fig. 21-8 Interrupt Structure

21.5.1.4 System Control Signals

There are some control signals configured through *VOP_GRF_VOP_CON0* and *VOP_GRF_VOP_CON1*.

Table 21-3 DSI2 Host Controller interfaced with PD_VOP GRF

Signal Name	Description
ipi_format[3:0]	IPI Pixel Format, only used when DSI2 controller operate in auto mode.
ipi_color_depth[3:0]	IPI Pixel Color Depth, only used when DSI2 controller operate in auto mode.
ipi_shutdown	IPI Shutdown command

Signal Name	Description
ipi_colormode	IPI Color Mode command
mem_clk_gating_en	Set 1 to this bit enables clock gating function of DSI2 Host memory for low power consideration.

The ipi_shutdown and ipi_colormode signals can be used to send display commands. These signals are toggle sensitive.
ipi_shutdown signal:

- When this signal rises, it corresponds to Shut Down Peripheral Command request.
- When this signal falls, it corresponds to Turn On Peripheral Command request.

ipi_colormode signal:

- When this signal rises, it corresponds to Color Mode On Command request.
- When this signal falls, it corresponds to Color Mode Off Command request.

To guarantee the order of display commands inside video frame, the following conditions should be met:

- Up to one display command request can be made per line
- Last line cannot receive display command requests
- Display command requests must occur after the HSYNC period

The transmission mode is controlled by lpdt_display_cmd_en bit from DSI_VID_TX_CFG register.

21.5.2 Programming Flow

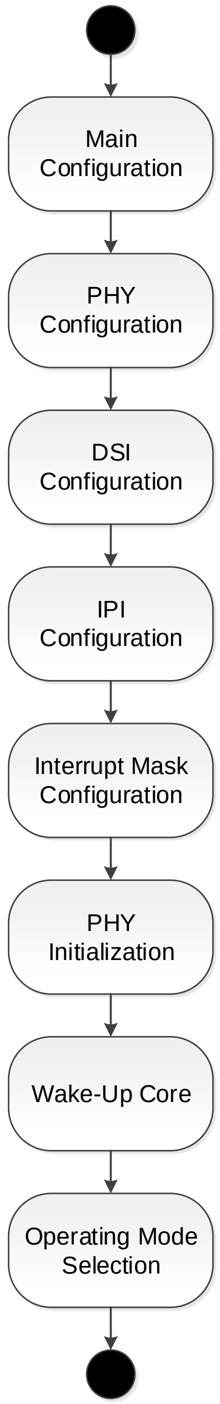

Fig. 21-9 Configuration Sequence

1) Configure controller MAIN registers by following the programming sequence in “MAIN Registers Configuration”
2) Configure PHY related registers by following the programming sequence in “PHY Configuration”
3) Configure DSI2 features by following the programming sequence in “DSI2 Protocol Configuration”
4) Configure IPI related registers by following the programming sequence in “Image Pixel Interface (IPI) Configuration”
5) Enable the errors that should trigger the interrupt pin, by writing in the different INT_MSK_<group>.
6) Perform the necessary operations to initialize the PHY, as described in the PHY documentation.
7) Assert the bit PWR_UP[0] to power up the IP.
8) Select the desired operating mode by following the sequence in “Selecting Operating Modes”

21.5.2.1 MAIN Registers Configuration

1. Configure the available timeouts, if desired, by using the following registers:
- TO_HSTX_CFG: Configures the counter for high-speed transfer timeout.
- TO_HSTXRDY_CFG: Configures the counter for high-speed ready signal timeout.
- TO_LPRX_CFG: Configures the counter for low-power data reception timeout.
- TO_LPTXRDY_CFG: Configures the counter for low-power ready signal timeout.
- TO_LPTXTRIG_CFG: Configures the counter for low-power trigger transmission timeout.
- TO_LPTXULPS_CFG: Configures the counter for ULPS entry timeout.
- TO_BTA_CFG: Configures the counter for bus turn-around procedure timeout.

2. Select if the controller is intended to work in Manual or Automatic mode, by writing in MANUAL_MODE_CFG register.

21.5.2.2 PHY Configuration

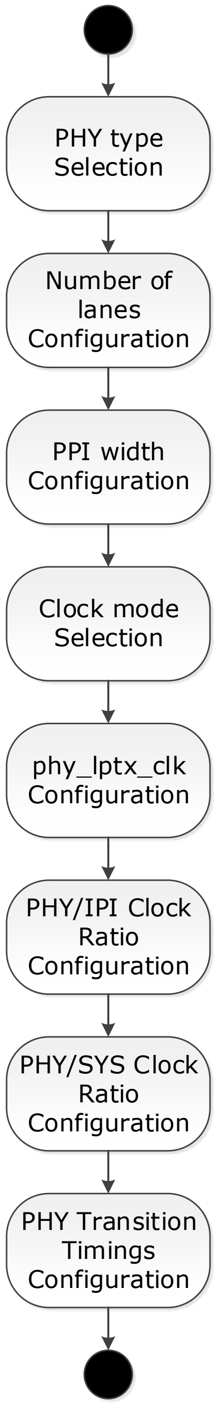

Fig. 21-10 PHY Related Configuration Sequence

Select the type of PHY to be used using the phy_type field of the PHY_MODE_CFG register.

1. Configure the number of PHY lanes using the phy_lanes field of the PHY_MODE_CFG

register.
2. Configure the PPI width of the PHY data lanes using the ppi_width field of the PHY_MODE_CFG register.
3. Configure the PHY Clock mode using the clk_type field of the PHY_CLK_CFG register.
4. Configure the phy_lptx_clk frequency using the divisor factor field of the PHY_CLK_CFG register. If the controller is not set to work in automatic mode (MANUAL_MODE_CFG register), follow these steps:
5. Configure the PHY/IPI clock ratio value in PHY_IPI_RATIO_MAN_CFG register.
6. Configure the PHY/SYS clock ratio value in PHY_SYS_RATIO_MAN_CFG register.
7. Configure the PHY low-power to high-speed and high-speed to low-power transition timings, by writing into the PHY_LP2HS_MAN_CFG and PHY_HS2LP_MAN_CFG registers, respectively.
8. Configure the maximum read time, by writing into the PHY_MAX_RD_T_MAN_CFG register.
9. Configure the escape command duration, by writing into the PHY_ESC_CMD_T_MAN_CFG register.
10. Configure the escape byte duration, by writing into the PHY_ESC_BYTE_T_MAN_CFG register.

21.5.2.3 DSI2 Protocol Configuration

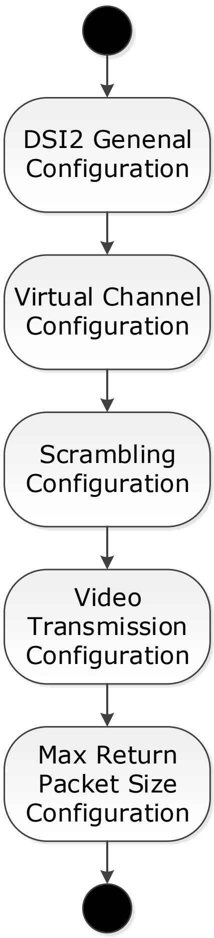

Fig. 21-11 DSI2 related Configuration Sequence

1. Configure EoTp and BTA options to meet peripheral characteristics using the DSI_GENERAL_CFG register.
2. Configure the virtual channel for transmission using the DSI_VCID_CFG register.
3. If required, enable the Scrambling feature using bit 0 of the DSI_SCRAMBLING_CFG register. By default, the scrambling polynomial is as defined in MIPI DSI-2 Specification; however, it can be changed using the DSI_SCRAMBLING_CFG register.
4. Configure the video transmission options using the DSI_VID_TX_CFG register.
5. Configure the maximum return packet size that the peripheral can send, using the DSI_MAX_RPS_CFG register. The set maximum return packet size command allows

the host processor to limit the size of the response packets coming from a peripheral. The initial value of the maximum return packet size is one byte. To get more than one byte, the host has to send this command with the desired size as a parameter before sending a read command.

Note: The maximum return packet size must not exceed the DSI2 host controller read FIFO size in order to avoid an overflow. The DSI2 host controller read FIFO has 256 bytes' size.

21.5.2.4 Image Pixel Interface (IPI) Configuration

The Image Pixel Interface (IPI) can be used to transmit an image using Video mode or Data Stream mode. Follow the programming sequence described in Below Figure to configure Image Pixel Interface.

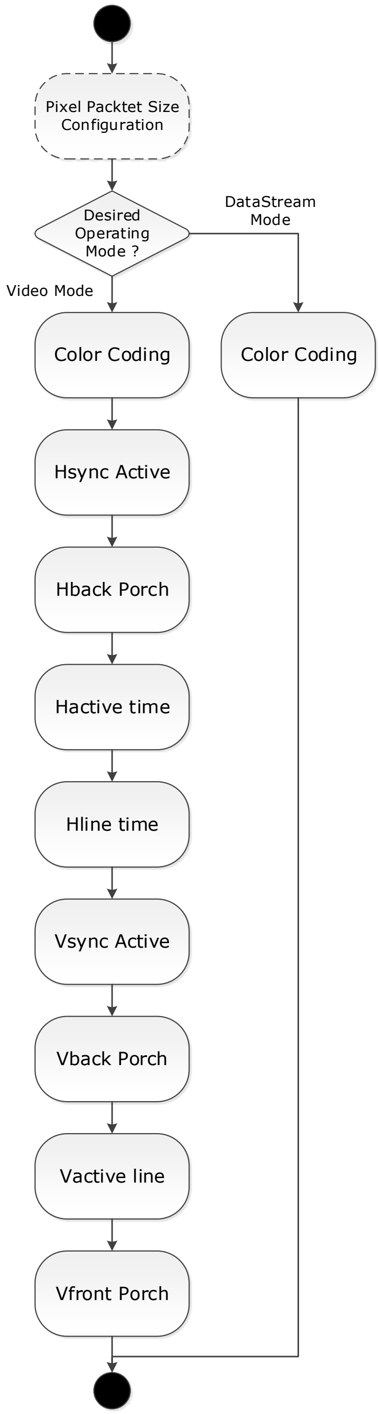

Fig. 21-12 Video Format related Configuration Sequence

1. If required, configure the number of pixels per packet using the IPI_PIX_PKT_CFG register
2. If controller is not set to work in automatic mode (MANUAL_MODE_CFG register), follow the next steps:

3. Configure the IPI Color Coding, by writing into the IPI_COLOR_MAN_CFG register.
4. If the controller is intended to operate in Data Stream mode, no more steps are required. If it is intended to operate in Video mode, follow these steps:
5. Configure the Horizontal Sync Active time by writing into the IPI_VID_HSA_MAN_CFG register.
6. Configure the Horizontal Back Porch time by writing IPI_HBP_MAN_CFG register.
7. Configure the Horizontal Active time by writing IPI_HACT_MAN_CFG register.
8. Configure the Total line time (HSA+HBP+HACT+HFP) by writing IPI_HLINE_MAN_CFG register.
9. Configure the Vertical Sync Active period in lines by writing IPI_VSA_MAN_CFG register.
10. Configure the Vertical Back Porch period in lines by writing IPI_VBP_MAN_CFG register.
11. Configure the Vertical Active period in lines by writing IPI_VACT_MAN_CFG register.
12. Configure the Vertical Front Porch period in lines by writing IPI_VFP_MAN_CFG register

21.5.2.5 Selecting Operating Modes

1. Request MIPI_DSI2_Host Controller to enter into the selected mode by writing in the in the MODE_CTRL register.
2. Verify that the MIPI_DSI2_Host Controller has entered into the selected mode by reading the MODE_STATUS register.

21.5.2.6 Using the Command Request Interface (CRI)

Follow the sequence illustrated in below Figure to send and receive packets through CRI

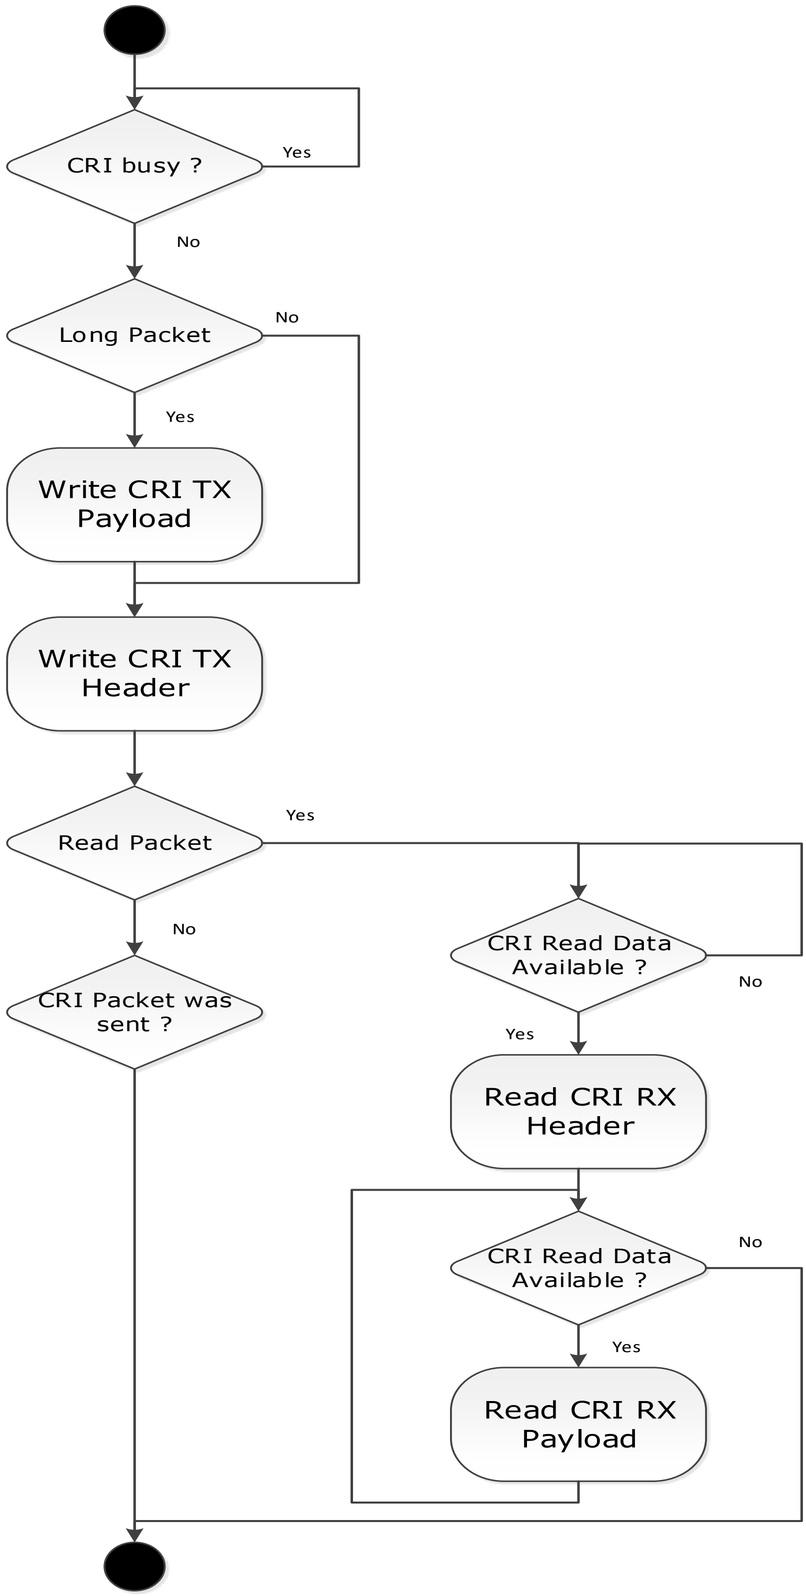

Fig. 21-13 Command related Configuration Sequence

1) Read the CORE_STATUS register to ensure that CRI is not busy.
2) If the requested packet is a long packet, write the respective payload through the CRI_TX_PLD register, four bytes per write, from the first to the last payload byte. Multiple writes may be required if the payload is bigger than 4 bytes.
3) Configure the packet header and the desired transmission mode, by writing the CRI_TX_HDR register. If the packet is not described in DSI2 specification, configure the additional cmd_hdr_rd and cmd_hdr_long bits also, to identify if the packet is a write/read and short/long.
4) If desired, when the request packet is not a read packet, check if the packet is

completely sent by reading the CRI busy status in the CORE_STATUS register. When sending read packets, the controller receives the peripheral responses and makes them available. To get the response data, follow these steps:

5) Read the CORE_STATUS register cri_rd_data_avail bit to check if there is CRI read data available.
6) Read the CRI_RX_HDR register to obtain the response header.
7) If the response is long, the CORE_STATUS register continues flagging CRI read data available until all payload bytes are read.
8) Obtain the response payload bytes by reading the CRI_RX_PLD register, four bytes per read, from the first to the last payload byte.

Note: The maximum command write payload size is 640 bytes.

21.5.3 Configuration examples

Since the PPI width of the High-Speed Transmit Data in DCPHY is fixed to 16 bits, the MIPI DSI2 host controller's PPI width should be set 16 to match it.

21.5.3.1 Case 1

Case1 related parameter:

- Video Mode, Burst Mode
- DPHY - 2Gbps/Lanes
- Video Format 1920x1080@60HZ, RGB888, uncompressed

Configuration Sequence:

1) set MANUAL_MODE_CFG = 1
2) set phy_type = 0 (DPHY), phy_lanes = 3 (4 Lanes), ppi_width = 1 (16 bits) in PHY_MODE_CFG
3) set clk_type = 0 (Continuous Clocks) in PHY_CLK_CFG
4) set vid_mode_type = 2 (Burst Mode) in DSI_VID_TX_CFG
5) set ipi_depth = 3 (8 bits), ipi_format = 0 (RGB) in IPI_COLOR_MAN_CFG
6) set IPI_HSA_MAN_CFG
7) set IPI_HBP_MAN_CFG
8) set IPI_HACT_MAN_CFG
9) set IPI_HLINE_MAN_CFG
10) set IPI_VSA_MAN_CFG = vsa
11) set IPI_VBP_MAN_CFG = vbp
12) set IPI_VACT_MAN_CFG = vact
13) set IPI_VFP_MAN_CFG = vfp
14) set IPI_RATIO_MAN_CFG = $\frac{MIPI\_DCPHY\_HSCLK\_Freq\ (125M)}{IPI\_CLK\_Freq\ (37.125M)}$
15) set SYS_RATIO_MAN_CFG = $\frac{MIPI\_DCPHY\_HSCLK\_Freq\ (125M)}{SYS\_CLK\_Freq\ (350M)}$
16) set PHY_LP2HS_MAN_CFG = PHY_LP2HS_TIME << 16, PHY_HS2LP_MAN_CFG = PHY_HS2LP_TIME << 16 , where
17) PHY_LP2HS_TIME = (TLPX + THS-PREPARE + THS-ZERO) / Tphy_hstx_clk
18) PHY_HS2LP_TIME = (THS-TRAIL + THS-EXIT) / Tphy_hstx_clk
19) Power up MIPI DCPHY
20) set pwr_up = 1 to power up DSI2 core
21) set MODE_CTRL = 3 (Video Mode)
22) enable VOP to transmitting video

21.5.3.2 Case 2

Case2 related parameter:

- Data Stream Mode
- DPHY - 2Gbps/Lanes
- Video Format 4K@60HZ, RGB888, compressed

Configuration Sequence:

1) set MANUAL_MODE_CFG = 1
2) set phy_type = 0 (DPHY), phy_lanes = 3 (4 Lanes), ppi_width = 1 (16 bits) in PHY_MODE_CFG

3) set clk_type = 0 (Continuous Clocks) in PHY_CLK_CFG
4) set ipi_depth = 3 (8 bits) and ipi_format = 11 (Compressed) in IPI_COLOR_MAN_CFG
5) set dsihost*_ipi_color_depth = 3 (8 bits) and dsihost*_ipi_format = 11 (Compressed) in VOP_GRF_VOP_CON0/1 in VOP_GRF
6) set max_pix_pkt = 3840 which equal to one compressed line byte number
7) set IPI_RATIO_MAN_CFG
8) set SYS_RATIO_MAN_CFG
9) set PHY_LP2HS_MAN_CFG = PHY_LP2HS_TIME << 16, PHY_HS2LP_MAN_CFG = PHY_HS2LP_TIME << 16
10) Power up MIPI DCPHY
11) set pwr_up = 1 to power up DSI2 core
12) set MODE_CTRL = 2 (Command Mode)
13) start transmitting power-up command and DSC PPS to display panel using CRI_TX_PLD and CRI_TX_HDR
14) set MODE_CTRL = 4 (DataStream Mode)
15) enable VOP to transmitting video

Chapter 22 MIPI D-PHY / C-PHY Combo PHY

22.1 Overview

The MIPI D-PHY / C-PHY Combo PHY is a high speed, low power, low cost PHY, especially suited for mobile applications. It is commonly used for connecting a mobile display driver or a camera sensor to a host processor according to MIPI Alliance DPHY V2.0 and C-PHY V1.1 specification. Nevertheless, it can be applied to many other applications.

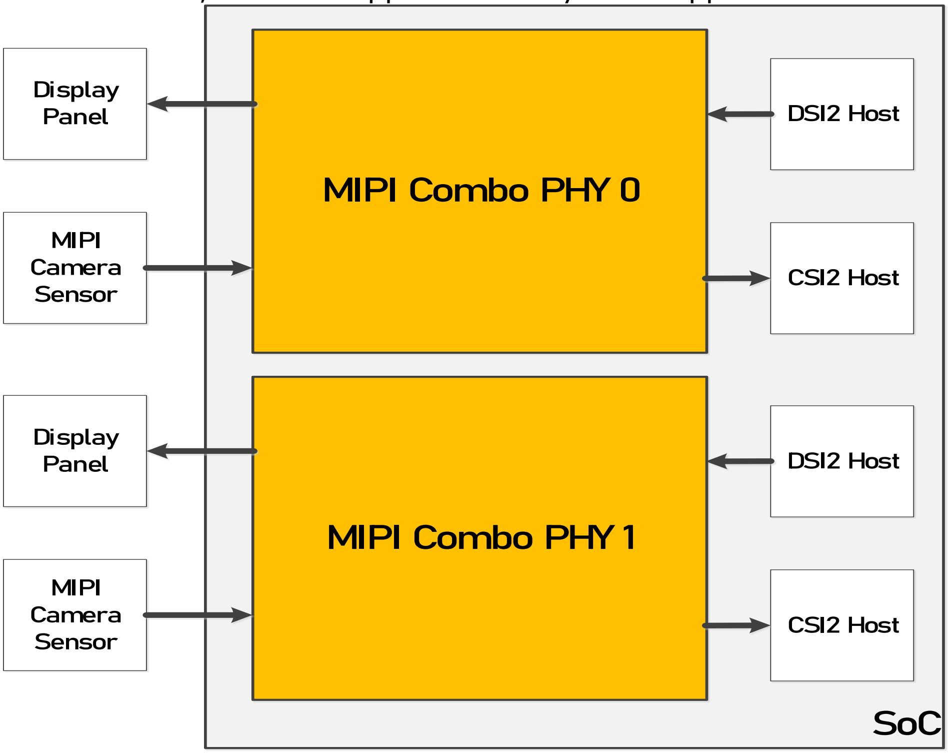

Fig. 22-1 MIPI Combo PHY

The features of D-PHY are:

- D-PHY spec v2.0 compatible
- Supports 1 Clock lane and up to 4 data lanes scalability in TX and RX respectively
- High-Speed mode: Differential and terminated: 80Mbps ~ 4500 Mbps.
- Low-Power mode: Single-ended and non-terminated, 1.2 V swing: 10 Mbps maximum
- All lanes support high-speed transmission in the forward direction.
- Bi-directional data transmission in Low-Power mode at the Master Data Lane 0 only.
- Synchronous link between Master (data source) and Slave (data sink).

The features of C-PHY are:

- C-PHY spec v1.1 compatible
- Supports up to 3 trios scalability in TX and RX respectively
- High-Speed mode: Differential and terminated
  - TX: 80Msps ~ 2000Msps
  - RX: 80Msps ~ 2500Msps
- Low-Power mode: Single-ended and non-terminated: 10Mbps maximum

Note: The TX and RX only support operate in the same PHY mode.

22.2 Block Diagram

The 4-lane D-PHY architecture including lanes and common block is shown in the below figure. IP is composed of common block (BIAS/PLL), Master clock lane, Master data 4 lanes, Slave clock lane, and Slave data 4 lanes. PLL offers the operating clock for Master block operation. Slave block uses clock from Slave clock lane input PAD at the normal operation mode. BIAS block make the analog reference voltages and currents for analog function according to MIPI specification. HS mode 0.4V voltage regulator is embedded into IP and is just used for Master blocks.

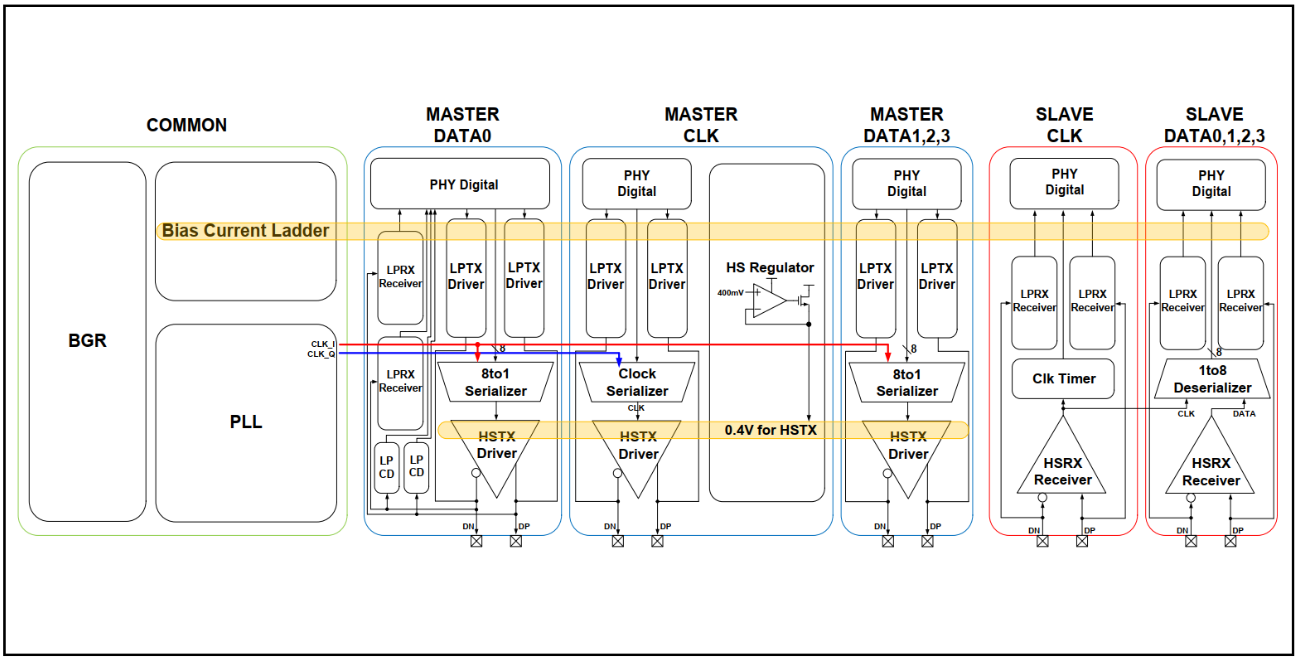

Fig. 22-2 MIPI Combo PHY Block Diagram

MIPI Combo PHY comprises with:

- BGR and bias generator
- Phase Locked Loop (PLL)
- Serializer
- HS TX Driver
- LP TX Driver
- Deserializer
- HS RX Receiver
- LP RX Receiver

22.3 Function Description

22.3.1 BGR and bias generator

The BGR circuit generates high-accuracy reference voltage of 820mV across PVT variation. A bias generator makes internal-resistor (RMRES)-referred currents, and these currents are distributed to each block in Common and Lanes. The internal resistor-referred current is generated using internally integrated replica resistor to compensate resistance error across PVT variation.

22.3.2 Phase Locked Loop (PLL)

The PLL in the Common synthesizes high-speed clock, which is used for TX serializer from a reference clock. In the PHY, the high frequency clock from PLL is used in the serialization of TX data. The following are the main features of the PLL.

- Supports output frequency from 80MHz to 2.5GHz clock
- Supports pre-defined and programmable divider setting for MIPI D-PHY specification
- Supports spread spectrum clocking (SSC) with sigma-delta modulated fractional divider

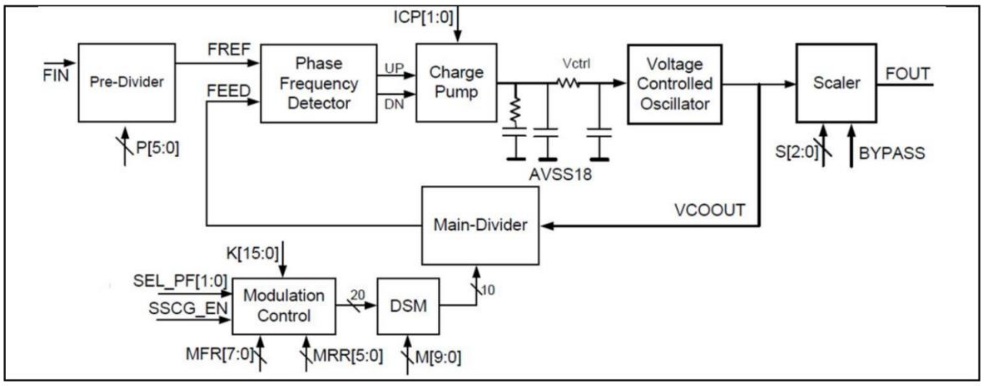

Fig. 22-3 PLL Diagram

22.3.3 Serializer

The serializer accepts 8-bit data from the PHY digital which is synchronized to TX byte clock. The parallel data is converted to the high-speed serial data. Finally, serializer transmits the serial data through the driver.

22.3.4 HS TX Driver

The driver generates baud-rate voltage waveform on TX output pads. The driver comprises of pre-driver and main-driver. The output data of serializer are delivered to the main-driver via the pre-driver. The main driver is based on voltage-mode driver to achieve a small power consumption and voltage swing.

22.3.5 LP TX Driver

In the low power mode, LP TX driver sends the low frequency data under 10Mbps. Generally, LP-11 stop state and HS enter sequence (LP-11 - LP-01 - LP-00) are used mostly.

22.3.6 Deserializer

In the BIST (Built-In Self-Test) mode, the serial data from the serializer is fed back to the de-serializer. And in the real mode, the real data from HS-RX receiver is sent to the de-serializer. De-serializer converted serial data to 8-bit parallel data and transferred them into PHY digital circuit for sending data to link or checking bit error at BIST mode.

22.3.7 HS RX Receiver

The high speed data from the MIPI D-PHY master has the MIPI D-PHY electrical characteristics. HS RX receiver convert it to the TTL CMOS level and send it to de-serializer for making the low parallel data.

22.3.8 LP RX Receiver

In the low power mode, LP RX receiver make esc clock from LP signal and converts the voltage level from 1.2V level to TTL CMOS logic level. And it sends them to PHY digital for command interpretation. And LP RX receiver always watches the DP/DN signal level. If DP/DN goes to LP-11, PHY recognizes Stop-state, and enters to low power mode.

22.3.9 PLL and Clock Lane Connection

The below figure illustrates the PLL and Clock Lane connection. MIPI D-PHY is source synchronous system. Master clock lane sends high speed differential clock to Slave clock lane. During LP mode (Low Power mode), LP signals are sent by master block. LP-TX sends the LP signals for changing mode between LP mode and HS mode. Slave block has the termination resistor between differential signals that is enabled during HS mode. Master PLL generates the high speed clock from input clock.

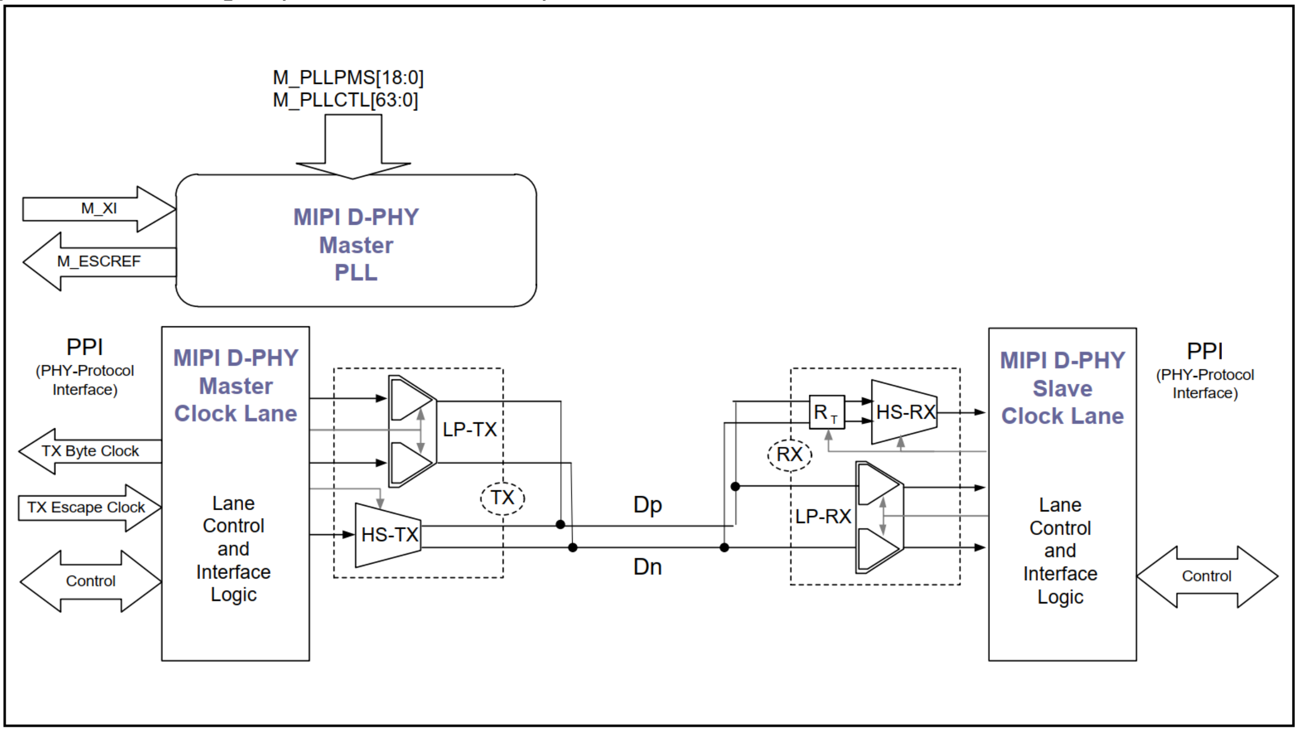

Fig. 22-4 Clock Lane Connection

22.3.10 Data Lane Connection

The below figure illustrates the Data0 Lane connection between Master and the Slave.

Master Data0 lane is the special lane for DSI interface because it has LP-CD and LP-RX. LP-RX is used for Turn-Around function according to MIPI standard specification. It is used to be called as BTA (Bus Turn-Around). It is known that BTA is needed for sending the Low Power Data Transmission from Slave to Master. LP-CD (Low Power Contention Detector) is used for detecting the abnormal state when the both of Master LP-TX and Slave LP-TX at BTA mode are enabled and the output signals are conflicted.

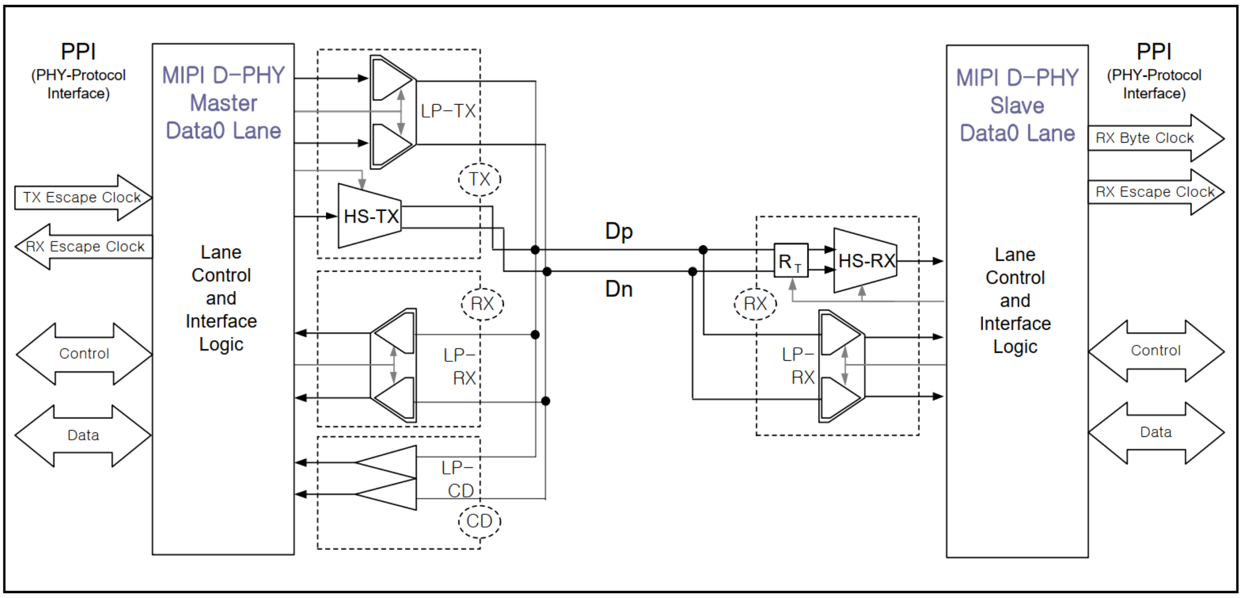

Fig. 22-5 Data 0 Lane Connection

The below figure illustrates the Data1/2/3 Lane connection between Master and the Slave. LP mode signals are used for switching mode between LP mode and HS mode. HS mode is used for interfacing high speed signals. All interface pins between PHY and protocol layer are defined at MIPI stand specification, PPI (PHY-Protocol Interface). Slave block has the termination resistor between differential signals that is enabled during HS mode.

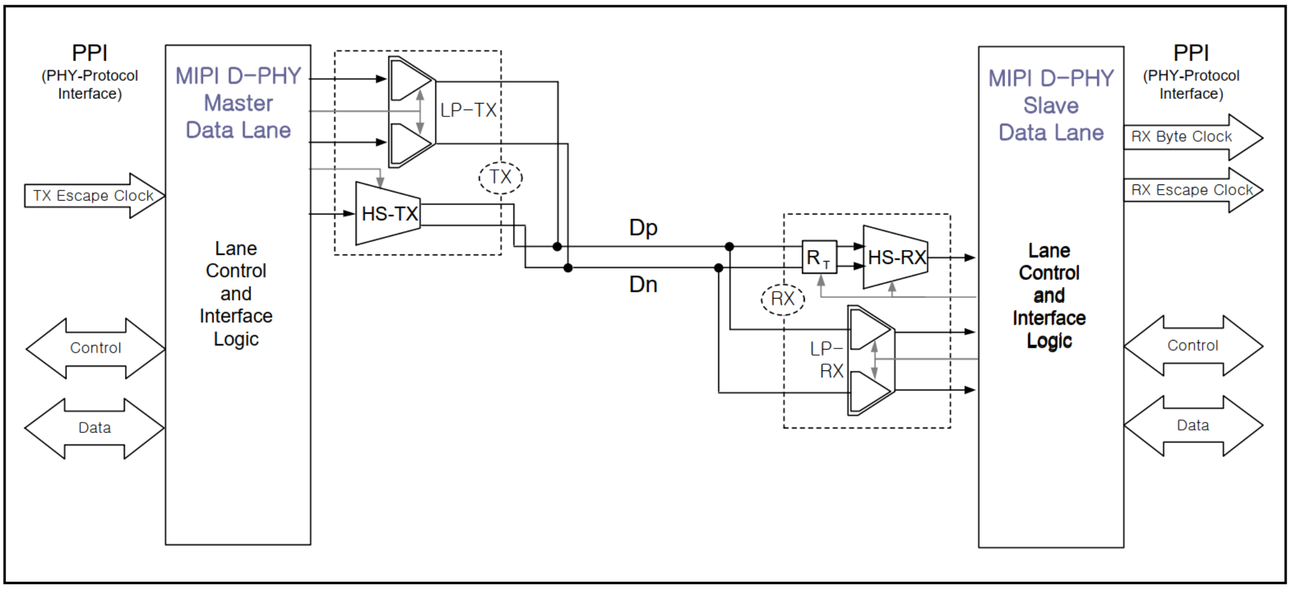

Fig. 22-6 Data 1/2/3 Lane Connection

22.4 Register Description

22.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

Table 22-1 DCPHY Address Mapping

Base Address[11:8]	Device	Address Length	Offset Address Range
4’b0000	BIAS	256 BYTE	0x0000 ~ 0x00ff
4’b0001	PLL	256 BYTE	0x0100 ~ 0x01ff

4’b0011	Master Clock Lane	256 BYTE	0x0300 ~ 0x03ff
4’b0100	Master Data 0 Lane	256 BYTE	0x0400 ~ 0x04ff
4’b0101	Master Data 1 Lane	256 BYTE	0x0500 ~ 0x05ff
4’b0110	Master Data 2 Lane	256 BYTE	0x0600 ~ 0x06ff
4’b0111	Master Data 3 Lane	256 BYTE	0x0700 ~ 0x07ff
4’b1011	Slave Clock Lane	256 BYTE	0x0b00 ~ 0x0bff
4’b1100	Slave Data 0 Lane	256 BYTE	0x0c00 ~ 0x0cff
4’b1101	Slave Data 1 Lane	256 BYTE	0x0d00 ~ 0x0dff
4’b1110	Slave Data 2 Lane	256 BYTE	0x0e00 ~ 0x0eff
4’b1111	Slave Data 3 Lane	256 BYTE	0x0f00 ~ 0x0fff

22.4.2 Registers Summary

DCPHY_M0_BIAS_CON4
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
6:5	RW	0x0	I_MUX_SEL Output Voltage(400mV/200mV/530mV) selction pin 2b'00 : 400mV 2b'01 : 200mV 2b'10 : 530mV 2b'11 : 530mV D-PHY: 2'b00 C-PHY: 2'b10
4:0	RO	0x00	reserved

DCPHY_M0_PLL_CON0
Address: Operational Base + offset (0x0100)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12	RW	0x0	PLL_EN PLL Control Logic Block Enable Register. For use PLL in PHY module, user can set this register after setting registers.
11	RO	0x0	reserved
10:8	RW	0x0	S Register for Division Value of the 3-bit Programmable Scaler.
7:6	RO	0x0	reserved
5:0	RW	0x00	P Register for Division Value of the 6-bit Programmable Pre-Divider. PLL has to be reset if P value is changed.

DCPHY_M0_PLL_CON1
Address: Operational Base + offset (0x0104)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	K Value of 16-bit DSM.

DCPHY_M0_PLL_CON2
Address: Operational Base + offset (0x0108)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	USE_SDW_REG Shadow Register Enable Register. For using frequency hopping function in PHY, user can set this register before controlling the interface signal PLL_CFG_UPDT.
14	RW	0x0	M_ESCREF_EN M_ESCREF Output Enable Register. When user wants to measure the Escape Clock of Master Lanes, set this register.
13	RW	0x0	FOUT_MASK Register for Scaler's Re-initialization Time Control Pin. Default value is 1'b0.
12	RW	0x0	FEED_EN Register for Monitoring Pin. If FEED_EN is 1, FEED_OUT is enabled. Default value is 1'b0.
11:10	RO	0x0	reserved

Bit	Attr	Reset Value	Description
9:0	RW	0x000	M Register for Division Value of the 10-bit Programmable Main-Divider. PLL has to be reset if M value is changed.

DCPHY_M0_PLL_CON3
Address: Operational Base + offset (0x010C)

Bit	Attr	Reset Value	Description
31:14	RO	0x00000	reserved
13:8	RW	0x00	MRR Register for Value of 6-bit Modulation Rate Control. PLL has to be reset if MRR is changed.
7:0	RW	0x00	MFR Register for Value of 8-bit Modulation Frequency Control. PLL has to be reset if MFR is changed.

DCPHY_M0_PLL_CON4
Address: Operational Base + offset (0x0110)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11	RW	0x0	SSCG_EN Register for Enable Pin for Dithered Mode(Active-high).
10	RW	0x0	FSEL Register for Monitoring Pin. If FSEL is 0, FEED_OUT is FREF If FSEL is 1, FEED_OUT is FEED Default value is 1'b0.
9	RW	0x0	BYPASS Register for Bypass Function of PLL. If BYPASS is 1, bypass mode is enabled. (FOUT: FIN) If BYPASS is 0, PLL operates normally.
8	RW	0x0	AFC_ENB Register for Monitoring Pin. If AFC_ENB is 0, AFC is enabled and VCO is calibrated automatically. If AFC_ENB is 1, AFC is disabled and VCO is calibrated manually by EXTAFC[4:0] for the test of VCO range. Default value is 1'b0.
7:5	RO	0x0	reserved
4:0	RW	0x00	EXTAFC Register for Monitoring Pin. If AFC_ENB is 1, AFC is disabled and VCO is calibrated manually by EXTAFC[4:0] for the test of VCO range. Default value is 5'b0_0000.

DCPHY_M0_PLL_CON5
Address: Operational Base + offset (0x0114)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	CLK_BUFF_EN_SEL Clock Buffering Enable Selection Register. 1'b0: Clock buffering is enabled when PLL_EN is set. 1'b1: Clock buffering is enabled when ENABLE(M%_DPHY_M#C_GNR_CON0) is set.

Bit	Attr	Reset Value	Description
14	RW	0x0	F_OUT_EN PLL Output to External Module Enable Control Register. For sharing PLL signals of this module with other module, user can set this register before enabling the PLL.
13	RW	0x0	CAL_SEL_CK Clock I-Q Phase Change Control Register. 1'b0: Use Q Phase. 1'b1: Use I Phase. (Changed)
12	RW	0x0	CAL_SEL_DATA Data I-Q Phase Change Control Register. 1'b0: Use I Phase. 1'b1: Use Q Phase. (Changed)
11	RW	0x0	SEL_EXTCLK PLL of External Module Enable Register. For using shared clock and clock signals by PLL of external module, user can set this register without enabling the PLL in this module. 1'b0: Use Internal PLL. (Default) 1'b1: Use External PLL.
10	RW	0x0	RESET_N_SEL Clock Divider Reset Selection Register. 1'b0: Release clock divider reset when PLL_EN is set. 1'b1: Release clock divider reset when ENABLE(M%_DPHY_M#C_GNR_CON0) is set.
9	RW	0x0	MS_ENABLECLK_SEL PLL Buffering Enable Selection Register. 1'b0: PLL buffering is enabled when ENABLE(M%_DPHY_M#C_GNR_CON0) is set. 1'b1: PLL buffering is enabled when ENABLE(M%_DPHY_S#C_GNR_CON0) is set.
8	RW	0x0	PLL_ENABLE_SEL PLL Buffering Enable Selection Register. 1'b0: PLL buffering is enabled when PLL_EN is set. 1'b1: PLL buffering is enabled when ENABLE(M%_DPHY_M#C_GNR_CON0) is set.
7:6	RO	0x0	reserved
5:4	RW	0x0	ICP Register for Controls the Charge-Pump Current. Default value: 2'b00
3:2	RO	0x0	reserved
1:0	RW	0x0	SEL_PF Register for Value of 2-bit Modulation Method Control. 00: Down spread 01: Up spread 1x: Center spread. PLL has to be reset if SEL_PF is changed.

DCPHY_M0_PLL_CON6

Address: Operational Base + offset (0x0118)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved

Bit	Attr	Reset Value	Description
12	RW	0x0	CLK_BUFF_EN_SEL Clock Gating Disable Control Register. 1'b0: Clock gating function is available. 1'b1: Clock gating function is not available when PLL_WCLK_EN is asserted.
11:8	RW	0x0	WCLK_BUF_SFT_CNT Word Clock Buffer Shift Count Control Register. Please set this register as below. Roundup((Word Clock Period) / 38.46 + 2)
7	RW	0x0	PLL_TEST_DIV_EN PLL Test Divider Enable Control Register. For measuring frequency in ATE test environment, user can set this register and measure the divided clock frequency at the port "PLL_TEST_DIV_TM."
6	RW	0x0	D2A_CLK_BUF_EN_SEL D2A_CLK_BUF_EN Enable Selection Register. 1'b0: D2A_CLK_BUF_EN 1'b1: ENABLE(M%_DPHY_M#C_GNR_CON0)
5	RW	0x0	INTERNAL_LOOPBACK_EN Internal Loopback Test Enable Register. 1'b1: Internal Loopback Test
4	RW	0x0	M_RESETN_IQ_SEL M_RESETN Phase Control Register. 1'b0: I Phase 1'b1: Q Phase
3	RW	0x0	BITCLKDIV2_OUT_ENB Bit Clock /2 Divider Output Enable Control Register. 1'b0: Enable 1'b1: Disable
2	RW	0x0	BITCLKDIV4_OUT_ENB Bit Clock /4 Divider Output Enable Control Register. 1'b0: Enable 1'b1: Disable
1	RW	0x0	BITCLKDIV8_OUT_ENB Bit Clock /8 Divider Output Enable Control Register. 1'b0: Enable 1'b1: Disable
0	RW	0x0	BGR_REF_CLK_EN BGR_REF_CLK Output Enable Control Register. 1'b0: Disable 1'b1: Enable

DCPHY_M0_PLL_CON7

Address: Operational Base + offset (0x011C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	PLL_LOCK_CNT PLL Lock Timing Control Register. This reigster is the count value of PLL lock indication. When set the PLL_EN register, PHY lock counter starts to count. And when count value reaches to the value of this register, PLL_LOCK(M%_PLL_STAT0[0]) is set to HIGH. Generally, 200us is needed for locking the PLL.

DCPHY_M0_PLL_CON8

Address: Operational Base + offset (0x0120)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	PLL_STB_CNT PLL Stabilization Timing Control Register. This register is the count value of PLL stablization is done. When the signal PLL_CFG_UPDT is asserted for frequency hopping function, PHY stabilizing counter starts to count. And when count value reaches to the value of this register, the signal PLL_CFG_READY is set to HIGH. Generally, 100us is needed for stablizing PLL in frequency hopping.

DCPHY_M0_PLL_STAT0

Address: Operational Base + offset (0x0140)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	PLL_LOCK PLL Lock Indicate Register. This register is set when output clock of PLL is locked and ready to operate after setting PLL_EN. User can control setting timing of this register using PLL_LOCK_CNT(M0_PLL_CON7[15:0]) register. And user can control ENABLE register of each Lanes after PLL_LOCK is set.

DCPHY_M0_DPHY_MC_GNR_CON0

Address: Operational Base + offset (0x0300)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RO	0x0	PHY_READY PHY Ready Indicate Register. This register is set when PHY is ready to operate after stablizing biasing. User can control setting timing of this register using T_PHY_READY(DPHY_M#C_GNR_CON1[15:0]) register. And user should release the RESETN of the Lane after all of PHY_READY register in lanes are set.
0	RW	0x0	ENABLE PHY Enable Register. For using Lane, user can set this register after PLL is locked.

DCPHY_M0_DPHY_MC_GNR_CON1

Address: Operational Base + offset (0x0304)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RW	0x0000	T_PHY_READY PHY Ready Timing Control Register. This register is the count value of PHY ready indication. When set the ENABLE register, PHY ready counter starts to count. And when count value reaches to the value of this register, PHY_READY(DPHY_M#C_GNR_CON0[1]) is set to HIGH. Generally, 200us is needed for stablizing the bias and the ready counter operates with Reference Clocks.

DCPHY_M0_DPHY_MC_ANA_CON0

Address: Operational Base + offset (0x0308)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved

Bit	Attr	Reset Value	Description
14:12	RW	0x7	EDGE_CON Cap Peaking Control Register. Set the register as below. In case of D-PHY 3'b111 In case of C-PHY 3'b001
11:10	RO	0x0	reserved
9	RW	0x0	EDGE_CON_DIR Cap Peaking Direction Control Register. Set the register as below. In case of D-PHY,1'b0 In case of C-PHY,1'b1
8	RW	0x1	EDGE_CON_EN Cap Peaking Enable Register.

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	T_PHY_READY PHY Ready Timing Control Register. This register is the count value of PHY ready indication. When set the ENABLE register, PHY ready counter starts to count. And when count value reaches to the value of this register, PHY_READY(DPHY_S#D2_GNR_CON0[1]) is set to HIGH. Generally, 200us is needed for stablizing the bias and the ready counter operates with Reference Clocks.

And please refer to "Supplement Guide" for setting this register according to data rate.

DCPHY_M0_DPHY_SD3_TIME_CON1
Address: Operational Base + offset (0x0F34)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	T_ERR_SOT_SYNC SoT Sync Error Detect Timing Control Register. This count value is used in High-Speed Transmit operation. There is a watchdog timer in Receive logic for detecting SoT Sync Error. If the Sync Pattern is not detected until the watchdog timer is expired, then the PPI signal "ERRSOTSYNC" goes to HIGH.

DCPHY_M0_DPHY_SD3_DATA_CON0
Address: Operational Base + offset (0x0F38)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	DATA_INV Data Inversion Control Register. When this register is set to HIGH, the data input of DP/DN will be inverted.
0	RW	0x0	DATA_SWAP Data Swap Control Register. When this register is set to HIGH, 16-bit data output will be swapped.

DCPHY_M0_DPHY_SD3_DESKEW_CON0
Address: Operational Base + offset (0x0F40)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4	RW	0x0	SKEW_CAL_DES_SEL Skew Calibration Clock Division Ratio Control Register.
3:1	RO	0x0	reserved
0	RW	0x0	SKEW_CAL_EN Skew Calibration Enable Register.

DCPHY_M0_DPHY_SD3_DESKEW_CON1
Address: Operational Base + offset (0x0F44)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RW	0x00	SKEW_CAL_FINAL_COMP_TIME Skew Calibration Final Compare Time Control Register.
7:6	RW	0x0	SKEW_CAL_COMP_TOL Skew Calibration Compare Tolerance Control Register.
5:4	RW	0x0	SKEW_CAL_COMP_WAIT_TIME Skew Calibration Compare Wait Time Control Register.
3:0	RW	0x0	SKEW_CAL_COMP_RUN_TIME Skew Calibration Compare Run Time Control Register.

DCPHY_M0_DPHY_SD3_DESKEW_CON2
Address: Operational Base + offset (0x0F48)

Bit	Attr	Reset Value	Description
31:13	RO	0x00000	reserved
12:8	RW	0x00	SKEW_CAL_DATA_COARSE_SET Skew Calibration Manual Data Coarse Delay Control Register.
7:5	RO	0x0	reserved
4:0	RW	0x00	SKEW_CAL_CLK_COARSE_SET Skew Calibration Manual Data Fine Delay Control Register.

DCPHY_M0_DPHY_SD3_DESKEW_CON3
Address: Operational Base + offset (0x0F4C)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:12	RW	0x0	SKEW_CAL_DATA_FINE_FALL_SET Skew Calibration Manual Data Fine Falling Delay Control Register.
11:8	RW	0x0	SKEW_CAL_DATA_FINE_RISE_SET Skew Calibration Manual Data Fine Rising Delay Control Register.
7:4	RW	0x0	SKEW_CAL_CLK_FINE_FALL_SET Skew Calibration Manual Clock Fine Falling Delay Control Register.
3:0	RW	0x0	SKEW_CAL_CLK_FINE_RISE_SET Skew Calibration Manual Clock Fine Rising Delay Control Register.

DCPHY_M0_DPHY_SD3_DESKEW_CON4
Address: Operational Base + offset (0x0F50)

Bit	Attr	Reset Value	Description
31:12	RO	0x00000	reserved
11:8	RW	0x0	SKEW_CAL_FINE_MAX_SET Skew Calibration Maximum Fine Delay Step Control Register.
7:5	RO	0x0	reserved
4:0	RW	0x00	SKEW_CAL_COARSE_MAX_SET Skew Calibration Maximum Coarse Delay Step Control Register.

22.6 Application Notes

22.6.1 System-level Interaction

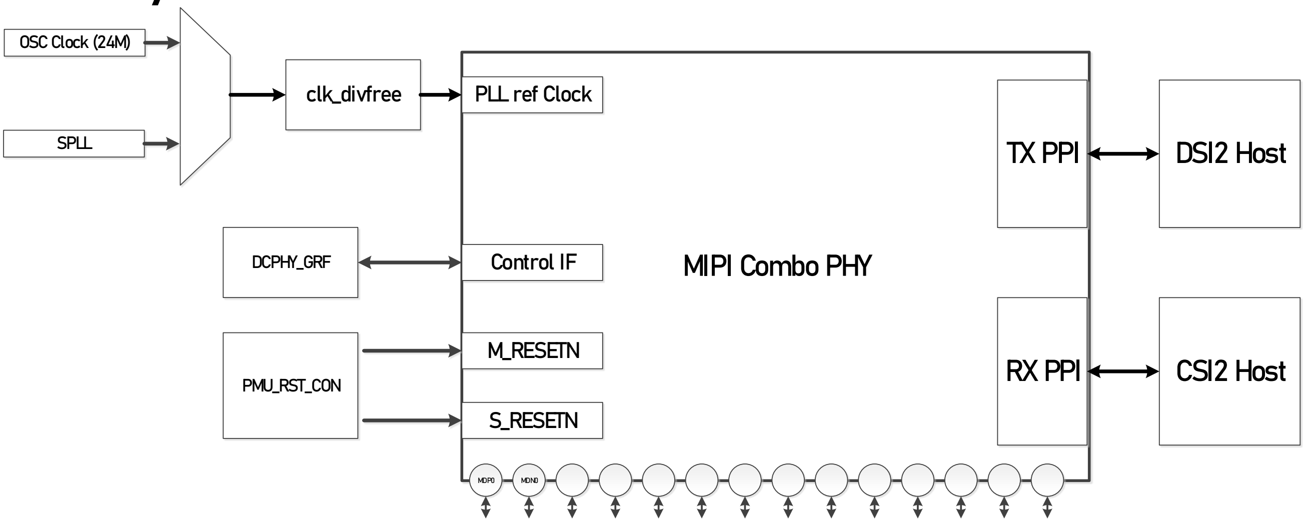

Fig. 22-7 DCPHY System Level Interaction

22.6.1.1 Clock

- **pll_ref_clk**: MIPI Combo PHY PLL reference clock could be configured to choose the source from external oscillator 24Mhz clock or system PLL clock. The default setting is oscillator 24Mhz clock for clock quality consideration.

22.6.1.2 Reset

- **M_RESETN**: reset to PLL block, TX Clock lane block and data lane 0/1/2/3 block.
- **S_RESETN**: reset to RX Clock lane block and data lane 0/1/2/3 block.

M_RESETN and S_RESETN are programmed in *PMU1CRU_SOFTRST_CON04 register.*

22.6.1.3 AMBA APB 3 Interface

MIPI D-PHY/C-PHY combo PHY has internal registers to control the PHY itself and to debug. These internal registers are accessible through the APB interface, and each register is a maximum of 16bits wide. The APB slave in the PHY is completely compatible with AMBA 3.0 APB specification.

Table 22-4 DCPHY APB Base Address

IP	Base Address
MIPI_Combo_PHY_0	0xFEDA0000
MIPI_Combo_PHY_1	0xFEDB0000

22.6.1.4 System Control Signals

MIPI Combo PHY mode and some debug status are interacted with their corresponding GRF.

Table 22-5 DCPHY GRF Base Address

IP	Base Address
MIPI_Combo_PHY_GRF0	0xFD5E8000
MIPI_Combo_PHY_GRF1	0xFD5EC000

M/S_CPHY_MODE: D-PHY / C-PHY mode select signal of bias / DTB / PLL / TX / RX block.

22.6.2 PLL Programmability

PLL in MIPI Combo PHY is a 1.8V/0.75V dual supply-voltage phase locked loop (PLL) with a wide-output-frequency-range for frequency synthesis. It consists of a phase frequency detector (PFD), a charge pump, a voltage-controlled oscillator (VCO), a 6-bit predivider, a 10-bit main-divider, a 3-bit scaler, a delta-sigma modulator (DSM) and an automatic

frequency control (AFC).
The output frequency (Fout) is related to the input frequency (Fin) using the following equation.

$$Fvco = \frac{((M + \frac{K}{65536}) \times 2 \times Fin)}{P}$$

$$Fout = \frac{((M + \frac{K}{65536}) \times 2 \times Fin)}{(P \times 2^{s})}$$

where p, m, s, and k are the division values in decimal numbers for pre-divider, main-divider, scaler, and DSM, respectively.
Frequency of VCO's output: 2600MHz ≤ F_{vco} ≤ 6600MHz
P[5:0], M[9:0] and S[2:0] are unsigned integers. K[15:0] is a two's complement integer.

- 6'b000001 ≤ P[5:0] ≤ 6'b11 1111 and 6MHz ≤ FFREF(FFIN / p) ≤ 30MHz
- 10'b00_0100_0000 ≤ M[9:0] ≤ 10'b11_1111_1111
- 3'b000 ≤ S[2:0] ≤ 3'b110
- 16'b1000_0000_0000_0000 ≤ K[15:0] ≤ 16'b0111_1111_1111_1111

22.6.3 Start-up Sequence

The below figure illustrates the initialization sequence.

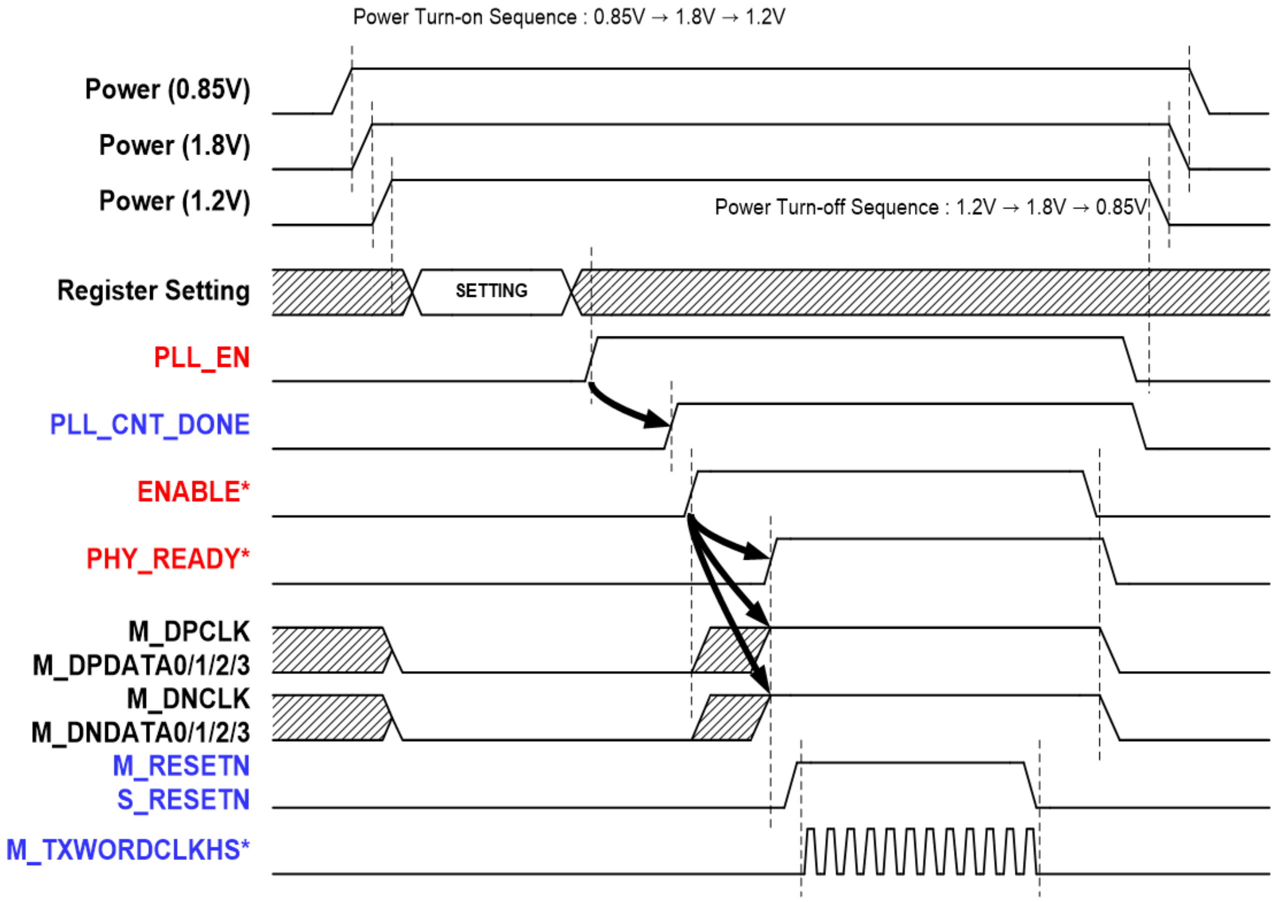

Fig. 22-8 DCPHY Start Up Sequence

(1) Turn the powers on by the sequence according to the initialization sequence figure. After power sequence is done, drivers in PHY are stabilized and DP/DN pad outputs of each Lane become LP-00 state.
(2) Set the special function registers through APB interface including the registers of PLL. DO NOT set PLL_EN and ENABLE register in this time.
    - PLL_EN: PLL_CON0[12]
    - ENABLE: DPHY_M0C_GNR_CON0[0] / DPHY_M0D#_GNR_CON0[0] / COMBO_M0D#_GNR_CON[0] / DPHY_S0C_GNR_CON0[0] /

DPHY_S0D#_GNR_CON0[0] / COMBO_S0D#_GNR_CON[0]
(3) Enable PLL by set PLL_EN register to HIGH. If Slave Lanes are only used, then PLL sequence can be skipped at the real set.
(4) When PLL_EN is set to HIGH, PLL lock counter is started for getting stabilized clock. The lock counter is expired when the count value is reached to the value set as REG_PLL_LOCK_CNT (PLL_CON7[15:0]). And then, the interface signal PLL_CNT_DONE is asserted.
(5) Through ENABLE registers, the Lanes are enabled (# = 0/1/2/3).
- ENABLE: DPHY_M0C_GNR_CON0[0] / DPHY_M0D#_GNR_CON0[0] / COMBO_M0D#_GNR_CON[0] / DPHY_S0C_GNR_CON0[0] / DPHY_S0D#_GNR_CON0[0] / COMBO_S0D#_GNR_CON[0]

(6) When ENABLE is set to HIGH, the circuits need 200us for initializing Low-Power regulator and stabilizing bias block. For this, there are PHY ready counter in each Lanes. The counter is expired when the count value is reached to the value set as T_PHY_READY (GNR_CON1[15:0]). And then, PHY_READY (GNR_CON0[1]) register is set to HIGH.
- T_PHY_READY : DPHY_M0C_GNR_CON1[15:0] / DPHY_M0D#_GNR_CON1[15:0] / COMBO_M0D#_GNR_CON1[15:0] / DPHY_S0C_GNR_CON1[15:0] / DPHY_S0D#_GNR_CON1[15:0] / COMBO_S0D#_GNR_CON1[15:0]
- PHY_READY: DPHY_M0C_GNR_CON0[1] / DPHY_M0D#_GNR_CON0[1] / COMBO_M0D#_GNR_CON0[1] / DPHY_S0C_GNR_CON0[1] / DPHY_S0D#_GNR_CON0[1] / COMBO_S0D#_GNR_CON0[1]

(7) After PHY_READY is set to HIGH, the pad outputs DP/DN are stabilized to LP-11 state.
(8) After all of PHY_READY of each Lane, user can release reset of PHY "M_RESETN" or "S_RESETN".
(9) M_TXWORDCLKHS* are toggled after releasing the reset.

22.6.4 Configuration examples

22.6.4.1 Case 1 (TX operate at 4.5Gbps DPHY Mode, Ref_Clk = 24Mhz)

Configuration Sequence:

① set PMU1CRU_SOFTRST_CON04[3] = 1 to assert M_RESETN
② set BIAS block
- BIAS_CON0 = 0x0010
- BIAS_CON1 = 0x0110
- BIAS_CON2 = 0x3223

③ set TX PLL
- PLL_CON0 = 0x0002 (P = 2, S = 0)
- PLL_CON1 = 0x7fff (K = 32767)
- PLL_CON2 = 0x00bb (M = 187)
- PLL_CON3 = 0x3f08
- PLL_CON4 = 0x0800
- PLL_CON5 = 0x0500
- PLL_CON7 = 0xF000
- PLL_CON8 = 0xF000

④ set TX clock lane
1) set MC_GNR_CON0 = 0xf000
2) set MC_ANA_CON0 = 0x7133
3) set MC_ANA_CON1 = 0x0001
4) set timing parameters through
MC_TIME_CON0/MC_TIME_CON1/MC_TIME_CON2/MC_TIME_CON3 refer to the Supplement Guide Timing Table.
5) set DPHY_MC_DESKEW_CON0 = 0x9cb1 to enable deskew calibration function.

⑤ set TX data lane (* = 0,1,2,3)
1) set COMBO_MD*_GNR_CON1 = 0x2000
2) set COMBO_MD*_ANA_CON0 = 0x7133
3) set COMBO_MD*_ANA_CON0 = 0x0001
4) set timing parameters through
COMBO_MD*_TIME_CON0/COMBO_MD*_TIME_CON1/COMBO_MD*_TIME_CON2

/COMBO_MD*_TIME_CON3/COMBO_MD*_TIME_CON4 refer to the Supplement Guide Timing Table.

⑥ set PLL_EN = 1(PLL_CON0[0])

⑦ wait PLL is locked (read the PLL_STAT0[0])

⑧ set DPHY_MC_GNR_CON0[0]/COMBO_MD0_GNR_CON0[0]/COMBO_MD1_GNR_CON0[0]/COMBO_MD2_GNR_CON0[0]/COMBO_MD3_GNR_CON0[0] = 0x1 to enable lanes.

⑨ wait clock lane and data lanes' PHY_READY (GNR_CON0[1]) register is set to HIGH

⑩ set PMU1CRU_SOFTRST_CON04[3] = 0 to deassert M_RESETN

22.6.4.2 Case 2 (TX operate at 2Gbps CPHY Mode, Ref_Clk = 24Mhz)

Configuration Sequence:

① set MIPI_Combo_PHY_GRF_CON0 = 0x9 (M_CPHY_MODE = 1)

② set PMU1CRU_SOFTRST_CON04[3] = 1 to assert M_RESETN

③ set BIAS block
- BIAS_CON0 = 0x0010
- BIAS_CON1 = 0x0110
- BIAS_CON2 = 0x3223
- BIAS_CON4.I_MUX_SEL = 0x2
- DPHY_MC_ANA_CON2.HS_VREG_AMP_ICON = 0x2

④ set TX PLL
- PLL_CON0 = 0x0003 (P = 3, S = 0)
- PLL_CON1 = 0x7fff (K = 32767)
- PLL_CON2 = 0x007C (M = 124)
- PLL_CON3 = 0x3f08
- PLL_CON4 = 0x0800
- PLL_CON5 = 0x0500
- PLL_CON7 = 0xF000
- PLL_CON8 = 0xF000

⑤ set TX data lane (* = 0,1,2)
1) set COMBO_MD*_GNR_CON1 = 0x2000
2) set timing parameters through COMBO_MD*_TIME_CON0/COMBO_MD*_TIME_CON1/COMBO_MD*_TIME_CON2/COMBO_MD*_TIME_CON3/COMBO_MD*_TIME_CON4 refer to the Supplement Guide Timing Table.

⑥ set PLL_EN = 1 (PLL_CON0[0])

⑦ wait PLL is locked (read the PLL_STAT0[0])

⑧ set COMBO_MD0_GNR_CON0[0]/COMBO_MD1_GNR_CON0[0]/COMBO_MD2_GNR_CON0[0] = 0x1 to enable lanes.

⑨ wait data lanes' PHY_READY (GNR_CON0[1]) register is set to HIGH

⑩ set PMU1CRU_SOFTRST_CON04[3] = 0 to deassert M_RESETN

22.6.4.3 Case 3 (RX operate at 2.5Gbps DPHY Mode)

Configuration Sequence:

① set PMU1CRU_SOFTRST_CON04[4] = 1 to assert S_RESETN

② set RX clock lane timing parameter
   set DPHY_SC_TIME_CON0 = 0x301.

③ set RX data lane (* = 0,1,2,3) timing parameter (refer to the Supplement Guide Timing Table)
   set COMBO_SD*_TIME_CON0 = 0xd.
   set COMBO_SD*_TIME_CON1 = 0x3.

④ set DPHY_SC_GNR_CON0[0]/COMBO_SD0_GNR_CON0[0]/COMBO_SD1_GNR_CON0[0]/COMBO_SD2_GNR_CON0[0]/COMBO_SD3_GNR_CON0[0] = 0x1 to enable lanes.

⑤ wait clock lane and data lanes' PHY_READY (GNR_CON0[1]) register is set to HIGH

⑥ set PMU1CRU_SOFTRST_CON04[4] = 0 to deassert S_RESETN

22.6.4.4 Case 4 (RX operate at 2.5Gsps CPHY Mode)

Configuration Sequence:

① set MIPI_Combo_PHY_GRF_CON0 = 0x9 (CPHY_MODE = 1)
② set PMU1CRU_SOFTRST_CON04[4] = 1 to assert S_RESETN
③ set RX data lane (* = 0,1,2) timing parameter (refer to the Supplement Guide Timing Table)
set COMBO_SD*_TIME_CON0 = 0x1.
set COMBO_SD*_TIME_CON1 = 0x32.
④ set COMBO_SD0_GNR_CON0[0]/COMBO_SD1_GNR_CON0[0]/COMBO_SD2_GNR_CON0[0] = 0x1 to enable lanes.
⑤ wait data lanes' PHY_READY (GNR_CON0[1]) register is set to HIGH
⑥ set PMU1CRU_SOFTRST_CON04[4] = 0 to deassert S_RESETN

Chapter 23 EDP TX Controller

23.1 Overview

This eDP TX is compliant with DisplayPort standard 1.2a and standard eDP 1.3. DisplayPort is an industry standard to accommodate the growing broad adoption of digital display technology within the PC and consumer electronics (CE) industries. It consolidates the internal and external connection methods to reduce device complexity and cost, supports necessary features for key cross industry applications, and provides performance scalability to enable the next generation of displays featuring higher color depths, refresh rates, and display resolutions.

EDP TX Controller supports the following features:

- Compliant with DisplayPort™ Specification, Version 1.2
- Compliant with eDP™ Specification, Version 1.3
- Main link containing 4 physical lanes of 5.4/2.7/1.62 Gbps/lane
- Bi-directional auxiliary link with up to 1Mbps speed
- Support RGB, YCbCr 4:4:4, YCbCr 4:2:2 and 8/10 bit per component video format
- Support HDCP v1.3, integrated HDCP encryption engine for transmitting protected audio and video content
- Support PSR
- Support I2S audio interface, the maximum number of channels is 8
- Support S/PDIF audio interface
- 24 MHz crystal clock
- PRBS or programmable transmitter pattern for main link quality test
- Hot plug and unplug detection and link status monitor
- Supports reading of the display EDID

23.2 Block Diagram

EDP TX Controller comprises with:

- Video Data Capture
- Audio Data Capture
- DP Transmitter
- APB Slave Interface
- DPTX PHY

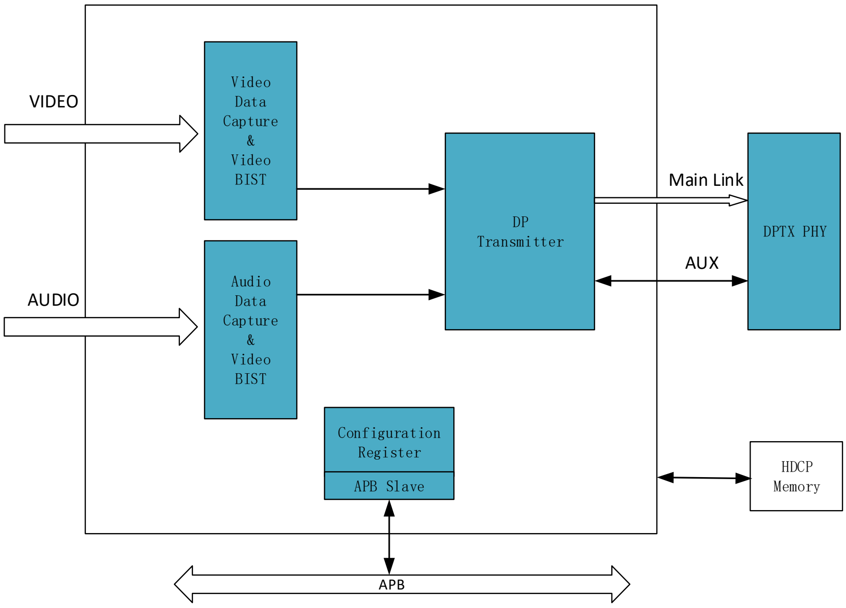

Fig. 23-1 EDP TX Controller Block Diagram

23.3 Function Description

23.3.1 Video Data Capture

The video data comes from VOP. The eDP TX receives signals and stores the video signals into the buffer. Afterward, the DP transmitter reads data from the buffer.

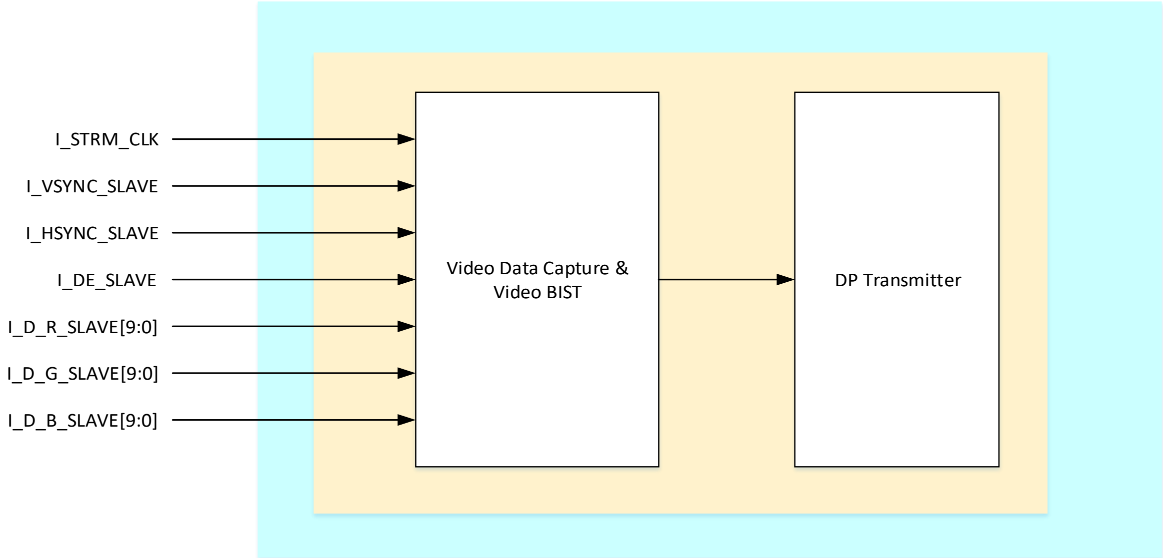

Fig. 23-2 Block diagram of Video Interface

23.3.2 Audio Data Capture

The audio data comes from I2S or S/PDIF. For audio, there are two interface: S/PDIF slave and I2S slave. In S/PDIF slave mode, the audio stream is sent from the S/PDIF input. In I2S slave mode, the audio stream is sent from the I2S S/PDIF input.

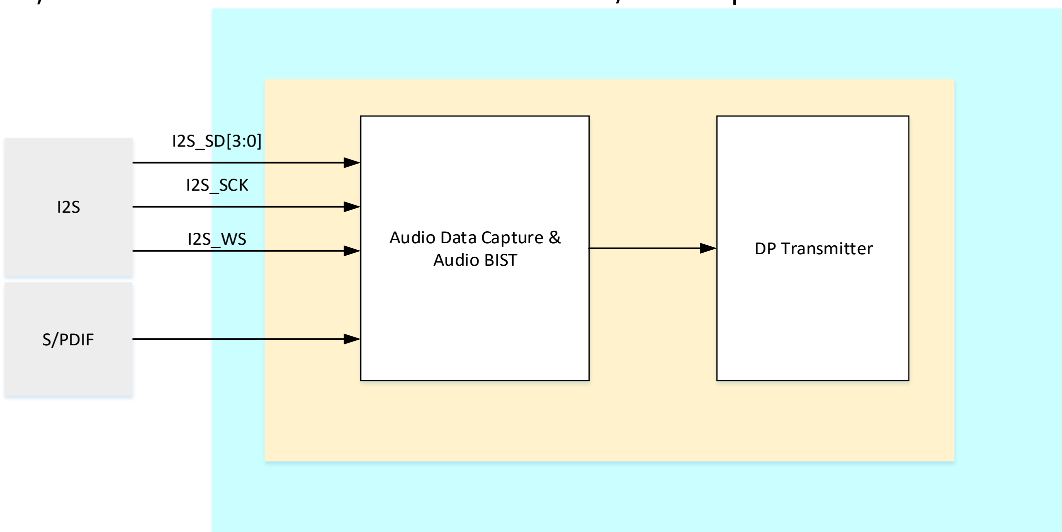

Fig. 23-3 Audio data interface block diagram

23.3.3 DP Transmitter

The DP_TX gets the video data from the Video FIFO module. Then the video data will be packed into TU (Transfer Unit). The Info Frame is passed directly through the APB interface. Some main link attributes data come from APB interface, but the information of input video timing of main link attribute come from Video Capture module.

23.3.4 APB Slave Interface

The APB slave interface is used at the configuration registers interface. Configure eDP TX and get its status. HDCP key memory is whiten by the APB slave interface, too.

23.3.5 DPTX PHY

The eDP TX PHY is combo transmit eDP and HDMI. In eDP mode, it can support 4 physical lanes of 5.4/2.7/1.62 Gbps/lane and bi-directional auxiliary link with up to 1Mbps speed.

23.4 Register Description

23.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

23.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
EDPTX_DP_TX_VERSION	0x0010	W	0x00000060	DPTX Version
EDPTX_FUNC_EN_1	0x0018	W	0x0000007D	Function Enable Register 1
EDPTX_FUNC_EN_2	0x001C	W	0x00000087	Function Enable Register 2
EDPTX_VIDEO_CTL_1	0x0020	W	0x00000000	Video Control Register 1
EDPTX_VIDEO_CTL_2	0x0024	W	0x00000010	Video Control Register 2

23.4.3 Detail Register Description

EDPTX_DP_TX_VERSION

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x60	dp_tx_version DPTX Version

EDPTX_FUNC_EN_1

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x1	vid_cap_func_en_n Video capture functions enable. 1'b0: Normal operation 1'b1: Disable video capture
5	RW	0x1	vid_fifo_func_en_n Video FIFO functions enable. 1'b0: Normal operation 1'b1: Disable video FIFO
4	RW	0x1	aud_fifo_func_en_n Audio FIFO functions enable. 1'b0: Normal operation. 1'b1: Disable audio FIFO.
3	RW	0x1	aud_func_en_n Audio FIFO and capture module function enable. 1'b0: Normal operation 1'b1: Disable audio FIFO and capture module If audio data (DMA or SPDIF) should be transmitted, AUD_FUNC_EN_N and AUD_FIFO_FUNC_EN_N should be set to 0 (enable).
2	RW	0x1	hdcp_func_en_n HDCP module functions enable. 1'b0: Normal operation 1'b1: Disable HDCP logic By disabling and enabling HDCP, all of registers in HDCP are cleared, except for the HDCP key inside of SPSRAM. Therefore, as an easy way to prepare re-authentication, firmware can disable and enable again to clear all HDCP registers.
1	RO	0x0	reserved
0	RW	0x1	sw_func_en_n Software defined function enable. 1'b0: Normal operation 1'b1: Disable all the function modules The bit has the highest priority, if the bit is 1, other function enable bits does not work.

EDPTX_FUNC_EN_2

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x1	ssc_func_en_n SSC module enable. 1'b0: Normal mode 1'b1: Disable SSC module To apply updated SSC parameters into SSC operation, firmware must disable and enable this bit.
6:3	RO	0x0	reserved
2	RW	0x1	aux_func_en_n AUX channel module function enable. 1'b0: Normal operation 1'b1: Disable AUX channel module
1	RW	0x1	serdes_fifo_func_en_n Serdes FIFO function enable. 1'b0: Normal mode 1'b1: Disable Serdes FIFO To reset the serdes fifo, firmware must disable and enable this bit.
0	RW	0x1	ls_clk_domain_func_en_n Link symbol clock domain modules functions enable. 1'b0: Normal mode 1'b1: Disable the modules in link symbol clock domain. To reset the modules in link symbol clock domain, firmware must disable and enable this bit.

EDPTX_VIDEO_CTL_1

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	video_en Video data input enable. 1'b0: Disable video data input 1'b1: Enable video data input It takes effect at next video frame.
6	RW	0x0	video_mute Video mute enable. In video mute mode, the solid color, specified in Base + 0x04A8 ~ Base + 0x04B0, is displayed. 1'b0: Disable 1'b1: Enable Output video data is changed properly as soon as this bit is configured.
5:0	RO	0x00	reserved

EDPTX_VIDEO_CTL_2

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	in_d_range Dynamic range. This bit field is used to specify video data format in main stream attribute data. 1'b1: CEA range (16 ~ 235) 1'b0: VESA range (0 ~ 255)

Bit	Attr	Reset Value	Description
6:4	RW	0x1	in_bpc Video input bit per color/ component (bpc). This bit field is used to specify video data format in main stream attribute data. Note that 6 bpc mode is invalid in YCbCr 422 mode. 3'b011: 12 bits 3'b010: 10 bits 3'b001: 8 bits 3'b000: 6 bits Other: Reserved
3:2	RO	0x0	reserved
1:0	RW	0x0	in_color_f Colorimetric format of input video. This is used to specify video data format in main stream attribute data. 2'b11: Reserved 2'b10: YCbCr444 2'b01: YcbCr422 2'b00: RGB

EDPTX_VIDEO_CTL_3
Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	in_yc_coeffi YCbCr Coefficients of input video. This is used to specify video data format in main stream attribute data. 1'b1: ITU709 1'b0: ITU601
6:5	RO	0x0	reserved
4	RW	0x0	vid_chk_update_type Select video format stability check method in video capture block. 1'b1: Check stability with the difference between adjacent frames. 1'b0: Check stability with the difference of differences between adjacent frames. Compares difference of 1st and 2nd to difference of 3rd and 4th frame.
3:0	RO	0x0	reserved

EDPTX_VIDEO_CTL_4
Address: Operational Base + offset (0x002C)

6	RW	0x0	hdcp_hpd_rst HDCP block reset control. 1'b0: No reset for HDCP block when HPD is low. 1'b1: Reset HDCP when HPD is low.
5:2	RO	0x0	reserved
1	RW	0x0	link_check_mode HDCP link integrity check mode: 1'b1: HDCP polling link integrity check status, and re-start HDCP Authentication automatically when detected link integrity check fail. 1'b0: HDCP don't polling link integrity check status.
0	RW	0x0	hw_hdcp_int The DP receiver initiates a HDCP interrupt through Hot Plug Detect Pin to DP transmitter whenever DP receiver finds R0' calculation done, downstream KSV list is ready and V' calculation done, or HDCP link integrity check failure. A firmware on DP transmitter must set this bit to 1 in order to make H/W HDCP authentication module do some proper action when firmware of DP transmitter find it out that the interrupt about HDCP. This bit is self cleared.

EDPTX_SPDIF_PHASE1_CTL_0

Address: Operational Base + offset (0x0650)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	spdif_phase1_ctl_0 This register control SPDIF 1 cycle phase counter value [7:0], if bit SPDIF_PHASE1_CTL_EN is 0, the 1 cycle phase counter value [7:0] is read out. If the register SPDIF_PHASE1_CTL_EN is 1, firmware can force this value by writing data to this register. The bits can be read only when SPDIF_STREAM_DET is one. SPDIF_PHASE1_CTL should be set as Fls_clk / (32*Faudio_frequency * AudioChannelNum * 2). Here 2 are for biphase encoding and 32 is for each sub frame. For example if audio_frequency is 44.1KHz, Audio Channel Number is 2 and ls_clk frequency is 135M Hz. 135,000,000/ (32*44,100*2*2) = 23.9. SPDIF_PHASE1_CTL should set to 24.

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4	RW	0x0	aux_busy AUX channel status bit. If this bit is read as 1, AUX channel access should be halted. 1'b1: AUX CH is busy 1'b0: AUX CH is idle
3:0	RW	0x0	aux_status This register indicate the AUX channel access status 4'b0000: OK 4'b0001: NACK_ERROR 4'b0010: TIMEOUT_ERROR 4'b0011: UNKNOWN_ERROR 4'b0100: MUCH_DEFER_ERROR 4'b0101: TX_SHORT_ERROR 4'b0110: RX_SHORT_ERROR 4'b0111: NACK_WITHOUT_M_ERROR 4'b1000: I2C_NACK_ERROR Other: Reserved

EDPTX_AUX_ERR_NUM

Address: Operational Base + offset (0x0784)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:0	RW	0x00	aux_err_num The error number counter of AUX channel counts when AUX channel access failed. In AUX CH reading, this number indicates the number of read back byte. In AUX CH writing, this number indicates the number of reply command.

EDPTX_AUX_CH_DEFER_CTL

Address: Operational Base + offset (0x0788)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	defer_ctrl_en AUX CH received DEFER command count control enable 1'b1: If the count that AUX CH receive DEFER command equal to (DEFER_COUNT * 64), the AUX CH transaction is terminated, and the AUX_STATUS is 0100 1'b0: The count that AUX CH receive DEFER command is unlimited
6:0	RW	0x7f	defer_count The count is defined to limit the max count AUX CH receive DEFER command. When DEFER_CTRL_EN is 1 and AUX CH received (DEFER_COUNT * 64) DEFER command, the AUX CH will terminate the transaction

EDPTX_AUX_RX_COMM

Address: Operational Base + offset (0x078C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	aux_rx_comm AUX CH received command

EDPTX_BUFFER_DATA_CTL

Address: Operational Base + offset (0x0790)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	buf_clr Write 1 to this bit to clear AUX CH data buffer (BUF_DATA_0 ~ BUF_DATA_15). Always read back 0 from this bit. This bit's type is R/W. This bit is self cleared. Note: For the write operation, set this bit to 1 before writing data to BUF_DATA_0~15. And for READ operation, this bit has only to be set before starting data transfer by setting AUX_EN.
6:5	RO	0x0	reserved
4	RW	0x0	buf_have_data 1'b0: Buffer have data 1'b1: Buffer have not data
3:0	RW	0x0	buffer_data_count The counts of data AUX CH buffer have.

EDPTX_AUX_CH_CTL_1

Address: Operational Base + offset (0x0794)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:4	RW	0x0	aux_length Register control AUX CH transaction length.
3:0	RW	0x0	aux_tx_comm Register control AUX CH transaction command.

EDPTX_AUX_ADDR_7_0

Address: Operational Base + offset (0x0798)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	aux_addr_7_0 AUX_ADDR[7:0], Register control AUX CH address.

EDPTX_AUX_ADDR_15_8

Address: Operational Base + offset (0x079C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	aux_addr_15_8 AUX_ADDR[15:8], Register control AUX CH address

EDPTX_AUX_ADDR_19_16

Address: Operational Base + offset (0x07A0)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:0	RW	0x0	aux_addr_19_16 AUX_ADDR[7:0], Register control AUX CH address.

EDPTX_AUX_CH_CTL_2

Address: Operational Base + offset (0x07A4)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	pd_aux_idle Power down AUX CH when AUX CH is in idle state. 1'b1: Power down AUX CH in idle state. 1'b0: Keep AUX CH power up in idle state.
2	RW	0x0	aux_pn_inv Invert AUX CH PN 1'b1: Invert PN 1'b0: Normal mode
1	RW	0x0	addr_only AUX CH issue "address only" command 1'b1: Issue "address only" command 1'b0: Normal AUX CH command
0	RW	0x0	aux_en Register control AUX CH operation enable Write 1 to this bit to enable AUX CH operation This bit will self-clear when AUX CH operation is finished. This bit is self cleared.

EDPTX_BUF_DATA

Address: Operational Base + offset (0x07C0)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:0	RW	0xff	buf_data AUX CH buffer data 0 ~ 15

EDPTX_SOC_GENERAL_CTL

Address: Operational Base + offset (0x0800)

Bit	Attr	Reset Value	Description
31:18	RO	0x0000	reserved
17:16	RW	0x0	audio_bit_mapping_type Audio bit mapping type in 16bit audio mode 2'b00: Type 0 2'b01: Type 1 2'b10: Type 2 2'b11: Reserved
15	RO	0x0	reserved
14:13	RW	0x0	pcm_size PCM data bit size 2'b00: 16 bit 2'b01: 20 bit 2'b10: 24 bit 2'b11: Reserved

Notes: I=input, O=output, I/O=input/output, bidirectional, NS=Not Set

23.6 Application Notes

23.6.1 EDP TX Clock Domain Overview

The eDP TX clock domain can be seen in the figure below. The clock frequency of "o_tx_link_sym_clk" and "o_tx_hs_clk" should be set according to PHY registers. From the figure, can get this frequency relation,

o_tx_link_sym_clk = I_CH_TXD_CLK = I_CLK_DIV2 = i_tx_data_clk
o_tx_hs_clk = I_LINK_CLK
o_tx_hs_clk = 2 * o_tx_link_sym_clk

The clock o_tx_hs_clk has twice the frequency of o_tx_link_sym_clk. For example, link rate is 2.7Gbps, o_tx_hs_clk should be 270M and o_tx_link_sym_clk should be 135M.

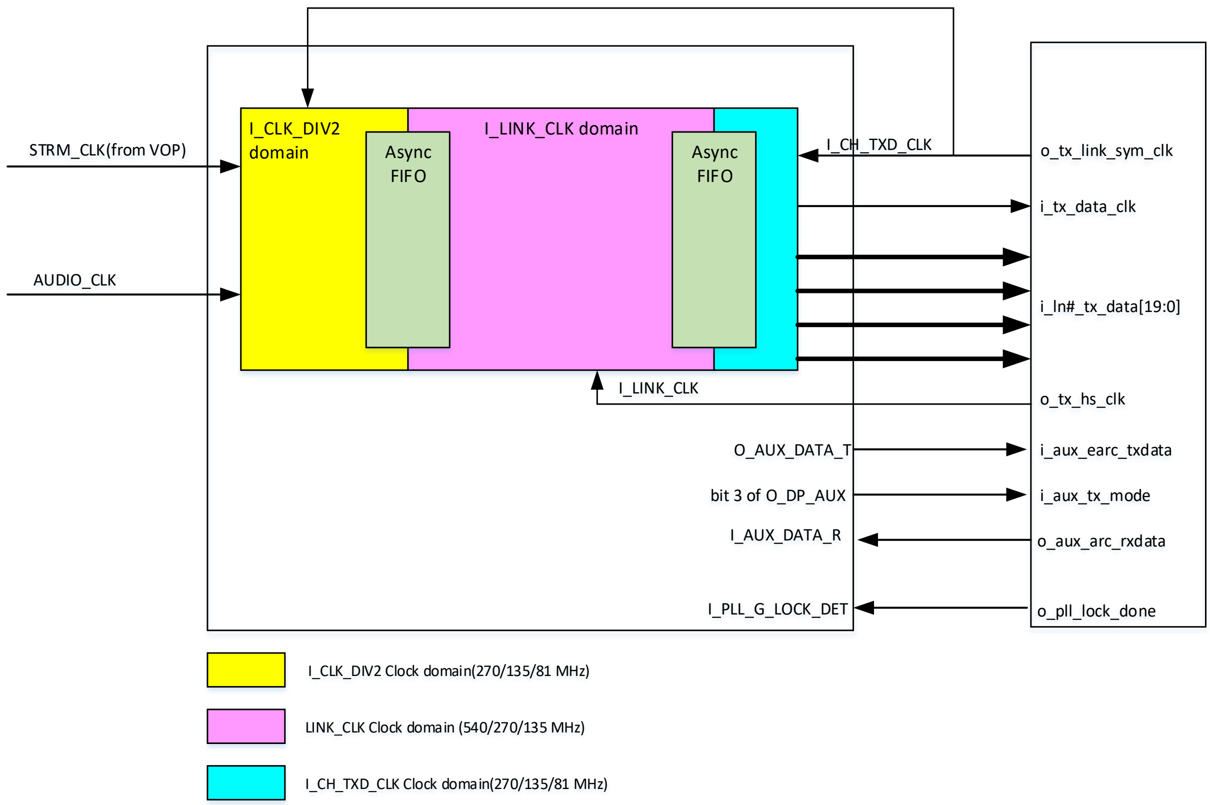

Fig. 23-4 DP Clock Domain

23.6.2 EDP TX Controller Programming Guide

After PHY is ready, the eDP TX controller can begin to work.

23.6.2.1 How to Initialize DP

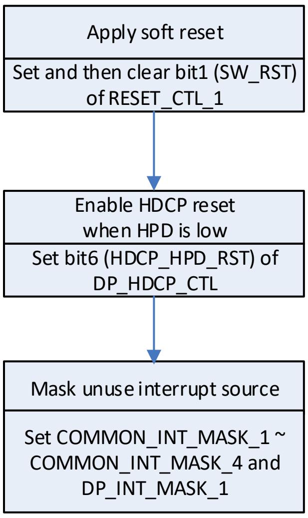

Fig. 23-5 DP controller Initial

23.6.2.2 How to Detect Hot Plug Insertion

In Wait Hot Plug state, chip is in power down status. System only responses to hot plug change interrupt. When a hot plug interrupt is detected, in the interrupt routine, firmware will judge whether it is a receiver plug-in or un-plug or link training request. If plug-in, chip will be powered on and system state will be set to Read and Parse EDID.

23.6.2.3 How to Access DPCD Space in DP Rx

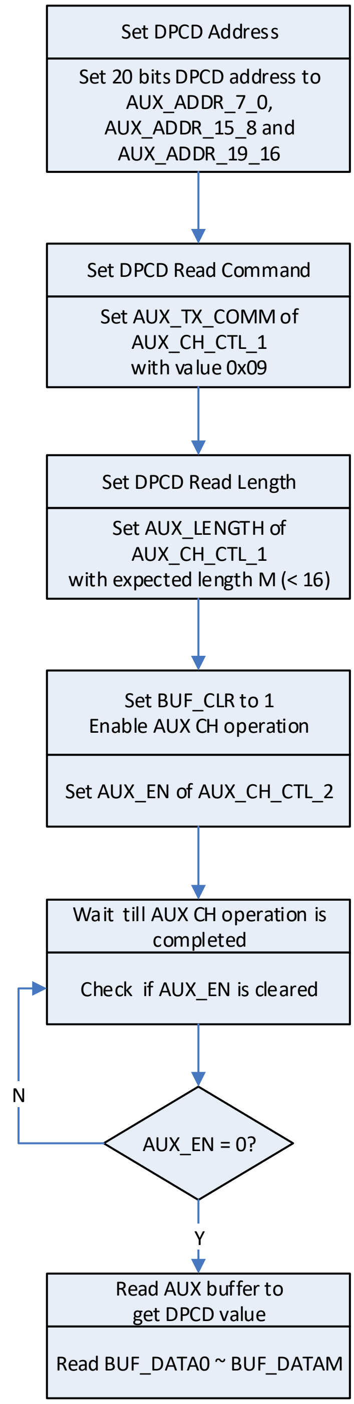

Fig. 23-6 DP DPCD Read

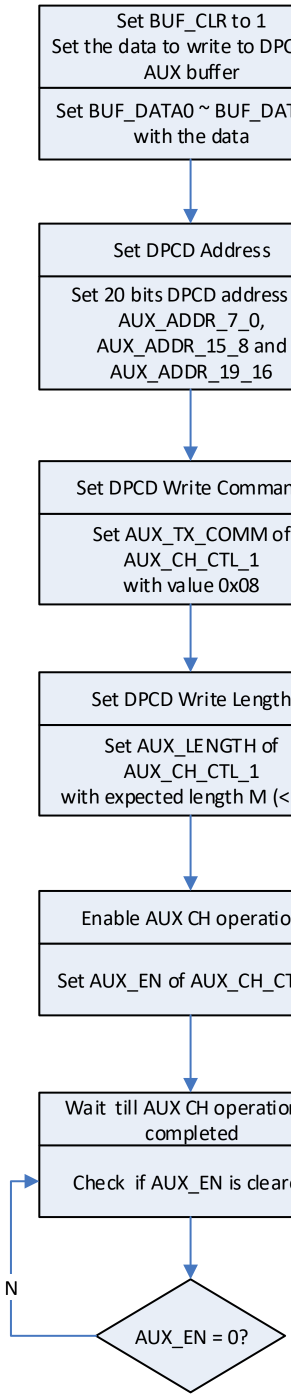

Fig. 23-7 DP DPCD Write

23.6.2.4 How to Write into EDID space in DP Rx

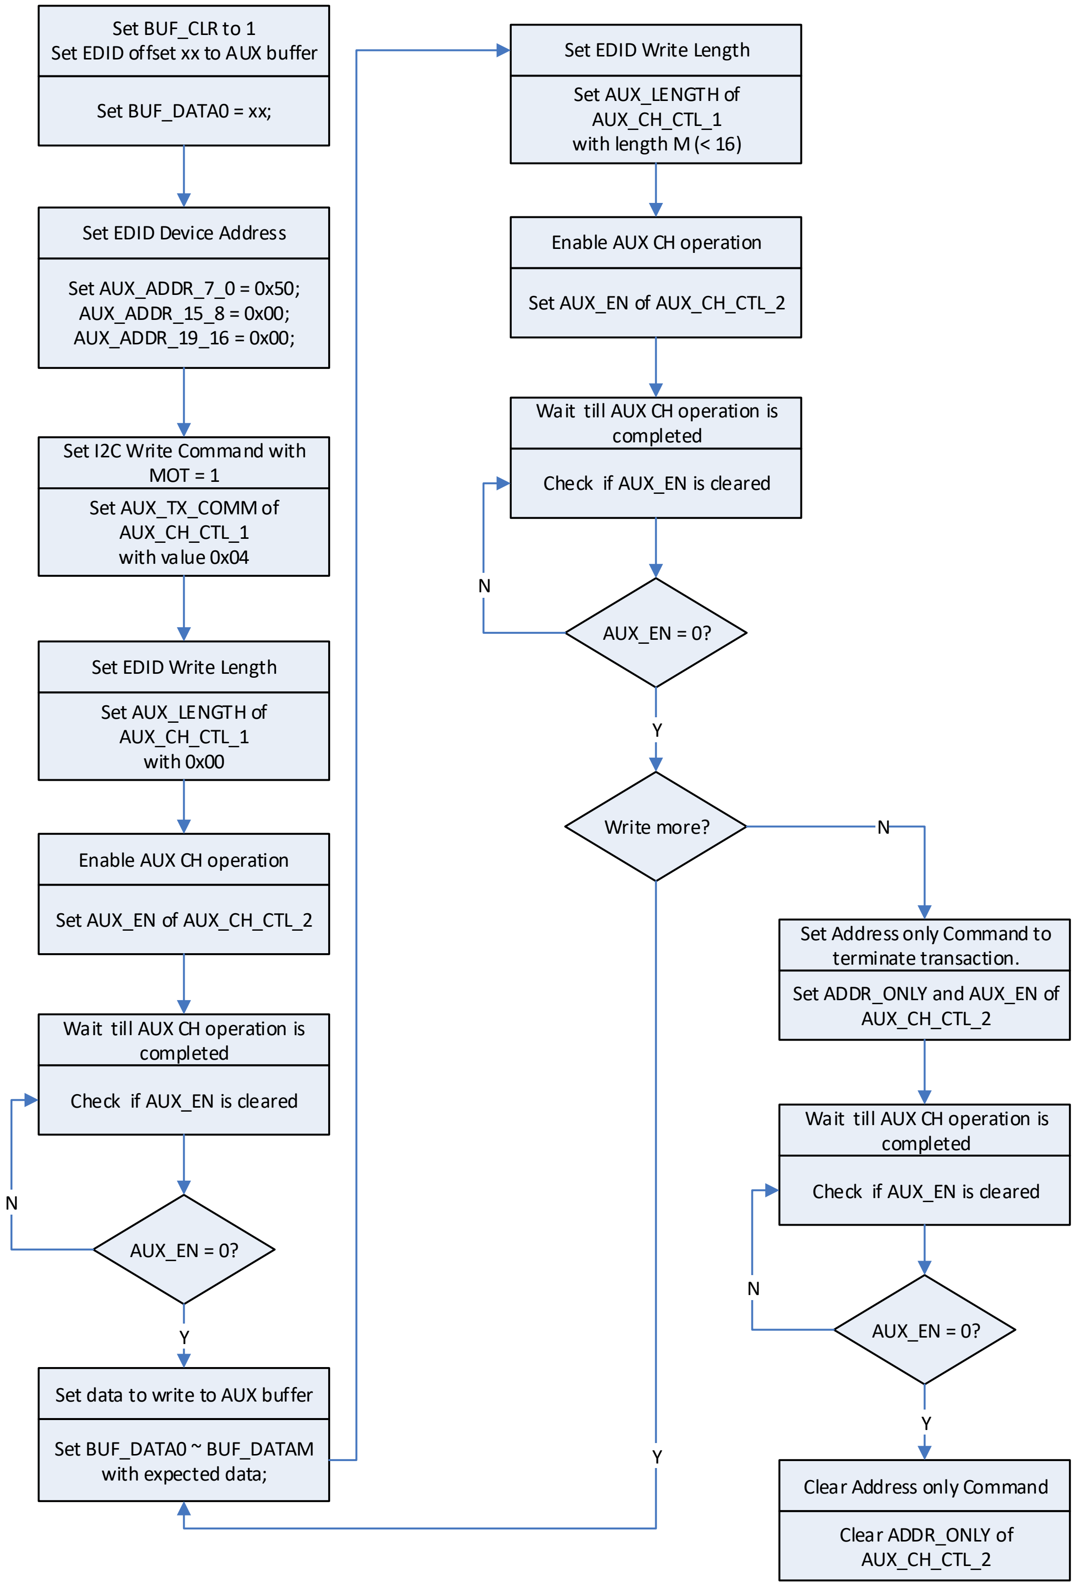

Fig. 23-8 Write into EDID space in DP Rx

23.6.2.5 How to READ From EDID Space in DP Rx

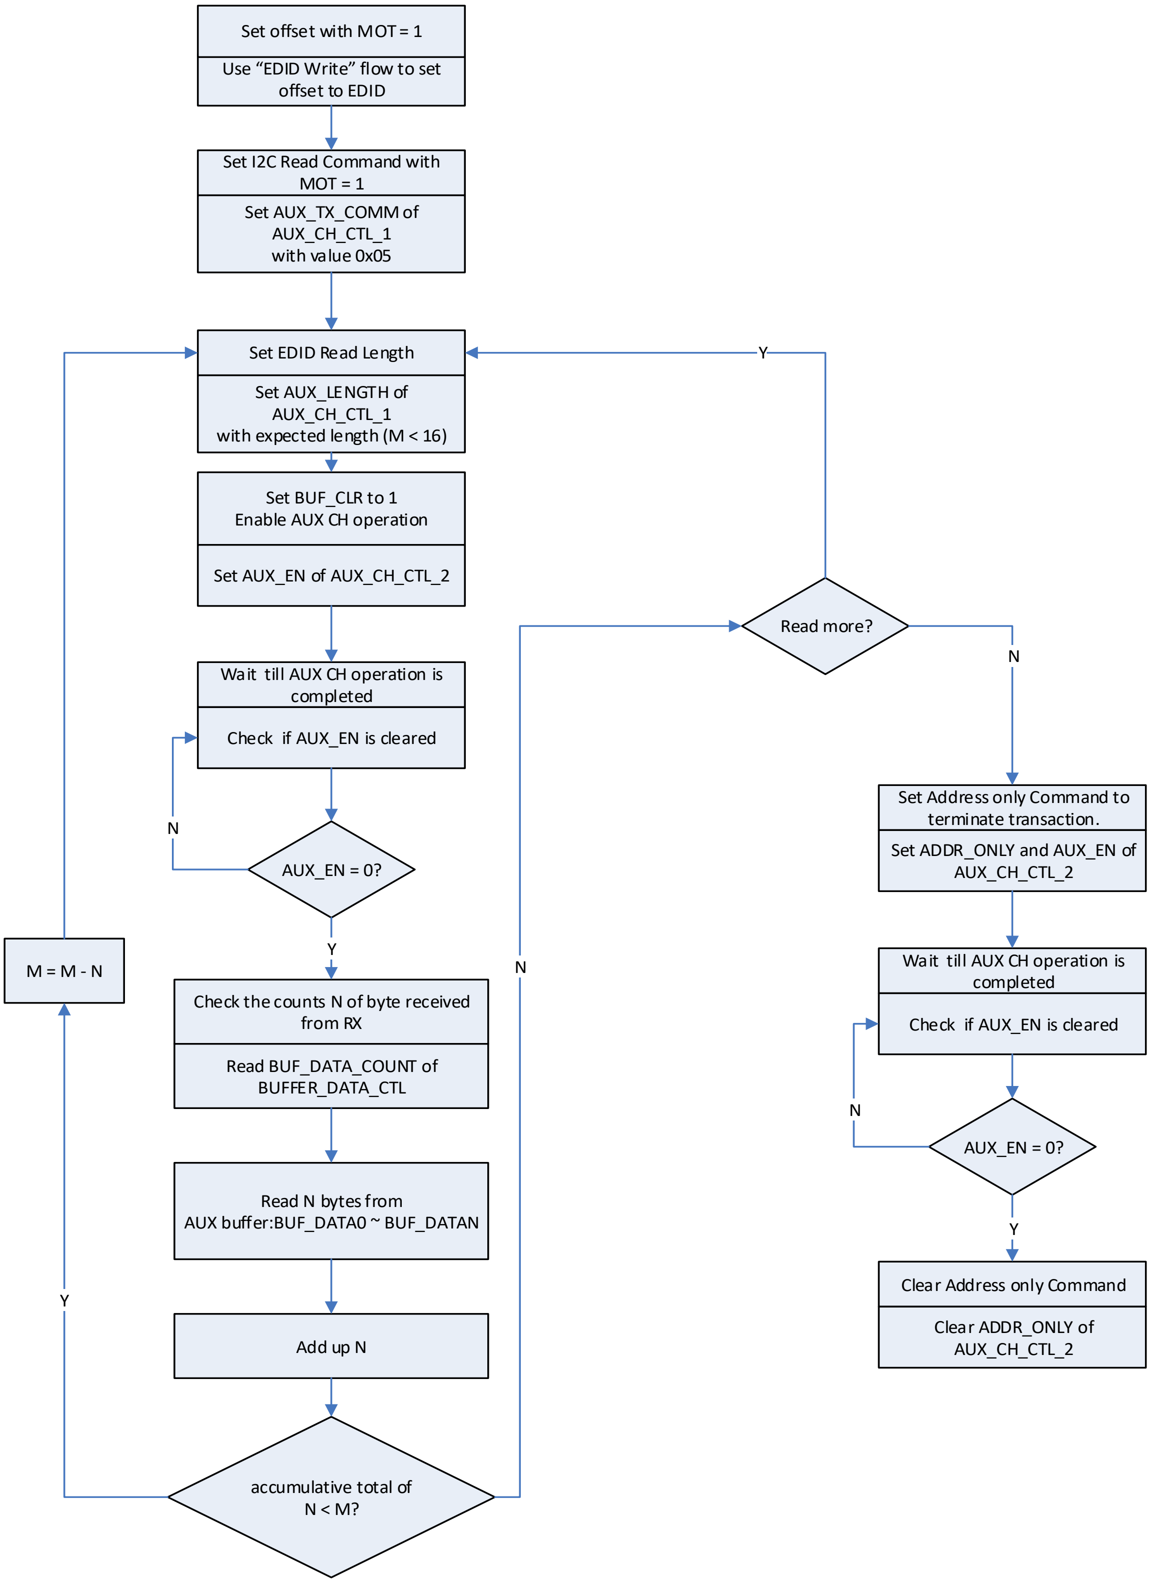

Fig. 23-9 Read from EDID space in DP Rx

23.6.2.6 How to do SW Link Training

23.6.2.6.1 State Machine of SW Link Training

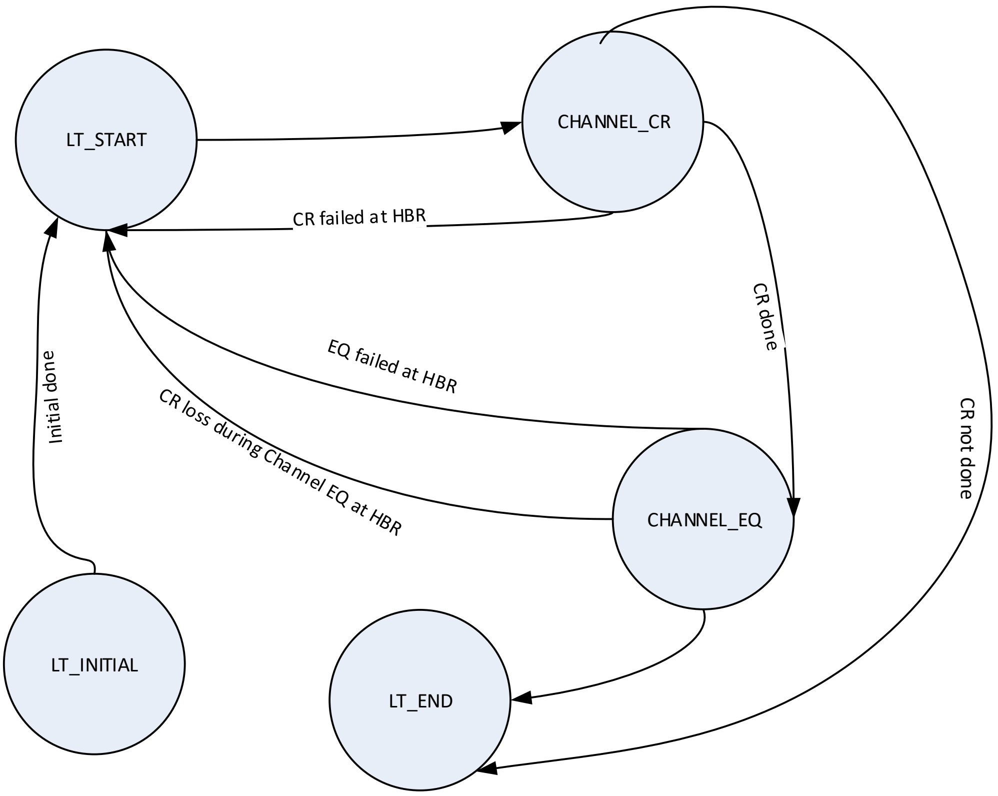

Fig. 23-10 State Machine of SW Link Training

23.6.2.6.2 State LT_INITIAL

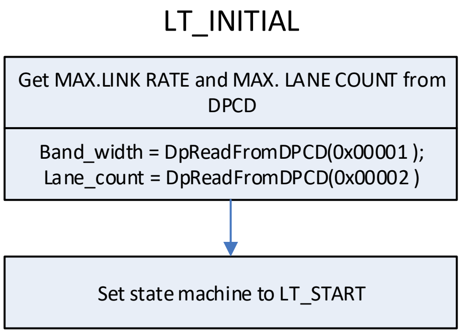

Fig. 23-11 State LT_INITIAL

23.6.2.6.3 State LT_START

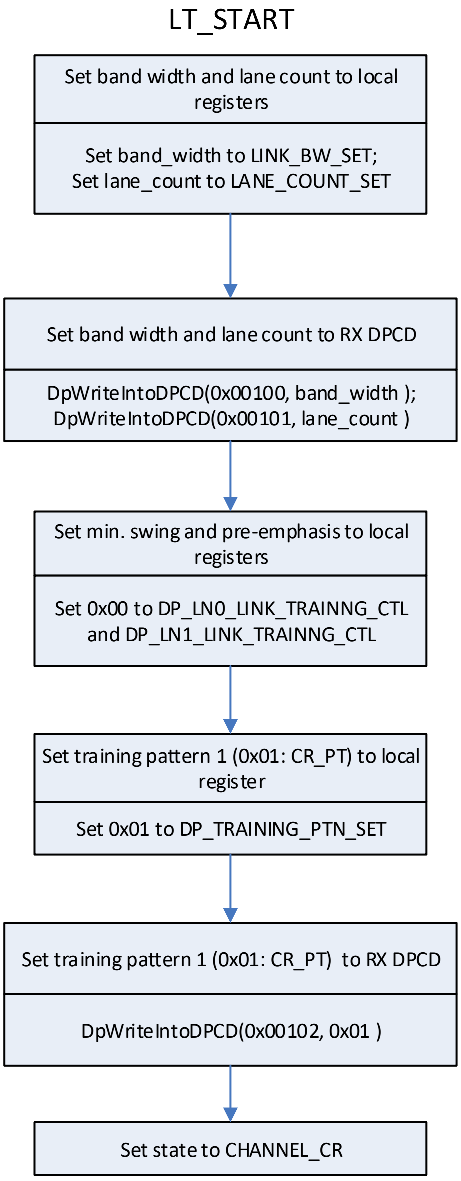

Fig. 23-12 State LT_START

23.6.2.6.4 State CHANNEL_CR

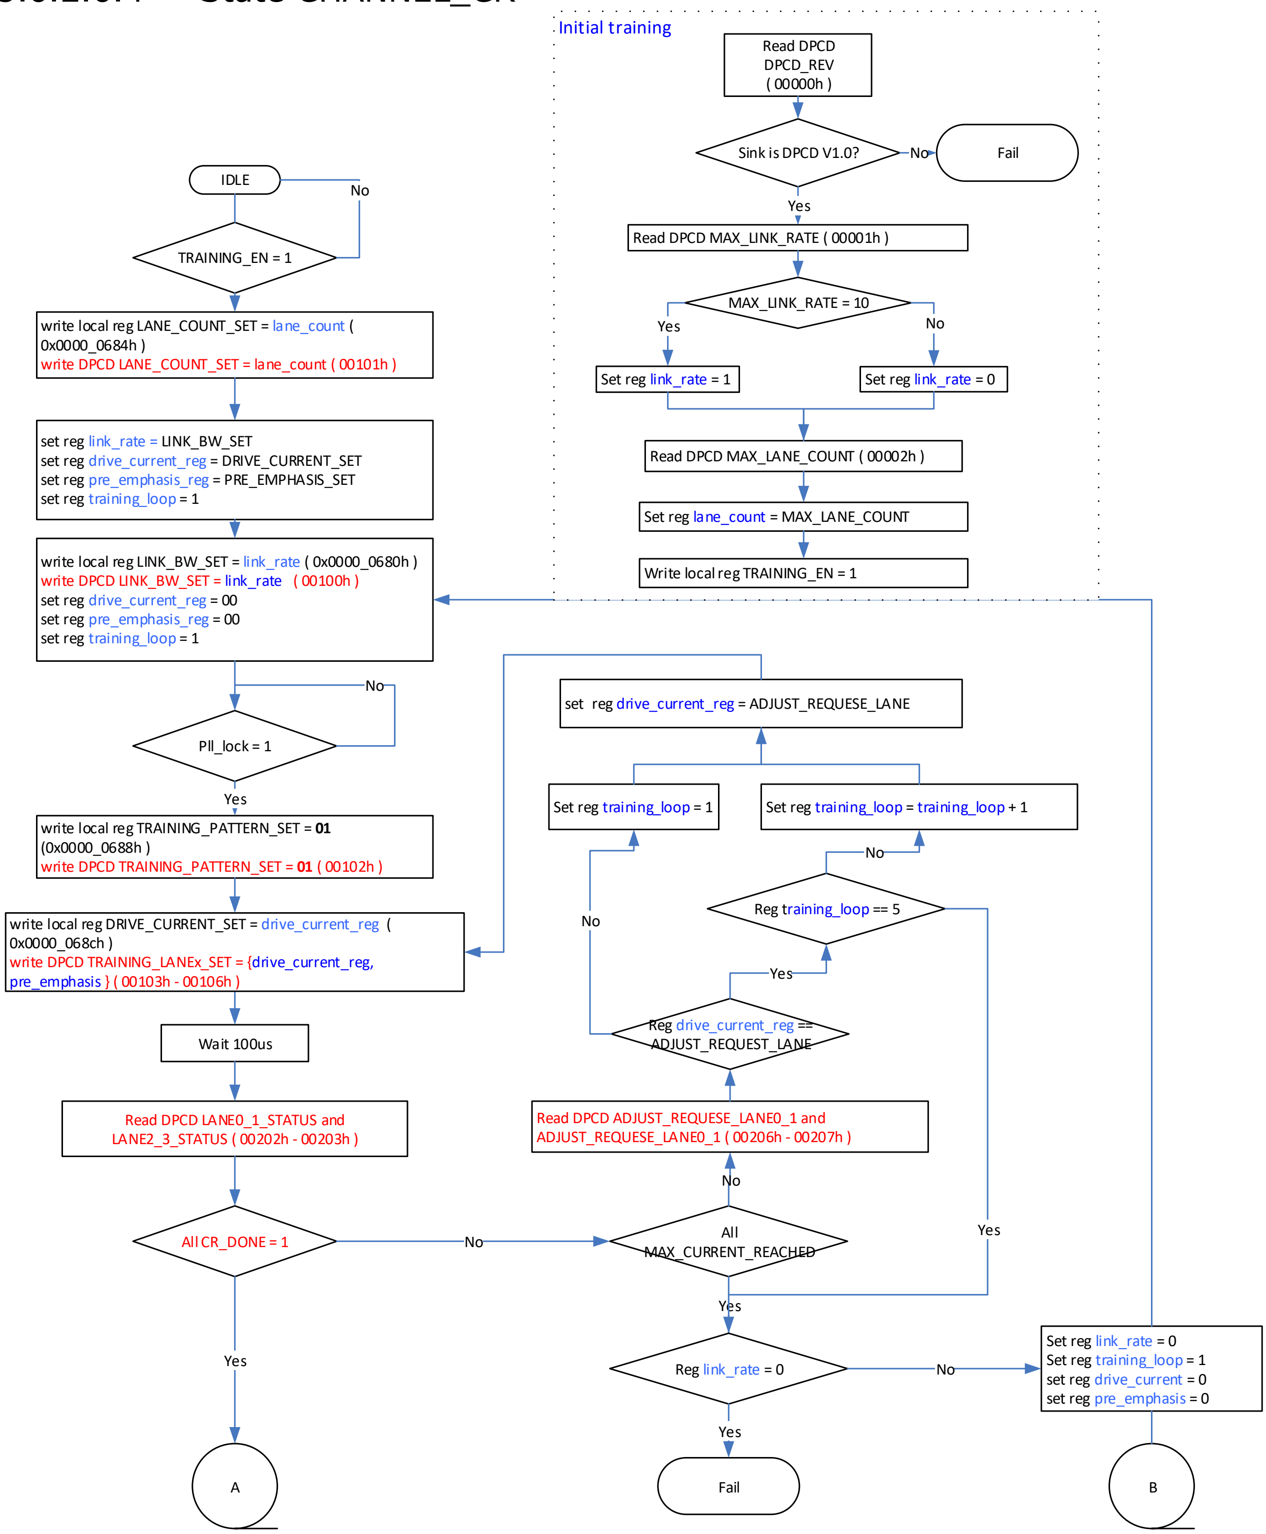

Fig. 23-13 Link Training Initial and Clock Recovery Training

23.6.2.6.5 State CHANNEL_EQ

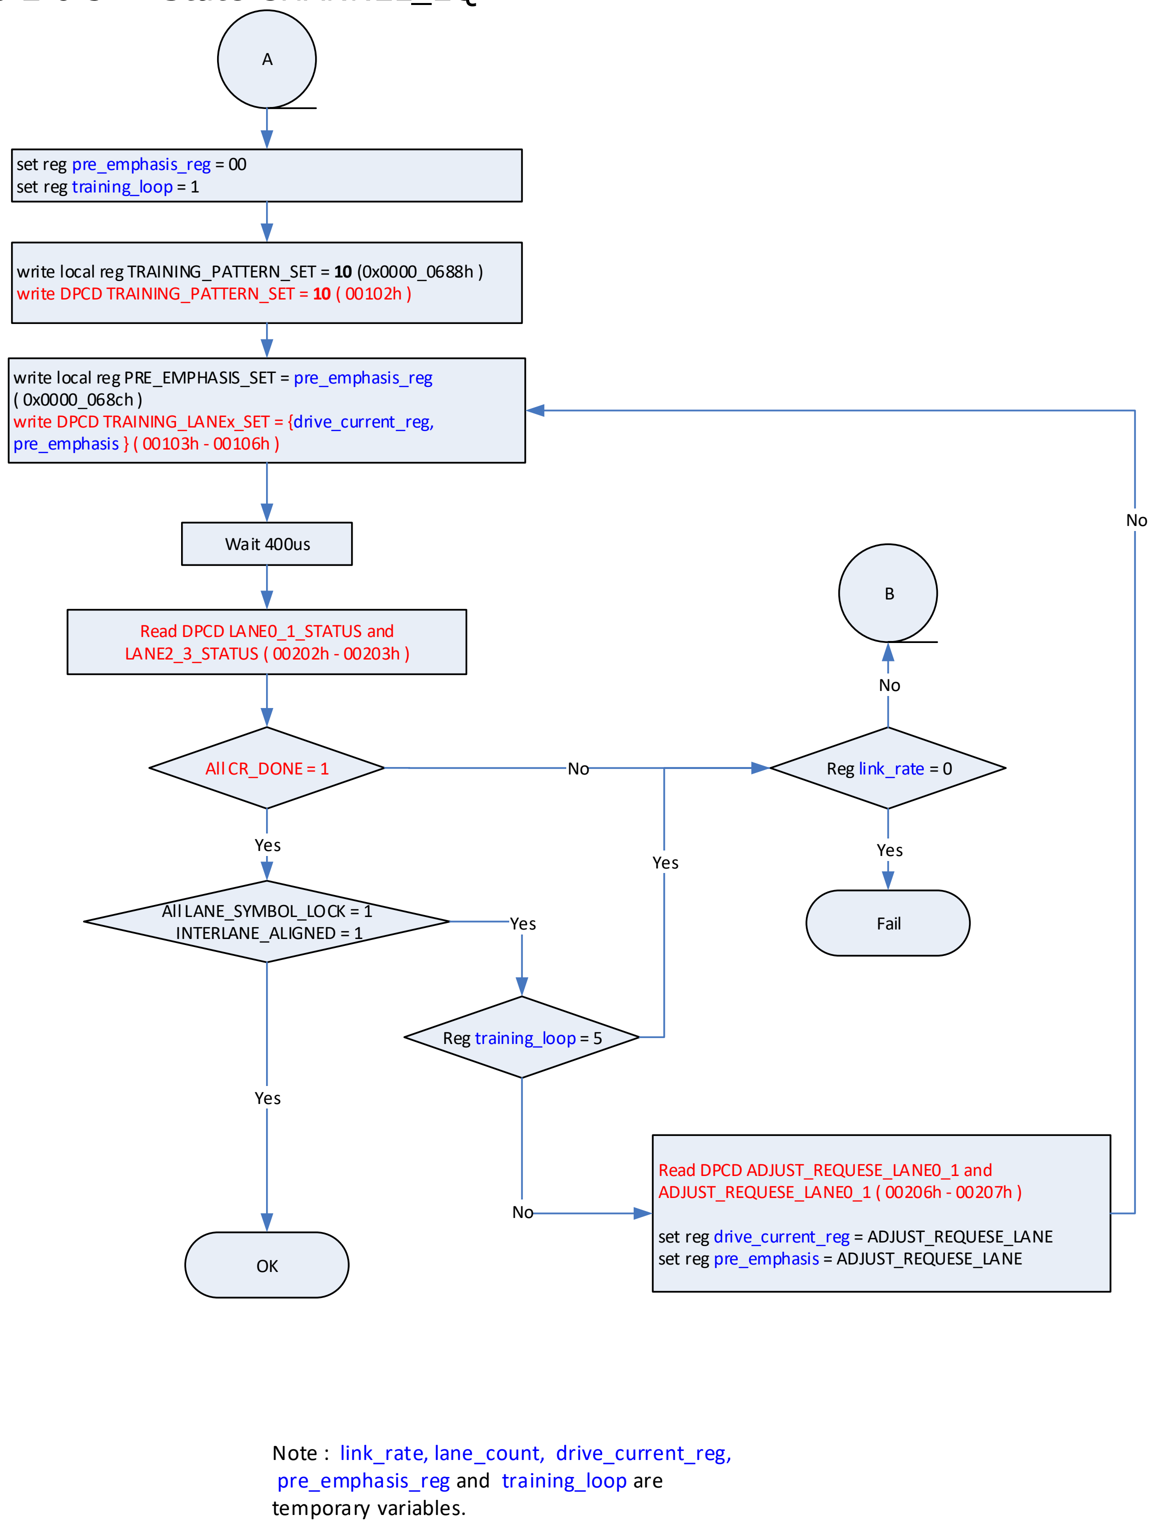

Fig. 23-14 Equalizer Training

23.6.2.7 How to Setup Main Stream Attribute Data

23.6.2.7.1 Attribute of Video timing

Chip hardware setups attribute of video timing automatically.

23.6.2.7.2 Attribute of Color Depth

Set IN_BPC of VIDEO_CTL_2 with correct value.

23.6.2.7.3 Attribute of Color Space

Set IN_COLOR_F of VIDEO_CTL_2 [1:0] with correct value.
IN_YC_COEFFI of VIDEO_CTL_3 [7] also must be set.

23.6.2.8 How to do HDCP Authentication and Encryption

23.6.2.8.1 Initialize HDCP Key

Taking eDP0 as an example, the configuration process is as follows.
<Step 1>Set HDCP Key write enable. <BUS_SGRF_SOC_CON21>[12] = 1’b0
<Step 2>Write HDCP Key into memory. The base HDCP key address for eDP0 is 0xFDF18000.
<Step 3>Set HDCP Key access by controller. <BUS_SGRF_SOC_CON21>[12] = 1’b1

For eDP1
<Step 1>Set HDCP Key write enable. <BUS_SGRF_SOC_CON21>[13] = 1’b0
<Step 2>Write HDCP Key into memory. The base HDCP key address for eDP1 is 0xFDF1C000.
<Step 3>Set HDCP Key access by controller. <BUS_SGRF_SOC_CON21>[13] = 1’b1

23.6.2.8.2 SW HDCP State Machine

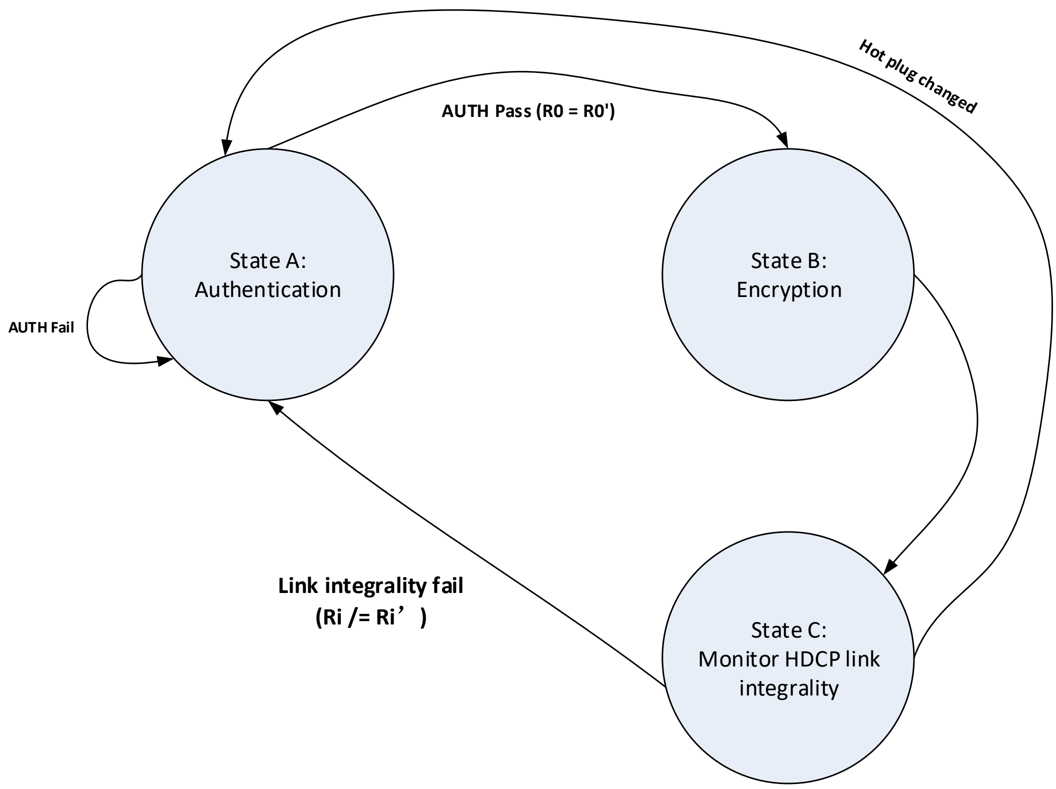

Fig. 23-15 SW HDCP State Machine

23.6.2.8.3 SW HDCP Flowchart

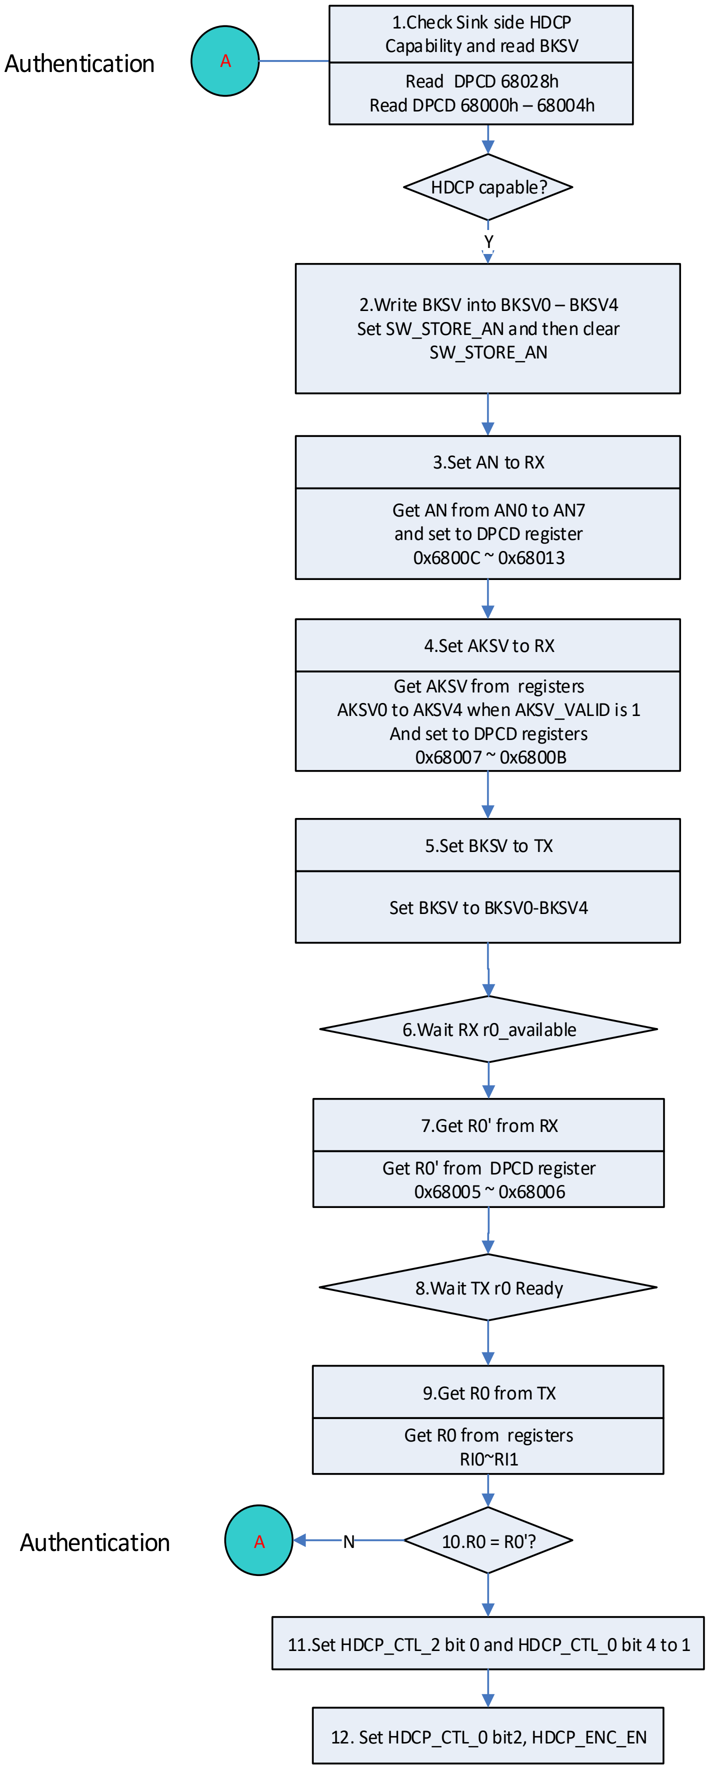

Fig. 23-16 SW HDCP Flowchart A

Note that BKSV to BKSV0~BKSV4 are loaded two times in step2 and in step5. With the first BKSV writing, AKSV starts to be loaded and SW_STORE_AN function is enabled. As another function, validity of BKSV is possible by the bit filed, BKSV_VALID. In the other hand, the second BKSV writing starts the R0 calculation.

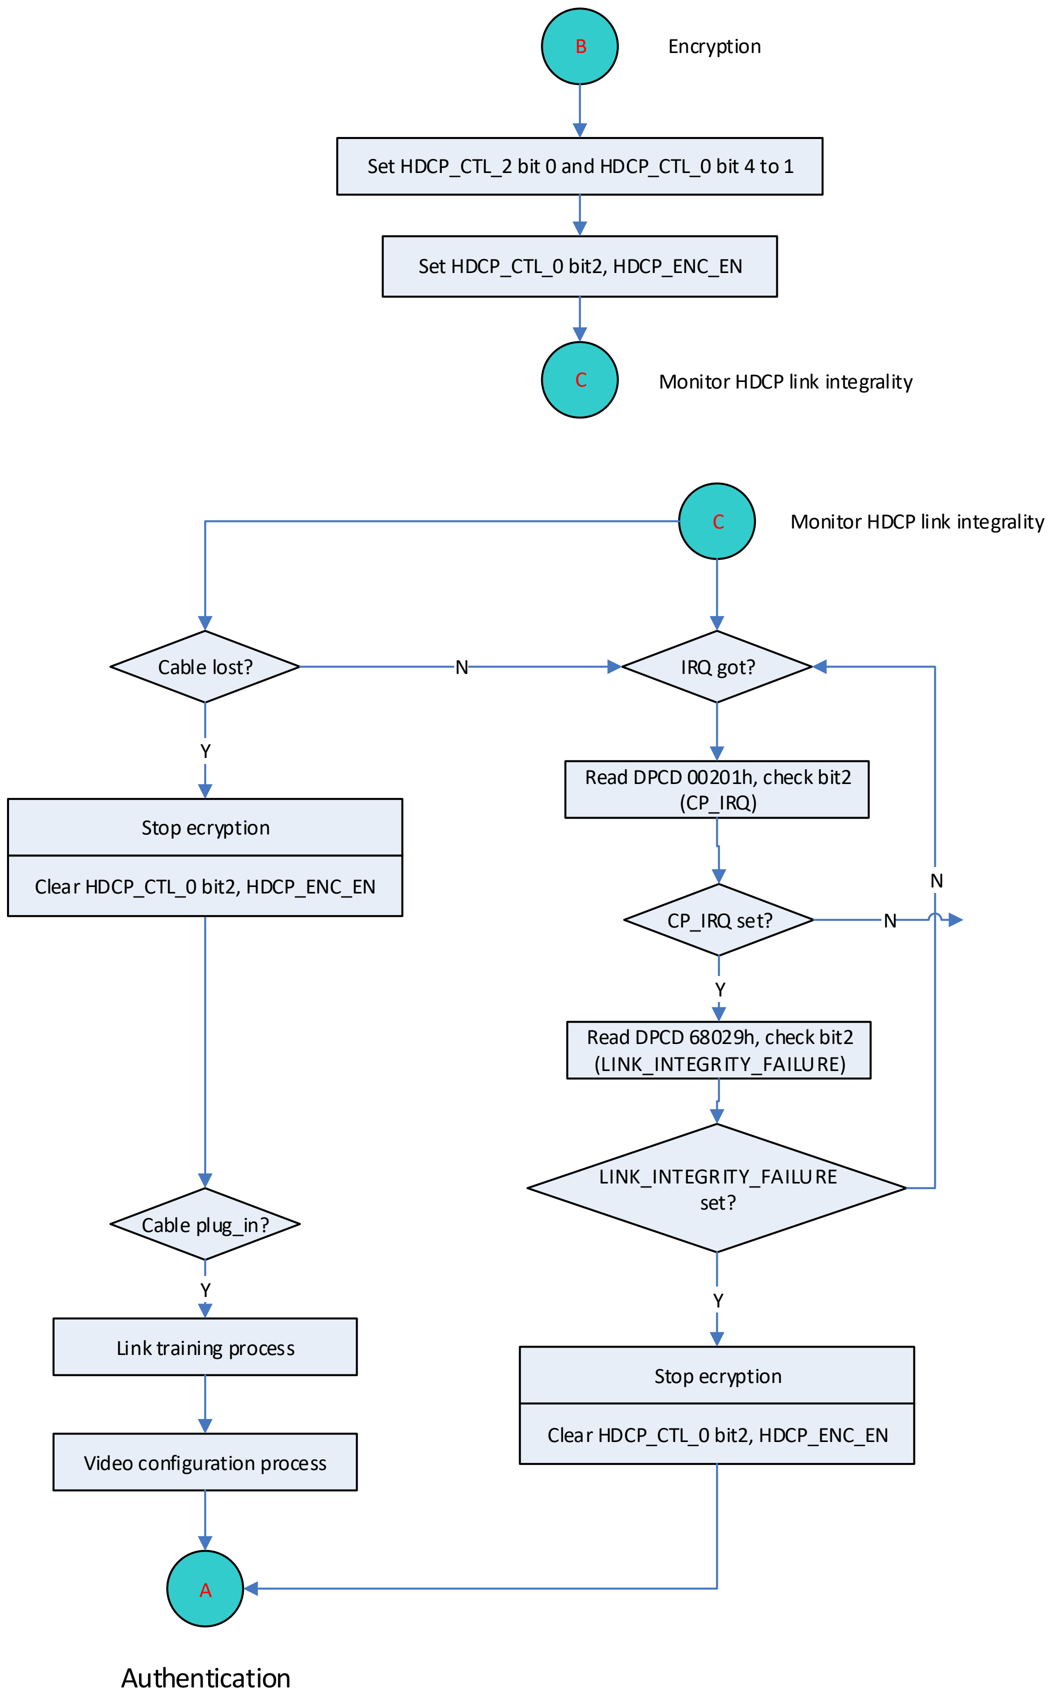

Fig. 23-17 SW HDCP Flowchart B

23.6.2.9 How to Configure Video

We suggest using M value auto-generated mode.
Slave mode video configuration process (M value auto-generated)

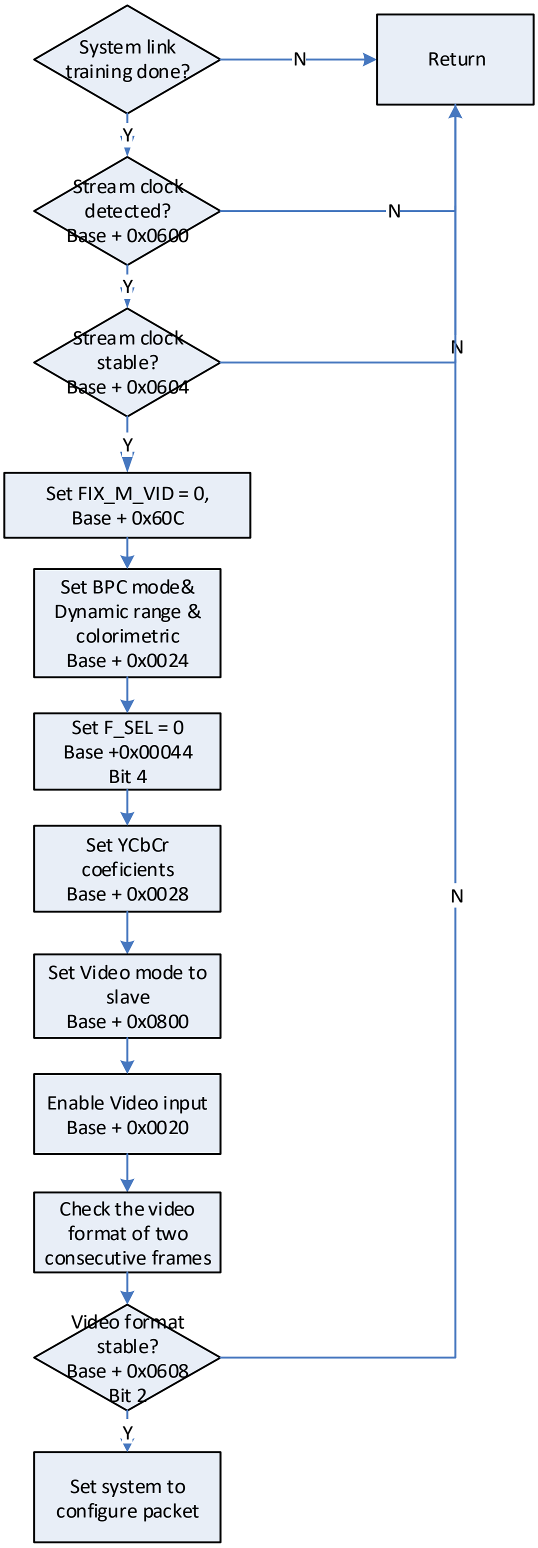

Fig. 23-18 Slave mode video configuration process (M value auto-generated)

Slave mode video configuration process (M value register defined 1400x1050/108M, RGB888, 2.7G)

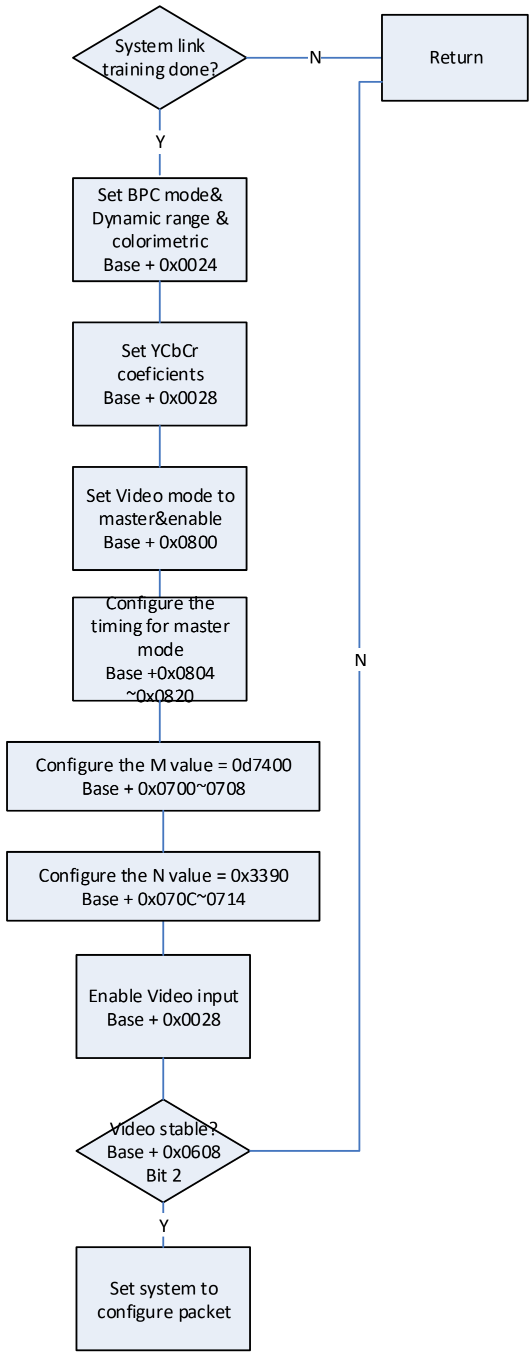

Fig. 23-19 Slave mode video configuration process (M value register defined)

Notes: Usually, you do not need to set FIX_M_VID to 1. We suggest that set FIX_M_VID to 0.

If FIX_M_VID is 0, then the hardware calculated M_VID value is used. But, if FIX_M_VID must be set to 1 by any reason, then M_VID_0, M_VID_1 and M_VID_2 should be set by using following formula.
M_VID = F_STRM_CLK * N_VID / FDIV2_CLK
Notes: F_STRM_CLK means the frequency of STRM_CLK, FDIV2_CLK means the frequency of I_CLK_DIV2. STRM_CLK and I_CLK_DIV2 can be found in figure DP Clock Domain.

N_VID must be choose let the result of this equation is an integer, for example N_VID is 13500 (0x34bc) in 2.7G and 8100 (0x1fa4) in 1.62G.
2.7G: M_VID = F_STRM_CLK*0x34BC/135M
1.62G: M_VID = F_STRM_CLK*0x1FA4/81M
For example, if input is 1400x1050/108M, RGB888, 2.7G,
M_VID = 108*0x34BC/135= 0x2A30,
set M_VID_0 = 0x30, set M_VID_1 = 0x2A, set M_VID_2 = 0.

23.6.2.10 How to Configure Audio

If want to transfer S/PDIF or I2S by eDP TX, please set these GRF registers first.
<VO1_GRF_VO1_CON0>[3] = 1'b1 //eDP0 I2S
<VO1_GRF_VO1_CON0>[4] = 1'b1 //eDP0 S/PDIF
<VO1_GRF_VO1_CON1>[3] = 1'b1 //eDP1 I2S
<VO1_GRF_VO1_CON1>[4] = 1'b1 //eDP1 S/PDIF
The controller should be set as below. We suggest using M value auto-generated mode.
Slave mode audio configuration process (M value auto-generated)

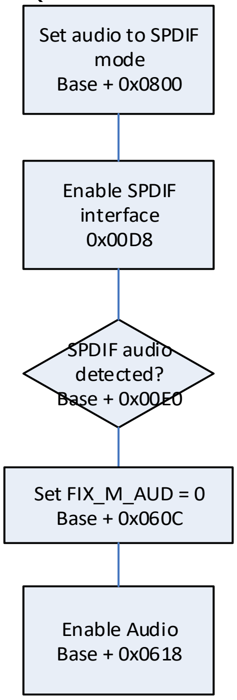

Fig. 23-20 Slave mode audio configuration process (M value auto-generated)

For example audio type is I2S, which is 2CH, 44.1kHz, 16 bits sample, setting as below

```
<EDPTX_DP_AUD_CTL>        = 0x11
<EDPTX_FUNC_EN_1>         = 0x04
<EDPTX_AUD_CTL>           = 0x01
<EDPTX_I2S_CTRL>          = 0x10
<EDPTX_I2S_CH_SWAP>       = 0x02
<EDPTX_DP_AUD_CTL>        = 0x15
<EDPTX_I2S_CH_CTRL1>      = 0x00

//I2S STA
<EDPTX_AUDIO_I2S_CH_STA1>       = 0x00
<EDPTX_AUDIO_I2S_CH_STA2>       = 0x00
<EDPTX_AUDIO_I2S_CH_STA3>       = 0x21
<EDPTX_AUDIO_I2S_CH_STA4>       = 0x10
<EDPTX_AUDIO_I2S_CH_STA5>       = 0x01
```

For other sample_rate, channel number and bits_per_sample, change the setting value.
If I2S is 8CH, <EDPTX_I2S_CH_CTRL1> bit2 should be 1'b1.
Slave mode audio configuration process (Register defined M value, 48 KHz, 2.7 G)

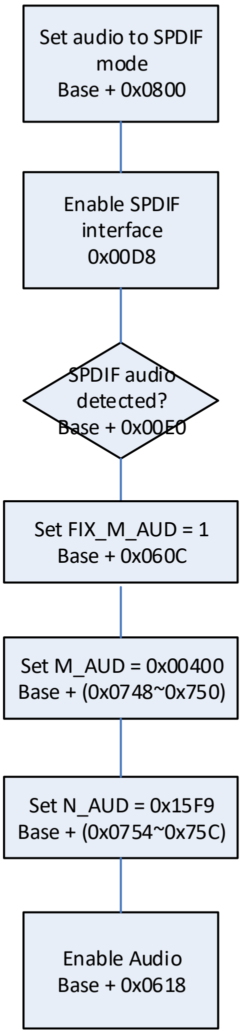

Fig. 23-21 Slave mode audio configuration process (Register defined M value)

Notes: Usually, you do not need to set FIX_M_AUD to 1. We suggest that set FIX_M_AUD to 0.

If FIX_M_AUD is 0, then the hardware calculated M_AUD value is used. But, if FIX_M_AUD must be set to 1 by any reason, then M_AUD_0, M_AUD_1, M_AUD_2 and N_AUD_0, N_AUD_1, N_AUD_2 should be set by using following formula.
M_AUD = 512*Faud_sample* N_AUD / 2 * FLS_CLK
Notes: Faud_sample is the sampling frequency of the audio stream being transported. FLS_CLK is the frequency of I_LINK_CLK. I_LINK_CLK can be found in figure 1-4 DP Clock Domain.

For example,
2.7G M_AUD = 512*Faud_sample *N_AUD/270,000,000
1.62G M_AUD = 512*Faud_sample*N_AUD/162,000,000

23.6.2.11 How to PROCESS interrupt

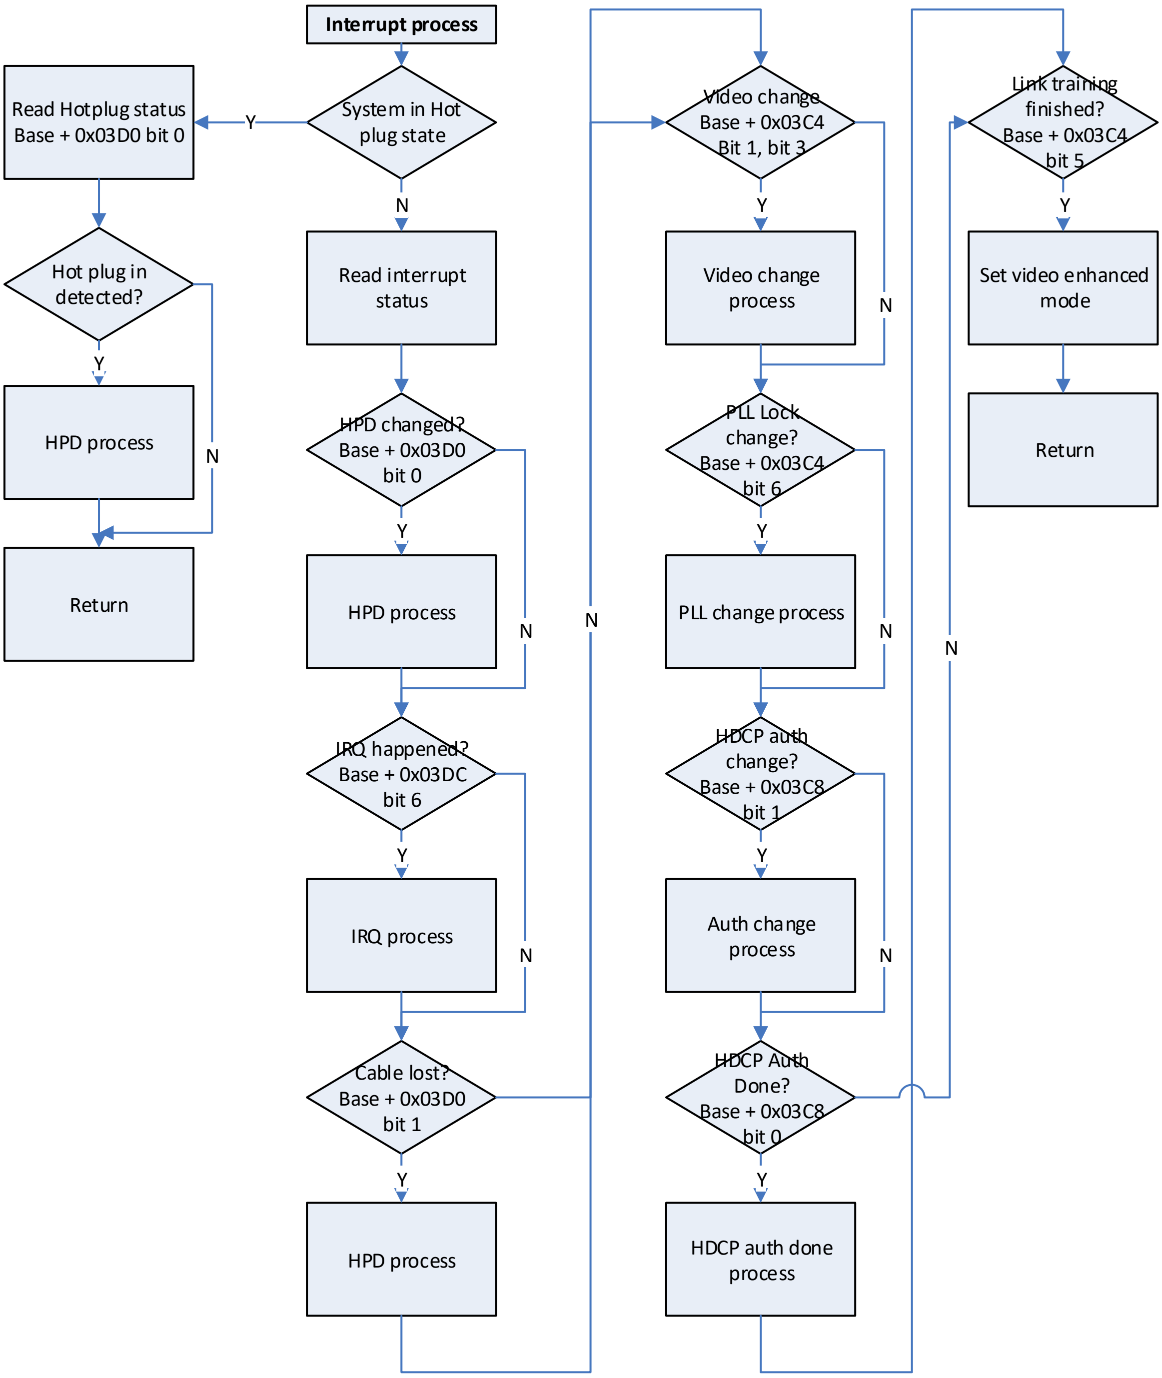

Fig. 23-22 Interrupt process

23.6.2.12 How to Send Auxiliary Information Packets

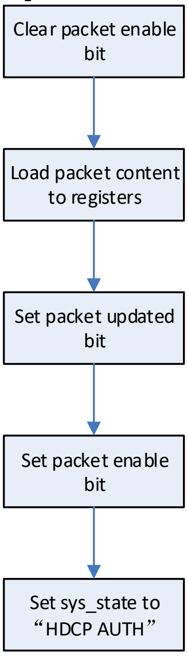

Fig. 23-23 Send Auxiliary Information Packets

23.6.3 GRF Setting for EDP TX

There are two eDP TX in this system. They both need to set GRF correctly.

eDP0:

```
<HDPTXPHY_GRF_CON0> [0]   = 1'b1 //PHY0
<VO1_GRF_VO1_CON0>[0]     = 1'b1
<VOP_GRF_VOP_CON2>[1:0]   = 2'b01
```

eDP1:

```
<HDPTXPHY_GRF_CON0> [0]   = 1'b1 //PHY1
<VO1_GRF_VO1_CON1>[0]     = 1'b1
<VOP_GRF_VOP_CON2>[4:3]   = 2'b01
```

If want to transfer S/PDIF or I2S, please set these registers.

<VO1_GRF_VO1_CON0>[3] = 1'b1 //eDP0 I2S
<VO1_GRF_VO1_CON0>[4] = 1'b1 //eDP0 S/PDIF
<VO1_GRF_VO1_CON1>[3] = 1'b1 //eDP1 I2S
<VO1_GRF_VO1_CON1>[4] = 1'b1 //eDP1 S/PDIF

Chapter 24 HDMI TX Controller

24.1 Overview

The HDMI TX Controller supports the following features:HDMI 2.1 Compliance

- Fixed Rate Link (FRL) stream
- Support for 4K@120 Hz and 8K@60 Hz video modes
- Extended Metadata Packets
- Variable Refresh Rate (VRR) including Quick Media Switching (QMS) which is also known as Cinema VRR)
- Fast Vactive (FVA), which is also known as Quick Frame Transport (QFT)
- Transmission of Compressed Video
- Reed-Solomon Forward Error Correction (RSFEC)
- SCDC I2C DDC access
- TMDS Scrambler to enable support for 2160 p@60 Hz with RGB/YCbCr 4:4:4
- YCbCr 4:2:0 support to enable 2160 p@60 Hz at lower HDMI link speeds
- Character Error Detection
- Multi-stream Audio Support (Multi-stream Audio Sample)
- Enhanced Audio Return Channel (EARC)

HDCP 1.4 Compliance

- According to HDMI 2.1 Specification, support for this HDCP encryption/decryption method is not available when operating in Fixed Rate Link mode
- For HDMI 2.0 and lower version specifications, HDCP 1.4 content protection engine is available

HDCP 2.3 Compliance

- External HDCP 2 interface is provided, which allows connecting HDCP 2 Embedded Security Module IP that can be licensed separately

Single-channel DVI 1.0 backward compatibility (dual-link DVI is not supported) All HDMI sources are compatible with all DVI-compliant sinks and all HDMI sinks are compatible with DVI-compliant sources. All HDMI devices are compatible to the DVI 1.0 Specification, except some rules. For more information on these rules, see the *HDMI 1.4b Specification*.
Supports the following video formats:

- RGB 4:4:4 8-bit normal color mode
- RGB 4:4:4 10-bit deep color mode
- YCBCR 4:4:4 8-bit normal color mode
- YCBCR 4:4:4 10-bit deep color mode
- YCBCR 4:2:0 8-bit normal color mode
- YCBCR 4:2:0 10-bit deep color mode
- Up to 4K x 2K video format (HDMI 1.4b)
- CEA-861-F video format (HDMI 2.0)
- CTA-861-G video format (HDMI 2.1)

Supports encoded audio data:

- L-PCM
- L-PCM multi-channel
- High Bit-Rate audio

Supports CEC function. CEC is a protocol that provides high-level control functions between all of the various audiovisual products in your environment. The CEC bus allows all products in the system to potentially discover and communicate with each other.
Support eARC function. The eARC TX uses the HPD and utility lines of the HDMI connector to receive audio samples from HDMI sink to HDMI source, along with bidirectional control data packets.
The supported audio formats include:

- L-PCM (up to 32 channels)

24.2 Block Diagram

HDMI TX CONTROLLER comprises with:

- MM: Main Module
- APB: APB Interface Module
- AVP: Audio Video Packet Module

- EARC: Enhanced Audio Return Channel Receiver (eARC Rx) Controller
- CEC Module: Consumer Electronics Control Module
- HDCP 2.x Encoder (External)
- IPI: Image Pixel Interface
- STI: SPDIF Tx Interface
- ITI: I2S Tx Interface
- SRI: S/PDIF Rx Interface
- IRI: I2S Rx Interface

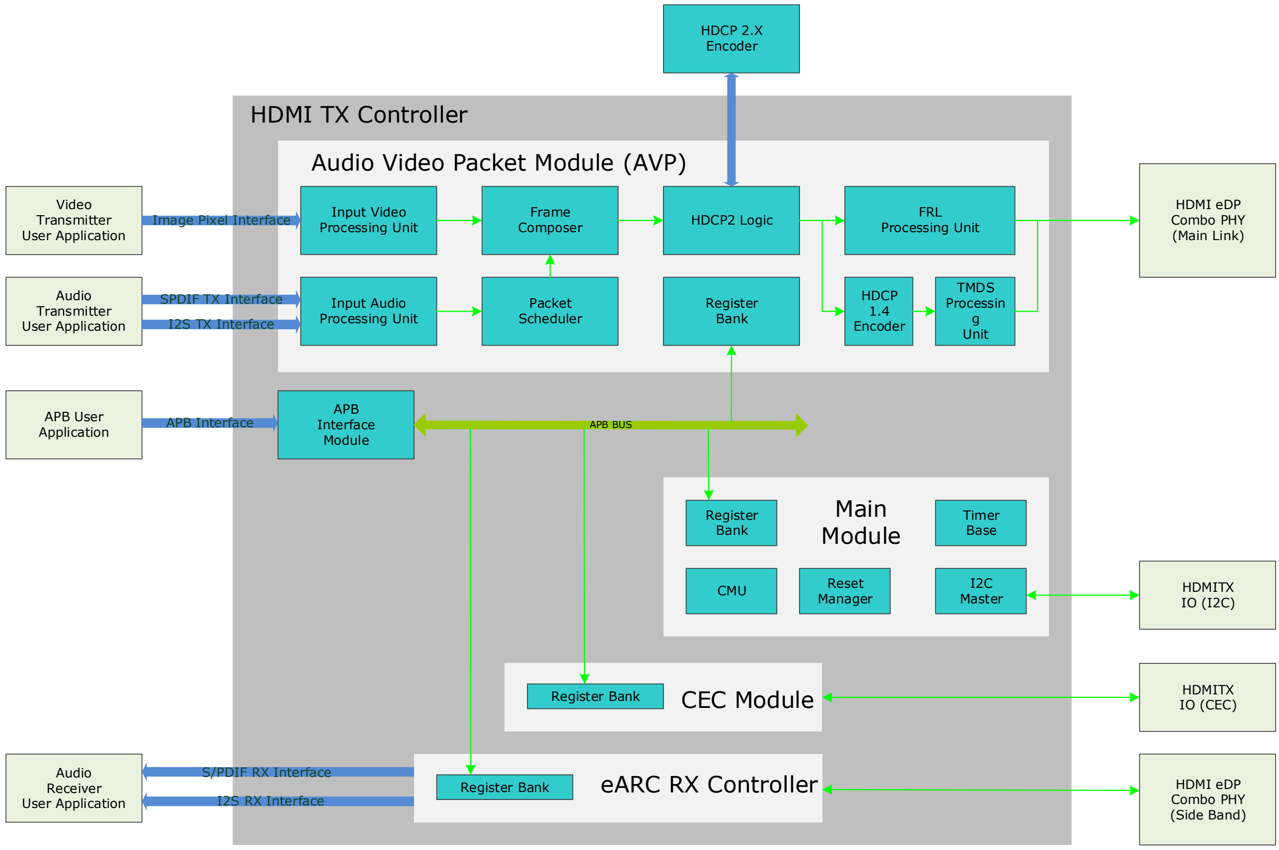

Fig. 24-1 HDMI TX Controller Block Diagram

24.3 Function Description

24.3.1 Main Module

This includes the following sub modules which can be common or completely independent of the remaining macro blocks.

- Reset Manager Module
- Timer Base Module
- Control Measurement Unit
- Status and Control Data Channel Module
- Display Data Channel
- I2C Master Module

24.3.1.1 Reset Manager Module

The Reset Manager module, generates all reset and initial signals required by the other functional modules; Synchronizes the resets to different clock domains; Guarantees that the resets from different clock domains to the same functional modules; Overlap when asserted the reset architecture of the HDMI TX Controller comprises of three types of clearing logic: the asynchronous reset, software initials, and software disables.

24.3.1.2 Timer Base Module

The Timer Base module generates timer bases for the reference counters of the different timers. The timer bases are calculated based on the timer_reference_base (frequency of the reference clock - refclk) field of the timer_base_config0 registers.

24.3.1.3 Control Measurement Unit

The Control Measurement Unit (CMU) measures the frequency and provides watchdog of imeasclk signal (frequency greater than 2 KHz). Frequency= ocfgr_clk_freq[19:0]/base time signal or evaluation period.

24.3.1.4 Status and Control Data Channel Module

The Status and Data Control Channel (SCDC) operates as a point-to-point communication protocol to exchange data between the HDMI Source and the HDMI Sink. It is an I2C-based system and makes use of the same I2C interface used for E-EDID (DDC) accesses and for HDCP (I2C Bus) accesses. This protocol extends the I2C standard by providing a mechanism for the Sink device (I2C Slave) to request a Source device (I2C Master) to initiate a status check read. The SCDC access is used for Read/Write operations into the SCDC registers for retrieving information about the actual status of the controller.

24.3.1.5 Display Data Channel

The Display Data Channel (DDC) reads E-EDID and SCDC structure to determine the capabilities and characteristics of the Sink. DDC implements the I2C Master for DDC/E-DDC channel in HDMI TX controller.

The DDC Controls all I2C transactions Interfaces with HDCP 1.4, HDCP 2.x, SCDC, and software The I2C Master complies with the *I2C Bus Specification, Version 2.1*.

24.3.1.6 I2C Master Module

The I2C Master module implements the I2C Master for E-DDC channel in HDMI TX Controller. It is responsible for all I2C transactions and it can interface with HDCP 1.4, HDCP 2.x, SCDC, and software (SW). The software interface allows reading the Sink's E-EDID based on system needs. The I2C Master complies with the *I2C Bus Specification 2.1*.

24.3.2 AMBA APB Interface Module

The APB Interface communicates between the AMBA 3 APB Slave Interface module and the HDMI TX Register Bank. The AMBA APB Interface module. Receives the APB Master's Read/Write operations and translates them into the internal Register Bank Access (RBK) protocol; Multiplexes the Register Bank access to the several domains based on the APB address; Synchronizes the Register Bank access protocol into/from the corresponding clock domain For more information, see *AMBA 3 APB Protocol*.

24.3.3 Audio Video Packets (AVP) Module

The Audio Video Packets (AVP) module packages the input audio, video, and packet information into a TMDS stream and prepares it for transmission in to the FRL or TMDS stream. This stream can be redirected for encryption to an external HDCP 2.x encoder. An HDCP 1.4 encoder is used internally for the TMDS stream. AVP module consists of the following modules: "Video Processing Unit","FRL Processing Unit","TDMS Processing Unit" ,"Audio Processing Unit".

24.3.3.1 Video Processing Unit

The Video Processing Unit receives the video stream from the user application side to transmit into the HDMI stream. The Video Processing Unit of the AVP module consists of the components shown in Figure 24 -2.

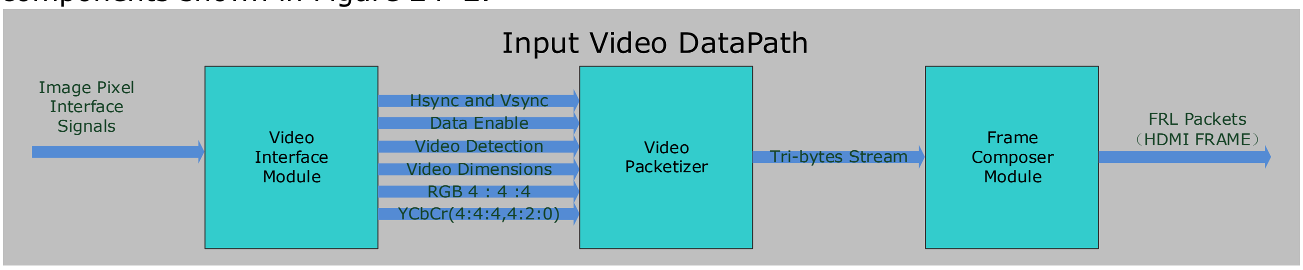

Fig. 24-2 Input Video Data Path

The Video Interface module detects and measures the video parameters and characteristics of the input video stream (IPI). The Video Interface module also samples the Image Pixel Interface (IPI) and maps the correspondent video data to the internal blocks. The measured video parameters are: Hfront, Hback, Hblank, Hactive, Htotal, Hsync Width, Vsync Width, Vback, Vblank, Vactive, Vtotal.

The measured video characteristics are Vsync polarity, Hsync polarity, Alternative video detection, Field detection, Progressive or Interlaced video detection.

24.3.3.2 FRL Processing Unit

The FRL Processing Unit of the AVP module consists of the components shown in Figure24-3.

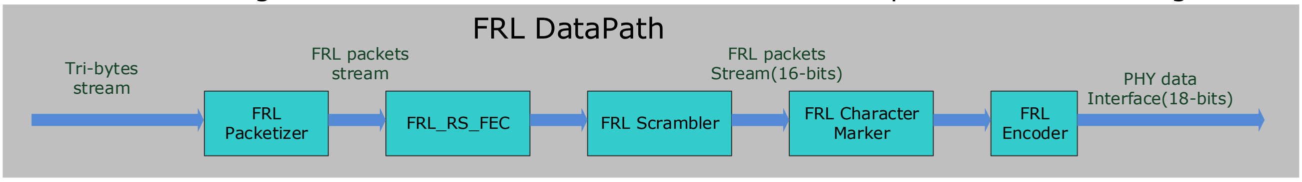

Fig. 24-3 FRL Data Path

24.3.3.3 TMDS Processing Unit

The TMDS Processing Unit processes the TMDS stream which includes audio, video, and auxiliary data stream. The TMDS Processing Unit of the AVP module consists of the components shown in Figure 24-4.

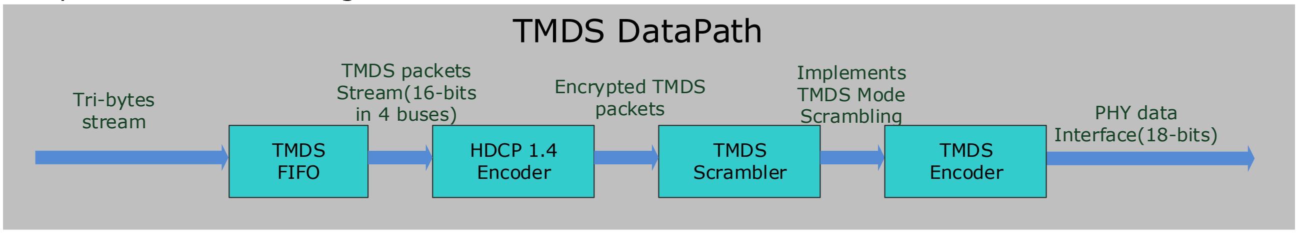

Fig. 24-4 TMDS Data Path

24.3.3.4 HDCP 1.4 Encoder

The HDCP 1.4 Encoder module receives the data from the TMDS Datapath from the four buses (a, b, c and d). This data includes the following: Video, Data Island, Control Period, HSYNC and VSYNC Indication, Data Enable This module encrypts the TMDS Stream. HDCP 1.4 uses an custom cipher for data encoding, a Finite State Machine to control the encryption operation and a dedicated access to the I2C Master present in the HDMI TX controller. For more information about the HDCP protocol, see the *HDCP 1.4 Specification*.

24.3.3.5 Audio Processing Unit

The Input Audio Processing Unit receives the audio data-Inter-IC Sound (I2S) Interface, and Sony/Philips Digital Interface (S/PDIF), from the application side to transmit into the HDMI stream. The Input Audio Processing Unit of the AVP module consists of the components shown in Figure 24-5.

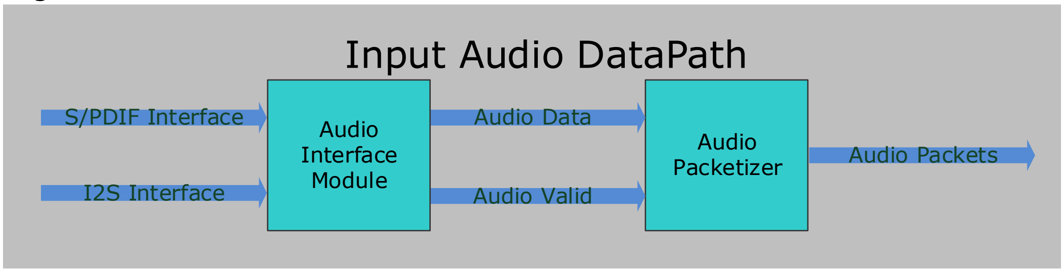

Fig. 24-5 Input Audio Data Path

24.3.3.6 Packet Scheduler

The Packet Scheduler schedules enabled packets and transfers it to the Frame Composer module. You can configure the priorities of the packets.

24.3.4 Enhanced Audio Return Channel Receiver (eARC Rx) Controller

The eARC Rx controller Uses the HPD and Utility lines to receive audio samples from the eARC Rx sink. Supports bi-directional communication of data packets. The data packets are read and written through the register bank. The following are the audio output selectable interfaces: Sony/Philips Digital Interface (S/PDIF) (up to 8 audio channels); Inter-IC Sound (I2S) (up to 8 audio channels)

24.3.5 Consumer Electronics Control Module

The Consumer Electronics Control (CEC) module Provides high-level control functions for all the various audio-visual products connected to the HDMI. Uses a single bidirectional line for transmission and reception of messages. The following terms are commonly used for CEC module: Message–The information (payload data) received by CEC application/software level. Frame–A frame is one burst of a data flow (including payload and overhead data) received by the CEC controller after triggered by the CEC software. The maximum size of a frame is 16 data blocks (including a header block). Data/Header block–One data/header block consists of 10-bits, in which 8-bits are payload data and 2-bits are overhead. There are two operation modes for a CEC module. Initiator mode–In this mode, the CEC module sends out messages and waits for a follower for feed-back. CEC module works in this mode when it sends a frame. After the transmission is complete, it reverts to the follower mode automatically. Follower mode–In this mode, the CEC module receives messages and sends appropriate acknowledgment to the initiator. The CEC module always works in the follower mode whenever it does not transmit any data. There can be more than one followers.

24.3.6 HDCP 2.x Encoder(External)

The HDCP 2.x Encoder encrypts the Tri-bytes stream using the HDCP 2.x encryption protocol. The HDCP 2.x specification includes a more powerful authentication protocol and a locality check that ensures the sink and source are close together. HDCP 2.x is not backward compatible with HDCP 1.4, so both protection systems co-exist in the HDMI TX controller. The controller provides support for HDCP 2.x, through external HDCP 2.x encoder. HDCP 2.x Encoder (HDCP2 ESM) can be automatically configured and integrated with the controller. The verification environment also supports this encryption engine.

24.3.7 Register Bank

The register bank comprises of 32-bit registers that can be seen from the software side, as read-only, write-only, read-write. The configuration shell module placed per clock domain and functional area reduces the number of synchronizations. Synchronization is done at the APB level instead at the bit field or signal levels. The Register Bank of the HDMI TX controller is divided into four regions that is placed within the functional domain, AVP, MAIN, CEC, eARC RX.

24.4 Register Description

24.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

24.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
HDMI TX Controller_CORE_ID	0x0000	W	0x48515458	IP Identification Register
HDMI TX Controller_VER_NUMBER	0x0004	W	0x30313030	IP Version Number Register
HDMI TX Controller_VER_TYPE	0x0008	W	0x6C753030	IP Version Type Register
HDMI TX Controller_CONFIG_REG	0x000C	W	0x11E0D501	IP Configuration Identification Register
HDMI TX Controller_CORE_TIMESTAMP_HHMM	0x0014	W	0x31373336	IP Timestamp HHMM Register
HDMI TX Controller_CORE_TIMESTAMP_MMDD	0x0018	W	0x30333131	IP Timestamp MMDD Register
HDMI TX Controller_CORE_TIMESTAMP_YYYY	0x001C	W	0x32303231	IP Timestamp YYYY Register
HDMI TX Controller_GLOBAL_SWRESET_REQUEST	0x0040	W	0x00000000	Main Controller Software Reset Register
HDMI TX Controller_GLOBAL_SWDISABLE	0x0044	W	0x00000000	Main Controller Synchronous Disable Register

Name	Offset	Size	Reset Value	Description
HDMI TX Controller_RESET_MANAGER_CONFIG0	0x0048	W	0x00000000	Main Controller Software Configuration Register 0
HDMI TX Controller_RESET_MANAGER_STATUS0	0x0050	W	0x00000000	Main Controller Software Status Register 0
HDMI TX Controller_RESET_MANAGER_STATUS1	0x0054	W	0x00000000	Main Controller Software Status Register 1
HDMI TX Controller_RESET_MANAGER_STATUS2	0x0058	W	0x00000000	Main Controller Software Status Register 2
HDMI TX Controller_TIMER_BASE_CONFIG0	0x0080	W	0x198B7B25	Timer Base Configuration Register 0
HDMI TX Controller_TIMER_BASE_STATUS0	0x0084	W	0x00000000	Timer Base Status Register 0
HDMI TX Controller_I2CM_SM_SCL_CONFIG0	0x00E0	W	0x085E085E	I2C Master Standard-mode SCL configuration 0

24.4.3 Detail Registers Description

HDMI TX Controller_CORE_ID

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:24	RO	0x48	CORE_ID_ASCII3 ASCII encoded value of the first character of the IP identification code. Values: 0x48 (ASCII_H): H ASCII Character Value After Reset:0x48
23:16	RO	0x51	CORE_ID_ASCII2 ASCII encoded value of the second character of the IP identification code. Values: 0x51 (ASCII_Q): Q ASCII Character Value After Reset:0x51
15:8	RO	0x54	CORE_ID_ASCII1 ASCII encoded value of the third character of the IP identification code. Values: 0x54 (ASCII_T): T ASCII Character Value After Reset:0x54
7:0	RO	0x58	CORE_ID_ASCII0 ASCII encoded value of the fourth character of the IP identification code. Values: 0x58 (ASCII_X): X ASCII Character Value After Reset:0x58

HDMI TX Controller_VER_NUMBER

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:24	RO	0x30	VER_NUMBER_ASCII3 ASCII encoded value of the first character of the IP version. Value After Reset:0x30
23:16	RO	0x31	VER_NUMBER_ASCII2 ASCII encoded value of the second character of the IP version. Value After Reset:0x31
15:8	RO	0x30	VER_NUMBER_ASCII1 ASCII encoded value of the third character of the IP version. Value After Reset:0x30
7:0	RO	0x30	VER_NUMBER_ASCII0 ASCII encoded value of the fourth character of the IP version. Value After Reset:0x30

HDMI TX Controller_VER_TYPE

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:24	RO	0x6c	VER_TYPE_ASCII3 ASCII encoded value of the first character of the IP release type. Value After Reset:0x6c
23:16	RO	0x75	VER_TYPE_ASCII2 ASCII encoded value of the second character of the IP release type. Value After Reset:0x75
15:8	RO	0x30	VER_TYPE_ASCII1 ASCII encoded value of the third character of the IP release type. Value After Reset:0x30

Bit	Attr	Reset Value	Description
7:0	RO	0x30	VER_TYPE_ASCII0 ASCII encoded value of the fourth character of the IP release type. Value After Reset:0x30

HDMI TX Controller_CONFIG_REG

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:29	RW	0x0	Reserved5 Reserved Field:Yes
28	RO	0x1	CEC The CEC interface is present in the generated controller RTL. Value After Reset:0x1
27:25	RW	0x0	Reserved4 Reserved Field:Yes
24	RO	0x1	EARCRX Enhanced Audio Return Channel (eARC) RX interface is present in the generated controller RTL. Value After Reset:0x1
23	RO	0x1	AUD_UD Support for IEC 60958 User Data channel is present in the generated controller RTL. Value After Reset:0x1
22	RO	0x1	AUD_MS Support for Multi-Stream Audio is present in the generated controller RTL. Value After Reset:0x1
21	RO	0x1	AUD_HBR Support for High Bit Rate Audio is present in the generated controller RTL. Value After Reset:0x1
20	RO	0x0	AUD_3D Support for 3D Audio is present in the generated controller RTL. Value After Reset:0x0
19:16	RW	0x0	Reserved3 Reserved Field:Yes
15	RO	0x1	CVTEM Support for Compressed Video Timing Extended Metadata (CVTEM) Packets is present in the generated controller RTL. Value After Reset:0x1
14	RO	0x1	VTEM Support for Video Timing Extended Metadata (VTEM) Packets is present in the generated controller RTL. Value After Reset:0x1
13	RO	0x0	EEMP Support for External Extended Metadata Packets (EEMP) is present in the generated controller RTL. Value After Reset:0x0
12	RO	0x1	FRL The Fixed Rate Link (FRL) feature is present in the generated controller RTL. Value After Reset:0x1
11	RW	0x0	Reserved2 Reserved Field:Yes

Bit	Attr	Reset Value	Description
10	RO	0x1	HDCP14_SW_SHA1CALC The hardware for the SHA-1 calculation for HDCP 1.4 Protocol is not present in the generated controller RTL and the software calculates the SHA-1. Value After Reset:0x1
9	RO	0x0	HDCP14_DKSET_EXTERNAL The Device Key Set from the HDCP 1.4 Protocol is stored in the external memory. Value After Reset:0x0
8	RO	0x1	HDCP14 Support for HDCP1.4 Encryption is present in the generated controller RTL. Value After Reset:0x1
7:5	RW	0x0	Reserved1 Reserved Field:Yes
4	RO	0x0	PR Support for Pixel Repetition is present in the generated controller RTL. Value After Reset:0x0
3:1	RW	0x0	Reserved0 Reserved Field:Yes
0	RO	0x1	AVP The HDMI TX Audio, Video, and Packet (AVP) processing is present in the generated controller RTL. Value After Reset:0x1

HDMI TX Controller_CORE_TIMESTAMP_HHMM

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:24	RO	0x31	CORE_TIMESTAMP_HHMM_ASCII3 ASCII value of the tens digit of the hour. Values: 0x30 (TENS_OF_HOURS_0): 0 is the tens digit of the hours 0x31 (TENS_OF_HOURS_1): 1 is the tens digit of the hours 0x32 (TENS_OF_HOURS_2): 2 is the tens digit of the hours Value After Reset:0x31
23:16	RO	0x37	CORE_TIMESTAMP_HHMM_ASCII2 ASCII value of the units digit of the hour. Values: 0x30 (HOUR_0): 0 is the units digit of the hours 0x31 (HOUR_1): 1 is the units digit of the hours 0x32 (HOUR_2): 2 is the units digit of the hours 0x33 (HOUR_3): 3 is the units digit of the hours 0x34 (HOUR_4): 4 is the units digit of the hours 0x35 (HOUR_5): 5 is the units digit of the hours 0x36 (HOUR_6): 6 is the units digit of the hours 0x37 (HOUR_7): 7 is the units digit of the hours 0x38 (HOUR_8): 8 is the units digit of the hours 0x39 (HOUR_9): 9 is the units digit of the hours Value After Reset:0x37

Bit	Attr	Reset Value	Description
15:8	RO	0x33	CORE_TIMESTAMP_HHMM_ASCII1 ASCII value of the tens digit of the minute. Values: 0x30 (TENS_OF_MINUTES_0): 0 is the tens digit of the minutes 0x31 (TENS_OF_MINUTES_1): 1 is the tens digit of the minutes 0x32 (TENS_OF_MINUTES_2): 2 is the tens digit of the minutes 0x33 (TENS_OF_MINUTES_3): 3 is the tens digit of the minutes 0x34 (TENS_OF_MINUTES_4): 4 is the tens digit of the minutes 0x35 (TENS_OF_MINUTES_5): 5 is the tens digit of the minutes Value After Reset:0x33
7:0	RO	0x36	CORE_TIMESTAMP_HHMM_ASCII0 ASCII value of the units digit of the minute. Values: 0x30 (MINUTE_0): 0 is the units digit of the minutes 0x31 (MINUTE_1): 1 is the units digit of the minutes 0x32 (MINUTE_2): 2 is the units digit of the minutes 0x33 (MINUTE_3): 3 is the units digit of the minutes 0x34 (MINUTE_4): 4 is the units digit of the minutes 0x35 (MINUTE_5): 5 is the units digit of the minutes 0x36 (MINUTE_6): 6 is the units digit of the minutes 0x37 (MINUTE_7): 7 is the units digit of the minutes 0x38 (MINUTE_8): 8 is the units digit of the minutes 0x39 (MINUTE_9): 9 is the units digit of the minutes Value After Reset:0x36

HDMI TX Controller_CORE_TIMESTAMP_MMDD

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:16	RO	0x3033	CORE_TIMESTAMP_MM ASCII value of the month (in numerical format) Values: 0x3031 (MONTH_01): Month 1 of the year 0x3032 (MONTH_02): Month 2 of the year 0x3033 (MONTH_03): Month 3 of the year 0x3034 (MONTH_04): Month 4 of the year 0x3035 (MONTH_05): Month 5 of the year 0x3036 (MONTH_06): Month 6 of the year 0x3037 (MONTH_07): Month 7 of the year 0x3038 (MONTH_08): Month 8 of the year 0x3039 (MONTH_09): Month 9 of the year 0x3130 (MONTH_10): Month 10 of the year 0x3131 (MONTH_11): Month 11 of the year 0x3132 (MONTH_12): Month 12 of the year Value After Reset:0x3036

Bit	Attr	Reset Value	Description
15:0	RO	0x3131	CORE_TIMESTAMP_DD ASCII value of the day Values: 0x3031 (DAY_01): Day 1 of the month 0x3032 (DAY_02): Day 2 of the month 0x3033 (DAY_03): Day 3 of the month 0x3034 (DAY_04): Day 4 of the month 0x3035 (DAY_05): Day 5 of the month 0x3036 (DAY_06): Day 6 of the month 0x3037 (DAY_07): Day 7 of the month 0x3038 (DAY_08): Day 8 of the month 0x3039 (DAY_09): Day 9 of the month 0x3130 (DAY_10): Day 10 of the month 0x3131 (DAY_11): Day 11 of the month 0x3132 (DAY_12): Day 12 of the month 0x3133 (DAY_13): Day 13 of the month 0x3134 (DAY_14): Day 14 of the month 0x3135 (DAY_15): Day 15 of the month 0x3136 (DAY_16): Day 16 of the month 0x3137 (DAY_17): Day 17 of the month 0x3138 (DAY_18): Day 18 of the month 0x3139 (DAY_19): Day 19 of the month 0x3230 (DAY_20): Day 20 of the month 0x3231 (DAY_21): Day 21 of the month 0x3232 (DAY_22): Day 22 of the month 0x3233 (DAY_23): Day 23 of the month 0x3234 (DAY_24): Day 24 of the month 0x3235 (DAY_25): Day 25 of the month 0x3236 (DAY_26): Day 26 of the month 0x3237 (DAY_27): Day 27 of the month 0x3238 (DAY_28): Day 28 of the month 0x3239 (DAY_29): Day 29 of the month 0x3330 (DAY_30): Day 30 of the month 0x3331 (DAY_31): Day 31 of the month Value After Reset:0x3136

HDMI TX Controller_CORE_TIMESTAMP_YYYY

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:24	RO	0x32	CORE_TIMESTAMP_YYYY_ASCII3 ASCII value of the thousands digit of the year Values: 0x31 (YEAR_THOUSANDS_1): 1 is the thousands digit of the year 0x32 (YEAR_THOUSANDS_2): 2 is the thousands digit of the year Value After Reset:0x32
23:16	RO	0x30	CORE_TIMESTAMP_YYYY_ASCII2 ASCII value of the hundreds digit of the year Values: 0x30 (YEAR_HUNDREDS_0): 0 is the hundreds digit of the year 0x39 (YEAR_HUNDREDS_9): 9 is the hundreds digit of the year Value After Reset:0x30

Bit	Attr	Reset Value	Description
15:8	RO	0x32	CORE_TIMESTAMP_YYYY_ASCII1 ASCII value of the tens digit of the year Values: 0x30 (YEAR_TENS_0): 0 is the tens digit of the year 0x31 (YEAR_TENS_1): 1 is the tens digit of the year 0x32 (YEAR_TENS_2): 2 is the tens digit of the year 0x33 (YEAR_TENS_3): 3 is the tens digit of the year 0x34 (YEAR_TENS_4): 4 is the tens digit of the year 0x35 (YEAR_TENS_5): 5 is the tens digit of the year 0x36 (YEAR_TENS_6): 6 is the tens digit of the year 0x37 (YEAR_TENS_7): 7 is the tens digit of the year 0x38 (YEAR_TENS_8): 8 is the tens digit of the year 0x39 (YEAR_TENS_9): 9 is the tens digit of the year Value After Reset:0x32
7:0	RO	0x31	CORE_TIMESTAMP_YYYY_ASCII0 ASCII value of the units digit of the year. Values: 0x30 (YEAR_UNITS_0): 0 is the units digit of the year 0x31 (YEAR_UNITS_1): 1 is the units digit of the year 0x32 (YEAR_UNITS_2): 2 is the units digit of the year 0x33 (YEAR_UNITS_3): 3 is the units digit of the year 0x34 (YEAR_UNITS_4): 4 is the units digit of the year 0x35 (YEAR_UNITS_5): 5 is the units digit of the year 0x36 (YEAR_UNITS_6): 6 is the units digit of the year 0x37 (YEAR_UNITS_7): 7 is the units digit of the year 0x38 (YEAR_UNITS_8): 8 is the units digit of the year 0x39 (YEAR_UNITS_9): 9 is the units digit of the year Value After Reset:0x31

HDMI TX Controller_GLOBAL_SWRESET_REQUEST

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:28	RW	0x0	Reserved3 Reserved Field:Yes
27	WO	0x0	EARCRX_CMDC_SWINIT_P Reset control field that when activated resets the CMDC controller in the EARCRX functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
26	WO	0x0	EARCRX_DMAC_SWINIT_P Reset control field that when activated resets the DMAC controller in the EARCRX functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0

Bit	Attr	Reset Value	Description
25	WO	0x0	EARCRX_SWINIT_P Reset control field that when activated resets the EARCRX functional unit, including all configuration and status bits. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
24:19	RW	0x00	Reserved2 Reserved Field:Yes
18	WO	0x0	CEC_CTRL_SWINIT_P Reset control field that when activated resets the controller in the CEC functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
17	WO	0x0	CEC_SWINIT_P Reset control field that when activated resets the CEC functional unit, including all configuration and status bits. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
16	WO	0x0	I2C_SWINIT_P Reset control field that when activated resets the I2C Master in the MAIN functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
15:12	RW	0x0	Reserved1 Reserved Field:Yes
11	WO	0x0	AVP_DATAPATH_PACKET_METADATA_SWINIT_P Reset control field that when activated resets the Extended Metadata Packets data path of the AVP functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
10	WO	0x0	AVP_DATAPATH_PACKET_AUDIO_SWINIT_P Reset control field that when activated resets the audio data path of the AVP functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0

Bit	Attr	Reset Value	Description
9	WO	0x0	AVP_DATAPATH_PACKET_SWINIT_P Reset control field that when activated resets the packet data path of the AVP functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
8	WO	0x0	AVP_DATAPATH_HDCP_KEYS_SWINIT_P Reset control field that when activated resets the HDCP keys used in the data path of the AVP functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
7	WO	0x0	AVP_DATAPATH_VIDEO_SWINIT_P Reset control field that when activated resets the video data path of the AVP functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
6	WO	0x0	AVP_DATAPATH_SWINIT_P Reset control field that when activated resets the data path of the AVP functional unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
5	WO	0x0	AVP_SWINIT_P Reset control field that when activated resets the AVP functional unit, including all configuration and status bits. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0
4:2	RW	0x0	Reserved0 Reserved Field:Yes
1	WO	0x0	MASTER_NOMAINRB_SWINIT_P Main reset control field that when activated resets all functional units. Also resets all configuration and status bits except those that are part of the MAIN unit. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0

Bit	Attr	Reset Value	Description
0	WO	0x0	MASTER_SWINIT_P Main reset control field that when activated resets all functional units and all configuration registers. This bit is self clearing: Values: 0x0 (NO_ACTION): no action 0x1 (START_RESET): start reset Value After Reset:0x0

HDMI TX Controller GLOBAL SWDISABLE

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:27	RW	0x00	Reserved3 Reserved Field:Yes
26	RW	0x0	EARCRX_CTRL_SWDISABLE Disable control field that when activated disables the controllers in the EARCRX functional unit. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_EARCRX_CTRL): disable affected units Value After Reset:0x0
25	RW	0x0	EARCRX_SWDISABLE Disable control field that when activated disables the EARCRX functional unit. Also reset all contained configuration and status bits. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_EARCRX): disable affected units Value After Reset:0x0
24:19	RW	0x00	Reserved2 Reserved Field:Yes
18	RW	0x0	CEC_CTRL_SWDISABLE Disable control field that when activated disables the controller in the CEC functional unit. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_CEC_CTRL): disable affected units Value After Reset:0x0
17	RW	0x0	CEC_SWDISABLE Disable control field that when activated disables the CEC functional unit. Also reset all contained configuration and status bits. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_CEC): disable affected units Value After Reset:0x0
16	RW	0x0	I2C_SWDISABLE Disable control field that when activated disables the I2C Master in the MAIN functional unit. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_I2C): disable affected units Value After Reset:0x0
15:12	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
11	RW	0x0	AVP_DATAPATH_PACKET_METADATA_SWDISABLE Disable control field that when activated disables the Extended Metadata Packet data path of the AVP functional unit. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_AVP_DATAPATH_PACKET_METADATA): disable affected units Value After Reset:0x0
10	RW	0x0	AVP_DATAPATH_PACKET_AUDIO_SWDISABLE Disable control field that when activated disables the audio data path of the AVP functional unit. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_AVP_DATAPATH_PACKET_AUDIO): disable affected units Value After Reset:0x0
9	RW	0x0	AVP_DATAPATH_PACKET_SWDISABLE Disable control field that when activated disables the packet data path of the AVP functional unit. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_AVP_DATAPATH_PACKET): disable affected units Value After Reset:0x0
8	RW	0x0	AVP_DATAPATH_TMDS_SWDISABLE Disable control field that when activated disables the TMDS data path of the AVP functional unit. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_AVP_DATAPATH_TMDS): disable affected units Value After Reset:0x0
7	RW	0x0	AVP_DATAPATH_FRL_SWDISABLE Disable control field that when activated disables the FRL data path of the AVP functional unit. Values: 0x0 (NO_ACTION): no action 0x1 (DISABLE_AVP_DATAPATH_FRL): disable affected units Value After Reset:0x0

HDMI TX Controller_TIMER_BASE_CONFIG0

Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:29	RW	0x0	Reserved0 Reserved Field:Yes
28:0	RW	0x198b7b25	TIMER_REFERENCE_BASE Timer Reference Base, this represents the number of irefclk cycles in 1 second. This is the frequency of the refclk. Attention: This register is always consistent with input irefclk clock frequency. Example of configured value for irefclk of 428.571429 MHz is 29'd428571429. Value After Reset:0x198b7b25

HDMI TX Controller_TIMER_BASE_STATUS0

Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:1	RW	0x00000000	Reserved0 Reserved Field:Yes
0	RO	0x0	TIMER_BASE_LOCKED_ST Timer base locked status flag. Note: Writing a new Timer Reference Base to the register global_timer_ref_base initiates new Timer Base calculations. While these are in progress, this status is expected to fall momentaneously and when the calculations are finally done it is expected to rise, together with corresponding interrupt request timer_base_locked_irq. Values: 0x0 (NOT_LOCKED): Timer Base calculations in progress and not locked. 0x1 (LOCKED): Timer Base calculations completed and locked. Value After Reset:0x0

Address: Operational Base + offset (0x0920)

Bit	Attr	Reset Value	Description
31:9	RW	0x000000	Reserved1 Reserved Field:Yes
8	RO	0x0	HDCP14_KEY_WR_OK HDCP Key write OK. Value After Reset:0x0
7:6	RW	0x0	Reserved0 Reserved Field:Yes
5:0	RO	0x00	HDCP14_KEY_INDEX HDCP Key index. Valid range is 00h ... 27h. Value After Reset:0x0

HDMI TX Controller_HDCP14_AKSV_H
Address: Operational Base + offset (0x0924)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved0 Reserved Field:Yes
7:0	RW	0x00	HDCP14_AKSV_HIGH DDC AKSV register content (bits 39:32). Value After Reset:0x0

HDMI TX Controller_HDCP14_AKSV_L
Address: Operational Base + offset (0x0928)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	HDCP14_AKSV_LOW DDC AKSV register content (bits 31:0). Value After Reset:0x0

HDMI TX Controller_HDCP14_AN_H
Address: Operational Base + offset (0x092C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	HDCP14_AN_VALUE_HIGH An value register content (bits 63:32). Value After Reset:0x0

HDMI TX Controller_HDCP14_AN_L
Address: Operational Base + offset (0x0930)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	HDCP14_AN_VALUE_LOW An value register content (bits 31:0). Value After Reset:0x0

HDMI TX Controller_HDCP14_STATUS0

Address: Operational Base + offset (0x0934)

Bit	Attr	Reset Value	Description
31:24	RW	0x00	Reserved2 Reserved Field:Yes
23:20	RO	0x0	HDCP14_I2C_NACK_CNT HDCP 1.4 Total of I2C NACK Received. Cleared when hdcp14_restart_p is set to 1 or the number of received I2C NACK reaches the value defined in hdcp14_i2c_nack_threshold. Value After Reset:0x0
19:17	RW	0x0	Reserved1 Reserved Field:Yes
16	RO	0x0	HDCP14_BKSV_REVOC_FAIL_ST HDCP 1.4 BKSV Revocation status. When changed, it triggers the bksv_revoc_fail_irq interrupt. Value After Reset:0x0
15:9	RO	0x00	HDCP14_RPT_DEVICE_COUNT HDCP 1.4 Receiver/Repeater DEVICE_COUNT. Total number of attached downstream devices. Always zero for HDCP Receivers. This count does not include the HDCP Repeater itself, but only downstream devices downstream from the HDCP Repeater Value After Reset:0x0
8	RO	0x0	HDCP14_RPT_MAX_DEVS_EXCEEDED HDCP 1.4 Receiver/Repeater MAX_DEVS_EXCEEDED. Topology error indicator. When set to one, more than 127 downstream devices, or the capacity of the KSV Fifo, are attached. Value After Reset:0x0
7:5	RO	0x0	HDCP14_RPT_DEPTH HDCP 1.4 Receiver/Repeater DEPTH. Three-bit repeater cascade depth. This value gives the number of attached levels through the connection topology. Value After Reset:0x0
4	RO	0x0	HDCP14_RPT_MAX_CASCADE_EXCEEDED HDCP 1.4 Receiver/Repeater MAX_CASCADE_EXCEEDED. Topology error indicator. When set to one, more than seven levels of video repeater have been cascaded together. Value After Reset:0x0
3	RO	0x0	HDCP14_RCV_HDMI_MODE HDCP 1.4 Receiver HDMI_MODE: Values: 0x0 (DVI_MODE): DVI Mode. 0x1 (HDMI_MODE): HDMI Mode. Value After Reset:0x0
2	RO	0x0	HDCP14_AUTH_ST HDCP 1.4 Authentication State: Values: 0x0 (NON_AUTHENTICATED): Not Authenticated 0x1 (AUTHENTICATED): Authenticated Value After Reset:0x0
1	RW	0x0	Reserved0 Reserved Field:Yes

Bit	Attr	Reset Value	Description
0	RO	0x0	HDCP14_OESS_ESSS HDCP 1.4 Encryption Status Signaling status: Values: 0x0 (OESS): OESS 0x1 (EESS): EESS Value After Reset:0x0

31:8	RW	0x000000	Reserved0 Reserved Field:Yes
7:0	RW	0x00	AUDPKT_VBIT_CHANNEL8_1_OVR_VALUE IEC 60958 Validity override value - Channels 1-8 Only used when audpkt_vbit_ovr_en=1 Note: The LSB (bit) of the field corresponds to channel 1 and the MSB (bit) to channel 8. Value After Reset:0x0

HDMI TX Controller_CEC_TX_CONTROL

Address: Operational Base + offset (0x1000)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	Reserved0 Reserved Field:Yes
1	WO	0x0	FRAME_SEND_CLR_P Prevents further re-transmissions. If the transmission is ongoing, it is attempted to completion. Value After Reset:0x0

Bit	Attr	Reset Value	Description
0	WO	0x0	FRAME_SEND_SET_P Set by software to trigger CEC sending a frame as an initiator. If cec_cfg.txreq_discad_ifrxbusy==0, the frame is transmitted even after receiving a frame in between. Otherwise, the frame to be sent is discarded as soon as a new incoming frame arrives (before being able to transmit). Value After Reset:0x0

HDMI TX Controller_CEC_STATUS
Address: Operational Base + offset (0x1004)

Bit	Attr	Reset Value	Description
31:9	RW	0x000000	Reserved2 Reserved Field:Yes
8	RO	0x0	CECTX_BUSY_ST Hardware is busy transmitting a frame. When this bit changes, it generates the cectx_busy_irq interrupt. Value After Reset:0x0
7:5	RW	0x0	Reserved1 Reserved Field:Yes
4	RO	0x0	CECRX_BUSY_ST Hardware is busy receiving a message frame. If 'send' is asserted for a new TX message to be sent, it is delayed until the ongoing RX message is done. When this bit changes, it generates the cecrx_busy_irq interrupt. Value After Reset:0x0
3:1	RW	0x0	Reserved0 Reserved Field:Yes
0	RO	0x0	FRAME_SEND_PENDING_ST Frame send pending status: Values: 0x1 (FRAME_PENDING): A frame is set to be transmitted (waiting for the end of an incoming message or to have access to the line). This bit keeps at 1 while the transmission is going on. 0x0 (NO_FRAME_PENDING): CEC transmission is done (no matter successful or failed). Value After Reset:0x0

HDMI TX Controller_CEC_CONFIG
Address: Operational Base + offset (0x1008)

Bit	Attr	Reset Value	Description
31:14	RW	0x00000	Reserved3 Reserved Field:Yes

Bit	Attr	Reset Value	Description
13:12	RW	0x0	SIGNAL_FREE_TIME Selects the Signal Free Time period that is to be respected before attempting to transmit or re-transmit a frame. If 0 is selected then the core follows the HDMI specification in CEC 9.1 Signal free time. Values: 0x0 (AUTO): Follows HDMI specification 0x1 (THREE_BIT_PERIOD): Waits for 3-bit periods before attempt transmission 0x2 (FIVE_BIT_PERIOD): Waits for 5-bit periods before attempt transmission 0x3 (SEVEN_BIT_PERIOD): Waits for 7-bit periods before attempt transmission Value After Reset:0x0
11:10	RW	0x0	Reserved2 Reserved Field:Yes
9	RW	0x0	RX_AUTOMATIC_DRIVE_ACKNOWLEDGE RX automatic drive acknowledge. Values: 0x0 (WAIT_FOR_INITIATOR_ACK): Wait for initiator to drive logic '1' at ACK/NACK bit position for follower to reply with ACK/NACK bit. 0x1 (DRIVE_ACK): Automatically drive ACK/NACK bit at 2.65 ms of EOM initiator bit. Value After Reset:0x0
8	RW	0x1	CECFILTER Filter enable. Active high. Values: 0x1 (FILTER_ACTIVE): CEC filter is active and filters spurious signals in the CEC line (filter pulses <0.1ms) 0x0 (NO_FILTER): CEC filter inactive Value After Reset:0x1
7:6	RW	0x0	Reserved1 Reserved Field:Yes
5:4	RW	0x1	FRAME_NRETRANS Select number of re-transmission the hardware attempts as initiator after an arbitration loss (cectx_arblost_irq) or line error detection (cectx_lineerror_irq) Values: 0x0 (NO_RETRANS): Re-transmission is not attempt 0x1 (RETRANS_1): Re-transmit one time 0x2 (RETRANS_2): Re-transmit two times 0x3 (RETRANS_3): Re-transmit three times Value After Reset:0x1
3:2	RW	0x0	Reserved0 Reserved Field:Yes
1	RW	0x0	BROADCAST_NACK Broadcast State. Values: 0x1 (BROADCAST_NACK): Respond with Negative ACK to any received broadcast message. Message not stored in RX registers. 0x0 (RECEIVE_BROADCAST): Receive broadcast messages. Value After Reset:0x0

Bit	Attr	Reset Value	Description
0	RW	0x0	TXREQ_DISCARD_IF_RXBUSY Transmit request (cec_ctrl.send = 1) is discarded if a RX transfer is ongoing. Values: 0x1 (DISCARD_IF_BUSY): The transmit request is cancelled if there is an ongoing RX transfer on the CEC line, raising the RX busy interrupt. 0x0 (WAIT_TO_TRANSMIT): The transmit request is always recorded by the TX FIFO for immediate or later transmission, depending on the CEC line status. For instance, the transmit is performed as soon as possible. Value After Reset:0x0

HDMI TX Controller_CEC_ADDR

Address: Operational Base + offset (0x100C)

Bit	Attr	Reset Value	Description

HDMI TX Controller_CEC_TX_BITTIME_CONFIG

Address: Operational Base + offset (0x1068)

Bit	Attr	Reset Value	Description
31	RW	0x0	Reserved7 Reserved Field:Yes

Bit	Attr	Reset Value	Description
30:28	RW	0x6	TX_ROUND_TRIP_DELAY TX round trip delay. The CEC input line is sampled after this delay to check if the drive zero of the CEC output is in fact in the line. This value is greater than the fall edge output delay of the CEC line output. Note: With the filter ON, the values below 0.1 ms works as the interrupt, drive_err_irq triggers since the delay caused by the filter is already greater than the specified value. Values: 0x0 (ROUND_TRIP_DELAY_0.02ms): 0.02 ms 0x1 (ROUND_TRIP_DELAY_0.04ms): 0.04 ms 0x2 (ROUND_TRIP_DELAY_0.06ms): 0.06 ms 0x3 (ROUND_TRIP_DELAY_0.08ms): 0.08 ms 0x4 (ROUND_TRIP_DELAY_0.10ms): 0.10 ms 0x5 (ROUND_TRIP_DELAY_0.13ms): 0.13 ms 0x6 (ROUND_TRIP_DELAY_0.16ms): 0.16 ms 0x7 (ROUND_TRIP_DELAY_0.20ms): 0.20 ms Value After Reset:0x6
27	RW	0x0	Reserved6 Reserved Field:Yes
26:24	RW	0x3	TX_STARTBIT_TIME_RISESAMPLE TX start bit rise sample. This is the time (counted from the fall edge of the startbit) when the CEC input line is sampled to check if the line is zero. Note: From this time on (and until the next bit fall edge), if the CEC line is zero the arbitration lost interrupt is triggered. Values: 0x0 (START_BIT_RISE_SAMPLE_3.75ms): 3.75 ms 0x1 (START_BIT_RISE_SAMPLE_3.80ms): 3.80 ms 0x2 (START_BIT_RISE_SAMPLE_3.85ms): 3.85 ms 0x3 (START_BIT_RISE_SAMPLE_3.91ms): 3.91 ms 0x4 (START_BIT_RISE_SAMPLE_3.95ms): 3.95 ms 0x5 (START_BIT_RISE_SAMPLE_4.00ms): 4.00 ms 0x6 (START_BIT_RISE_SAMPLE_4.05ms): 4.05 ms 0x7 (START_BIT_RISE_SAMPLE_4.10ms): 4.10 ms Value After Reset:0x3
23	RW	0x0	Reserved5 Reserved Field:Yes
22:20	RW	0x4	TX_STARTBIT_TIME_TOTALDURATION TX start bit total duration. This is the time when the next bit starts: Note: When the CEC Filter is enabled, both options 0 and 1, produces a start bit total duration of 4.40 ms, due to the delay added by the filter (0.1 ms). Values: 0x0 (START_BIT_TOTAL_DURATION_4.30ms): 4.30 ms (or 4.40 ms when CEC Filter is enabled) 0x1 (START_BIT_TOTAL_DURATION_4.35ms): 4.35 ms (or 4.40 ms when CEC Filter is enabled) 0x2 (START_BIT_TOTAL_DURATION_4.40ms): 4.40 ms 0x3 (START_BIT_TOTAL_DURATION_4.45ms): 4.45 ms 0x4 (START_BIT_TOTAL_DURATION_4.50ms): 4.50 ms 0x5 (START_BIT_TOTAL_DURATION_4.55ms): 4.55 ms 0x6 (START_BIT_TOTAL_DURATION_4.60ms): 4.60 ms 0x7 (START_BIT_TOTAL_DURATION_4.65ms): 4.65 ms Value After Reset:0x4

Bit	Attr	Reset Value	Description
19	RW	0x0	Reserved4 Reserved Field:Yes
18:16	RW	0x4	TX_STARTBIT_TIME_LH_TRANS TX start bit low to high transition time. This is the duration of the low period of the start bit. Values: 0x0 (START_BIT_LH_TRANS_3.50ms): 3.50 ms 0x1 (START_BIT_LH_TRANS_3.55ms): 3.55 ms 0x2 (START_BIT_LH_TRANS_3.60ms): 3.60 ms 0x3 (START_BIT_LH_TRANS_3.65ms): 3.65 ms 0x4 (START_BIT_LH_TRANS_3.70ms): 3.70 ms 0x5 (START_BIT_LH_TRANS_3.75ms): 3.75 ms 0x6 (START_BIT_LH_TRANS_3.80ms): 3.80 ms 0x7 (START_BIT_LH_TRANS_3.85ms): 3.85 ms Value After Reset:0x4
15	RW	0x0	Reserved3 Reserved Field:Yes
14:12	RW	0x4	TX_ERR_NOTIFY_TIME TX error notify time. This is the duration of the low logic value of the CEC line for an error notification. Values: 0x0 (ERR_NOTIFY_3.40ms): 3.40 ms 0x1 (ERR_NOTIFY_3.45ms): 3.45 ms 0x2 (ERR_NOTIFY_3.50ms): 3.50 ms 0x3 (ERR_NOTIFY_3.55ms): 3.55 ms 0x4 (ERR_NOTIFY_3.60ms): 3.60 ms 0x5 (ERR_NOTIFY_3.65ms): 3.65 ms 0x6 (ERR_NOTIFY_3.70ms): 3.70 ms 0x7 (ERR_NOTIFY_3.75ms): 3.75 ms Value After Reset:0x4
11	RW	0x0	Reserved2 Reserved Field:Yes
10:8	RW	0x4	TX_BIT_TIME_PERIOD TX initiator data bit period. The time when a new consecutive bit starts. Values: 0x0 (BIT_PERIOD_2.20ms): 2.20 ms 0x1 (BIT_PERIOD_2.25ms): 2.25 ms 0x2 (BIT_PERIOD_2.30ms): 2.30 ms 0x3 (BIT_PERIOD_2.35ms): 2.35 ms 0x4 (BIT_PERIOD_2.40ms): 2.40 ms 0x5 (BIT_PERIOD_2.45ms): 2.45 ms 0x6 (BIT_PERIOD_2.50ms): 2.50 ms 0x7 (BIT_PERIOD_2.55ms): 2.55 ms Value After Reset:0x4
7	RW	0x0	Reserved1 Reserved Field:Yes

Bit	Attr	Reset Value	Description
6:4	RW	0x4	TX_BIT_TIME_RETHIGH TX initiator return to high data bit time when indicating a logic bit 0 (zero). Values: 0x0 (RETHIGH_1.30ms): 1.30 ms 0x1 (RETHIGH_1.35ms): 1.35 ms 0x2 (RETHIGH_1.40ms): 1.40 ms 0x3 (RETHIGH_1.45ms): 1.45 ms 0x4 (RETHIGH_1.50ms): 1.50 ms 0x5 (RETHIGH_1.55ms): 1.55 ms 0x6 (RETHIGH_1.60ms): 1.60 ms 0x7 (RETHIGH_1.65ms): 1.65 ms Value After Reset:0x4
3	RW	0x0	Reserved0 Reserved Field:Yes
2:0	RW	0x4	TX_BIT_TIME_LH_TRANS TX initiator low to high data bit transition time when indicating a logical 1 (one). Values: 0x0 (LH_TRANS_0.40ms): 0.40 ms 0x1 (LH_TRANS_0.45ms): 0.45 ms 0x2 (LH_TRANS_0.50ms): 0.50 ms 0x3 (LH_TRANS_0.55ms): 0.55 ms 0x4 (LH_TRANS_0.60ms): 0.60 ms 0x5 (LH_TRANS_0.65ms): 0.65 ms 0x6 (LH_TRANS_0.70ms): 0.70 ms 0x7 (LH_TRANS_0.75ms): 0.75 ms Value After Reset:0x4

HDMI TX Controller_EARCRX_CMDC_CONFIG0

Address: Operational Base + offset (0x1800)

Bit	Attr	Reset Value	Description
31:27	RW	0x00	Reserved4 Reserved Field:Yes
26	RW	0x1	EARCRX_XACTREAD_STOP_CFG eARC RX CMDC Read Transactions - After the eARC RX device sends an ACK in response to the Offset (state [ACK3]), if a STOP Command is received different behaviors that can be configured Values: 0x0 (XACTREAD_STOP_IDLE): The Read Transaction FSM will jump to [IDLE] as a failed transaction. 0x1 (XACTREAD_STOP_ACK4): The Read Transaction FSM will jump to [ACK4] and respond with ACK, finishing the transaction successfully. Value After Reset:0x1

Bit	Attr	Reset Value	Description
25	RW	0x1	EARCRX_XACTREAD_RETRY_CFG eARC RX CMDC Read Transactions - After the eARC RX device sends an ACK in response to the Offset (state [ACK3]), if a RETRY Command is received different behaviors that can be configured Values: 0x0 (XACTREAD_RETRY_ACK3): The Read Transaction FSM will stay in state [ACK3] and send ACK again. 0x1 (XACTREAD_RETRY_IDLE): The Read Transaction FSM will jump to [IDLE] without sending any response. This event will trigger interrupt earcrx_cmdc_heartbeat_lost_irq. Value After Reset:0x1
24	RW	0x1	EARCRX_CMDC_DSCVR_EARCVALID0_TO_DISC1 eARC RX CMDC Discovery - Enable jump from [RX eARC] to [RX DISC1] when a successful Heartbeat transaction is received with bit EARC_TX_STAT:EARC_VALID=0. Values: 0x0 (DSCVR_EARCVALID0_DISABLE): The Discovery FSM will not change state when bit EARC_TX_STAT:EARC_VALID=0 is received. 0x1 (DSCVR_EARCVALID0_ENABLE): When in state [RX eARC], the Discovery FSM will jump to state [RX DISC1] when bit EARC_TX_STAT:EARC_VALID=0 is received. Value After Reset:0x1
23:20	RW	0x0	Reserved3 Reserved Field:Yes
19	RW	0x0	EARCRX_CMDC_XACT_OVERFLOW_END_EN End a transaction on Data Overflow An Overflow condition is more than earcrx_cmdc_xact_rdsize bytes on a Read Transaction, or more than 256 bytes on a Write transaction. Note: Regardless of the value of this field, any data overflow situation will be notified through status bit earcrx_cmdc_status:earcrx_cmdc_xact_data_overflow at the end of the transaction. Values: 0x0 (ENDOVERFLOW_DISABLE): End on overflow disabled - If the eARC TX device sends more than earcrx_cmdc_xact_rdsize bytes of data or requests to receive more than 255 bytes of data, the eARC RX will respond indefinitely with <NACK> until a <STOP> is received to end the transaction. 0x1 (ENDOVERFLOW_ENABLE): End on overflow enabled - If the eARC TX device sends or requests to receive more than 255 bytes of data, the eARC RX will end the transaction imediately. Value After Reset:0x0

Bit	Attr	Reset Value	Description
18	RW	0x1	EARCRX_CMDC_XACT_RESTART_EN Allow for Transaction Re-Start if a eARC_READ or eARC_WRITE command packet is received out-of-place during a transaction; Note: Setting this field to 0 is a test mode, and should not be used in normal operation. Values: 0x0 (RESTART_DISABLE): Transaction Re-Start Disabled - Any unexpected Command Packet will terminate the transaction, signalled by register field earcrx_cmdc_status:earcrx_cmdc_xact_failed_unexpcmd=1. 0x1 (RESTART_ENABLE): Transaction Re-Start Enabled - Normal operation mode - During a transaction, if the eARC TX device sends an eARC_READ or eARC_WRITE command packet at any time other than at the start of a transaction, the eARC RX Controller will re-start and discard all data sent/received in the ongoing transaction. The transaction re-start event does not generate any interrupt, only at the end of the new transaction will the re-start be signalled by register field earcrx_cmdc_status:earcrx_cmdc_xact_restarted=1. Value After Reset:0x1
17	RW	0x0	Reserved2 Reserved Field:Yes
16	RW	0x0	EARCRX_CMDC_RX_COMMA_NOCOUNT During the Discovery [DISC1] and [DISC2] states, the eARC TX shall send COMMA ON/OFF sequence pairs, up to the spec count NeARC_RX_CONN_COMMA_COUNT(max), while waiting for Heartbeat transactions from eARC TX. This bit enables this behaviour. Values: 0x0 (COMMA_COUNT_ENABLE): Normal COMMA ON/OFF pair count is enabled, per HDMI2.1 spec. When the max count is reached, the line will be kept idle until TeARC_RX_TIMEOUT has expired, and Discovery times out. 0x1 (COMMA_COUNT_DISABLE): Disable COMMA ON/OFF pair count. The COMMA pairs will be sent regardless of the count, until TeARC_RX_TIMEOUT has expired, and Discovery times out. Value After Reset:0x0
15	RW	0x0	Reserved1 Reserved Field:Yes
14:8	RW	0x00	EARCRX_CMDC_RX_XACT_TIMEOUT eARC RX timeout while waiting for an eARC TX Command during a Transaction Timeout value in increments of 1ms. When expired, this timeout will assert status bit earcrx_cmdc_xact_failed_timeout at the end of a transaction. Note 1: The HDMI2.1 specification does not state any timeout value for this function, except for an eventual Heartbeat Loss after nominal TeARC_LOST_HEARTBEAT of up to 130ms; - 0 : Disabled - 1 : 1ms - 2 : 2ms - 3 : 3ms - ... - 126 : 126ms - 127 : 127ms Value After Reset:0x0

Bit	Attr	Reset Value	Description
7:5	RW	0x0	Reserved0 Reserved Field:Yes
4	RW	0x0	EARCRX_CMDC_WHITELIST_EN Enable the CMDC Transaction Whitelist. Note: In the whitelist Device ID / Offset pairs, a value of 0x00 for the Offset means that any Offset value is accepted for that particular Device ID; Values: 0x0 (WHITELIST_DISABLE): Transaction Whitelist disabled; Any Device ID / Offset combination is accepted; 0x1 (WHITELIST_ENABLE): Transaction Whitelist Enabled. Only the selected pairs of Device ID and Offset will be accepted (registers earcrx_cmdc_whitelist0/1/2/3_config); Any transaction for a Device ID / Offset pair that is not included in the list will result in a NACK reply to the eARC TX's [DEVICE ID]or [OFFSET]command packets, as applicable; Value After Reset:0x0
3	RW	0x0	EARCRX_CMDC_ECC_INV_SYNBITORDER Invert ECC bit order, for both TX and RX packets, relative to the last stage on the LFSR syndrome generator as the LFSR-MSb: Values: 0x0 (ECCBITORD_MSBFIRST): LFSR-MSb sent first 0x1 (ECCBITORD_LSBFIRST): LFSR-LSb sent first Value After Reset:0x0
2	RW	0x1	EARCRX_CMDC_RXPKT_ECC_ERRCORRECT_EN ECC Error Correction enable for received packets Values: 0x0 (ECC_DISABLED): ECC Disabled - The received ECC syndrome bits are only checked against the locally calculated syndrome. 0x1 (ECC_ENABLED): ECC Enabled - The received ECC syndrome is used to correct bit errors in the package. Value After Reset:0x1
1	RW	0x0	EARCRX_CMDC_RXPKT_BADPAR_TOLERANT Accept RX packets with failed Parity check. Note: This action is independent from the value of earcrx_cmdc_rxpkt_badecc_tolerant. Value After Reset:0x0
0	RW	0x0	EARCRX_CMDC_RXPKT_BADECC_TOLERANT Accept RX packets with failed ECC check. Note 1: The ECC check depends on the value of earcrx_cmdc_rxpkt_ecc_errcorrect_en. Note 2: This action is independent from the value of earcrx_cmdc_rxpkt_badpar_tolerant. Value After Reset:0x0

HDMI TX Controller_EARCRX_CMDC_CONFIG1

HDMI TX Controller_EARCRX_CMDC_CONTROL

Address: Operational Base + offset (0x1808)

Bit	Attr	Reset Value	Description
31:6	RW	0x0000000	Reserved1 Reserved Field:Yes
5	RW	0x0	EARCRX_CMDC_DISCOVERY_FORCE_CONNECTED Force the [RX eARC] Discovery connected state. This mode bypasses the Discovery and COMMA process, and immediately enables CMDC transactions. The bypass state jump is done from any Discovery state except [DSCVR_OFF] and [RX H14b ARC]. The eARC Discovery field must be set for this mode to be activated (earcrx_cmdc_discovery_en=1). The HDMI1.4 ARC mode field must be cleared for this mode to be activated (earcrx_h14barc_active=0). Heartbeat periodic transactions are active in this mode. Heartbeat Loss detection depends on the value of field earcrx_cmdc_heartbeat_loss_en. Note: This is a test mode, and should not be used in normal operation. Values: 0x0 (FORCE_DISCOVERY_CONNECT_DISABLE): Disabled. The Controller will perform the normal Discovery process including COMMA ON/OFF periods. If already in [RX eARC] state, the Controller will continue normally in this state, until Heartbeat Loss of HPD is disabled. 0x1 (FORCE_DISCOVERY_CONNECT_ENABLE): Enabled. Will jump the Discovery FSM from any state into [RX eARC]. Note that the physical line HPD bit (earcrx_connector_hpd) must be set and Heartbeat transactions performed successfully for the Controller to remain in this state, otherwise it may enter a state loop in the Discovery FSM. Value After Reset:0x0

Bit	Attr	Reset Value	Description
4	RW	0x1	EARCRX_CMDC_HEARTBEAT_LOSS_EN Heartbeat Loss timeout enable This timeout event will trigger interrupt earcrx_cmdc_heartbeat_lost_irq. Note: Setting this field to 0 is a test mode, and should not be used in normal operation. Values: 0x0 (HEARTBEAT_LOSS_DISABLE): Heartbeat Loss Disabled. The Controller will never timeout on failed Heartbeat transaction pairs, and will keep the [RX eARC] Discovery state until the physical line HPD bit is cleared (earcrx_connector_hpd=0) or Discovery is disabled (earcrx_cmdc_discovery_en=0). 0x1 (HEARTBEAT_LOSS_ENABLE): Hearbeat Loss Enabled . Normal operation mode, Heartbeat Loss will be detected as a TeARC_LOST_HEARTBEAT timeout without a successfull Heartbeat transaction pair, when in Discovery [RX eARC] state. Value After Reset:0x1
3	RW	0x0	EARCRX_CMDC_DISCOVERY_EN eARC RX CMDC Discovery enable: Note 1: The eARC RX function cannot be enabled when HEC is in use. Note 2: This bit can be controlled independently from earcrx_dmac_audio_en. Values: 0x0 (DISCOVERY_DISABLE): Discovery Disabled - Discovery FSM will not progress from [RX IDLE1] state. If eARC is currently active, Discovery state reverts to [RX IDLE1] after any ongoing transaction is completed. 0x1 (DISCOVERY_ENABLE): Discovery Enabled - Allow Discovery state machine to progress from [RX IDLE1] when HPD is set high. Value After Reset:0x0
2	RW	0x0	Reserved0 Reserved Field:Yes
1	RW	0x0	EARCRX_CONNECTOR_HPD Set to the curent HPD value on the physical HDMI Connector. Value After Reset:0x0
0	RW	0x0	EARCRX_H14BARC_ACTIVE Set to 1 when H14b ARC is active. eARC Discovery is not possible when this bit is set. Value After Reset:0x0

0	RO	0x0	EARCRX_CMDC_STUCKHIGH When set, indicates that the eARC line Common Mode is stuck high for longer than 2 bit lengths. Value After Reset:0x0

HDMI TX Controller_EARCRX_CMDC_XACT_INFO

Address: Operational Base + offset (0x1820)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	EARCRX_CMDC_XACT_SIZE Effectively transferred payload data size in bytes-1; that is, the number of bytes in this field is the transferred byte size minus one. - 0 : 1 bytes transferred - 1 : 2 bytes transferred - ... - 255 : 256 bytes transferred Note 1: This valued applies to both Read and Write transactions. Value After Reset:0x0
23:16	RO	0x00	EARCRX_CMDC_XACT_OFFSET Received Offset Valid even if rejected due to Whitelist restriction. Only valid if Device ID has been accepted. Value After Reset:0x0
15:8	RO	0x00	EARCRX_CMDC_XACT_DEVICEID Received Device ID Valid even if rejected due to Whitelist restriction. Value After Reset:0x0
7:1	RW	0x00	Reserved0 Reserved Field:Yes
0	RO	0x0	EARCRX_CMDC_XACT_TYPE Received Transaction Type: Values: 0x0 (XACT_RCV_READ): Read transaction received 0x1 (XACT_RCV_WRITE): Write transaction received Value After Reset:0x0

HDMI TX Controller_EARCRX_CMDC_XACT_ACTION

Address: Operational Base + offset (0x1824)

Bit	Attr	Reset Value	Description
31:2	RW	0x00000000	Reserved0 Reserved Field:Yes
1	WO	0x0	EARCRX_CMDC_XACT_WRDATA_STORED_P After a Write Transaction, writing 1 to this field indicates to the HW that the SW has read all the data received in registers earcrx_cmdc_xact_wr[x]; Only after this write will the HW stop responding to any incoming [eARC_WRITE] command with NACK. Value After Reset:0x0
0	WO	0x0	EARCRX_CMDC_XACT_RDDATA_AVAIL_P During a Read Transaction, writing a 1 to this field triggers the HW to stop responding to eARC TX CONT packets with NACK, and respond with the data in registers earcrx_cmdc_xact_rd[x], up to the size indicated in earcrx_cmdc_xact_rd0:earcrx_cmdc_xact_rdsize. Value After Reset:0x0

HDMI TX Controller_EARCRX_CMDC_HEARTBEAT_RXSTAT_SET
Address: Operational Base + offset (0x1828)

Bit	Attr	Reset Value	Description
31:8	RW	0x000000	Reserved0 Reserved Field:Yes
7	WO	0x0	EARCRX_CMDC_HEARTBEAT_RXSTAT_BIT7_SET Set value for Heartbeat EARC_RX_STAT[7] - Reserved for future use, set to 0; Value After Reset:0x0
6	WO	0x0	EARCRX_CMDC_HEARTBEAT_RXSTAT_BIT6_SET Set value for Heartbeat EARC_RX_STAT[6] - Reserved for future use, set to 0; Value After Reset:0x0
5	WO	0x0	EARCRX_CMDC_HEARTBEAT_RXSTAT_BIT5_SET Set value for Heartbeat EARC_RX_STAT[5] - Reserved for future use, set to 0; Value After Reset:0x0
4	WO	0x0	EARCRX_CMDC_HEARTBEAT_RXSTAT_STAT_CHNG_SET Set value for Heartbeat EARC_RX_STAT[4] - STAT_CHNG When this bit is set to 1, this will trigger bit EARC_RX_STAT:STAT_CHNG to be sent as 1 during Heartbeat transactions. The HW will revert back to sending EARC_RX_STAT:STAT_CHNG as 0 when the eARC TX device sends back EARC_TX_STAT:STAT_CHNG_CONF=1 SW shall set this bit to 1 within TEARC_STAT_CHNG_UPD of updating the ERX_LATENCY register. Note: During this handshaking process, the values of the STAT_CHNG and STAT_CHNG_CONF bits can be monitored by SW by reading status bits earcrx_cmdc_heartbeat_rxstat_stat_chng and earcrx_cmdc_heartbeat_txstat_stat_chng_conf; Value After Reset:0x0
3	WO	0x0	EARCRX_CMDC_HEARTBEAT_RXSTAT_CAP_CHNG_SET Set value for Heartbeat EARC_RX_STAT[3] - CAP_CHNG When this bit is set to 1, this will trigger bit EARC_RX_STAT:CAP_CHNG to be sent as 1 during Heartbeat transactions. The HW will revert back to sending EARC_RX_STAT:CAP_CHNG as 0 when the eARC TX device sends back EARC_TX_STAT:CAP_CHNG_CONF=1 SW shall set this bit to 1 within TEARC_CAP_CHNG_UPD of updating the Capabilities Data Structure. Note: During this handshaking process, the values of the CAP_CHNG and CAP_CHNG_CONF bits can be monitored by SW by reading status bits earcrx_cmdc_heartbeat_rxstat_cap_chng and earcrx_cmdc_heartbeat_txstat_cap_chng_conf; Value After Reset:0x0
2	WO	0x0	EARCRX_CMDC_HEARTBEAT_RXSTAT_BIT2_SET Set value for Heartbeat EARC_RX_STAT[2] - Reserved for future use, set to 0; Value After Reset:0x0
1	WO	0x0	EARCRX_CMDC_HEARTBEAT_RXSTAT_BIT1_SET Set value for Heartbeat EARC_RX_STAT[1] - Reserved for future use, set to 0; Value After Reset:0x0

Bit	Attr	Reset Value	Description
0	WO	0x0	EARCRX_CMDC_HEARTBEAT_RXSTAT_EARC_HPD_SET Set value for Heartbeat EARC_RX_STAT[0] - EARC_HPD Soft EARC_HPB bit to be used while in an eARC active state (earcrx_cmdc_heartbeat_txstat_earc_valid==1). Reserved for future use, set to 0; Value After Reset:0x0

0	RO	0x0	IPI_CLK_LOCKED_CHG_IRQ IPI Clock (ipi_clk) locked change interrupt. Value After Reset:0x0

HDMI TX Controller_MAINUNIT_0_INT_MASK_N

Address: Operational Base + offset (0x3014)

Bit	Attr	Reset Value	Description
31	RW	0x1	APB_REGBANK_READY_MASK_N Mask for apb_regbank_ready_irq. Values: 0x0 (MASK): Write 0 to mask apb_regbank_ready_irq. 0x1 (UNMASK): Write 1 to unmask apb_regbank_ready_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x1
30	RW	0x0	Reserved3 Reserved Field:Yes

Bit	Attr	Reset Value	Description
29	RW	0x0	RESET_MANAGER_STATUS_END_MASK_N Mask for reset_manager_status_end_irq. Values: 0x0 (MASK): Write 0 to mask reset_manager_status_end_irq. 0x1 (UNMASK): Write 1 to unmask reset_manager_status_end_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
28:25	RW	0x0	Reserved2 Reserved Field:Yes
24	RW	0x0	TIMER_BASE_LOCKED_MASK_N Mask for timer_base_locked_irq. Values: 0x0 (MASK): Write 0 to mask timer_base_locked_irq. 0x1 (UNMASK): Write 1 to unmask timer_base_locked_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
23	RW	0x0	Reserved1 Reserved Field:Yes
22	RW	0x0	EARC_BPCLK_VALID_STABLE_CHG_MASK_N Mask for earc_bpclk_valid_stable_chg_irq. Values: 0x0 (MASK): Write 0 to mask earc_bpclk_valid_stable_chg_irq. 0x1 (UNMASK): Write 1 to unmask earc_bpclk_valid_stable_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
21	RW	0x0	EARC_BPCLK_OFF_CHG_MASK_N Mask for earc_bpclk_off_chg_irq. Values: 0x0 (MASK): Write 0 to mask earc_bpclk_off_chg_irq. 0x1 (UNMASK): Write 1 to unmask earc_bpclk_off_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
20	RW	0x0	EARC_BPCLK_LOCKED_CHG_MASK_N Mask for earc_bpclk_locked_chg_irq. Values: 0x0 (MASK): Write 0 to mask earc_bpclk_locked_chg_irq. 0x1 (UNMASK): Write 1 to unmask earc_bpclk_locked_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
19:8	RW	0x000	Reserved0 Reserved Field:Yes
7	RW	0x0	AUDCLK_OFF_CHG_MASK_N Mask for audclk_off_chg_irq. Values: 0x0 (MASK): Write 0 to mask audclk_off_chg_irq. 0x1 (UNMASK): Write 1 to unmask audclk_off_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0

Bit	Attr	Reset Value	Description
6	RW	0x0	AUDCLK_LOCKED_CHG_MASK_N Mask for audclk_locked_chg_irq. Values: 0x0 (MASK): Write 0 to mask audclk_locked_chg_irq. 0x1 (UNMASK): Write 1 to unmask audclk_locked_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
5	RW	0x0	LINKQPCLK_OFF_CHG_MASK_N Mask for linkqpclk_off_chg_irq. Values: 0x0 (MASK): Write 0 to mask linkqpclk_off_chg_irq. 0x1 (UNMASK): Write 1 to unmask linkqpclk_off_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
4	RW	0x0	LINKQPCLK_LOCKED_CHG_MASK_N Mask for linkqpclk_locked_chg_irq. Values: 0x0 (MASK): Write 0 to mask linkqpclk_locked_chg_irq. 0x1 (UNMASK): Write 1 to unmask linkqpclk_locked_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
3	RW	0x0	VIDQPCLK_OFF_CHG_MASK_N Mask for vidqpclk_off_chg_irq. Values: 0x0 (MASK): Write 0 to mask vidqpclk_off_chg_irq. 0x1 (UNMASK): Write 1 to unmask vidqpclk_off_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
2	RW	0x0	VIDQPCLK_LOCKED_CHG_MASK_N Mask for vidqpclk_locked_chg_irq. Values: 0x0 (MASK): Write 0 to mask vidqpclk_locked_chg_irq. 0x1 (UNMASK): Write 1 to unmask vidqpclk_locked_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
1	RW	0x0	IPI_CLK_OFF_CHG_MASK_N Mask for ipi_clk_off_chg_irq. Values: 0x0 (MASK): Write 0 to mask ipi_clk_off_chg_irq. 0x1 (UNMASK): Write 1 to unmask ipi_clk_off_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0
0	RW	0x0	IPI_CLK_LOCKED_CHG_MASK_N Mask for ipi_clk_locked_chg_irq. Values: 0x0 (MASK): Write 0 to mask ipi_clk_locked_chg_irq. 0x1 (UNMASK): Write 1 to unmask ipi_clk_locked_chg_irq. The interrupt line is asserted if the corresponding interrupt is asserted. Value After Reset:0x0

HDMI TX Controller_EARCRX_0_INT_STATUS
Address: Operational Base + offset (0x4810)

Bit	Attr	Reset Value	Description
31:22	RW	0x000	Reserved1 Reserved Field:Yes
21	RO	0x0	EARCRX_CMDC_HEARTBEAT_EARCVALID0_IRQ eARC RX CMDC - Bit EARC_TX_STAT.EARC_VALID=0 has been received while in Discovery state [RX eARC] (active eARC operation), causing the Discovery FSM to jump to state [RX DISC1]. Note: This interrupt is only triggered if configuration field earcrx_cmdc_dscvr_earcvalid0_to_disc1 is 1. Value After Reset:0x0
20	RO	0x0	EARCRX_CMDC_HEARTBEAT_EARCTXSTAT_UPD_IRQ eARC RX CMDC - The contents of EARC_TX_STAT register has been updated by the eARC TX device after a successful Heartbeat Transaction while in Discovery state [eARC RX]. Value After Reset:0x0
19	RO	0x0	EARCRX_CMDC_XACT_READ_DATA_IRQ eARC RX CMDC - A Read Transaction is ongoing, and the received Device ID and Offset are valid; SW shall now write the requested size and data into the respective earcrx_cmdc_xact_rd[X] registers Value After Reset:0x0
18	RO	0x0	EARCRX_CMDC_XACT_DONE_IRQ eARC RX CMDC - A transaction has finished, SW must check the result in register earcrx_cmdc_info and earcrx_cmdc_status. Value After Reset:0x0
17	RO	0x0	EARCRX_CMDC_RXPKT_BADPAR_IRQ eARC RX CMDC - A packet has been received with the wrong parity bit value. Information interrupt, no SW action needed. Note: If bit earcrx_cmdc_config: earcrx_cmdc_rxpkt_badpar_tolerant is set, the packet is received and the data used within the transaction. Value After Reset:0x0

Bit	Attr	Reset Value	Description
16	RO	0x0	EARCRX_CMDC_RXPKT_BADECC_IRQ eARC RX CMDC - A packet has been received with bit errors, and the ECC syndrome could not be used to correct the errors. Information interrupt, no SW action needed. Note: If bit earcrx_cmdc_config:earcrx_cmdc_rxpkt_badecc_tolerant is set, the packet is received and the data used within the transaction. Value After Reset:0x0
15	RO	0x0	EARCRX_CMDC_RXPKT_INCOMPLETE_IRQ eARC RX CMDC - A packet has been received with too few bits, packet was not received correctly. Value After Reset:0x0
14	RO	0x0	EARCRX_CMDC_RXPKT_BADSYNC_IRQ eARC RX CMDC - A packet has been received with a bad SYNC bit sequence, packet was not received correctly. Value After Reset:0x0
13	RO	0x0	EARCRX_CMDC_RXPKT_BADPREAMBLE_IRQ eARC RX CMDC - A packet has been received with a bad PREAMBLE bit sequence, packet was not received correctly. Value After Reset:0x0
12	RO	0x0	EARCRX_CMDC_HEARTBEAT_CAP_CHNG_IRQ eARC RX CMDC - The CAP_CHNG/CAP_CHNG_CONF handshake in Heartbeat transactions has finished successfully, after a SW request for a Capabilities Data Structure information change notification (earcrx_cmdc_heartbeat_rxstat_set:earcrx_cmdc_heartbeat_rxstat_cap_chng_set=1). Value After Reset:0x0
11	RO	0x0	EARCRX_CMDC_HEARTBEAT_STAT_CHNG_IRQ eARC RX CMDC - The STAT_CHNG/STAT_CHNG_CONF handshake in Heartbeat transactions has finished successfully, after a SW request for a audio latency information change notification (earcrx_cmdc_heartbeat_rxstat_set:earcrx_cmdc_heartbeat_rxstat_stat_chng_set=1). Value After Reset:0x0
10	RO	0x0	EARCRX_CMDC_HEARTBEAT_LOST_IRQ eARC RX CMDC - Heartbeat Lost while in [RX eARC] Discovery state (active eARC operation). This interrupt is triggered if a TeARC_LOST_HEARTBEAT timeout elapses while waiting for a successful Heartbeat transaction. Note: This interrupt is only triggered if configuration field earcrx_cmdc_heartbeat_loss_en is 1. Value After Reset:0x0
9	RO	0x0	EARCRX_CMDC_DISCOVERY_TIMEOUT_IRQ eARC RX CMDC - A TeARC_RX_TIMEOUT timeout has occurred waiting a Heartbeat sequence with EARC_TX_STAT.EARC_VALID=1 from eARC TX, during Discovery. The eARC Discovery is not attempted anymore, and the SW may now request an H14b ARC connection if needed. If H14b ARC mode is activated, bit earcrx_cmdc_control:earcrx_h14barc_active =1 shall be set. Value After Reset:0x0

Bit	Attr	Reset Value	Description
8	RO	0x0	EARCRX_CMDC_DISCOVERY_DONE_IRQ eARC RX CMDC - Discovery is completed successfully, reaching state [RX eARC]; Transactions can now be performed. Value After Reset:0x0
7:0	RW	0x00	Reserved0 Reserved Field:Yes

24.6 Application Notes

24.6.1 Controller Programming Model

Figure 24-6. shows the recommended programming sequence to build an HDMI-compliant system. The main operation mode is the HDMI TX Controller's configuration.

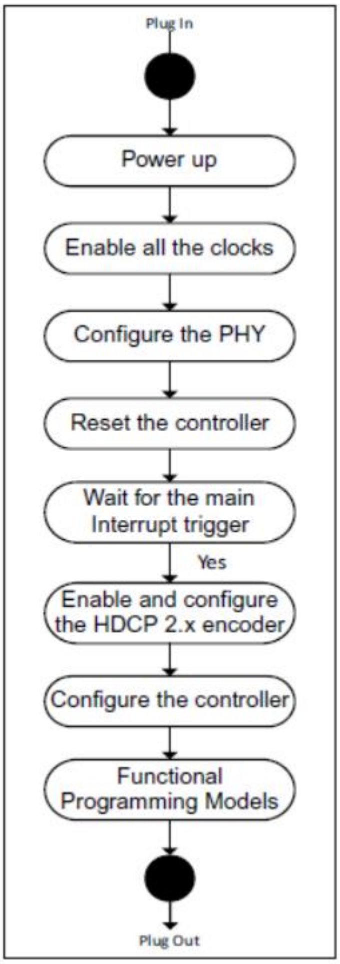

Fig. 24-6 Programming Sequence

24.6.1.1 Enabling the clocks

Enable all the clocks. The different clocks and their functions are the lists.

- apb_pclk: APB system interface clock.
- audclk: Audio interface clock.
- earc_bpclk: EARC RX audio interface biphase clock.
- ipi_clk: IPI interface clock.
- linkqpclk: Link quad-pixel clock.linkqpclk acts as TDMS clock in HDMI mode and as FRL clock in FRL mode. Synchronous to HDCP14 Encoder.
- refclk: Reference clock. Generates timer bases of different frequencies which can be used by counters of different timers. Synchronous to I2C master.
- vidqpclk: Video datapath clock.

24.6.1.2 Configuring the PHY
Configure the PHY as the HDMI eDP Combo PHY user guide (if applicable). Drive the required system and configuration clocks and pins with the required clock frequency.

24.6.1.3 Resetting the Controller
Reset the controller using the imainrst_n signal.

24.6.1.4 Triggering the Main Interrupt
Wait for the main interrupt line omain_int to be triggered. The apb_regbank_ready_irq is unmasked by default and notifies the software that the reset operation is complete and APB interface is online.

24.6.1.5 Configuring the HDCP 2.x Encoder
Enable and configure the HDCP2.x as per the HDCP2.x user guide (if applicable).

24.6.1.6 Configuring the Controller
This section describes the steps involved in configuring the HDMI TX Controller. Configure the timer_reference_base field of the timer_base_config0 register and wait for the timer_base_locked_irq interrupt to be triggered.

24.6.1.6.1 Configuring the Link
Configure the following components using the link_config0 register, DVI or HDMI, TMDS or FRL, FRL 3L or FRL 4L.

24.6.1.6.2 Configuring the Packets
Configure the following packet properties using the pktsched_* and pkt_<packet_type>* registers (if applicable), Packet contents - Register Writes, Scheduling options for the different packets.

24.6.1.6.3 Configuring the HDCP 1.4 Encoder
Configure the HDCP 1.4 using the hdcp14_* registers.

1. Write the hdcp14_an_value_high/low fields of the hdcp14_key_h/l registers.
2. Set HDCP 14 key encryption enable using the hdcp14_key_decrypt_en field of the hdcp14_config* registers if necessary.
3. Configure the decryption SEED using the hdcp14_key_decrypt_seed field of the hdcp14_key_seed register. Configure the HDCP An value, using the hdcp14_an_value_high/low fields of the hdcp14_an_h/l registers.
4. If the DKSET is stored in the register bank-(HDMI_QP_TX_HDCP14_DKSET_EXTERNAL=0) Write the HDCP keys in order, using the hdcp14_key_high/low fields of the hdcp14_key_h/l registers. For each HDCP Key, the MSB part (hdcp14_key_high), should be written first. Write the hdcp_aksv_high/low fields of the hdcp_aksv_h/l (40-bits for the hdcp_aksv_high) registers.
5. Initialize the HDCP Memories. Write the HDCP 1.4 KSV list in the revocation memory.
6. Update the HDCP HPD status using the hdcp14_hpd field of the hdcp14_config* registers.

24.6.1.6.4 Configuring the Audio Settings
Configure the audio settings, enable the interfaces, format status, pair layout, and so on using the audio_interface_[config/control/status]0 registers. Configuration of the number of active lanes and audio formats for the Serial Audio interface. Configure the related audio packet types-ACR, AMD, AUDI, ACP, ISRC BPCUV, user data, and others that can be overridden if they are not provided at audio interface input.

24.6.1.6.5 Configuring the Video Settings
Configure the pixel repetition factor using the vid_pr_factor [3:0] field of the video_interface_config1 register if required.

24.6.1.6.6 Configuring the SCDC
Configure the SCDC using the scdc_* and i2cm_* registers. You can configure the Scrambling, TMDS clock ratio, RR enable, FRL Rate, FFE levels, and so on.

24.6.1.6.7 Enabling Audio and Video Inputs
Provide data at the audio and video inputs.

24.6.1.6.8 Link Training
The Link Training procedure described in this section, requires the HDMI 2.1 TX Support parameter to be enabled. Otherwise, you should skip the Step 1.

1. Disable the video datapath of the AVP module by setting the

avp_datapath_video_swdisable field of the global_swdisable register. This enables the generation of GAPs only.
2. Update the scdc_config0 register to choose between. Polling by setting the scdc_upd_flags_poll_en field, or read request by setting the scdc_rr_en field. If you want to set an automatic clear after a read operation, set the scdc_upd_flags_audo_clr field.
3. Check if the update flag scdc_upd_flags_1/0 (Polling FLT_ready) has been changed by reading scdc_status0 register when the scdc_upd_flags_rd_irq interrupt of the mainunit_1_int_status register is triggered.
4. When the the FLT_ready is set, configure the FRL rate and the FFE levels on the Sink. To perform this write operation using the I2C, set the I2CM_write field of the I2CM_interface_control0 register. The FFE levels should also be set using the flt_ffe_levels field of the flt_config0 register.
5. Set the flt_start_p field of the flt_control0 register to start LTS:3. Hardware triggers the flt_exit_to_ltsp_irq interrupt of the mainunit_1_int_status register, after LTS:3 is complete. The hardware automatically completes all the LTS:3 operations.
6. Clear FLT_Update and monitor the scdc_upd_flags_clr_irq field of the mainunit_1_int_status register or the scdc_upd_flags_rd_p fields of the scdc_control0 register. Set the scdc_upd_flags_rd_p field of the scdc_control0 register to trigger an automatic read operation.
7. Check if the update flag scdc_upd_flags_1/0 has been set (Polling FRL_start) by reading the scdc_status0 register, when the scdc_upd_flags_rd_irq interrupt of the mainunit_1_int_status register is triggered. If scdc_upd_flags_* is set Link Training is complete.
8. Unset the avp_datapath_video_swdisable field of the global_swdisable register.

24.6.2 HDMI Audio and Video Programming Model

24.6.2.1 Audio Interface Programming Model

24.6.2.1.1 Audio Interfaces Configurations

The audio interface configurations can be performed using the audio_interface_config0 and audio_interface_config1 registers. Monitoring the audio interfaces can be performed using the audio_interface_status0 register and other interrupts. The required system configurations for the different audio interfaces are described in the following sections.

24.6.2.1.1.1 I2S Interface

The following section describes the system configurations for the I2S audio interface.
1. Select the I2S interface as the audio source, by setting the aud_if_sel[1:0] field of the audio_in-terface_config0 register to 2'h1.
2. Enable the active I2S lanes by configuring i2s_lines_en[3:0] field of the audio_interface_con-fig0 register. Each bit enables the respective data lane, i2s_lines_en[0] enables lane 0, i2s_lines_en[1] enables lane 1, i2s_lines_en[2] enables lane 2, i2s_lines_en[3] enables lane 3.
3. Enable the reception of the BPCUV bits (when transmitted), by setting i2s_bpcuv_en field of the audio_interface_config0 register to 1’b1.
4. Configure the audio format that is being received by writing the desired value to aud_format[2:0] field of the audio_interface_config0 register as shown in the list.
Audio Sample is Packet Type. Packet Type Value is 0x2, aud_format is 0x0.
HBR Audio Sample is Packet Type. Packet Type Value is 0x9, aud_format is 0x3.
Multi-Stream Audio Sample is Packet Type. Packet Type Value is 0xe, aud_format is 0x4.
5. When BPCUV bits reception is enabled, by default the B bit is extracted from the information received in the left channel. It is possible to force the receiver to extract the B bit from the right channel by setting the i2s_bbit_right field of the audio_interface_config0 register to 1’b1.
6. I2S operation can be monitored through the following interrupts, i2s_ws_err_irq interrupt indicates an illegal variation detected on iws_ws signal, i2s_bbit_err_irq interrupt indicates a mismatch between the B bits received in the left and right channels.

24.6.2.1.1.2 S/PDIF Interface

The following section describes the system configurations for the S/PDIF audio interface. 1.

Select the S/PDIF interface as the audio source, by setting aud_if_sel[1:0] field of the audio_interface_config0 register to 2'h2.
2. Enable the active S/PDIF lanes by configuring spdif_lines_en[3:0] field of the audio_interface_config0 register. Each bit enables the respective data lane, spdif_lines_en[0] enables lane 0, spdif_lines_en[1] enables lane 1, spdif_lines_en[2] enables lane 2, spdif_lines_en[3] enables lane 3.
3. Configure the audio format that is being received by writing the appropriate value to aud-format[2:0] field of the audio_interface_config0 register.
4. Data reception is done independently for each lane since there are four S/PDIF lanes.
5. It is possible to have a timing mismatch in the reception of the two different channels. By default, S/PDIF data is sampled using the timing of S/PDIF lane 0. This can be changed by configuring a different lane in spdif_pair_sel[1:0] field of the audio_interface_config0 register, 2’h0 selects lane 0, 2’h1 selects lane 1, 2’h2 selects lane 2, 2’h3 selects lane 3.
6. Monitor the S/PDIF reception through the following register bank entries. a. When data is being received correctly on the S/PDIF lines, the corresponding entries within the {spdif_line0_lock spdif_line1_lock spdif_line2_lock spdif_line3_lock} fields are enabled (set to 1’b1) b. Parity errors in the received data are signaled for the different S/PDIF lines through the spdif_line0_parity_err, spdif_line1_parity_err, spdif_line2_parity_err, and spdif_line3_parity_err interrupts c. Encoding errors in the received information are signaled for the different S/PDIF lines through the spdif_line0_protocol_err, spdif_line1_protocol_err, spdif_line2_proto-col_err, and spdif_line3_protocol_err interrupts.

24.6.2.1.2 Audio Storage

The received audio data may need to be stored before being transmitted; for example, audio received during an active video line can only be transmitted in the next blanking period. The audio storage can be configured and monitored through the following fields.
1. Overflows and underflows are signaled by the audfifo_ovf_irq and audfifo_udf_irq interrupts, respectively.
2. Audio FIFO can be cleared by setting the audfifo_clr_p field of the audio_interface_control0 register to 1’b1.
3. Audio FIFO can be configured to automatically clear itself, when an overflow occurs by setting the audfifo_init_on_ovf field of the audio_interface_config0 register to 1’b1.

24.6.2.2 Audio Packetizer Programming Model

24.6.2.2.1 Configure Audio Transmission

You should perform this process only if the HDMI TX Controller is configured in HDMI mode. In DVI mode, audio is not transmitted. The selected audio mode should be supported by the source (transmitter) and the sink (receiver) of the audio. The audio capabilities of the receiver are extracted from the E-EDID information. The steps to configure audio transmission are as follows.
1. Disable all audio sources.
2. Enable the audio data path of the AVP module by writing 1'b0 to the avp_datapath_packet_audio_swdisable field of the global_swdisable register.
3. Perform the reset of the audio data path of the AVP module by writing 1'b1 to the avp_datapath_packet_audio_swinit_p field of the global_swreset_request register.
4. Disable the transmission of the AUDS, ACR, AUDI, and AMD packets by writing 1'b0 to their corresponding fields as shown, AUDS: pktsched_auds_tx_en, ACR: pktsched_acr_tx_en. AUDI: pktsched_audi_tx_en, AMD: pktsched_amd_tx_en.
5. Select and configure the audio interfaces I2S, S/PDIF.
6. Configure the audio parameters. a. Audio Clock Regeneration.
i. Fix the audio at N factor for Audio Clock Regeneration. This factor depends on the audio sampling rate and video mode. For more information, see the *HDMI 2.1 Specification*.
ii. Write the audpkt_acr_n_value field of the audpkt_acr_control0 register.
iii. Set audio CTS factor for Audio Clock Regeneration.
7. Enable the transmission of the ACR, AUDI, and AMD packets by writing 1'b1 to their corresponding bit fields as shown, ACR: pktsched_acr_tx_en, AUDI: pktsched_audi_tx_en, AMD: pktsched_amd_tx_en.
8. Enable the transmission of the AUDS packet by writing 1'b1 to the pktsched_auds_tx_en field of the pktsched_pkt_en register.

9. Enable the audio sources according to the selected interface.
10.At this step, the software can continue to transmit the audio that it configured in the frames, or go back to Step 1 to reconfigure a new audio setup.

24.6.3 CEC Programming Model

24.6.3.1 Sending a Frame

The steps to send a CEC frame are as follows. 1. Write the frame message size (in bytes), to the cec_rxbuffer_cnt field of the cec_rx_count register.
2. Write the data to be transmitted, to the cec_rxbuffer_data_## (## represents 0 to 15).
a. The first cec_rxbuffer_data_0 byte is the header block and is mapped as cec_rxbuffer_data_0[7:0]={Initiator_address[3:0], Destination_address[3:0]}.
b. Fill the rest of the cec_rxbuffer_data_[15:1] fields with the data bytes to be transmitted (if necessary).
3. Order the CEC to send the frame by writing 1 to the frame_send_set_p field of the cec_tx_control register.
4. If the frame is: Successfully sent, then the cectx_done_irq field of the cec_int_status register is asserted. Not sent successfully, then one or more of the following interrupts can be triggered: cectx_nack_irq field of the cec_int_status register; cectx_arblost_irq field of the cec_int_status register; cectx_line_err_irq field of the cec_int_status register; cectx_nretransmit_fail_irq field of the cec_int_status register; cectx_frame_discarded_irq field of the cec_int_status register.

24.6.3.2 Read a Received Frame

The steps to read a received frame are as follows:
1. The software is informed that a frame is received successfully when the cecrx_eom_irq field of the cec_int_status register is triggered.
2. Read the cec_tx_count register to obtain information about: a. cec_txbuffer_cnt–number of bytes received (including header).
3. Read the necessary bytes from the TX buffer registers cec_txbuffer_data_## (0-15) accordingly with the information obtained in the cec_rx_count_status bit field.

24.6.3.3 Initial CEC Configuration

To use the CEC module, you must set up the following configuration registers.

24.6.3.3.1 CEC Configuration Register

The table shows the CEC configuration register cec_config and the different fields associated with the initial configuration.

Table 24-3 CEC Configuration Register

Field Name	Functionality
txreq_discard_if_rxbusy	Discards a transmit request (cec_ctrl.send=1) if receiver is busy
broadcast_nack	NACK to any received broadcast message by the CEC module. Message is not stored in the receiver registers.
cecfilter	Enable the CEC input filter.
frame_nretrans	Enable the CEC input filter.
rx_automatic_drive_acknowledge	Receiver automatic drive acknowledge.
signal_free_time	Selects the Signal Free time period that is to be respected before attempting to transmit or re-transmit a frame. If 0 is selected then the controller follows the HDMI specification in CEC 9.1 Signal free time.

24.6.3.3.2 CEC Address Register

The CEC address register-cec_addr should be set when the logical allocation is completed. You can define multiple addresses.

24.6.3.4 Cancel a TX Frame

You can cancel a TX frame by writing 1’b1 to the frame_send_clr field of the cec_tx_control register, if the frame to be transmitted is waiting for the end of an incoming frame (RX busy); the frame is set to be re-transmitted.
If the TX frame is already under transmission, then it is pushed to completion and not

cancelled.

24.6.3.5 Status Fields

The table shows the CEC status register cec_status and the different fields associated with the initial configuration.

Table 24-4 Status Fields

Field Name	Functionality
frame_send_pending_st	Frame is set to be transmitted. It is 1’b1 while a transmission is ongoing.
cecrx_busy_st	The CEC module is busy receiving a frame.
cectx_busy_st	The CEC module is busy transmitting a frame.

24.6.3.6 Interrupts

The table shows the CEC interrupts available in the cec_int_status register and conditions under which it is triggered.

Table 24-5 CEC Interrupts

Field Name	Functionality
cectx_done_irq	Frame transmission is completed successfully
cectx_nack_irq	NACK for direct address or broadcast is received while transmitting a frame
cectx_arblost_irq	CEC line arbitration is lost to another initiator
cectx_line_err_irq	Line error while transmitting a frame (detected a 0 instead of a 1)
cectx_nretransmit_fail_irq	All re-transmission attempts failed.
cectx_frame_discarded_irq	Frame to be sent was discarded since a new frame was received. Happens only when txreq_discard_if_rxbusy==1’b1.
cectx_busy_irq	The CEC TX FSM changes its busy state.
cecrx_busy_irq	The CEC RX FSM changes its busy state.
cectx_drive_err_irq	Drive zero in the CEC output is not seen in the CEC input.
cecrx_eom_irq	Frame is fully received with EOM after the last data block.
cecrx_notify_err_irq	Bit timing error is detected while cecrx_busy_irq is set. Error notification is sent to initiator.

24.6.3.7 CEC Bit Timing Fine Tuning

This is a debug-only feature that allows out-of-spec timings to be defined; to debug the CEC module. You can configure this feature by using the cec_rxqual_bittime_config register.

24.6.4 eARC Programming Model

The eARC RX controller enables simultaneous asynchronous operation of two different data channels. These data channels are operated independently and each has its own programming model.

24.6.4.1 Common Mode Data Channel Programming Model

Single read and write transactions, following an initial eARC Discovery process. Each read and write transactions can carry a payload of 1 to 255 bytes. The payload should have a defined payload size, device ID, and offset address. The hardware periodically performs a keep-alive mechanism called Heartbeat Sequence. The status and actions of the CMDC programming model are described in the following sections.

24.6.4.1.1 CMDC Configuration

You must configure the eARC RX CMDC controller before any operation. The registers used to configure the CMDC controller and their actions are as follows:

earcrx_cmdc_config0.

Handling of packet errors, ECC bit ordering, and parity errors.

Enabling device ID or offset whitelist enable.

Setting transaction timeout, restart, and data overflow.

Setting COMMA count for Discovery.

Loss enable for Heartbeat transactions.

earcrx_cmdc_config1.
Setting device ID or offset for the Heartbeat transactions
earcrx_cmdc_whitelist[0:3]_config.
Setting the allowed device ID or offset pairs, when whitelist is enabled.
earcrx_cmdc_sync_config.
Setting the pulse filter for eARC CMDC asynchronous inputs.
For more information on the field descriptions, see the "Register Description" chapter in the Databook.

24.6.4.1.2 Connect and Discovery

The CMDC Connect and Discovery steps are as follows:
1. Enable the eARC RX CMDC Discovery process by setting the earcrx_cmdc_discovery_en field of the earcrx_cmdc_control register.
2. The eARC TX device drives a logic-high-voltage-level pulse on the physical HPD connector pin, after at least 100 ms of low voltage level to start the eARC Discovery process. The software sets the earcrx_connector_hpd=1 field of the earcrx_cmdc_control register, when the correct voltage level is detected on physical HPD connector pin.
3. The hardware starts and performs the Discovery process by interacting with the eARC TX device after the HPD bit is asserted.
4. The hardware drives the COMMA sequences to the line and monitors the Heartbeat transactions from the eARC TX device, where the EARC_RX_STAT and EARC_TX_STAT status registers are exchanged between the two eARC devices.
5. The Discovery process is completed when the eARC TX device sets the EARC_VALID=1 field of the EARC_TX_STAT register. The next state is the [RX eARC].
6. There are two possible outcomes for the Discovery process that are communicated to software through the interrupts. earcrx_cmdc_discovery_done_irq: The eARC Discovery is complete and transactions can be executed. earcrx_cmdc_discovery_timeout_irq: A TeARC_RX_TIMEOUT timeout has occurred while waiting for a Heartbeat sequence with the EARC_TX_STAT.EARC_VALID=1 from the eARC TX device from [eARC TX], during Discovery. The eARC Discovery is not attempted again and the software can now request an H14b ARC connection if required. If the H14b ARC is used, earcrx_h14barc_active=1 field of the earcrx_cmdc_control register should be set. To perform eARC Discovery again, the H14b ARC mode must be disabled (earcrx- _h14barc_active=0). The eARC RX device waits for the opposing eARC TX device to set the HPD voltage low. When HPD low is detected, the software clears the HPD connector bit (earcrx_connector_hpd=0), and then returns to Step 2.
7. The eARC TX device can reset the eARC Discovery process to its initial state by setting the connector HPD voltage low. The software must always clear the respective earcrx_connector_hpd=0 field of the earcrx_cmdc_control register at this event, and then return to Step 2.
8. The Discovery state machine reverts to the state [RX DISC1] (Step 3), when in an active [RX eARC] state, if one of the following conditions occur: A Heartbeat Loss condition is detected; A valid Heartbeat is received with status bit EARC_TX_STAT:EARC_VALID=0 .
9. The current state of the Discovery state machine is available at earcrx_cmdc_discovery_state field of the earcrx_cmdc_status register. The state diagram follows the *HDMI 2.1 Specification*, as shown in Figure.

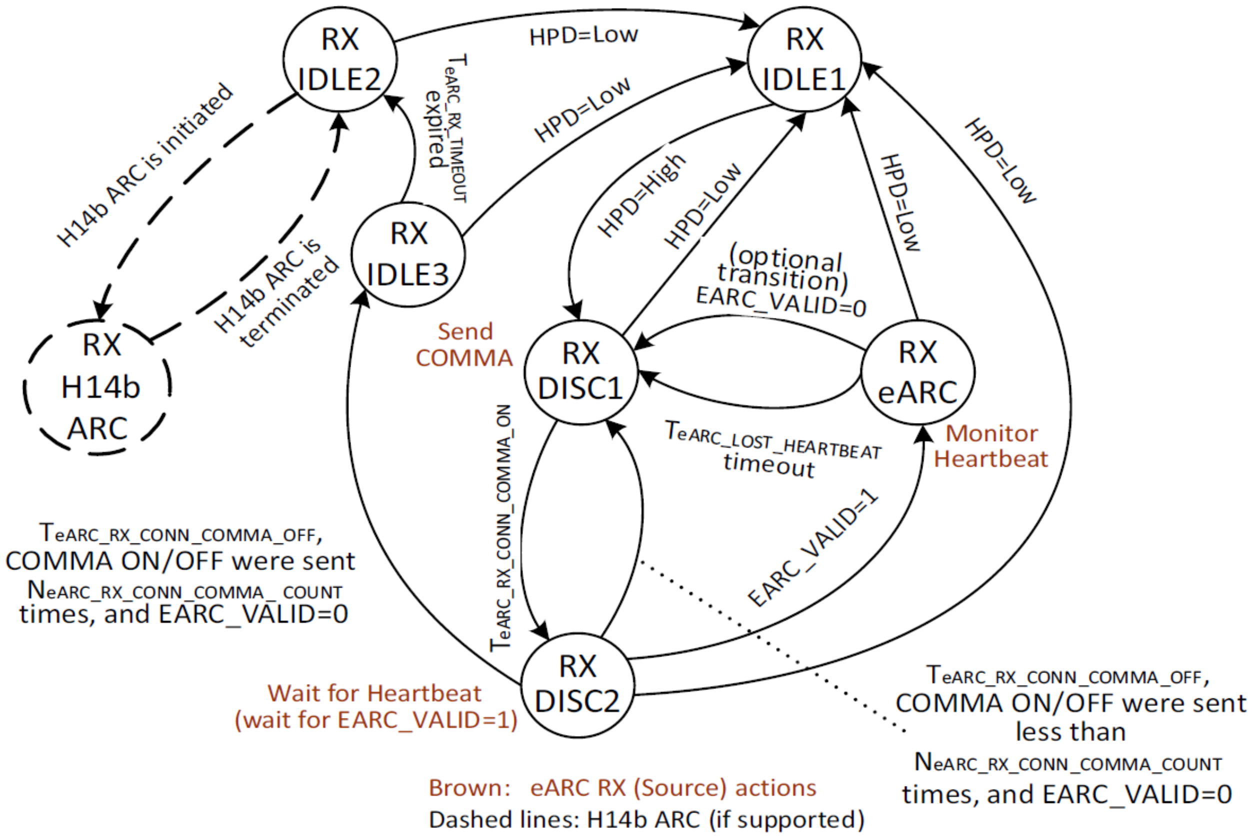

Fig. 24-6 HDMI2.1 Specification -eARC RX Discovery State Diagram

24.6.4.1.3 Heartbeat Sequence

The hardware automatically completes the Heartbeat sequence during the Discovery and regular Transaction operation, at time intervals TeARC_HEARTBEAT as initiated by the eARC TX device. The hardware performs a Heartbeat sequence as an uninterrupted read or write transaction pair, performed by reading EARC_RX_STAT status register from the eARC RX device, and writing the EARC_TX_STAT register into the eARC RX device. Each device manages the content of its status register. The software can verify the values of both status registers at any time. EARC_RX_STAT=earcrx_cmdc_status[7:0]; EARC_TX_STAT=earcrx_cmdc_status[15:8].

The bit values received by the EARC_TX_STAT register are cleared when exiting the Discovery state [RX eARC].

24.6.4.1.3.1 Configuration and Control

The software sets the expected device ID and offset values for the two Heartbeat transactions in each sequence in the earcrx_cmdc_config1 register. By default, the register values follow the *HDMI 2.1 Specification*. The values for EARC_RX_STATUS field is set by the software in the earcrx_cmdc_heartbeat_rxstat_set register.

24.6.4.1.3.2 Heartbeat Loss

A Heartbeat Loss condition is signaled during active eARC operation [RX eARC] state, if a Heartbeat sequence is not completed after TeARC_LOST_HEARTBEAT after the last successful Heartbeat. This triggers the earcrx_cmdc_heartbeat_lost_irq interrupt.

24.6.4.1.3.3 HPD Operation

During the eARC operation, the physical HPD wire is re-purposed, after the eARC discovery is complete, so that the eARC devices can utilize the status bit for the HPD signaling instead of the physical HPD. This is used, for example, to signal that the EDID has changed, without disabling the eARC communication. The eARC TX device sends the HPD value through the Heartbeat status bit EARC_TX_STAT[0]: HDMI_HPD.

24.6.4.1.3.4 eARC RX Capabilities Data Structure Change

1. When the eARC RX device changes the Capabilities Data Structure, it results in an

exchange of CAP_CHNG and CAP_CHNG_CONF status bits which are set to 1 and back to 0, in several Heartbeat trans-action sequences.
2. The software starts this event by setting the earcrx_cmdc_heartbeat_rxstat_cap_chng_set=1 field of the earcrx_cmdc_heartbeat_rxstat_set register.
3. This sets the EARC_RX_STAT:CAP_CHNG bit to be sent, as 1 during Heartbeat transactions. 4. The hardware reverts the EARC_RX_STAT:CAP_CHNG bit to 0, when the eARC TX device sends back the EARC_TX_STAT:CAP_CHNG_CONF=1 bit.
5. The earcrx_cmdc_heartbeat_cap_chng_irq interrupt is triggered to notify the software that the handshake is complete.
6. Then the eARC TX device reads the eARC RX Capabilities Data Structure using a read transaction.

24.6.4.1.3.5 eARC RX Audio Latency Change

1. When the eARC RX device changes to the audio latency information, the ERX_LATENCY register is updated.
2. The two eARC devices communicate this change by an exchange of the STAT_CHNG and STAT_CHNG_CONF bits being set to 1 and back to 0, in several Heartbeat transaction sequences.
3. The software starts this event by setting the earcrx_cmdc_heartbeat_rxstat_stat_chng_set=1 bit of the earcrx_cmdc_heartbeat_rxstat_set register.
4. This sets the EARC_RX_STAT: STAT_CHNG bit to be sent, as 1 during Heartbeat transactions.
5. The hardware reverts the EARC_RX_STAT:STAT_CHNG status bit to 0, when the eARC TX device sends back EARC_RX_STAT:STAT_CHNG_CONF=1 bit.
6. The earcrx_cmdc_heartbeat_stat_chng_irq interrupt is triggered to notify software that the handshake is complete. Then the eARC TX device performs the required transactions for Audio Latency change, according to the *HDMI2.1 Specification.*

24.6.4.1.4 eARC Transactions

The hardware receives and handles the read or write transaction that is initiated by the eARC TX device. The software handles the transaction only when required and it is signaled by the relevant interrupt.

24.6.4.1.4.1 Device ID and Offset Whitelist

1. The hardware automatically checks for a valid device ID and offset, sent by the eARC TX device for any transaction type. Any device ID or Offset can be accepted. They can also be accepted from a specific whitelist set.
2. If the whitelist function is disabled earcrx_cmdc_whitelist_en=0, any device ID and offset are accepted, and the transaction progresses to the data stage.
3. If the whitelist function is enabled earcrx_cmdc_whitelist_en=1, only the device ID and offset pairs defined in the earcrx_cmdc_whitelist[3:0]_config registers are accepted. Any value combinations outside of those defined in the registers results in a NACK packet response, ending the transaction.

24.6.4.1.4.2 Write Transactions

1. The hardware handles all the write transactions automatically.
2. When the write transaction is completed, the earcrx_cmdc_xact_done_irq interrupt is triggered and earcrx_cmdc_xact_successful=1 field of the earcrx_cmdc_status register is set. 3. The software can now obtain the received data in the earcrx_cmdc_xact_wr[64:0] register. 4. The hardware responds with a NACK to any new write transaction when the software is fetching the transaction information and data.
5. When the software completes the data fetching, it sets the earcrx_cmdc_xact_wrdata_stored=1 field of the earcrx_cmdc_xact_action register.
6. After this step, the hardware can accept a new write transaction from the eARC TX controller.

24.6.4.1.4.3 Read Transactions

1. The hardware handles the read transactions automatically.
2. After the device ID and offset are received and valid, earcrx_cmdc_xact_read_data_irq interrupt is triggered.
3. The software writes the requested read data into the respective registers. earcrx_cmdc_xact_rd0[7:0]: earcrx_cmdc_xact_rdsize Read transaction data size in bytes-1. earcrx_cmdc_xact_rd[X] Payload data.
4. The hardware responds to the CONT packets with NACK, while the software is loading data. 5. After payload size and data is loaded into registers, the software sets the earcrx_cmdc_xact_rd-data_avail=1 field of the earcrx_cmdc_xact_action register.
6. The hardware starts responding to CONT packets with the payload data, up to the size indicated in earcrx_cmdc_xact_rdsize field of the earcrx_cmdc_xact_rd0 register.
7. When the read transaction is finished, earcrx_cmdc_xact_done_irq interrupt is triggered.

24.6.4.1.4.4 Transaction Results

When a transaction is completed, regardless of success, failure, or transaction type (read or write), the earcrx_cmdc_xact_done_irq interrupt is triggered. The software checks the registers as shown in the table.

Table 24-6 earcrx_cmdc_status Register Fields

Field Name	Functionality
earcrx_cmdc_xact_finished	0: Transaction ongoing 1: Transaction completed
earcrx_cmdc_xact_successful	1: Transaction completed successfully
earcrx_cmdc_xact_failed_unexpcmd	1: Transaction failed due to Unexpected Command packet from eARC TX controller
earcrx_cmdc_xact_failed_uncorrecterr	1: Transaction failed due to Uncorrectable Error in received packet
earcrx_cmdc_xact_failed_stop	1: Transaction failed due to received STOP before the payload data stage
earcrx_cmdc_xact_failed_deviceid	1: Transaction failed due to rejected device ID
earcrx_cmdc_xact_failed_offset	1: Transaction failed due to rejected offset
earcrx_cmdc_xact_timeout	1: Timeout occurred during a transaction, waiting for a packet from eARC TX device (programmable time in field earcrx_cmdc_rx_xact_timeout)
earcrx_cmdc_xact_corrected_errnum	Accumulated number of ECC corrected single-bit errors in received packets, during a transaction
earcrx_cmdc_xact_restarted	1: Transaction restarted due to the received eARC_READ or eARC_WRITE command packet at an unexpected time
earcrx_cmdc_xact_data_overflow	1: The eARC TX device has sent or requested to receive more than 256 bytes of data during a write or read transaction

Table 24-7 earcrx_cmdc_xact_info Register

Field Name	Functionality
earcrx_cmdc_xact_info	Information on the received transaction type, device ID, offset, and the effectively transferred payload data size

If the eARC link becomes unresponsive, a possible state of eARC line stuck high can be checked in earcrx_cmdc_status:earcrx_cmdc_stuckhigh field.

24.6.4.1.4.5 eARC RX CMDC Interrupts

During eARC RX CMDC operation the interrupts described in Table in the earcrx_0_int_status register can be triggered.

Table 24-8 earcrx_cmdc Interrupts

Interrupt Name	Functionality
earcrx_cmdc_discovery_done_irq	Discovery is completed successfully, reaching the state [RX eARC]; transactions can now be performed

earcrx_cmdc_discovery_timeout_irq	A TeARC_RX_TIMEOUT timeout has occurred during the Discovery waiting for a Heartbeat sequence with EARC_TX_STAT.EARC_VALID=1 from the eARC TX device. The eARC Discovery is not attempted anymore, and the software can now request an H14b ARC connection if needed. If H14b ARC mode is activated, the software should set the bit earcrx_cmdc_control:earctx_h14barc_active=1
earcrx_cmdc_heartbeat_lost_irq	The Heartbeat is lost while in [RX eARC] state (active eARC operation). This interrupt is triggered when TeARC_LOST_HEARTBEAT timeout elapses while waiting for a successful Heartbeat transaction if the earcrx_cmdc_heartbeat_loss_en=1
earcrx_cmdc_heartbeat_stat_chng_i rq	The STAT_CHNG or STAT_CHNG_CONF status bits' handshake in the Heartbeat transactions is completed successfully, after a software request for a audio latency information change notification (earcrx_cmdc_heartbeat_rxstat_set:earcrx_cmdc_heartbeat_rxstat_stat_chng _set=1)
earcrx_cmdc_heartbeat_cap_chng_i rq	The CAP_CHNG or CAP_CHNG_CONF status bits' handshake in Heartbeat transactions is completed successfully, after a software request for a Capabilities Data Structure information change notification (earcrx_cmdc_heartbeat_rxstat_set:earcrx_cmdc_heartbeat_rxstat_cap_chng _set=1)
earcrx_cmdc_rxpkt_badpreamble_ir q	A packet is received with a bad PREAMBLE bit sequence, and so the packet received incorrectly. This is an information interrupt and no software action needed
earcrx_cmdc_rxpkt_badsync_irq	A packet is received with a bad SYNC bit sequence, and so the packet received incorrectly. This is an information interrupt and no software action needed
earcrx_cmdc_rxpkt_incomplete_irq	A packet is received with too few bits, and so the packet received incorrectly. This is an information interrupt and no software action needed
earcrx_cmdc_rxpkt_badecc_irq	A packet is received with bit errors, and the ECC syndrome cannot be used to correct the errors. This is an information interrupt and no software action needed If the earcrx_cmdc_config:earcrx_cmdc_rxpkt_badecc_tolerant bit is set, the packet is received and the data is used within the transaction.
earcrx_cmdc_rxpkt_badpar_irq	A packet is received with the wrong parity bit value. This is an information interrupt and no software action needed. If the earcrx_cmdc_config: earcrx_cmdc_rxpkt_badpar_tolerant bit is set, the packet is received and the data is used within the transaction
earcrx_cmdc_xact_done_irq	A transaction is completed and the software must check the result in the earcrx_cmdc_info and earcrx_cmdc_status register
earcrx_cmdc_xact_read_data_irq	A read transaction is ongoing, and the received device ID and offset are valid. The software now

	writes the requested size and data into the respective earcrx_cmdc_xact_rd[X] register where X is from 0 to 64
earcrx_cmdc_heartbeat_earctxstat_ upd_irq	eARC RX CMDC - The contents of the EARC_TX_STAT register is updated after a successful Heartbeat transaction while in the Discovery state [eARC RX]
earcrx_cmdc_heartbeat_earcvalid0_ irq	eARC RX CMDC - The EARC_TX_STAT.EARC_VALID=0 is received while in the [RX eARC] state (active eARC operation), causing the Discovery FSM to jump to the [RX DISC1] state. This interrupt is only triggered if the earcrx_cmdc_dscvr_earcvalid0_to_disc1 field is 1

24.6.4.2 Differential Mode Audio Channel Programming Model

The operation of the eARC device in DMAC programming model are described in the following sections.

24.6.4.2.1 eARC RX DMAC PHY Interface Timing

The timing relations between the each events and the signals, followed by the expected timing from the controller and requirements for the PHY are shown in the Figure.

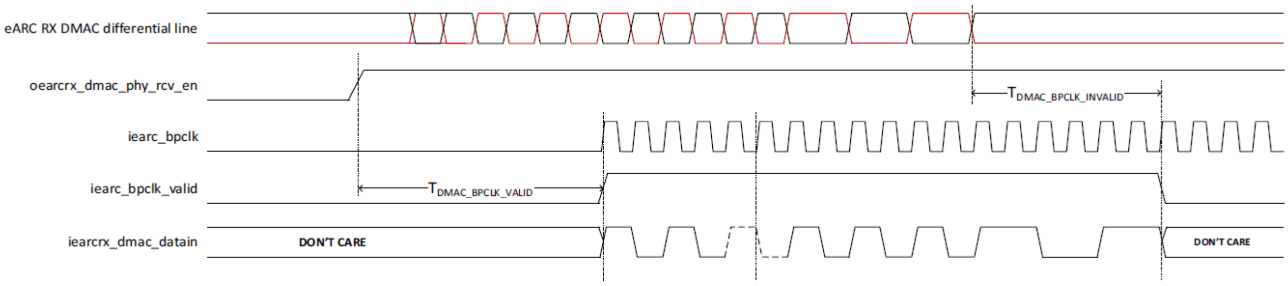

Fig. 24-6 eARC RX DMAC PHY Interface Timing

Table 24-9 eARC RX DMAC PHY Interface Timing Requirements

Timing	Description	Controller Event
TDMAC_BPCLK_VALID	The maximum time for the PHY DMAC receiver to be enabled and output biphase clock valid	NA
TDMAC BPCLK_INVALID	The time between no transitions coming on the eARC DMAC differential lines and the PHY notifying the eARC RX DMAC controller of the loss activity.	NA

24.6.4.2.2 eARC RX DMAC PHY Receiver Interface Description

The PHY receiver is enabled by the oearcrx_dmac_phy_rcv_en signal and is ready in TDMAC_BPCLK_VALID. The DMAC receiver on the PHY outputs the direct values from the line into iearcrx_dmac_datain signal, since the biphase decoding is done by the controller. The eARC RX DMAC PHY is configured in the earcrx_dmac_phy_config register.

24.6.4.2.3 Requirements

The eARC RX DMAC datapath is activated only after the eARC RX CMDC Discovery is completed successfully, and the Discovery state machine is in the [RX eARC] state. The software can verify if the eARC RX Discovery is completed successfully through the earcrx_0_int_status.earcrx_cmdc_discovery_done_irq interrupt; earcrx_cmdc_discovery_state=5 field of the earcrx_cmdc_status register (RX eARC).

24.6.4.2.4 Configuration

The eARC RX DMAC datapath and PHY are configured in the earcrx_dmac_config and earcrx_dmac_phy_config registers.

24.6.4.2.5 eARC RX DMAC Audio Reception

To start eARC RX audio reception the software must perform the following steps .

1. Enable the eARC RX PHY DMAC receiver by setting the earcrx_dmac_phy_rcv_en=1 field of the earcrx_dmac_phy_config register.

2. The software waits for the trigger of the following interrupts that indicate any activity in the eARC biphase clock iearc_bpclk, mainunit_0_int_status.earc_bpclk_off_chg_irq; mainunit_0_int_status.earc_bpclk_locked_chg_irq.
3. The software confirms that the eARC biphase clock is on and locked through the cmu_status.earc_bpclk_off_st=0 and cmu_status.earc_bpclk_locked_st=1 fields.
4. The software also confirms that the eARC biphase clock valid is through the mainunit_status0. earc_bpclk_valid_stable=1 field.
5. Enable the eARC RX DMAC audio datapath by setting the earcrx_dmac_en=1 field of the earcrx_dmac_control0 register.
6. The software waits for the earcrx_1_int_status. earcrx_dmac_chstatus_block_chg_irq interrupt, indicating the reception of a eARC audio Channel Status block.
7. The software reads the eARC audio Channel Status block received through the earcrx_dmac_chstatusX registers (where X is from 0 to 5) and analyzes their content (e.g. audio format, layout, channel allocation, and so on and so forth).
8. Configure the eARC RX DMAC audio channel enable using the earcrx_dmac_channel_alloc[31:0] field of the earcrx_dmac_control1 register for up to 32-channels (for example, bit 0: channel 1, and bit 31: channel 32).
9. Configure the eARC RX DMAC audio output interface using the earcrx_dmac_config register. Parallel Audio Output (up to 32 channels)-earcrx_dmac_config. earcrx_dmac_pao_en; S/PDIF IF (up to 8 channels)-earcrx_dmac_config.earcrx_dmac_sao_spdif_en; I2S IF (up to 8 channels) - earcrx_dmac_config.earcrx_dmac_sao_i2s_en.
10. Configure the IEC 60958-3 Channel Status information to be transmitted by the eARC RX audio output interfaces (PAO and SAO) through the earcrx_dmac_chstatus_streamer Y registers (where Y is from 0 to 14).
11. Configure the IEC 60958-3 user data information to be transmitted by the eARC RX audio output interfaces (SAO) through the earcrx_dmac_usrdata_streamer0 register.
12. Enable the eARC RX DMAC audio output interfaces by asserting the earctx_dmac_control0. earcrx_dmac_audio_en=1 field.

24.6.4.2.6 eARC DMAC Interrupts

During the eARC RX DMAC operation the interrupts from the earcrx_1_int_status, earcrx_intvec_index register can be triggered as shown in the table.

Table 24-10 eARC DMAC Interrupt

Interrupts	Functionality
earcrx_dmac_bprxsampler_parity_err_irq	Triggered when there is a eARC RX DMAC biphase-mark decoder IEC 60958 frame parity error in the received audio stream
earcrx_dmac_chstatus_block_chg_irq	Triggered when the eARC RX Channel Status block payload changes. Channel Status block is updated when every preamble B marker received (beginning of an IEC 60958 block)
earcrx_dmac_audio_type_chg_irq	eARC RX audio type status change interrupt. This interrupt is triggered whenever the earcrx_dmac_audio_type_st field changes state (regardless of the override enable)
earcrx_dmac_audio_mute_chg_irq	eARC RX audio MUTE status change interrupt. This interrupt is triggered whenever the earcrx_dmac_audio_mute_st field changes state (regardless of the override enable)
earcrx_dmac_ecc_rx_check_uncerr_irq	eARC RX DMAC uncorrectable errors in the received compressed audio
earcrx_dmac_usrdata_msg_hdmi_acp_chg_irq	eARC RX DMAC user data H14b ACP message payload change
earcrx_dmac_usrdata_msg_hdmi_isrc1_chg_irq	eARC RX DMAC user data H14b ISRC1 message payload change
earcrx_dmac_usrdata_msg_hdmi_isrc2_chg_irq	eARC RX DMAC user data H14b ISRC2 message payload change

earcrx_dmac_usrdata_msg_generic_chg_irq	eARC RX DMAC user data generic message payload change

Chapter 25 HDMI RX Controller

25.1 Overview

HDMIRX is fully compliant with HDMI1.4b and 2.0 specification. It offers a simple implementation for consumer electronics like DVD/player/recorder and camcorder. HDMIRX consists of one HDMI receiver controller and one HDMI receiver PHY.
HDMIRX supports the following features:

- Video formats:
  - HDMI 1.4b video formats
    - All CEA-861-E video formats up to 1080p@120Hz
    - HDMI 1.4b 4K x 2K video formats(3840x2160p@24Hz/25Hz/30Hz and 4096x2160p@24Hz)
    - HDMI 1.4b 3D video modes with up to 340 MHz (TMDS clock)
  - HDMI2.0 video formats
    - TMDS Scrambler to enable support for 2160p@60 Hz with RGB/YCbCr4:4:4 or YCbCr4:2:2
    - Supports YCbCr 4:2:0 to enable 2160p@60Hz at lower HDMI link speeds
- Colorimetry, 24-bit RGB 4:4:4, 24-bit YCbCr 4:4:4, 24/30-bit YCbCr 4:2:0, 24/30-bit YCbCr 4:2:2
- Pixel clock from 25 MHz up to 600 MHz
- Up to 192 kHz IEC60958 audio sampling rate
- S/PDIF 2channel output
- I2S 2/4/6/8channel output
- AMBA APB 3.0 register access
- SCDC I2C DDC access
- TMDS Scrambler to enable support for 2160p@60Hz with RGB/YCbCr 4:4:4
- Integrated CEC hardware engine
- Integrated HDCP1.4 key configuration
- Integrated E-EDID configuration
- AXI write DMA into DDR
  - Supports 64bit AXI bus width with 500M frequency
  - Burst8 alignment with the last burst length variable
  - Y and UV different store address
  - Supports virtual width

25.2 Block Diagram

HDMI_RX_WRAPPER: has two main sub_block: HDMI_QP_RX and HDMI_RX_DMA.
HDMIRXPHY lane3 is clock lane. Iextphy_tmdsdata0/iextphy_tmdsdata1/iextphy_tmdsdata2 just has low 40 valid bit, and it is corresponding to quad pixel rate. And itmdsqpclk is the 1/4 tmdsclk which corresponds to normal single pixel rate, for example, if the resolution is 1080p@60p, itmdsqpclk is 37.125M.

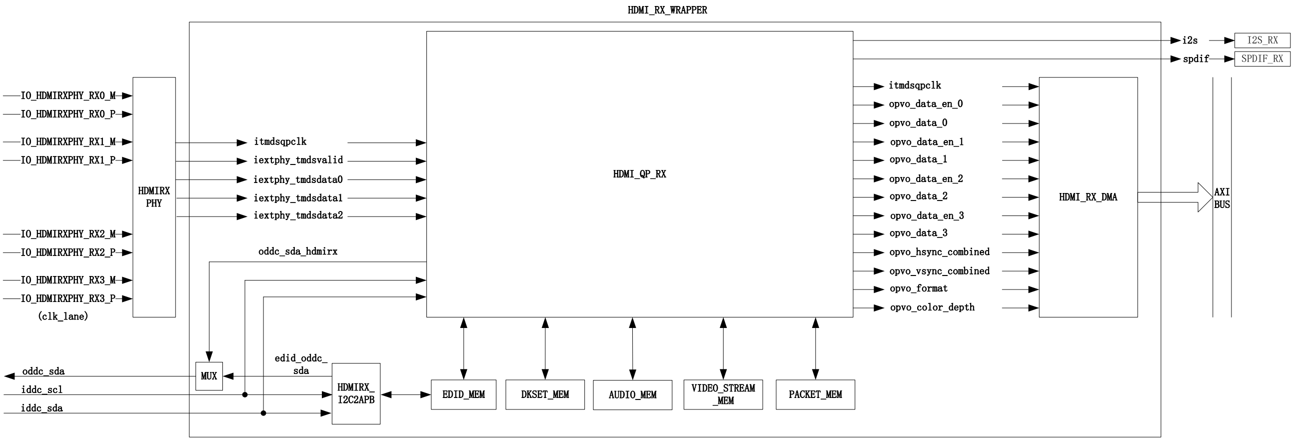

Fig. 25-1 HDMI_RX_WRAPPER Diagram

HDMI_QP_RX's block diagram is shown below.

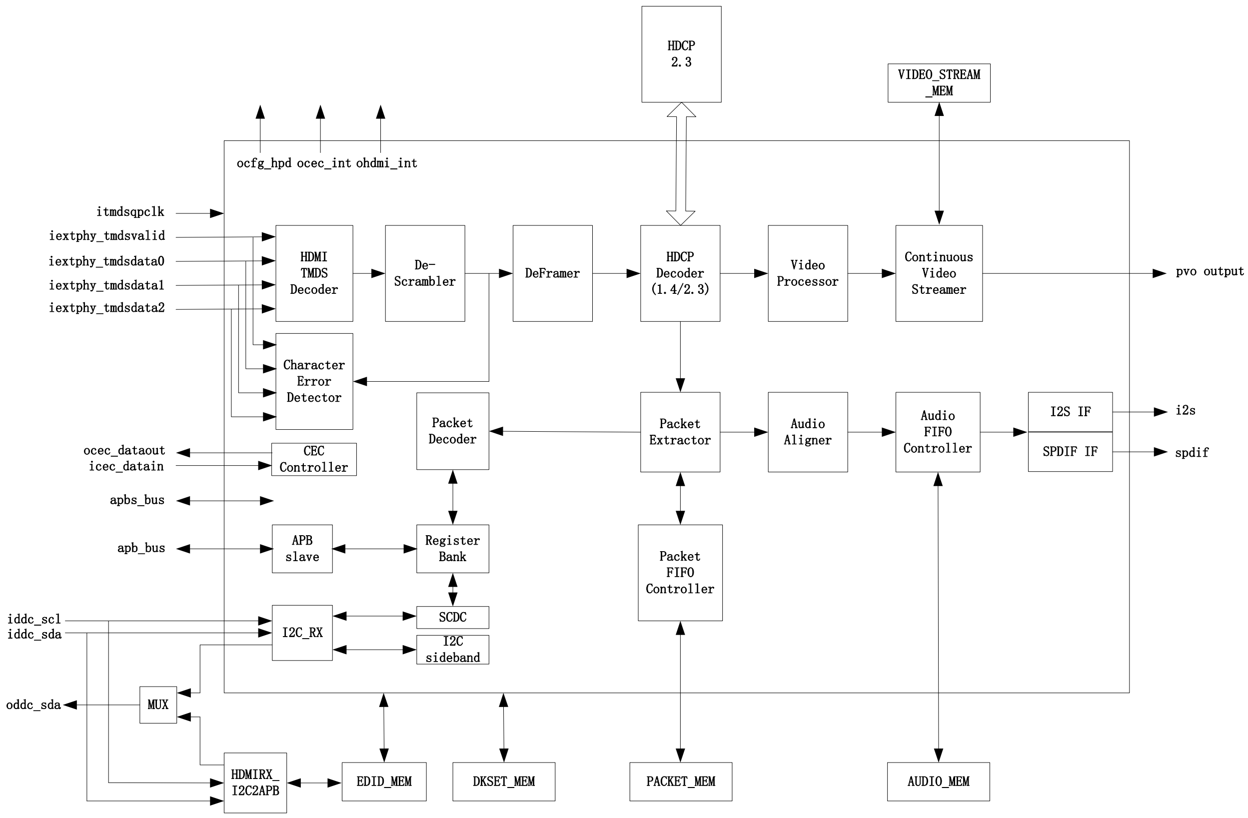

Fig. 25-2 HDMI_QP_RX Diagram

HDMI_RX_DMA's block diagram is shown below.

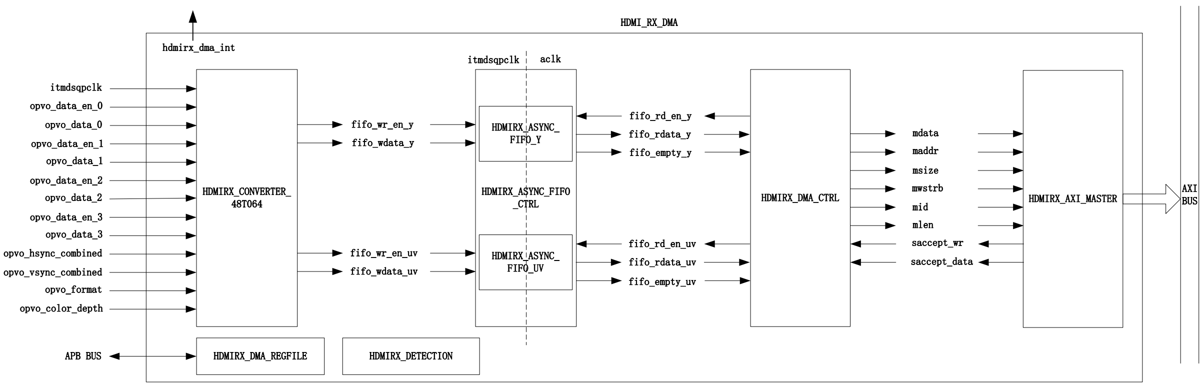

Fig. 25-3 HDMI_RX_DMA Diagram

25.3 Function Description

HDMIRX has two main sub-block: HDMI_QP_RX and HDMI_RX_DMA. HDMI_QP_RX receives three data channel lane, every data channel has 40bit valid data bit. HDMI_QP_RX video stream output quad data one cycle. And HDMI_RX_DMA will transform different data format into 64bit valid write data, and store them in the DDR through AXI bus with hdmirx_dma_ctrl.

25.3.1 HDMI TMDS Decoder

The HDMI TMDS Decoder module preforms TMDS decoding for each physical channel received from the PHY. In every itmdsqpclk cycle, input is four data buses, every data bus is 30bit with three physical channels. On each channel, data is received as 10bit TMDS symbols and decoded into either 8-bit video data, 4-bit Data Island data, or 2-bit Control Period data. The output is quad pixel rate with four parallel data stream. The input 40bit data is shown in diagram below.

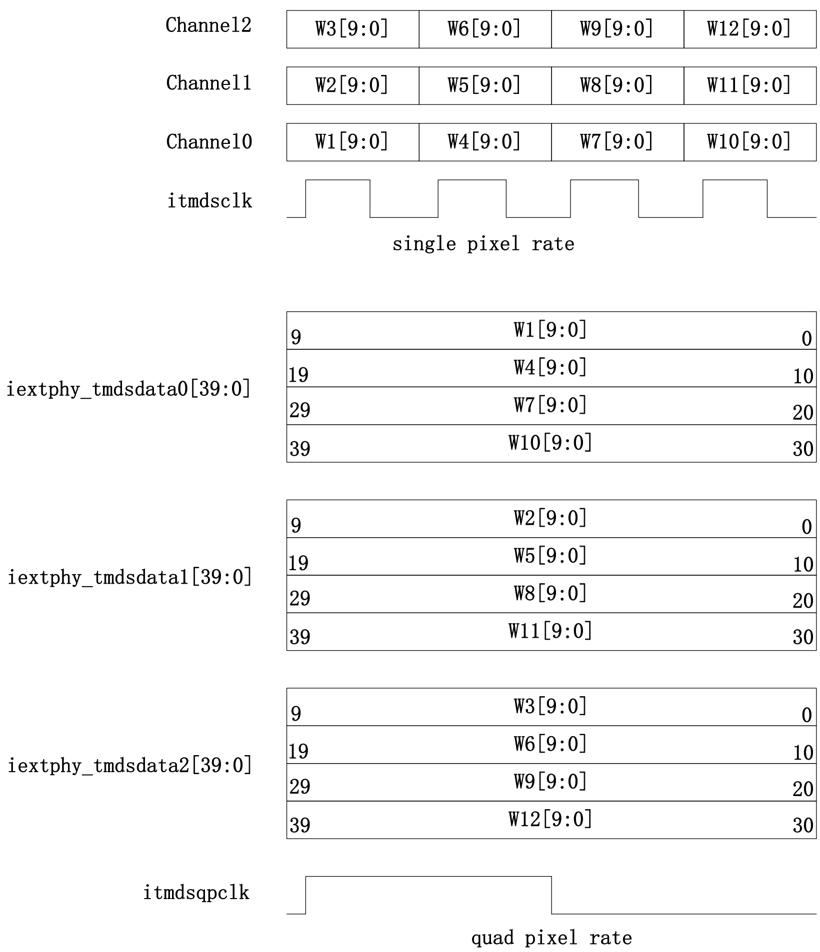

Fig. 25-4 HDMIRX input quad pixel rate Diagram

25.3.2 De-Scrambler

This module removes scrambling from source’s scrambled data. When the controller is operating in DVI, HDMI1.4b modes, this module behaves transparently.

25.3.3 Character Error Detection

This module provides a mechanism for the Sink side device to count and report(through SCDC channel) the Character Error number which it has detected. The Source uses this result to check the link quality by sampling the error counters at periodic intervals. The HDMI receiver implements character error detection, together with a character error counter for channel0, 1,
and 2. The receiver checks each incoming character as to whether it is valid in context. If the character is not valid, then the receiver increments a character error counter associated with each channel. If this character error counter is less than the threshold, this module will

output one important signal hdmirx_lock, this signal will be set 1'b1 to indicate that HDMIRX can output for hdmi_rx_dma module and the output data is valid data.

25.3.4 DeFramer

This module receives the HDMI data from the De-Scrambler and interprets its content. It extracts the Video and Data Island Data Enable from the data stream. Additionally, the block implements a glitch/spike filtering on Vertical and Horizontal Sync, the Guard Band, Preamble, Data Period, Video Period detection, and a Vertical Sync remap filtering.

25.3.5 HDCP Decoder

This module allows HDCP to decrypt the received content. It is capable of receiving any required key set using an external memory. The HDCP Decoder handles the data from the HDCP 1.4 engine and external HDCP2.3 engine, according to the incoming I2C Slave traffic.

25.3.6 Video Processor

This module is composed of the deep-color mode ungrouping, pixel de-repeater, video remapping, and video field detection functions. It assembles video data from the HDMI data stream in normal and deep color mode at any given HDMI specified format and representation.

If a Set-AVMUTE command is received from the HDMITX through the general control packet(GCP) for an automatic mute, you can program the mute value per component channel to allow usage across all color spaces. A manual force mode is also available to either control a video path mute through software or to test the subsequent connections.

25.3.7 Continuous Video Streamer

This module assembles a continuous video stream of only valid pixels during the video active period. This block also ensures video data period always begins in the bus0(opvo_data_0). The first line in the output, after a change in the video mode, can be ignored. The first line is used to measure video dimension parameters, necessary to generate output correctly as a continuous video stream in the subsequent lines. The Continuous Video Streamer uses an external memory to buffer the necessary video data in such a way that once the video output is enabled, there are enough buffered pixels to compensate for the subsequent invalid ones. This memory can store one 4k(4096) pixel line.

25.3.8 Packet Extractor

This module performs BCH decoding over received Data Island packets, establishing the Error Correction Code(ECC) feature. The generator polynomial related to this feature is defined in the HDMI specification and allows for one of the following configurable approaches over each BCH block:

- Correction of 1-bit error plus detection of 2-bits error
- Detection without correction of 1-bit error, 2-bits error and any odd n-bit error

Based on the ECC, the Packet Extractor provides filter configurability to discard packets that can't be corrected by the algorithm. Additionally, it calculates the Checksum of InfoFrame packets, and provides filter configurability to discard InfoFrames with errors detected through the Checksum.

Non-audio packets where errors are detected(but not corrected) can be discarded, depending on filter configuration. Audio packets are never discarded, regardless of error detection.

25.3.9 Packet Decoder

This module identifies Data Island packets extracted from HDMI link(TMDS) and separates them by Packet Type, redirecting their contents for storage in the Register Bank while also extracting the required information to control other blocks in the controller. The following packets are stored in a dedicated register set for direct software access.

Table 25-1 Packet type Mapping

Packet name	Packet Type value
Audio Clock Regeneration Packet(ACR)	0x01
General Control Packet(GCP)	0x03
Audio Content Protection Packet(ACP)	0x04
ISRC1 Packet	0x05
ISRC2 Packet	0x06
Gamut Metedata Packet(GMP)	0x0a

Audio Metedata Packet(AMP)	0x0d
Extended Metedata Packet(EMP)	0x7f
Vendor Specific InfoFrame Packet	0x81
Auxiliary Video Information InfoFrame Packet(AVI)	0x82
Source Product Description InfoFrame Packet	0x83
Audio InfoFrame Packet	0x84
NTSC VBI InfoFrame Packet	0x86
Dynamic Range and Mastering InfoFrame Packet(DRM)	0x87

When one of the dedicated packet registers changes value, the corresponding pkt_0_int_status. pktdec_*_chg_irq interrupt is triggered. Software must perform post-processing of the packet.

The registers that store the HDMI link packets have a snapshot feature that guarantees the data consistency during an APB read operation. This read operation starts in the lowest address of the corresponding packet. In this way, a snapshot of the packet being read is captured correctly and the APB read operation always returns consistent data. This flow is valid only when the pktdec_snapshot_bypass field is not enabled(set to 1'b0). Otherwise, there is no guaranteed consistency on the packets register when their contents are updated during the APB read operation.

25.3.10 Packet FIFO Controller

This module contains the logic to control the storage, by order of arrival, of non-audio type Data Island Packets through an external memory interface. This feature helps to reduce load from the application processor software, lowering real-time requirements of the system. The software is able to configure between free storing of every received packet or storing optional packets by individual packet type selection. The external packet memory is 448x64 size. Every packet type data will be stored in 4 memory 64bit unit.

Fig. 25-5 Packet FIFO Storage Layout

25.3.11 Audio Aligner

Audio packets received from the Packet Extractor are aligned to be stored in an external audio FIFO. The audio format detection and audio channel status extraction are also implemented in this block. The audio channel status extraction to the register bank relies on the B.X bit, which indicates the start of a new block of 192 frames. If the B.X bit does not align with the 192 frames, the channel status will not be sampled into the register bank. Two audio interfaces are provided: I2S(2ch/4ch/6ch/8ch) and S/PDIF(2ch).

25.3.12 Audio FIFO Controller

The Audio FIFO Controller will control the audio packet write/read operation corresponding to the configuration. The audio memory is 896x60 size.

25.3.13 HDMIRX_CONVERTER_48TO64

This module converts different format to 64bit valid data. This module supports different format below.

Table 25-2 Store format

Input format	Store format
RGB888	RGB888

	ARGB8888/RGBA8888
YCbCr420_8bit	YCbCr420_8bit
YCbCr422_8bit	YCbCr422_8bit
YCbCr444_8bit	YCbCr444_8bit
YCbCr420_10bit	YCbCr420_10bit
	YCbCr420_16bit_align
YCbCr422_10bit	YCbCr422_10bit
	YCbCr422_16bit_align

In HDMI1.4 spec, YCbCr422 8/10/12bit are all transfered in 12bit mode. The different input format is shown below.

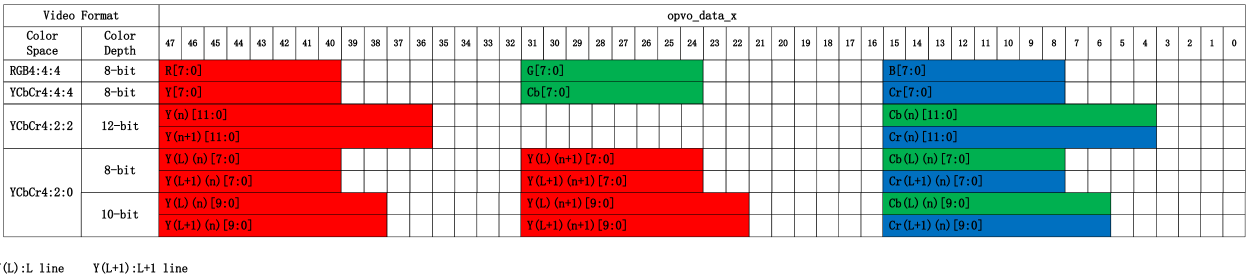

Fig. 25-6 HDMIRX input format map

(1)RGB888

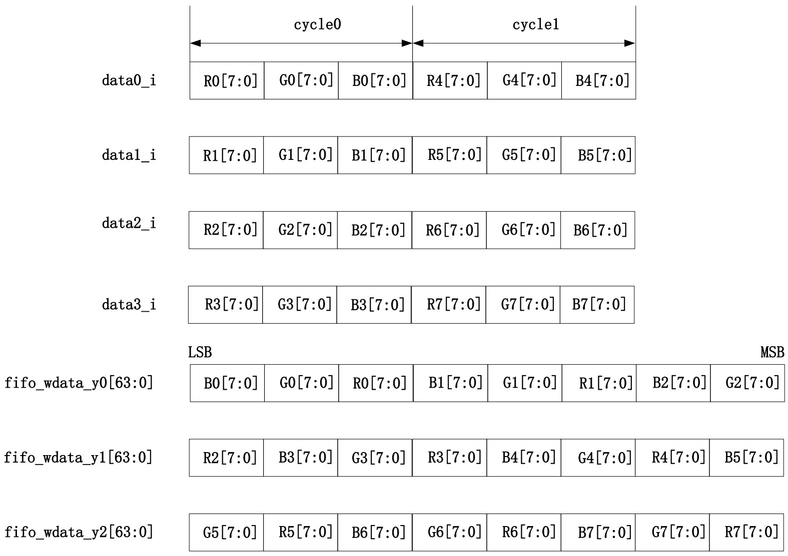

Fig. 25-7 RGB888 storage map

(2) ARGB8888/RGBA888

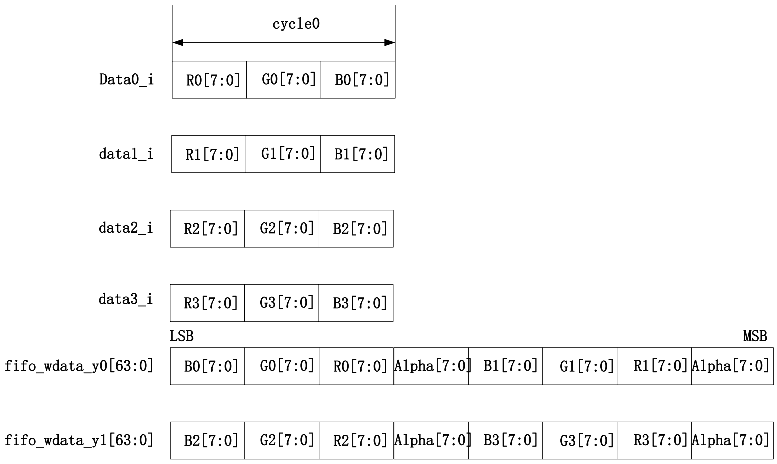

Fig. 25-8 ARGB8888 storage map

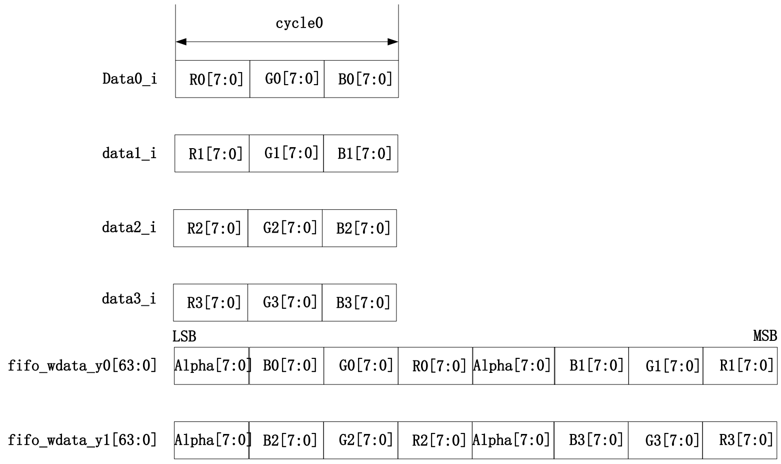

Fig. 25-9 RGBA8888 storage map

(3)YCbCr420_8bit

Odd line just store Y component, and Cb component will be stored in the Cb line buffer, and Cb will be read in the next line(even line).

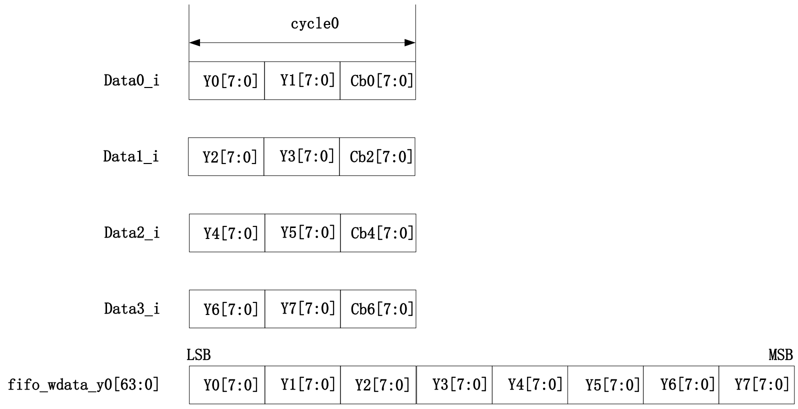

Fig. 25-10 YCbCr420_8bit odd line storage map

Even line will store Y and CbCr component.

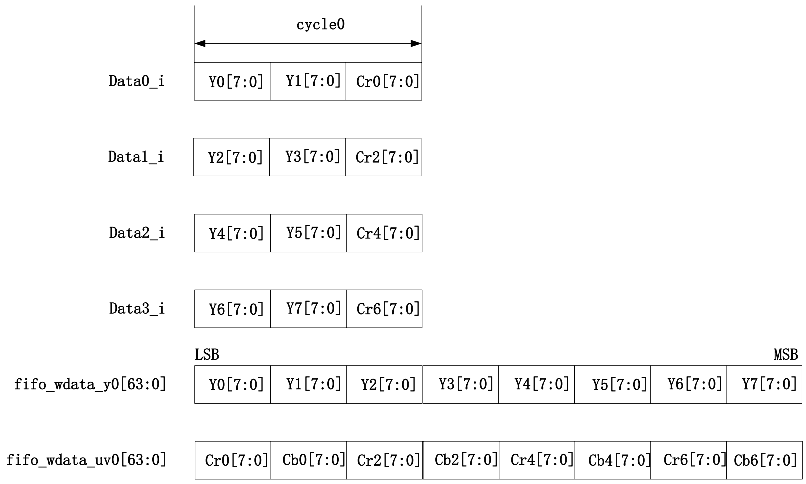

Fig. 25-11 YCbCr420_8bit even line storage map

(4)YCbCr422_8bit

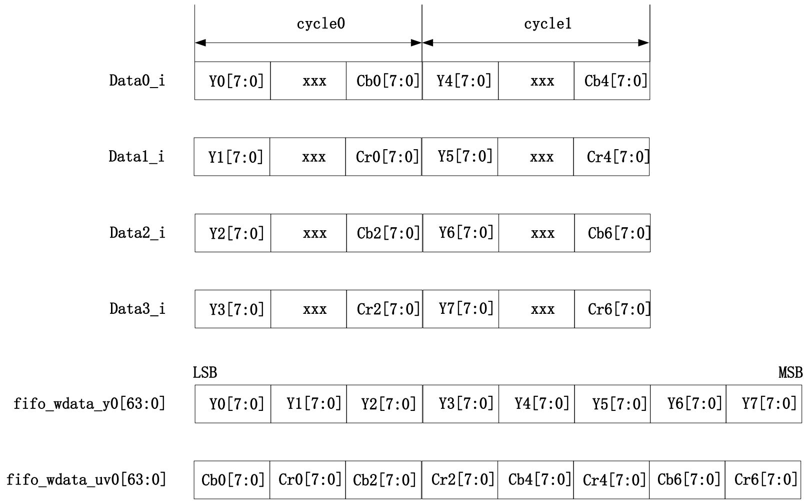

Fig. 25-12 YCbCr422_8bit storage map

(5)YCbCr444_8bit

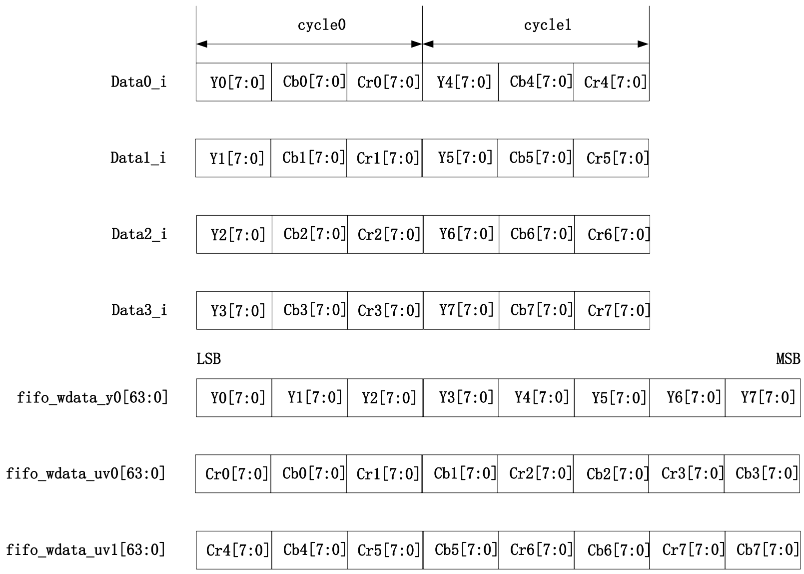

Fig. 25-13 YCbCr444_8bit storage map

(6)YCbCr420_10bit

Odd line just store Y component, and Cb component will be stored in the Cb line buffer, and Cb will be read in the next line(even line).

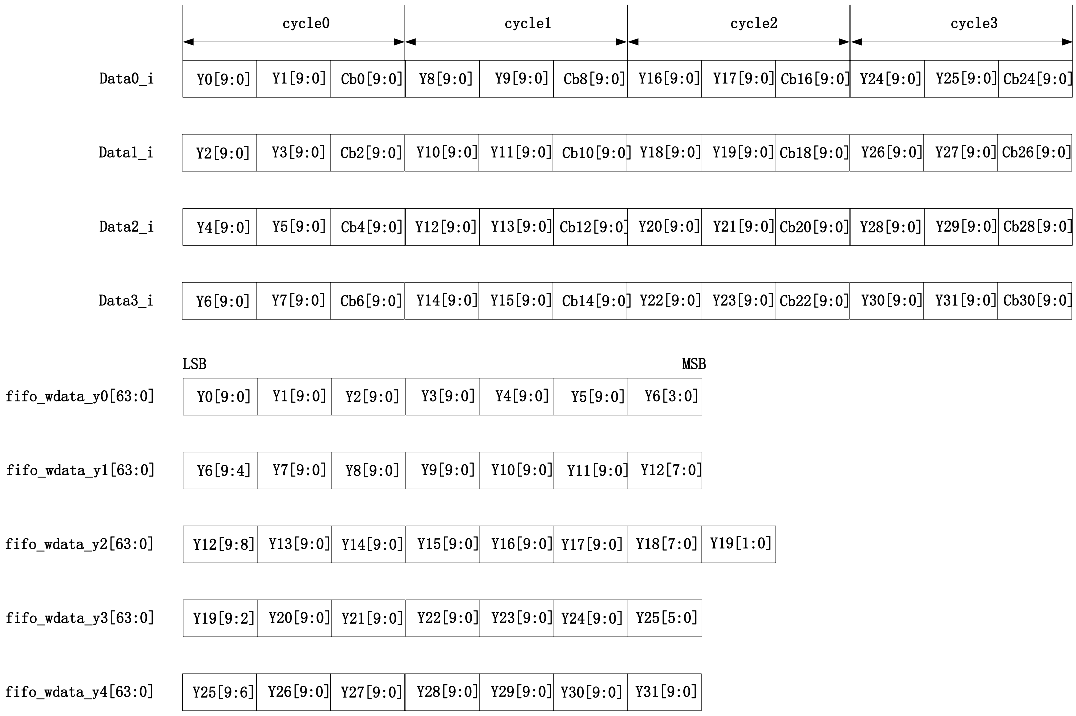

Fig. 25-14 YCbCr420_10bit odd line storage map

Even line will store Y and CbCr component.

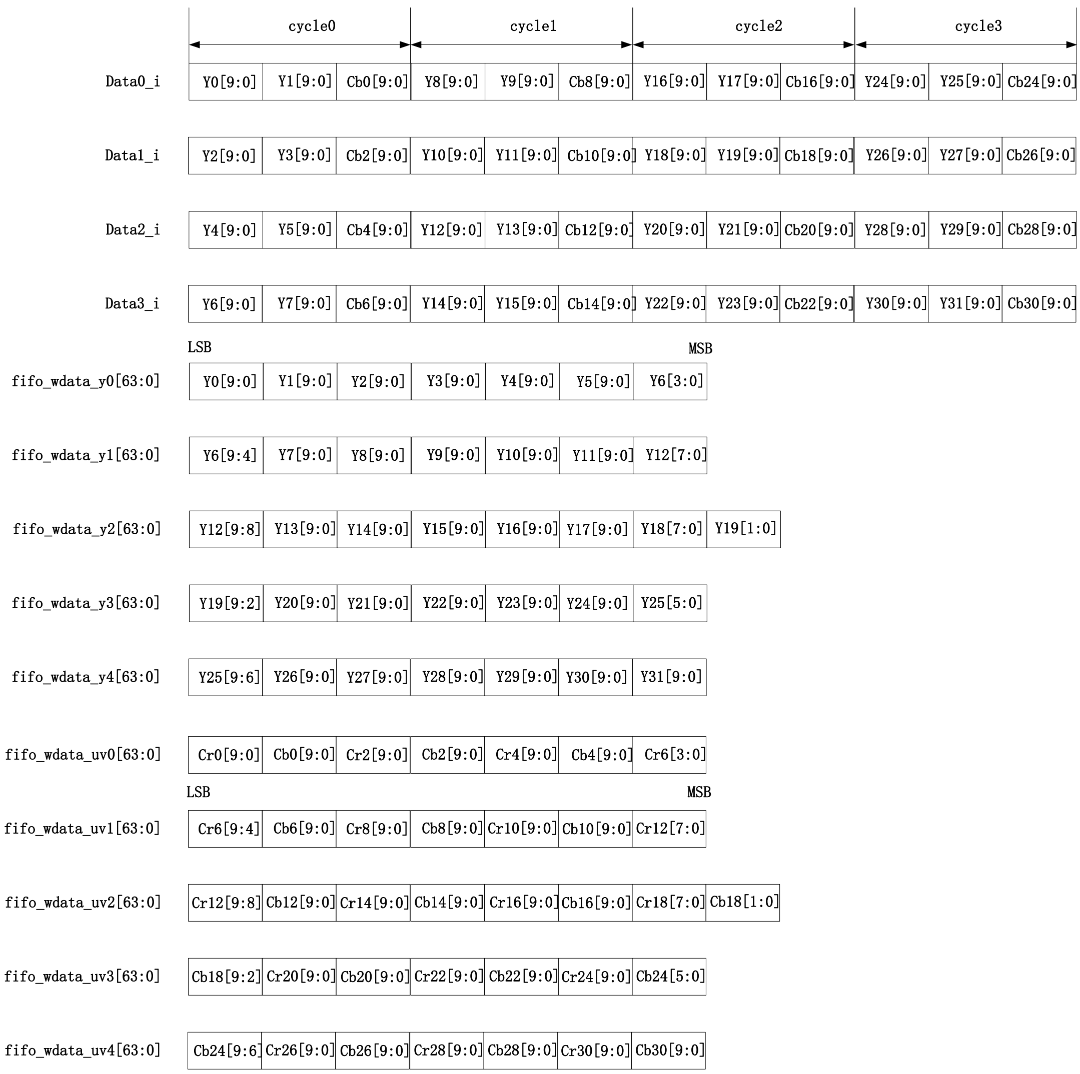

Fig. 25-15 YCbCr420_10bit even line storage map

(7)YCbCr420_16bit_align

Odd line just store Y component, and Cb component will be stored in the Cb line buffer, and Cb will be read in the next line(even line). Y10/CbCr10 can be padded 6bit dummy data in MSB or LSB, it is configurable.

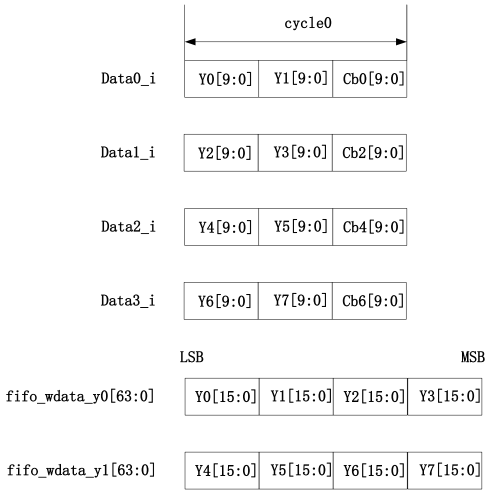

Fig. 25-16 YCbCr420_16bit_align odd line storage map

Even line will store Y and CbCr component.

(9) YCbCr422_16bit_align

Y10/CbCr10 can be padded 6bit dummy data in MSB or LSB, it is configurable.

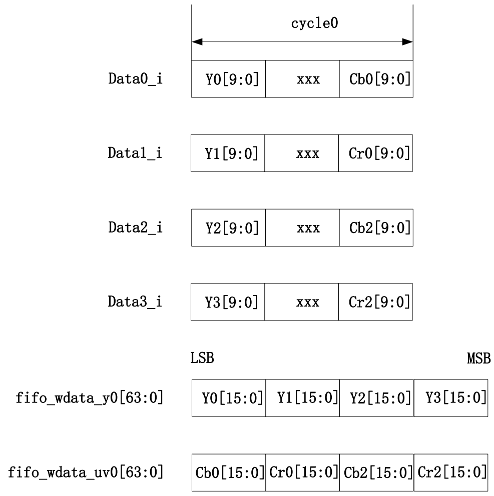

Fig. 25-19 YCbCr422_16bit_align storage map

25.3.14 HDMIRX_ASYNC_FIFO_CTRL

This module controls the HDMIRX asynchronous FIFO logic. Y_FIFO memory is 1024x64 size, UV_FIFO memory is 2048x64 size, it is enough for one 4k pixel line(max resolution 4096 pixel).

25.3.15 HDMIRX_DMA_CTRL

This module controls the HDMIRX AXI DMA awaddr/wdata logic. If input data stream is enough for burst8, and the hdmirx_dma_ctrl will send one burst8 command, and follow the wdata. Y component is priori to UV component, and they are send by polling mechanism.

25.4 Register Description

25.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

25.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
CORE_ID	0x0000	W	0x00000000	Core Identification Register

25.4.3 Detail Registers Description

CORE_ID
Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	core_id This register is ASCII encoded per byte: 31:24-8'h48=H ASCII Character 23:16-8'h51=Q ASCII Character 15:8-8'h52=R ASCII Character 7:0-8'h58=X ASCII Character ASCII representation of this register content is HQRX

VER_NUMBER
Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ver_number This register represents the ASCII value of current IP version, for example: 31:24-8'h31=1 ASCII Character 23:16-8'h30=0 ASCII Character 15:8-8'h30=0 ASCII Character 7:0-8'h61=a ASCII Character For the above example, ASCII representation of this register content is 1.00a

VER_TYPE
Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	ver_type This register represents the ASCII value of the current release type, for example: 31:24-8'h65=e ASCII Character 23:16-8'h61=a ASCII Character 15:8-8'h30=0 ASCII Character 7:0-8'h30=0 ASCII Character For the above example, ASCII representation of this register content is ea00

CONFIG_REG

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:29	RO	0x0	reserved
28	RO	0x0	earctx Indicates that Enhanced Audio Return Channel(eARC)TX interface is present on IP core hardware
27:25	RO	0x0	reserved
24	RO	0x0	phy_external Indicates that PHY external interface is present on IP core hardware
23:13	RO	0x000	reserved
12	RO	0x0	frl Indicates that hdmi2.1 features, including Fixed Rate Link(FRL)are present on IP core hardware
11:10	RO	0x0	reserved
9	RO	0x0	cec Indicates that CEC interface is present on IP core hardware
8	RO	0x0	pmu Indicates that Power Management Unit(PMU)is present on IP core hardware
7:6	RO	0x0	reserved
5	RO	0x0	hdcp2_interface Indicates that HDCP2 ESM is present on IP core hardware
4	RO	0x0	hdcp14_external_dkset Indicates that HDCP1.4 external device key set(DPK and Bksv) memory interface is present on IP core hardware
3:2	RO	0x0	reserved
1	RO	0x0	snps_audio_pll Indicates that Audio PLL interface is present on IP core hardware
0	RO	0x0	audio_sample_output Indicates that Audio Sample Output interface is present on IP core hardware

CORE_TIMESTAMP_HHMM

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	core_timestamp_hhmm This register represents the ASCII value of the timestamp for the Hours/Minutes(HHMM format)at the generation of the IP.

CORE_TIMESTAMP_MMDD

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	core_timestamp_mmdd This register represents the ASCII value of the timestamp for the Month/Day(MMDD format)at the generation of the IP.

CORE_TIMESTAMP_YYYY

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	core_timestamp_yyyy This register represents the ASCII value of the timestamp for the Year(YYYY format)at the generation of the IP

GLOBAL_SWRESET_REQUEST

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21	WO	0x0	phyctrl_swresetreq PHY control register parallel interface software reset request. Reading this register always returns zero. 1'b0: No effect 1'b1: This will generate the following synchronized reset that acts as an asynchronous reset in the RTL code: ophyctrl_refrst_n, ophyctrl_cr_pararst_n.
20:18	RO	0x0	reserved
17	WO	0x0	apb_swresetreq APB interface software reset request. Reading this register always returns zero. 1'b0: No effect 1'b1: Reset the APB interface logic This does not clear any register in any functional unit. This acts over the following internal reset signals: APB interface reset: oapb_ apbrst_n and oapb_refrst_n.
16	WO	0x0	cec_swresetreq CEC unit software reset request. 1'b0: No effect 1'b1: Reset the CEC unit Reading this register always returns zero. This acts over the following internal reset signals: CEC reset: ocec_refrst_n
15:13	RO	0x0	reserved
12	WO	0x0	datapath_swresetreq AVPUNIT datapath software reset request. 1'b0: No effect 1'b1: Reset the AVPUNIT logic Reading this register always returns zero. This does not reset the AVPUNIT registers neither reset the HDCP1.4 DPK keys stored in the HDCP1.4 engine, nor reset the SCDC module or I2C Slave module. This acts over the following internal reset signals: AVPUNIT datapath resets: odatapath_refrst_n, odatapath_tmdsqprst_n, oaud_audrst_n, oaud_tmdsqprst_n, oaud_refrst_n, ohdcp_refrst_n, ohdcp_tmdsqprst_n, opktfifo_ tmdsqprst_n, opktfifo_apbrst_n, and opktfifo_refrst_n
11	WO	0x0	pktfifo_swresetreq Packet FIFO functional unit software reset request. 1'b0: No effect 1'b1: Reset the packet FIFO related configuration registers. Reading this register always return zero. This acts over the following internal reset signals: Audio logic resets: opktfifo_tmdsqprst_n, opktfifo_apbrst_n, and opktfifo_ refrst_n.

Bit	Attr	Reset Value	Description
10	WO	0x0	hdcp_swresetreq HDCP functional unit software reset request. 1'b0: No effect 1'b1: Reset the HDCP logic in the AVPUNIT Reading this register always returns zero. This acts over the following internal reset signals: HDCP logic resets: ohdcp_refrst_n, ohdcpkey_refrst_n, and ohdcp_tmdsqprst_ n.
9	WO	0x0	audio_swresetreq Audio functional unit software reset request. Reading this register always returns zero. 1'b0: No effect 1'b1: Reset the audio logic in the AVPUNIT. This acts over the following internal reset signals: Audio logic resets: oaud_audrst_n, oaud_tmdsqprst_n, and oaud_refrst_n.
8	WO	0x0	avpunit_swresetreq avpunit software reset request: 1'b0: No effect 1'b1: Reset all the avpunit logic Reading this register always returns zero. This acts over the following internal reset signals: oavpunit_refrst_n, oavpunit_tmdsqprst_n, odatapath_refrst_n, odatapath_tmdsqprst_n, oaud_audrst_n, oaud_tmdsqprst_n, oaud_refrst_n, oscdc_refrst_n, oi2c_refrst_n, ohdcp_refrst_n, ohdcpkey_refrst_n, ohdcp_tmdsqprst_n, opktfifo_tmdsqprst_n, opktfifo_apbrst_n, and opktfifo_refrst_n.
7:1	RO	0x00	reserved
0	WO	0x0	main_swresetreq Main reset control field that when activated resets all configuration and status bits and resets all functional units. 1’b0: No action 1’b1: Start reset This acts over the following internal reset signals: (1)Main Unit reset: omain_refrst_n (2)AVPUNIT resets: oavpunit_refrst_n, oavpunit_tmdsqprst_n, odatapath_refrst_n, odatapath_tmdsqprst_n, oaud_audrst_n, oaud_tmdsqprst_n, oaud_refrst_n, oscdc_refrst_n, oi2c_refrst_n, ohdcp_refrst_n, ohdcpkey_refrst_n, ohdcp_tmdsqprst_n, opktfifo_tmdsqprst_n, opktfifo_apbrst_n, and opktfifo_refrst_n (3)CEC reset: ocec_refrst_n (4)APB interface reset: oapb_apbrst_n, oapb_refrst_n (5)PHY controller reset: ophyctrl_refrst_n, ophyctrl_cr_pararst_n This bit is self clearing.

GLOBAL_SWENABLE

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21	RW	0x1	phyctrl_enable PHY Control Register Parallel interface synchronous enable. 1'b0: It disables the following synchronous enable bits: CREG synchronous enables: wphyctrl_ref_en, wphyctrl_cr_para_en. 1'b1: It enables the corresponding synchronous enable bit.
20:17	RO	0x0	reserved

Bit	Attr	Reset Value	Description
16	RW	0x1	cec_enable CEC synchronous enable. 1'b0: It disables the following synchronous enable bits: CEC synchronous enables: ocec_ref_en. 1'b1: It enables the corresponding synchronous enable bit. Attention: CEC associated registers are cleared.
15:14	RO	0x0	reserved
13	RW	0x1	tmds_enable TMDS datapath synchronous enable. 1'b0: It disables the following synchronous enable bits: TMDS datapath synchronous enables: otmds_ref_en, otmds_tmdsqp_en. 1'b1: It enables the corresponding synchronous enable bit.
12	RW	0x1	datapath_enable AVPUNIT datapath synchronous enable: 1'b0: It disables the following synchronous enable bits: AVPUNIT datapath synchronous enable: odatapath_ref_en, odatapath_ tmdsqp_en, otmds_ref_en, otmds_tmdsqp_en, oaud_aud_en, oaud_tmdsqp_en, oaud_ref_en, ohdcp_ref_en, ohdcp_tmdsqp_en, opktfifo_apb_en, opktfifo_tmdsqp_en, opktfifo_ref_en 1'b1: It enables the corresponding synchronous enable bit. Attention: This does not clear AVPUNIT registers neither the HDCP1.4 DPK keys stored in the HDCP1.4 engine.
11	RW	0x1	pktfifo_enable Packet FIFO synchronous enable: 1'b0: It disables the following synchronous enable bits: Packet FIFO synchronous enables: opktfifo_apb_en, opktfifo_tmdsqp_en, opktfifo_ref_en. 1'b1: It enables the corresponding synchronous enable bit. Attention: Packet FIFO associated registers are cleared.
10	RW	0x1	hdcp_enable HDCP 1.4 synchronous enable. 1'b0: It disables the following synchronous enable bits. HDCP synchronous enables: ohdcp_ref_en, ohdcpkey_ref_en, ohdcp_ tmdsqp_en. 1'b1: It enables the corresponding synchronous enable bit. Attention: HDCP associated configuration registers are not cleared but HDCP1.4 keys stored inside HDCP1.4 engine are cleared. Attention: When HDCP1.4 is disabled(global_swenable: hdcp_enable == 0) and HDCP type selection is HDCP1.4 (hdcp2_status: hdcp2_type_sel_sts==0), video and audio are not available in downstream blocks. In this condition, no video and audio are provided on the respective output interfaces.
9	RW	0x1	audio_enable Audio synchronous enable. 1'b0: It disables the following synchronous enable bits: Audio synchronous enables: oaud_aud_en, oaud_tmdsqp_en, oaud_ref_ en. 1'b1: It enables the corresponding synchronous enable bit. Attention: Audio associated registers are not cleared.

Bit	Attr	Reset Value	Description
8	RW	0x1	avpunit_enable AVPUNIT synchronous enable. 1'b0: It disables the following synchronous enable bits. AVPUNIT synchronous enable: oavpunit_ref_en, oavpunit_tmdsqp_en, odatapath_ref_en, odatapath_tmdsqp_en, otmds_ref_en, otmds_tmdsqp_en, oaud_aud_en, oaud_tmdsqp_en, oaud_ref_en, oscdc_ ref_en, oi2c_ref_en, ohdcp_ref_en, ohdcpkey_ref_en, ohdcp_tmdsqp_en, opktfifo_apb_en, opktfifo_tmdsqp_en, opktfifo_ref_en. 1'b1: It enables the corresponding synchronous enable bit. Attention: After this bit field is successfully released, the mainunit_0_int_status.regbank_ready_irq interrupt is triggered raising the ohdmi_int signal. This interrupt is automatically triggered by the main unit to warn the software that the AVPUNIT register bank is ready to be accessed.
7:1	RO	0x00	reserved
0	RW	0x1	main_enable Main synchronous enable. 1'b0: It disables the following synchronous enable bits. (1)Main unit synchronous enable: omain_ref_en (2)AVPUNIT synchronous enable: oavpunit_ref_en, oavpunit_tmdsqp_en, odatapath_ ref_en, odatapath_tmdsqp_en, otmds_ref_en, otmds_tmdsqp_en, oaud_aud_en, oaud_tmdsqp_en, oaud_ref_en, oscdc_ref_en, oi2c_ref_en, ohdcp_ref_en, ohdcpkey_ref_en, ohdcp_tmdsqp_en, opktfifo_apb_en, opktfifo_tmdsqp_en, opktfifo_ ref_en. (3)CEC synchronous enable: ocec_ref_en. 1'b1: The control of the synchronous enables is performed by its individual bits. Attention: After this bit field is successfully released, the mainunit_0_int_status.apb_if_ready_irq and mainunit_0_int_status.regbank_ready_irq interrupts are triggered raising the ohdmi_int signal. This interrupt is automatically triggered by the main unit to warn the software that the register bank is ready to be accessed.

GLOBAL_TIMER_REF_BASE

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:1	RW	0x0	min_ucp_char_qst Minimum number of followed Unscrambled Control Characters required for an Unscrambled Control Period to be considered for applying reset to the Descrambler LFSRs. 2'b00: A complete Unscrambled Control Period is considered if the number of received Unscrambled Control characters resides between 5 and 8. 2'b01: A complete Unscrambled Control Period is considered if the number of received Unscrambled Control characters resides between 6 and 8. 2'b10: A complete Unscrambled Control Period is considered if the number of received Unscrambled Control characters resides between 7 and 8. 2'b11: Only a complete received Unscrambled Control Period is considered (8 out of 8 Unscrambled Control characters received).
0	RW	0x0	recover_unsync_stream_qst Recover unsynched HDMI stream. Until the first Descrambler synchronization character sequence(Unscrambled Control Period)is received, the Descrambler LFSRs are not synchronized, and therefore data combined with their output values is considered invalid. With this debug field configured high, the unsynchronized stream is forwarded as valid data to datapath blocks that succeed the Descrambler.

DESCRAND_STATUS

Address: Operational Base + offset (0x0218)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
4	RO	0x0	scramb_det_sts Scrambling detected(scrambling detected even with auto detection control disabled, that is, scramben_sel_qst != 1). This status signal is driven high when a Scrambled Control Code is received. If a Control Period with more than eight Unscrambled Control Characters is received, this status signal is driven low.
3:1	RO	0x0	reserved
0	RO	0x0	descrand_sync_st Descrambler synchronization status. 1'b0: Descrambler is not synchronized 1'b1: Unscrambled Control Period synchronization symbols have been received and Descrambler is synchronized

DESCRAND_SYNC_SEQ_CONFIG

Address: Operational Base + offset (0x022C)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6:4	RW	0x4	descrand_sync_seq_err_cnt_thr Interrupt counter threshold for sync sequence(Unscrambled Control Period)errors. 3'b000: 2 3'b001: 4 3'b010: 8 3'b011: 16 3'b100: 32 3'b101: 64 3'b110: 128 3'b111: 256
3:1	RO	0x0	reserved
0	RW	0x1	descrand_sync_seq_err_cnt_en Interrupt counter enable for Sync Sequence(Unscrambled Control Period) errors. 1'b0: The interrupt is set every time the related event occurs. 1'b1: The interrupt is set when the counter is a multiple of the value set by the threshold.

DESCRAND_SYNC_SEQ_CLEAR

Address: Operational Base + offset (0x0230)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	WO	0x0	descrand_sync_seq_err_cnt_clr_p Clear sync_seq_err interrupt counter 1'b0: No action 1'b1: Clear counter to 0 Note: This register is auto-clear. Reading this register always reads zero.

DESCRAND_SYNC_SEQ_STATUS

Address: Operational Base + offset (0x0234)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:0	RO	0x00	descrand_sync_seq_err_cnt_sts Interrupt counter for sync_seq_err events. This register reflects the number of incomplete Descrambler Synchronization Character sequences received, in case of errors in the TMDS stream. The HDMI2.0 Specification dictates that the Unscrambled Control Period corresponds exactly to eight consecutive Unscrambled Control Characters. If this sequence is received with less than the defined number of characters and therefore is considered incomplete, this counter is incremented.

DEFRAMER_CONFIG0

Address: Operational Base + offset (0x0270)

Address: Operational Base + offset (0x048C)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	speaker_alloc_ovr_value Speaker Allocation Override Value. Each bit defines one channel to be outputed. (1)If Audio Packets received are 3D Audio Packets then the 32bit are used to define up to 32 channels (2)If Audio Packets received are not 3D Audio Packets then the only the 8 LSB are used to override the Speaker Allocation

AUDIO_PROC_STATUS1

Address: Operational Base + offset (0x0490)

Bit	Attr	Reset Value	Description
31:24	RO	0x00	aud_speaker_alloc Currently active audio Speaker Allocation value
23:21	RO	0x0	reserved
20:17	RO	0x0	aud_sample_present Contains the sample_present value of AS, OBA, MSAS, MSOBA audio packets. Note: On remaining audio packet types this field is set to 4'b1111.
16:13	RO	0x0	aud_sample_flat Contains the sample_flat(or samples_invalid) value of AS, OBA, MSAS, MSOBA, and DST audio packets. Note1: In DST audio packets, the sample_invalid value is replicated in the 4bits of this field. Note2: On remaining audio packet types this field is set to 4'b0000 Note3: If the Audio Generator is used when the HDMI_QP_RX_ASO interface is defined, this register is set with the sample_flat that is defined on the agen_sample_flat field.
12:9	RO	0x0	reserved
8	RO	0x1	aud_mute_st Indicates current audio mute status 1'b0: Mute disabled 1'b1: Mute enabled
7:4	RO	0x0	reserved

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x1	bch_aud_errcorr_en_qst BCH Error correction enable, applicable to audio packets only. The BCH Error Correction Code implementation in the controller is according to what is defined in the HDMI1.4b specification. Depending on if the BCH Error Correction is enabled, one of the following approach is taken: bch_aud_errcorr_en_qst=1: Detection and correction of Subpackets containing 1bit error, plus detection of Subpackets containing 2bit errors.(no action is performed in this case) bch_aud_errcorr_en_qst=0: Detection(but no correction) of Subpackets containing 1bit, 2bit and any odd-n bit errors. Note: Although the Error Correction Code mechanism is able to detect errors in audio Subpackets(as described above), filtering is not applied. In that sense, switching off bch_aud_errcorr_en_qst performs no action over the incoming Subpackets.
0	RW	0x1	bch_errcorr_en_qst BCH Error correction enable, applicable to non-audio packets only. The BCH Error Correction Code implementation in the controller is according to what is defined in the HDMI1.4b specification. Depending on if the BCH Error Correction is enabled, one of the following approach is taken: bch_errcorr_en_qst=1: Detection and correction of Subpackets containing 1bit error, plus detection of Subpackets containing 2bit errors. bch_errcorr_en_qst=0: Detection(but no correction) of Subpackets containing 1bit, 2bit and any odd-n bit errors. Note: Packets with detected(but not corrected)errors are filtered depending on pktex_bch_errfilt_config individual field configuration.

6:4	RW	0x0	pktdec_acr_deltacts_thr_qst ACR Delta CTS Threshold. This field configures the minimum ACR CTS variation between two consecutive values in order for the interrupt request acr_cts_chg_irq to be triggered. (1)3'b000: Minimum Delta CTS = 1 (2)3'b001: Minimum Delta CTS = 2 (3)3'b010: Minimum Delta CTS = 4 (4)3'b011: Minimum Delta CTS = 8 (5)3'b100: Minimum Delta CTS = 16 (6)3'b101: Minimum Delta CTS = 32 (7)3'b110-3'b111: Reserved
3:1	RO	0x0	reserved
0	RW	0x0	pktdec_acr_cts_n_over_en ACR CTS/N Override enable 1'b0: Override disabled 1'b1: Override enabled. The controller outputs 'ocfg_audpll_mux_cts' and 'ocfg_audpll_mux_n' takes their values from register fields 'pktdec_acr_cts_ovr_value' and 'pktdec_acr_ n_ovr_value', instead of the values from the received ACR Subpackets. If the override values are different from the last received ACR Subpacket, interrupt 'pktdec_acr_cts_chg_irq' is triggered once.

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved
8	RO	0x0	vmon_alt_detect Alternative video detection 1'b0: Odd frame detected-Vsync fall edge aligned with Hsync rise edge 1'b1: Even frame detected-Vsync fall edge misaligned with Hsync rise edge Note: Alternative video detection is only enabled when preceding Vsync rise edge is aligned with Hsync rise edge.
7:5	RO	0x0	reserved
4	RO	0x0	vmon_ilace_detect Interlaced video detection 1'b0: Progressive video format 1'b1: Interlaced video format Video format is consider interlaced if either field or alternative detections are asserted at least once every two Vsync cycles.
3:1	RO	0x0	reserved
0	RO	0x0	vmon_field_detect Field detection 1'b0: Odd field-Vsync rise edge aligned with Hsync rise edge 1'b1: Even field-Vsync rise edge misaligned with Hsync rise edge

CEC_TX_CONTROL

Address: Operational Base + offset (0x2000)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	WO	0x0	frame_send_clr_p Prevents further re-transmissions. If the transmission is ongoing, it is attempted to completion.
0	WO	0x0	frame_send_set_p Set by software to trigger CEC sending a frame as an initiator. If cec_cfg.txreq_discad_ifrxbusy == 0, the frame is transmitted even after receiving a frame in between. Otherwise, the frame to be sent is discarded as soon as a new incoming frame arrives(before being able to transmit)

CEC_STATUS

Address: Operational Base + offset (0x2004)

Bit	Attr	Reset Value	Description
31:9	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
8	RO	0x0	cectx_busy_st Hardware is busy transmitting a frame When this bit change, It generates the cectx_busy_irq interrupt.
7:5	RO	0x0	reserved
4	RO	0x0	cecrx_busy_st Hardware is busy receiving a message frame. If 'send' is asserted for a new TX message to be sent, it is delayed until the ongoing RX message is done. When this bit changes, it generates the cecrx_ busy_irq interrupt.
3:1	RO	0x0	reserved
0	RO	0x0	frame_send_pending_st Frame send pending status 1'b1: A frame is set to be transmitted(waiting for the end of an incoming message or to have access to the line). This bit keeps at 1 while the transmission is going on. 1'b0: CEC transmission is done(no matter successful or failed)

CEC_CONFIG

Address: Operational Base + offset (0x2008)

Bit	Attr	Reset Value	Description
31:10	RO	0x000000	reserved
9	RW	0x0	rx_automatic_drive_acknowledge RX automatic drive acknowledge 1'b0: Wait for initiator to drive logic "1" at ACK/NACK bit position for follower to reply with ACK/NACK bit 1'b1: Automatically drive ACK/NACK bit at 2.65ms of EOM initiator bit
8	RW	0x1	cecfilter Filter enable. Active high 1'b1: CEC filter is active and filters spurious signals in the CEC line (filter pulses < 0.1ms) 1'b0: CEC filter inactive
7:6	RO	0x0	reserved
5:4	RW	0x1	frame_nretrans Select number of re-transmission the hardware attempts as initiator after an arbitration loss(cectx_arblost_irq) or line error detection(cectx_lineerror_irq)
3:2	RO	0x0	reserved
1	RW	0x0	broadcast_nack Broadcast State 1'b1: Respond with Negative ACK to any received broadcast message. Message not stored in RX registers 1'b0: Receive broadcast messages
0	RW	0x0	txreq_discard_if_rxbusy Transmit request(cec_ctrl.send=1)is discarded if a RX transfer is ongoing. 1'b1: The transmit request is cancelled if there is an ongoing RX transfer on the CEC line, raising the RX busy interrupt. 1'b0: The transmit request is always recorded by the TX FIFO for immediate or later transmission, depending on the CEC line status. For instance, the transmit is performed as soon as possible.

CEC_ADDR

Address: Operational Base + offset (0x200C)

Bit	Attr	Reset Value	Description
31:15	RO	0x00000	reserved
14:0	RW	0x0000	cec_follower_addr Logical address allocated to the CEC device. Each bit selects a specific address, multiple bits can be selected (1)Logical address 0 - Device TV (2)Logical address 1 - Recording Device 1 (3)Logical address 2 - Recording Device 2 (4)Logical address 3 - Tuner 1 (5)Logical address 4 - Playback Device 1 (6)Logical address 5 - Audio System (7)Logical address 6 - Tuner 2 (8)Logical address 7 - Tuner 3 (9)Logical address 8 - Playback Device 2 (10)Logical address 9 - Playback Device 3 (11)Logical address 10 - Tuner 4 (12)Logical address 11 - Playback Device 3 (13)Logical address 12 - Backup 1 (14)Logical address 13 - Backup 2 (15)Logical address 14 - Specific use The CEC always answers to broadcast messages unless the broadcast_nack field of the cec_config register is set to 1'b1.

Notes: I=input, O=output, I/O=input/output, bidirectional

25.6 Application Notes

25.6.1 HDMIRX Application

The figure below shows the recommended programming sequence to build an HDMIRX system.

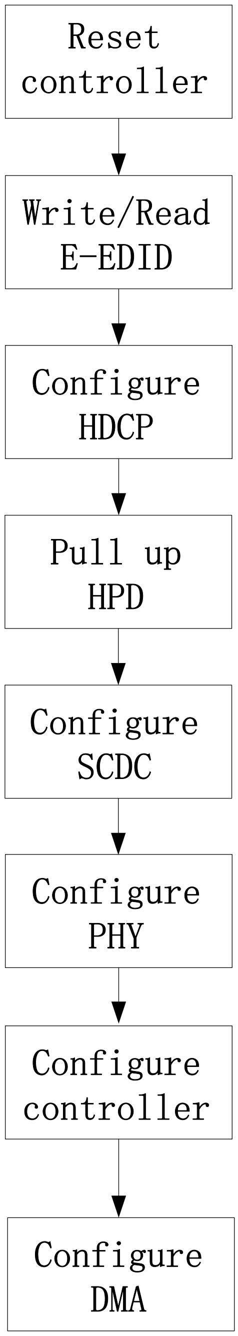

Fig. 25-20 HDMIRX configuration flow

25.6.1.1 Reset controller

HDMIRX controller main reset signal imain_rst_n is from CRU module, the CRU register base address is 0XFD7C0000. The register 0xaf4 below is the CRU register.

Table 25-4 Reset controller operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0xaf4[11]	resetn_hdmirx_ref_req	0x0	0x1	Configure HDMIRX controller main reset signal imain_rst_n to reset the whole HDMIRX controller
Wait for 100us at least				
0xaf4[11]	resetn_hdmirx_ref_req	0x0	0x0	Release the HDMIRX controller main reset signal

SFR Address	SFR Name	Default Value	Setting Value	Description
0x24[31:0]	global_swenable	0x0021 3f01	0x0	Configure all the sub-block enable 1'b0
0x24[31:0]	global_swenable	0x0021 3f01	0x0021 3f01	Configure all the sub-block enable 1'b1. [0]bit: main_enable [8]bit: avpunit_enable [9]bit: audio_enable [10]bit: hdcp_enable [11]bit: pktfifo_enable [12]bit: datapath_enable [13]bit: tmds_enable [16]bit: cec_enable [21]bit: phyctrl_enable

25.6.1.2 Write/Read E-EDID

Table 25-5 E-EDID operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x4428[6:0]	edid_slave_ addr	0x0	0x50	Configure EDID slave address, the common value is 0x50
0x4428[7]	edid_write_en	0x0	0x1	Configure EDID write enable
0x4424[7:0]	edid_wdata	0x0		Configure the first EDID write data
0x4424[7:0]	edid_wdata	0x0		Configure the second EDID write data
...(continue configure 0x4424)				
0x4424[7:0]	edid_wdata	0x0		Configure the 512th EDID write data
The driver will configure 512 EDID write data, and next can read the EDID data through APB bus for debug purpose				
0x4428[7]	edid_write_en	0x0	0x0	Disable EDID write enable
0x4428[8]	edid_read_en	0x0	0x1	Configure EDID read enable
0x4464[7:0]	edid_rdata	0x0		Read the first EDID data
0x4464[7:0]	edid_rdata	0x0		Read the second EDID data
...(continue read 0x4464)				
0x4464[7:0]	edid_rdata	0x0		Read the 512th EDID data
0xfd5a8008[2]	grf_con_hdmirx_sdain_msk	0x0	0x1	Unmask hdmirx ddc sda channel,if not, hdmirx ddc sda will always be 1
0xfd5a8008[1]	grf_con_hdmirx_sclin_msk	0x0	0x1	Unmask hdmirx ddc scl channel,if not, hdmirx ddc scl will always be 1

The user can read the EDID through APB bus just for debug purpose, and HDMITX will read the EDID through DDC bus.

25.6.1.3 Configure HDCP

1. configure HDCP1.4
(1)configure HDCP1.4 key

The driver configures the HDCP1.4 key through HDMIRX APB secure bus firstly, which is different from HDMIRX APB bus. The HDMIRX apb_secure bus has the base address 0XFDF10000(hdmirx_s_addr_offset).

Table 25-6 HDCP1.4 key configuration operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x24[10]	hdcp enable	0x0	0x0	Disable hdmirx hdcp1.4
0xFD586054[14]	sgrf_con_hdmirx_apbs_sel	0x0	0x0	Mux hdcp1.4 sram write enable for secure apb bus
0xFDF10000+0*4	hdmirx_hdcp14_key0[7:0]	0x0		Configure HDCP1.4 key0
0xFDF10000+1*4	hdmirx_hdcp14_key1[7:0]	0x0		Configure HDCP1.4 key1
...(continue configure HDCP1.4 key through address 0xFDF10000+i*4)				
0xFDF10000+288*4	hdmirx_hdcp14_key288[7:0]	0x0		Configure HDCP1.4 key288
0XFD586054[14]	sgrf_con_hdmirx_apbs_sel	0x0	0x1	Enable hdmirx hdcp1.4
0x24[10]	hdcp_enable	0x0	0x1	Mux hdcp1.4 sram read enable for hdmirx internal interface

The driver can read the HDCP1.4 key use the same address as write address. HDCP1.4 key SRAM is 289 byte size, so the offset address must multiply 4.

(2)configure decrypt_seed_en and decrypt_seed

Table 25-7 HDCP1.4 configuration operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x2f0[2:1]	[1]: hdcp_ovr_en [2]: hdcp_ovr_value	0x0	0x1	hdcp_ovr_value is 1'b0 means HDCP1.4
0x24[10]	hdcp_enable	0x0	0x1	Configure HDCP enable
0x290[0]	key_decrypt_en_qst	0x0	0x1	Configure key_decrypt_seed_en for decrypt seed
0x290[5:4]	eess_oess_sel_qst	0x0	0x2	EESS/OESS selection
0x290[11:8]	oess_ctl3_thr_qst	0x7	0x7	OESS number of CTL3=1 threshold to consider ENC_EN on OESS, it may be changed.
0x290[19:16]	eess_ctl_thr_qst	0xe	0xe	EESS number of CTL=1001 threshold to consider ENC_EN on EESS, it may be changed.
0x290[25]	fasti2c_qst	0x0	0x0	If fasti2c_qst is configured 1'b1, it means that the DDC bus support 400KHz transfers. If fasti2c_qst configure 1'b0, it means that the DDC bus just support 100KHz transfers.

SFR Address	SFR Name	Default Value	Setting Value	Description
0x290[26]	features_1dot1_qst	0x0	0x0	HDCP1.4 1.1 Features capability. It is disable.
0x290[27]	fastreauth_qst	0x0	0x0	Bcaps Fast Re-authentication value. It is disable.
0x290[28]	repeater_qst	0x0	0x0	HDCP Repeater capability value. It is disable.

When configure key_decrypt_seed, HDMIRX will read HDCP1.4 key SRAM and decrypt the HDCP1.4 encrypted key with the seed.
(3)configure HDCP2

Table 25-8 HDCP2 configuration operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x2f0[2:1]	[1]: hdcp_ovr_en [2]: hdcp_ovr_value	0x0	0x3	hdcp_ovr_value is 1’b1 means HDCP2

It is simple for HDMIRX controller configuration when in HDCP2 operation.

25.6.1.4 Pull up HPD

Table 25-9 HPD operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x50[0]	hpd	0x0	0x1	Pull up the HPD signal for HDMITX reading EDID and sending video

25.6.1.5 Configure SCDC

Table 25-10 Configure SCDC operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x580[0]	powerprovided	0x0	0x1	+5V power provided for SCDC operation
0x5c0[7:0]	scdc_sinkversion_qst	0x0	0x1	Configure SCDC sink version
0x164[7:0]	i2c_sda_in_hold_value_qst	0x0	0x15	Configure I2C SDA_IN hold time value(expressed in number of irefclk cycle)
0x164[15:8]	i2c_sda_out_hold_value_qst	0x0	0x80	Configure I2C SDA_OUT hold time value(expressed in number of irefclk cycle)

25.6.1.6 Configure PHY

HDMIRX controller has one cr_para interface to configure HDMIRX phy, and driver can configure the HDMIRX controller register to configure HDMIRX phy.

Table 25-11 HDMIRX phy configuration operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0xc0[0]	phy_reset	0x1	0x1	Reset HDMIRX phy
Wait for 100us				
0xc0[0]	phy_reset	0x1	0x0	Release HDMIRX phy reset
0xe0[1:0]	phycreg_cr_para_selection_mode	0x0	0x3	This signal control the selection between the PHY JTAG and cr_para interface. The driver select the cr_para interface here.
Read the [10]bit of SYS_GRF_SOC_STATUS1(0x384, The GRF base address is 0XFD58C000), until this bit is 1'b1. This signal sram_init_done indicates the HDMIRX phy SRAM initial done.				
Write the [1]bit of SYS_GRF_SOC_CON1(0x304), configure 1'b1. This signal is HDMIRX phy sram_ext_ld_done signal, it is the handshake signal with sram_init_done signal				
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x20c7	Configure the first write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x0	Configure the first write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the first wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the second write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the second write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the second wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the third write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x3	Configure the third write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)

SFR Address	SFR Name	Default Value	Setting Value	Description
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the third wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 4th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the 4th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 4th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 5th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the 5th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 5th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 6th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x3	Configure the 6th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 6th wdata finish

SFR Address	SFR Name	Default Value	Setting Value	Description
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 7th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the 7th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 7th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 8th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x0	Configure the 8th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 8th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 9th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x1	Configure the 9th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 9th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 10th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x0	Configure the 10th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)

SFR Address	SFR Name	Default Value	Setting Value	Description
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 10th wdata finish
0xc0[1]	phy_pddq	0x1	0x0	Configure phy pddq 1'b0, and HDMIRX phy begins to enable its reference voltage generator and performs termination calibration.
Read 0xc8[0] bit, it is pddq_ack, read this register bit, wait and until it is 1'b0. It indicates pddq finish.				
0xc0[8]	phy_hdmi_disable	0x1	0x0	Configure phy hdmi_disable 1'b0, and HDMIRX phy begins to enter initialization sequence, and phy begins to power up circuit calibrations.
Read 0xc8[1] bit, it is hdmi_disable_ack, read this register bit, wait and until it is 1'b0. It indicates power up finish.				
0xc0[11:9]	reffreq_sel	0x0	0x0	Select HDMIRX phy cr_para_clk frequency. Default value is 24M. 3'b000: 24M 3'b001: 25M 3'b010: 27M 3'b011: 48M 3'b100: 50M 3'b101: 54M 3'b110: 100M
0xc0[15]	rxdata_width	0x0	0x1	Configure the rxdata width. 1'b0 is 20bit valid, 1'b1 is 40bit valid. And this version is quad pixel, so it is 40bit valid.
Read 0x58c[1] bit, it is scdc_tmdsbitclkratio, before the HDMITX sends >= 3.4Gbps channel video, and it will be configured 1'b1 by the DDC bus.				
0xc0[16]	tmds_clk_ratio	0x0	0x0	If the HDMIRX phy channel bit rate is >= 3.4Gbps, for example 4k resolution, tmds_clk_ration must be configured 1'b1.

25.6.1.7 Configure controller

After HDMIRX phy power up, and has recovered the clock, and next the driver should

configure the video process, audio process, and CEC process.
(1)video process

Table 25-12 video process configuration operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x5018[31:0]	mainunit_0_int_clear	0x0	0xffffffff	Clear all the mainunit0 interrupt
0x5014[31:0]	mainunit_0_int_mask_n	0x0	0xffffffff	Enable all the mainunit0 interrupt
0x28[31:0]	global_timer_ref_base	0x198b7b25	0x198b7b25	It is irefclk frequency value. The default value is 428571429Hz(428.57MHz), there is another frequency 396MHz. The irefclk will count for 1ms/10ms/100s/1s, and will generate the corresponding pulse for many logic.
Wait for timer_base_locked_irq, which is the [26]bit of mainunit_0_int, and clear this interrupt status.				
0x60[14:0]	audclk_stable_freq_margin	0x1	0x1	Configure the audio clock allowed frequency variation(in kHz) for clock lock (audclk_locked_st), this field can’t exceed 7% of the nominal clock frequency.
0x60[30:16]	tmdsqpclk_stable_freq_margin	0x1	0x2	Configure the tmdsqpclk clock allowed frequency variation(in kHz) for clock lock(tmdsqpclk_locked_st), this field can’t exceed 7% of the nominal clock frequency.
0x5018[31:0]	mainunit_0_int_clear	0x0	0xffffffff	Clear all the mainunit0 interrupt
0x5014[31:0]	mainunit_0_int_mask_n	0x0	0xffffffff	Enable all the mainunit0 interrupt
0x5028[31:0]	mainunit_1_int_clear	0x0	0xffffffff	Clear all the mainunit1 interrupt
0x5024[31:0]	mainunit_1_int_mask_n	0x0	0xffffffff	Enable all the mainunit1 interrupt
0x5038[31:0]	mainunit_2_int_clear	0x0	0xffffffff	Clear all the mainunit2 interrupt
0x5034[31:0]	mainunit_2_int_mask_n	0x0	0xffffffff	Enable all the mainunit2 interrupt
0x5048[31:0]	avpunit_0_int_clear	0x0	0xffffffff	Clear all the avpunit0 interrupt

SFR Address	SFR Name	Default Value	Setting Value	Description
0x5044[31:0]	avpunit_0_int_mask_n	0x0	0xffffffff	Enable all the avpunit0 interrupt
0x5058[31:0]	avpunit_1_int_clear	0x0	0xffffffff	Clear all the avpunit1 interrupt
0x5054[31:0]	avpunit_1_int_mask_n	0x0	0xffffffff	Enable all the avpunit1 interrupt
0x5088[31:0]	pkt_0_int_clear	0x0	0xffffffff	Clear all the pkt0 interrupt
0x5084[31:0]	pkt_0_int_mask_n	0x0	0xffffffff	Enable all the pkt0 interrupt
0x5098[31:0]	pkt_1_int_clear	0x0	0xffffffff	Clear all the pkt1 interrupt
0x5094[31:0]	pkt_1_int_mask_n	0x0	0xffffffff	Enable all the pkt1 interrupt
0x50a8[31:0]	pkt_2_int_clear	0x0	0xffffffff	Clear all the pkt2 interrupt
0x50a4[31:0]	pkt_2_int_mask_n	0x0	0xffffffff	Enable all the pkt2 interrupt
0x50c8[31:0]	scdc_int_clear	0x0	0xffffffff	Clear all the SCDC interrupt
0x50c4[31:0]	scdc_int_mask_n	0x0	0xffffffff	Enable all the SCDC interrupt
0x50d8[31:0]	hdcp_int_clear	0x0	0xffffffff	Clear all the HDCP interrupt
0x50d4[31:0]	hdcp_int_mask_n	0x0	0xffffffff	Enable all the HDCP interrupt
0x5108[31:0]	cec_int_clear	0x0	0xffffffff	Clear all the CEC interrupt
0x5104[31:0]	cec_int_mask_n	0x0	0xffffffff	Enable all the CEC interrupt
0x210[1:0]	scramble_en_sel_qst	0x0	0x1	HDMI2.0 Scrambling Enable selector. 2’b00: SCDC control(default) 2’b01: Auto-detect. Enable descrambling when scrambled data is detected. 2’b10: Forces descrambling disable 2’b11: Forces descrambling enable
0x760[14:0]	ced_chlockmaxer_qst	0x0		Maximum errors detected within a period of 10ms to consider that the channel is locked. A channel shall be deemed to be locked if it accumulates a maximum of one error per Mcsc over the 10ms period.For example,if itmdsqpclk is 148.5M(4pixel rate),it is 594,if itmdsqpclk is 37.125M(4pixel rate),it is 149.
0x760[24]	ced_ctrlchecken_qst	0x1	0x1	Enable Character Error Checking during Control Period

SFR Address	SFR Name	Default Value	Setting Value	Description
0x760[25]	ced_gbchecken_qst	0x1	0x1	Enable Character Error Checking during Guard Bands
0x760[26]	ced_dataischecken_qst	0x1	0x1	Enable Character Error Checking during Data Island
0x760[27]	ced_viddatachecken_qst	0x1	0x1	Enable Character Error Checking during Video Data

(2)audio process

Table 25-13 audio process configuration operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x480[1]	i2s_en	0x0	0x0	Disable I2S enable
0x480[2]	spdif_en	0x0	0x0	Disable S/PDIF enable
0x5054[12]	aud_fmt_chg_mask_n	0x0	0x0	Mask audio format change interrupt
0x24[9]	audio_enable	0x0	0x0	Disable audio enable
Wait pktdec_acr_rcv_irq interrupt([3]bit of 0x50a0, pkt_2_int_status register), and read acr_packet(0x1100~0x111c).				
Extract cts[19:0] = {acr_sub_packet1[3:0], acr_sub_packet2[7:0], acr_sub_packet3[7:0]}. Extract n[19:0] = {acr_sub_packet4[3:0], acr_sub_packet5[7:0], acr_sub_packet6[7:0]}. reg 0x1104 is {acr_sub_packet3[7:0],acr_sub_packet2[7:0],acr_sub_packet1[7:0], acr_sub_packet0[7:0]},that cts[19:0] = {0x1104[11:8],0x1104[23:16],0x1104[31:24]}; reg 0x1108 is {acr_sub_packet7[7:0],acr_sub_packet6[7:0],acr_sub_packet5[7:0], acr_sub_packet4[7:0]},that n[19:0] = {0x1108[3:0],0x1108[15:8],0x1108[23:16]};				
Read tmdsqpclk value. Read 0x84[19:0], it is tmdsqpclk, it is tmdsclk/4(tmdsclk is the TMDS clock frequency of the single pixel rate , for example if the input resolution is 1080p, the tmdsclk is 148.5M, and tmdsqpclk is 148.5M/4=37.125M)				
Calculate audio clock frequency. Iaudclk = (tmdsqpclk*4)*n/cts. Calculate audio sample frequency fs = iaudclk/128.				
0x140[0](CRU_CLKSEL_CON140)	clk_hdmirx_aud_sel	0x0	0x1	Audio clock selection, select clk_hdmirx_aud_frac.
0x139[31:0](CRU_CLKSEL_CON139)	hdmirx_aud_frac_div	0x0		Configure iaudclk frequency fractional division coefficient. The audio clock source is 1188M, if the iaudclk is 6.144M, 1188/6.144 = 193.36. and 1/193.359 = 100/19336, so [31:16] = 0x64(100), [15:0] = 0x4b88(19336)
Wait pktdec_audif_rcv_irq interrupt([13]bit of 0x50a0, pkt_2_int_status register), and read audif_packet(0x1240~0x125c).				

SFR Address	SFR Name	Default Value	Setting Value	Description
Wait pktdec_amd_rcv_irq interrupt([9]bit of 0x50a0, pkt_2_int_status register), and read audio_metadata_packet(0x11c0~0x11dc).				
Extract channel count = audif_sub_packet1[2:0]. And driver can also extract other information from this audio_infoframe packet.				
0x24[9]	audio_enable	0x0	0x1	Configure audio enable
0x480[1]	i2s_en	0x0	0x0/0x1	If audio format is I2S, and enable i2s_en, configure 1'b1
0x480[2]	spdif_en	0x0	0x0/0x1	If audio format is S/PDIF, and enable spdif_en, configure 1'b1
0x468[9:0]	afifo_thr_pass_qst	0x0		Configure audio FIFO pass threshold level. For example, driver configures afifo_thr_pass_qst[9:0] = 10'd4, if The HDMIRX receives 16 audio packet, and will begin to read the HDMIRX audio FIFO, and begin to output the I2S/S/PDIF.
0x46c[25:16]	afifo_thr_low_qst	0x0		Configure audio FIFO low threshold level. For example, driver configures afifo_thr_low_qst[9:0] = 10'd2, if The HDMIRX audio FIFO has left 8 audio packet, and it will indicate HDMIRX audio FIFO is almost read empty, and we must adjust audio clock, or HDMIRX has lost the audio sample.
0x46c[9:0]	afifo_thr_high_qst	0x0		Configure audio FIFO high threshold level. For example, driver configures afifo_thr_low_qst[9:0] = 10'd64, if The HDMIRX audio FIFO has 256 audio packet, and HDMIRX has received too many audio packet, driver should adjust audio clock.
0x470[25:16]	afifo_thr_mute_low_qst	0x0		Configure audio FIFO mute low threshold level. For

SFR Address	SFR Name	Default Value	Setting Value	Description
				example, driver configures afifo_thr_low_qst[9:0] = 10’d1, if The HDMIRX audio FIFO has left 4 audio packet, and it will mute audio output.
0x470[9:0]	afifo_thr_mute_high_qst	0x0		Configure audio FIFO mute high threshold level. For example, driver configures afifo_thr_high_qst[9:0] = 10’d100, if The HDMIRX audio FIFO has received 400 audio packet, and it will mute audio output.
0x464[0]	afifo_init_p	1’b0	1’b1	Configure audio FIFO initialization pulse, and audio FIFO address pointers will be reset, and restart to receive audio data. If aud_fifo_overflow/aud_fifo_underflow, driver should also configure this bit.
0x5054[12]	aud_fmt_chg_mask_n	0x0	0x1	unmask audio format change interrupt

Driver should adjust iaudclk frequency in an interval of time, because HDMITX source audio clock frequency may be different from HDMIRX sink audio clock frequency. If driver ignores this audio clock difference, the audio FIFO may be read empty or write full. So driver must adjust iaudclk frequency in a fixed time intervals.

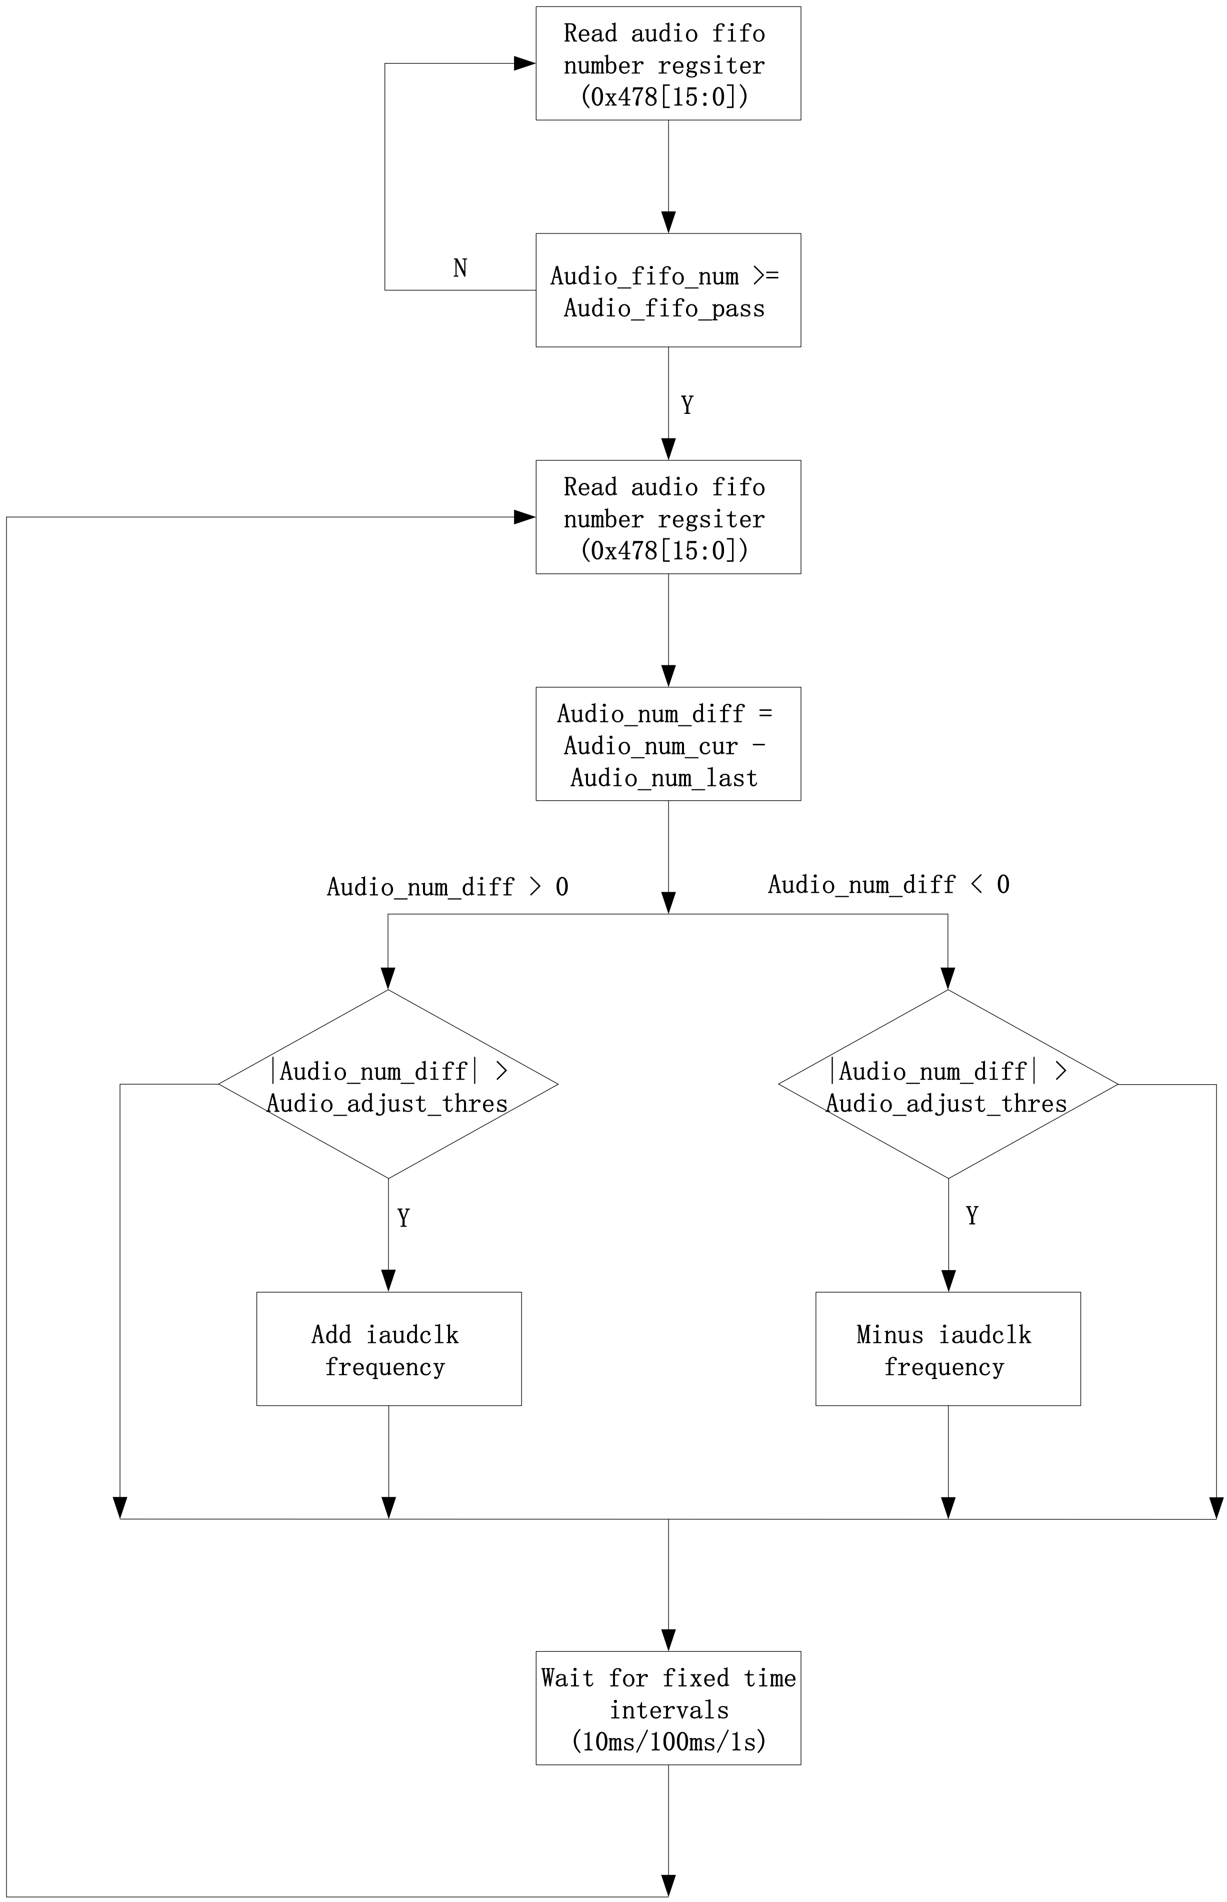

Fig. 25-21 audio clock adjust flow

(3)video resolution change process
If HDMITX changes the video resolution, and HDMIRX phy will lock again, and driver should detect this change event.

Table 25-14 video resolution change operation

SFR Address	SFR Name	Default Value	Setting Value	Description
wait tmdsqpclk_off_chg_irq interrupt(0x5010[5]), if this interrupt happens, it indicates that tmdsqpclk has been changed.				
Read the 0x84[19:0], it is tmdsqpclk_freq, it indicates the tmdsqpclk frequency.				
wait tmdsvalid_stable_chg_irq(0x5030[1]), It indicates that TMDS valid has been changed.				
Configure HDMIRX phy process and HDMIRX controller process again.				

(4)CEC operation
After CEC IOMUX configuration, driver can perform CEC operation, include sending process and receiving process.

Table 25-15 CEC sending operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x2020[3:0]	cec_tx_count	0x0		Configure the frame message size in bytes.
0x2024[31:0]	cec_tx_data3_0	0x0		Configure CEC tx data byte0-byte3. cec_tx_data byte0 is header block: {Initiator_address[3:0],Destination_address[3:0]}
0x2028[31:0]	cec_tx_data7_4	0x0		Configure CEC tx data byte4-byte7
0x202c[31:0]	cec_tx_data11_8	0x0		Configure CEC tx data byte8-byte11
0x2030[31:0]	cec_tx_data15_12	0x0		Configure CEC tx data byte12-byte15
0x2000[0]	frame_send_set_p	0x0	0x1	Configure to trigger CEC sending a frame as an initiator
Wait cectx_done_irq(0x5100[0]), If this interrupt triggers, it indicates that one frame has been send successfully. Or the driver will receive one or more of these interrupt below. cectx_nack_irq(0x5100[1]) cectx_arblost_irq(0x5100[2]) cectx_line_err_irq(0x5100[3]) cectx_nretransmit_fail_irq(0x5100[4]) cectx_frame_discarded_irq(0x5100[5])				

The following sequence describes the process of CEC receiving one frame.

Table 25-16 CEC receiving operation

SFR Address	SFR Name	Default Value	Setting Value	Description
Wait the interrupt cecrx_eom_irq(0x5100[11]bit), and if this interrupt triggers, it indicates that CEC has received one frame.				

SFR Address	SFR Name	Default Value	Setting Value	Description
Read the cec_rxbuffer_cnt(0x2040[3:0]), it is the received frame message size in bytes, including Header and Data blocks.				
Read the cec_rx_data3_0(0x2044). Read the cec_rx_data7_4(0x2048). Read the cec_rx_data11_8(0x204c). Read the cec_rx_data15_12(0x2050).				
0x2054[0]	locked_rxbuffer_clr_p	0x0	0x1	Configure this bit to allow the controller to receive a new incoming message.

25.6.1.8 Configure DMA

The following sequence describes the process of DMA.

Table 25-17 HDMIRX DMA operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x4410[0]	hdmirx_axi_error_int_clear_en	0x0	0x1	Clear hdmirx_axi_error_int
0x4410[1]	fifo_underflow_int_clear_en	0x0	0x1	Clear fifo_underflow_int
0x4410[2]	fifo_overflow_int_cleare_en	0x0	0x1	Clear fifo_overflow_int
0x4410[3]	timing_mismatch_int_clear_en	0x0	0x1	Clear timing_mismatch_int
0x4410[4]	false_frame_end_int_clear_en	0x0	0x1	Clear false_frame_end_int
0x4410[5]	last_frame_axi_unfinish_int_clear_en	0x0	0x1	Clear last_frame_axi_unfinish_int
0x4410[6]	hdmirx_lock_disable_int_clear_en	0x0	0x1	Clear hdmirx_lock_disable_int
0x4410[7]	hdmirx_dma_idle_int_clear_en	0x0	0x1	Clear hdmirx_dma_idle_int
0x4410[8]	line_flag_int_clear_en	0x0	0x1	Clear line_flag_int
0x440c[8:0]	int_enable	0x0	0x1ff	Enable all the interrupt
Read the video information. Read 0x4434 register for hdmirx_width/hdmirx_height, Read 0x4458 register for HDMIRX color_depth/format.				
0x441c[0]	reg_mirror_en	0x0	0x1	Register mirror enable. It make the register act in next frame start
0x4400[15:12]	ddr_store_format	0x0		Configure the DDR store format corresponding to format. The driver may have to configure alpha_value/

SFR Address	SFR Name	Default Value	Setting Value	Description
				dummy_value/padding_position_en
0x4404[31:0]	frame_addr_y	0x0		Configure RGB/Y component store address
0x4408[31:0]	frame_addr_uv	0x0		Configure UV component store address
0x4414[9]	uv_swap_en	0x0	0x1/0x0	If the format is YCbCr422, it should be configured 1’b0, or it is 1’b1.
0x4414[4]	vsync_toggle_en	0x0	0x1	Invert vsync polarity (optional)
0x4414[5]	hsync_toggle_en	0x0	0x1	Invert hsync polarity (optional)
0x4420[6:0]	vic_value	0x0		Configure vic_value for timing mismatch detection
0x4414[2]	timing_mismatch_int_detection_en	0x0	0x1	Enable timing mismatch detection
0x4418[11:0]	lock_frame_num	0x0	0x2	After hdmirx_lock pull up, and the first two frame will be abandoned as unvalid frame for timing detection and other information detection such as format, color_depth, vic_value.
0x4400[0]	abandon_en	0x0	0x1	When abandon_en enable, if hdmirx_lock is 1’b0, this frame will be treated as unvalid frame and will be abandoned.
Read 0x4454[3]bit(hdmirx_lock), if it is 1’b1, it indicates that HDMIRX three channel have been locked and the input TMDS data is valid.				
0x4414[1]	hdmirx_dma_en	1’b0	1’b1	DMA begins to receive data from HDMIRX controller and begins to store FIFO
0x4418[31:16]	line_flag_num	0x0		If HDMIRX has received line_flag_num lines, and it will trigger line_flag_int interrupt, and It indicates there is almost line_flag_num lines in DDR.
Wait line_flag_int interrupt(0x4410[8]bit), and driver begins to read HDMI data from DDR.				

Chapter 26 HDCP2.3 Controller

26.1 Overview

The HDCP2.3 controller is an Embedded Security Module (ESM). This module is a self-contained module that can be integrated with HDMI and DP cores to ensure DCP robustness rules for HDCP.
The ESM has a small MCU inside. It reads ESM Image for operation through the AXI interface.
The HDCP2.3 Controller supports following features:

- Supports HDCP Revision 2.3
- Bus Interface Features:
  - An AXI port for instruction fetch and shared R/W memory
  - An Identity Interface for secret keys used to secure the ESM
  - An Entropy Interface to a True Random Number Generator(TRNG)
  - A Host Port Interface (APB Interface) for an external host processor to send commands and get status from the ESM.
- Support configurable multi-port, up to six ports, each port can be configurable for HDMI or DP.
- Support configurable Transmitter/Receiver, it can be individually configured for HDMI and/or DP operation
- The HDMI portion of the port supports the following features:
  - HDMI video data and associated control
  - I2C sideband interface connected with the local HDMI I2C interface (shared with DDC) for access to the remote end of the HDCP link
  - A GPIO interface for direct hardware signaling between the ESM and the controller
  - Support HDMI streams up to 48Gbps (maximum data cipher throughput of 42.7Gbps for HDMI operation)
- The DP portion of the port contains the following features:
  - TX and RX AUX FIFO interfaces for access to the remote end of the HDCP link
  - AES keystream FIFO interface
  - A GPIO interface for direct hardware signaling between the ESM and the controller
  - State interface to indicate to the controller the ESM state, and to ensure the controller is synchronized to the ESM regarding its state
  - A Debug interface to allow user-defined controller signals to be captured and logged by the ESM
  - Support DP data rates up to 32.4Gbps (maximum data cipher throughput of 25.92Gbps for DP operation)
- MMU:
  - 4k/64k page size
  - TLB pre-fetch

26.2 Block Diagram

The ESM executes firmware from system memory external to the ESM which must be processed with the supplied tools as the firmware image is encrypted to the keys you created to present on the ID Interface. A host library (supplied in source code) is compiled with your application software running on the host processor to send commands to the ESM and monitor its status for results. The ESM has two types of instantiations, one instantiation has one HDMIRX interface and two HDMITX interface, and another instantiation has two DPTX interface. The following figure illustrates the HDMI controller’s connection with external interfaces.

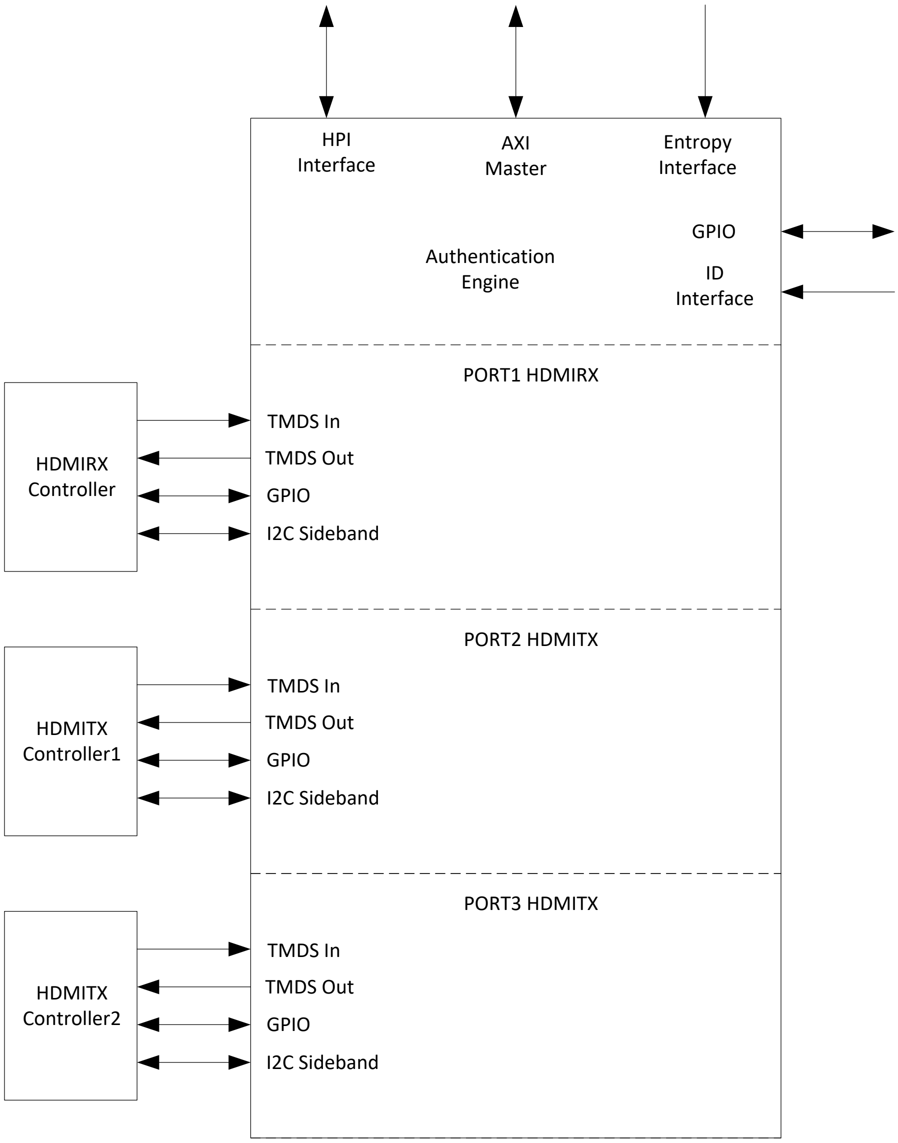

Fig. 26-1 HDCP2.3 with HDMI Block Diagram

The following figure illustrates the DP controller’s connection with external interfaces.

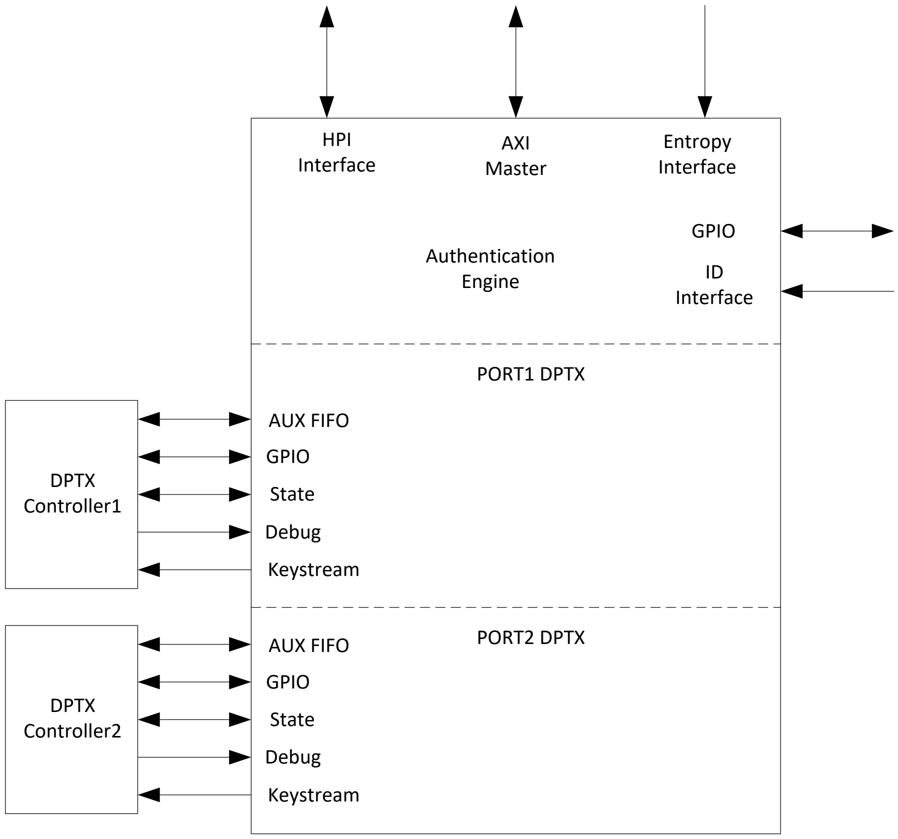

Fig. 26-2 HDCP2.3 with DP Block Diagram

The Embedded Security Module (ESM) is composed of two parts:

- The Authentication Engine (AE) contains a controller that runs the HDCP authentication process.
- The Content Encryption Engine (CEE) is an ESM component that encrypts data for the HDCP transmitter.

The following figure represents how the ESM is typically integrated in SOC.

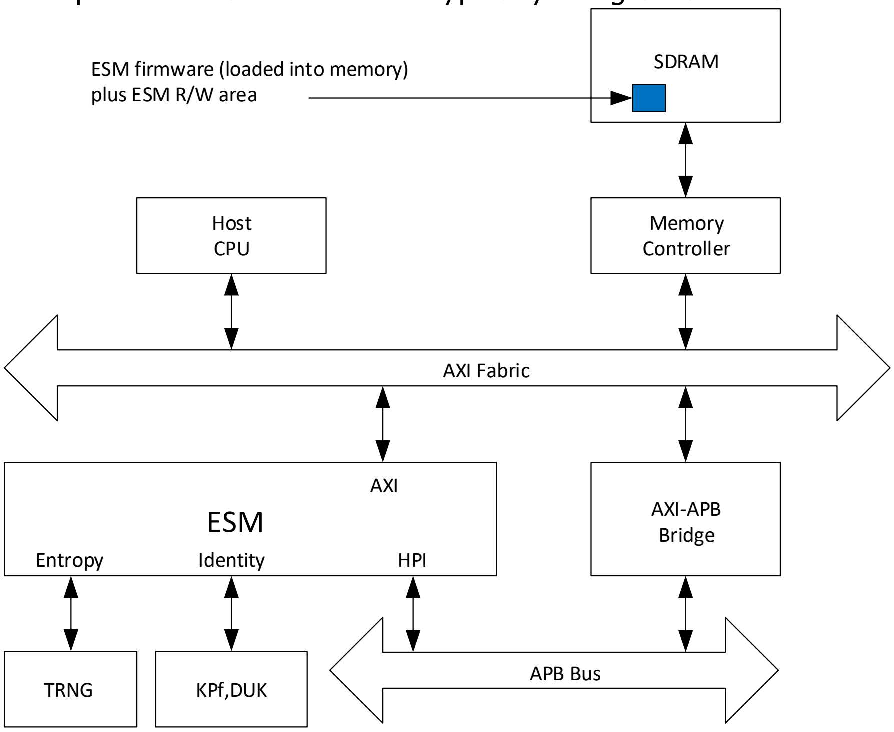

Fig. 26-3 Typical ESM Integration in SOC

26.3 Function Description

26.3.1 AXI interface

The ESM requires continuous access to its firmware for operation, which is accessed through the AXI interface and usually placed a reserved portion of SDRAM. It also uses this interface for communicating messages with the external host processor to pass content such as SRM data, pairing information, and debug/log information.

The ESM requires access to relatively fast and low latency external memory as it randomly accesses its firmware periodically to perform operations. For AXI transactions the average initial access latency may be up to 1000ns.

Note: *The ESM still functions in higher latency systems; however, the ESM may experience intermittent errors, such as failing to authenticate, as there are fixed timeout requirements during the authentication process which must be met. A system with persistent high latency memory accesses may prevent the ESM from fetching its firmware in a timely fashion resulting in protocol timeouts. Following Table summarizes the various requirements the ESM places on the memory, assuming an AXI interface clock of 428(396) MHz and an average latency of 1000 ns.*

Table 26-1 ESM Memory Access

Phase	**Duration (ms)**	**Appropriate Badwidth (Mbytes/sec)**	**Description**
Bootup	100(maximum)	5.0	Initial startup of ESM to Idle state.
TX Authentication	525ms	1.5	ESM transmitter authentication phase including capability check.
RX Authentication	525ms	1.0	ESM receiver authentication phase.
Idle, authenticated	n/a	< 1.0, 4.0	ESM is either in the Idle state waiting to start authentication or in the authenticated state. The second number is when the ESM has debug logging enabled.

The external host memory required by the ESM must be physically contiguous and allocated before the ESM can be started. The ESM Image and R/W memory buffer addresses must be 4K aligned otherwise the ESM cannot properly access the memory. Following table describes the requirements.

Table 26-2 ESM host memory requirements

Size (bytes)	**ESM Access**	**Purpose**
~256K	Read Only	Contains the ESM firmware. This size varies depending on the particular configuration of the ESM you are using.
20K + p*n*256 (TX) (p is the number of transmitters and n is the number of paired devices supported)	Read / Write	Bidirectional communication buffer to exchange data with the Host. Messages such as SRM updates, pairing data, and logging information are placed in this area by the host and the ESM. The number of pairs supported by this parameter is defined in the configuration file.

The provided ESM host application library allocates a small amount of the processor's memory space, which is accessible by the ESM. Communication with this interface is provided by the ESM host application library.

26.3.2 HPI Interface

The external host issues commands to the ESM through the HPI which supports a limited set of commands such as:

- Enabling and disabling of security on the link
- Enabling debugging/logging
- Retrieving pairing information

- Updating the SRM
- ESM status

Communication with this interface is provided by the ESM host application library.

26.3.3 APB interface (HPI)

The external host issues commands to the ESM through the HPI. The ESM supports a limited set of commands such as:

- Enabling and disabling of content security on the link
- Enabling debugging/logging
- Retrieving pairing information
- Updating the SRM
- ESM status

The external host must issue a SRM list to the ESM when one is available, according to the requirements of DCP LLC.
Communication with this interface is provided by the ESM host application library.

26.3.4 Identity Interface

This interface contains the secret keys the ESM requires to implement its security. The KPf and
DUK signals on this interface must be secure from tampering and external user observation as it is used by the ESM to create session keys and other cryptographic secrets required for operation.
When integrating the ESM into your design, you must take to ensure that these requirements are met otherwise the operation of the ESM can be compromised.

Table 26-3 Secure Key for ESM

Description	Purpose
Platform Key (KPf)	A customer created secret random key used to decrypt the ESM firmware. The KPf is intended to be common across a deployed model of a product.
Device Unique Key (DUK)	A customer created secret random key used to decrypt the DCP key data and to encrypt and decrypt content unique to the ESM such as the pairing message content. It is strongly recommended this value should be unique for every unit.
Device Number (Devnum)	This is a non-secret device number and is currently not used.

Note: *The KPf and DUK must be kept confidential as exposing either one compromises the security of the ESM.*

26.3.5 Entropy Interface

This interface connects to a True Random Number Generator (TRNG). The nonce data on this interface must be secure from tampering and external user observation as it is used by the ESM to create session keys and other cryptographic secrets required for secure operation.

Table 26-4 Entropy Interface

Signal	Description
I_ent_val[127:0]	This is the nonce data from the TRNG. The value is used to seed the ESM's PRNG which is used to generate keys for the authentication process and session keys. The value must be truly random and not generated by another PRNG, as per the HDCP for HDMI specification, Section 2.13 (Random Number Generation). Note the requirements for DP are the same.
O_ent_gen	If the ESM pull up this signal and will make TRNG generate n new I_ent_val[127:0].
I_ent_vld	I_ent_val valid signal, if it is 1'b1, it indicates that I_ent_val[127:0] is valid for ESM.

The ESM may request the generation of a new nonce by asserting the O_ent_gen signal. This signal involves an automatic handshake between the two cores and normally remains asserted until the TRNG for ESM responds lowering the I_ent_vld signal. At this point the

ESM normally acknowledges that the new request is underway by withdrawing the O_ent_gen signal. At this point the TRNG for ESM is generating a new nonce. When the nonce is stable, the TRNG for ESM raises the I_ent_vld signal indicating that the ESM can safely read the nonce value from the I_ent_val port. The ESM nonce interface waveform is in the figure below.

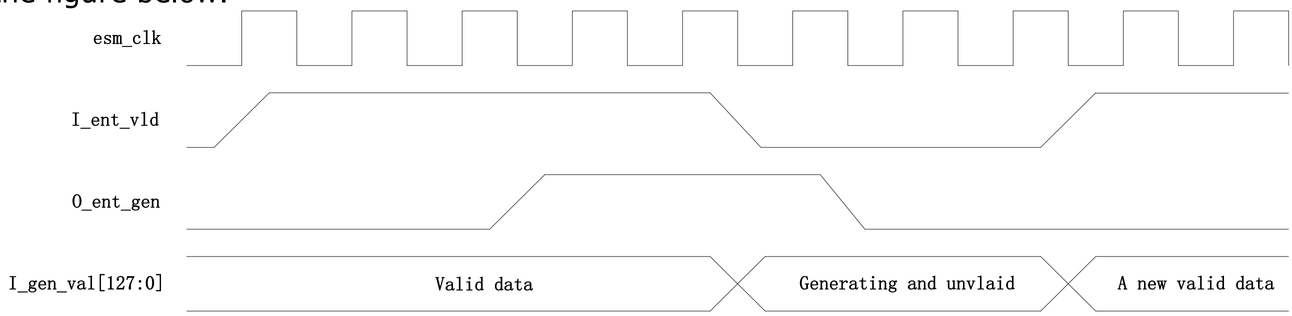

Fig. 26-4 ESM nonce interface

26.3.6 GPIO Interface

This interface contains a number of general purpose inputs and outputs which can be used by the host to monitor the status of the ESM.

26.3.7 HDMI Interface

The HDMI interface contains logic to apply content protection to the Data and Video Islands as the TMDS data passes through the ESM.

Table 26-5 HDMI Interface

Description	**Purpose**
I2C sideband	I2C sideband interface connected with HDMIRX/HDMITX I2C controller, and use the HDMIRX/HDMITX DDC interface for HDCP protocol communication with the remote device. It is mapped by the controller onto the DDC interface.
GPIO	Direct signals between the controller and the ESM to indicate the status of the ESM to the controller, and to signal the ESM
TMDS In	TMDS data output from the controller. For TX this is the unencrypted data, for the RX this is the encrypted data.
TMDS Out	TMDS data input to the controller. For a TX this is the encrypted data, for the RX this is the decrypted data.

The DP interface provides a cipher key stream to the controller which is responsible for XORing it onto the appropriate data symbols as identified in the HDCP for DP Specification, Section 3 (HDCP Encryption).

Table 26-6 DP Interface

Description	**Purpose**
AUX FIFO	Separate Ingress and Egress FIFOs for HDCP protocol communication with the remote device, mapped by the controller onto the AUX channel.
GPIO	Direct signals between the controller and the ESM to indicate the status of the ESM to the controller, and to signal the ESM
State	Signals from the ESM to the controller to indicate its state, with signals reflected back from the controller to the ESM to ensure the controller's state is synchronized with the ESM.
Debug	A general purpose debug port which allows the ESM to capture arbitrary signals from the controller for logging.
Keystream	A stream of AES keys used to decrypt the content data.

26.3.8 HDCP2.3 Controller Behavior

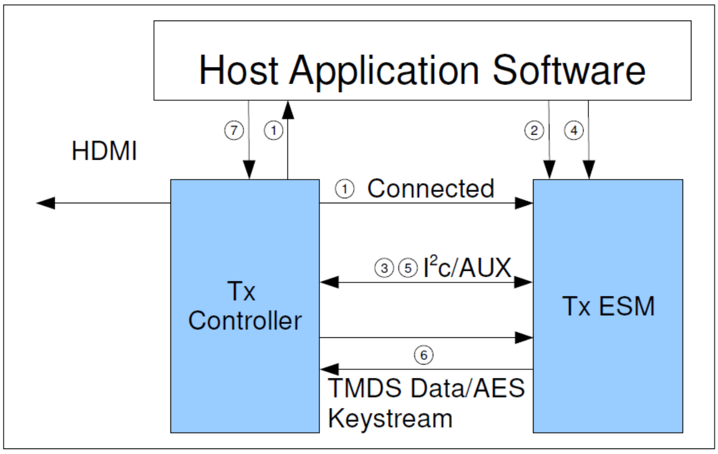

Fig. 26-5 Transmitter Authentication

If HDCP2.3 controller is a transmitter, it works as following steps:

1. The controller asserts the connected signal to the ESM. The application software receives the notification from the controller. For HDMI operation the ESM outputs a fixed pattern (the BSOD value) on the TMDS data output.
2. The application software issues the command HLC_HDCPTX_SetCapability which causes the ESM to perform a capability check with the receiver. Before this point in time the ESM does not know the capability of the RX so the port's capable GPIO output signal is not asserted.
3. The ESM queries the receiver. If the receiver does not support HDCP2.3 then the port's not_capable GPIO output is asserted. The application software should then check if the receiver supports HDCP1.4 (or no link protection) and take appropriate action; the ESM is no longer required. If the receiver supports HDCP2.3 then the capable GPIO output is asserted and the ESM transitions to a pre-authorized state. For HDMI operation this means unencrypted low value content is permitted on the video path (TMDS interface).
4. If the receiver supports HDCP2.3 the application software issues the command HLC_HDCP_Authenticate to the ESM. As a security feature the ESM enforces a timeout (set in the configuration file) after the receiver indicates it is HDCP2.3 capable to the time the command HLC_HDCP_Authenticate must be issued. If you exceed this time out you must repeat the process from step #2. (When the port is configured for HDMI it will switch its TMDS output back to the fixed pattern output).
5. The ESM initiates authentication with the receiver and successfully completes authentication (or not). The application software and the HDMI controller are appropriately notified (authenticated and authentication_failed outputs asserted accordingly).
6. If authentication is successful the ESM starts to encrypt the TMDS data (HDMI).
7. The application software can now send high value content securely on the link.

Following successful authentication the ESM periodically checks the status of the connected receiver. If a response is not received, or the receiver requests re-authentication the ESM immediately outputs a fixed pattern on the TMDS output (HDMI), asserts the outputs authentication_failed along with a reath_req, and returns to the Idle state. To re-authenticate you must call the function HLC_HDCP_Authenticate to drop authentication and then call the function again to start authentication.

26.3.9 HDCP2.3 Software Initialization

An external host controller (ARM Core or MCU) allocates memory, initializes the ESM, and enables the ESM controller. The general reset and startup sequence is:

a. Configure clocks for HDCP controller.

b. Load KPf & DUK from effuse to gasket.
c. The ESM reset is de-asserted and the ESM enters a reset state.
d. The host allocates contiguous memory for the firmware and R/W areas. The buffers are 4K aligned.
e. The host configures the ESM's HPI interface, defining the physical memory pointer for the
ESM firmware.
f. The host copies the ESM firmware from persistent storage to the firmware memory location.
g. The host enables the ESM controller, putting it in a running state. At this point the ESM initiates transactions on the AXI bus to fetch its firmware.
h. ESM asserts a GPIO to indicate it is booted to indicate it can accept commands. The status can also be monitored from the HPI interface.

The ESM host application library provides the startup sequence from step d through h.

26.3.10 Autostart

The autostart feature is an option which permits a transmitter or receiver port (configurable per port) on the ESM to autonomously take over the detection of a connection and run through the authentication process without intervention from the external host. In the event of an error the port automatically retries up to a specified number of attempts (configuration based) before idling requiring intervention from the host.

For a transmitter this feature automates the capability checking and authentication along with any re-authentication which may be required due to link errors. For a receiver this feature enables the port to immediately respond to authentication requests without host intervention.

26.3.11 Key Usage

There are two secrets, 128 bit keys you are responsible for creating for use by the ESM.

The Platform Key (KPf) is used by the ESM to decrypt its firmware. It is recommended this key be common for all ESMs deployed for a particular product as it permits a common (encrypted) firmware image to be deployed.

The Device Unique Key (DUK) is used by the ESM to protect secrets unique to the device such as HDCP receiver keys and locally generated data such as pairing information. Although it is not required, it is strongly recommended this key be unique for every different unit deployed in a product so that if the KPf is and DUK are compromised, device specific secrets for only that unit are exposed. Using a common DUK for all devices could permit device specific secrets for all devices to be exposed.

As shipped from the factory, the firmware cannot be used as-is and must be processed with tools that are provided with the ESM software package. Figure below illustrates the tools and the flow that are required to produce encrypted ESM firmware. You edit the firmware.aic file supplied with the firmware image and replace the factory test/simulation values with your secret KPf and DUK keys.

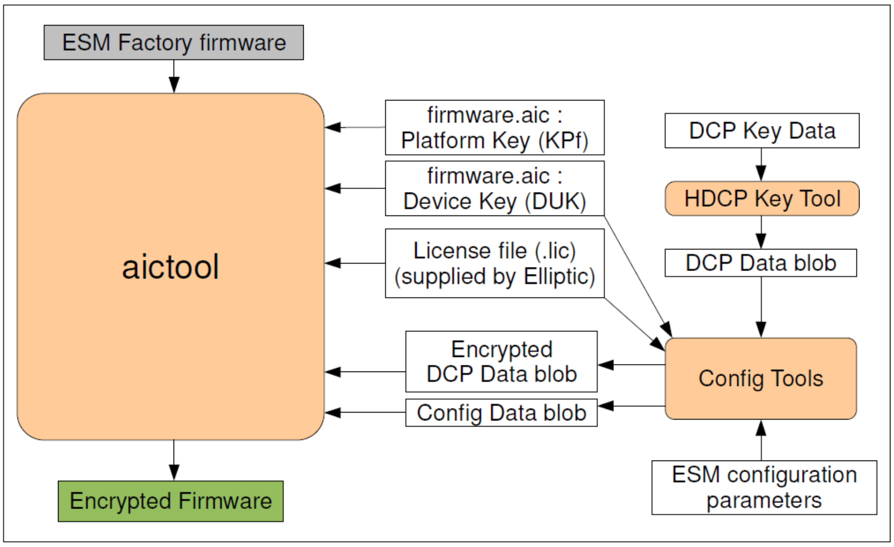

Fig. 26-6 ESM Image tool flow

The DCP TX key data is common for all transmitter ports whereas the DCP RX key data is unique for each receiver port.

To facilitate manufacturing it is highly desirable to build and deploy a common software image for all units. If ESM only contains transmitter ports then it is possible to do this, however if you also have receiver ports you are required by DCP to have a unique receiver key for each receiver in your design.

26.4 Register Description

26.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

26.4.2 HDCP2.3 Registers Summary

Name	Offset	Size	Reset Value	Description
FW_INFO_0	0x0008	W	0x00000000	Firmware Information 0
FW_INFO_1	0x000C	W	0x00000000	Firmware Information 1
HOST_IRQ_EN	0x0010	W	0x00000000	Interrupt enables
HOST_IRQ_STAT	0x0014	W	0x00000000	Interrupt Status
FW_ADDR	0x0020	W	0x00000000	Firmware Address
HOST_CTRL	0x002C	W	0x00000000	Host Control
HOST_MB_P0	0x0030	W	0x00000000	Host Mailbox Parameter 0
HOST_MB_P1	0x0034	W	0x00000000	Host Mailbox Parameter 1
HOST_MB_CTRL	0x0038	W	0x00000000	Host Mailbox Control
HOST_MB_OWN	0x003C	W	0x00000000	Host Mailbox Ownership

26.4.3 HDCP2.3 Detail Registers Description

FW_INFO_0

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	info Firmware version/info

FW_INFO_1
Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	info Firmware version/info

HOST_IRQ_EN
Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31	RW	0x0	glbl Global IRQ enable 1'b0: Disable irq enable 1'b1: Enable irq
30:22	RO	0x000	reserved
21	RW	0x0	err Error IRQ enable 1'b0: Disable irq enable 1'b1: Enable irq
20	RW	0x0	oob OOB IRQ enable 1'b0: Disable irq enable 1'b1: Enable irq
19:18	RO	0x0	reserved
17	RW	0x0	mb_rtn Mailbox return IRQ enable 1'b0: Disable irq enable 1'b1: Enable irq
16	RW	0x0	mb_msg Mailbox message IRQ enable 1'b0: Disable irq enable 1'b1: Enable irq
15:0	RW	0x0000	user User IRQ enable 16’h0: Disable irq enable 16’h1: Enable irq

HOST_IRQ_STAT
Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:22	RO	0x000	reserved
21	W1C	0x0	err Indicates the error status register has been written 1'b0: Inactive 1'b1: Active
20	W1C	0x0	oob Indicates the out-of-band status register has been written. 1'b0: Inactive 1'b1: Active
19:18	RO	0x0	reserved

Bit	Attr	Reset Value	Description
17	W1C	0x0	mb_rtn Indicates that the ESM has returned host mailbox ownership 1'b0: Inactive 1'b1: Active
16	W1C	0x0	mb_msg Indicates that the ESM has written a message to the mailbox 1'b0: Inactive 1'b1: Active
15:0	W1C	0x0000	user User defined interrupts triggered by writing to the USER_NOTIFY register. 16'h0: Inactive 16'h1: Active

FW_ADDR

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:12	RW	0x00000	ptr Pointer that controls the base address of the firmware image. This pointer is 4KB aligned. The pointer becomes RO and may not be modified after the HOST_CTRL/FW_VLD is written.
11:0	RO	0x000	reserved

HOST_CTRL

Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	WO	0x0	fw_vld The host may write this field with a "1" to start the ESM. All identity information must be available on the identity interface, the FW_ADDR register must be setup and the firmware must be loaded in the external memory prior to writing this register. 1'b0: Inactive 1'b1: Active

HOST_MB_P0

Address: Operational Base + offset (0x0030)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	param This is the lower 32 bits of the 64 bit arbitrary information corresponding to the current command to be passed through the host mailbox.

HOST_MB_P1

Address: Operational Base + offset (0x0034)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	param This is the upper 32 bits of the 64 bit arbitrary information corresponding to the current command to be passed through the host mailbox.

HOST_MB_CTRL

Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved

Bit	Attr	Reset Value	Description
15:0	RW	0x0000	cmd Writing this register sends a mailbox command to the ESM

HOST_MB_OWN

Address: Operational Base + offset (0x003C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	own This indicates ownership of the host mailbox. It is set by a write to the HOST_MB_CTRL register. It is cleared by the ESM after the mailbox command has been processed. The host mailbox registers must not be modified while the ESM owns the mailbox. When the ESM clears the bit, an MB_RTN interrupt is generated. 1'b0: Not-owned 1'b1: Owned

CPU_MB_P0

Address: Operational Base + offset (0x0040)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	param This is the lower 32 bits of the 64 bit arbitrary information corresponding to the current command passed through the cpu mailbox

CPU_MB_P1

Address: Operational Base + offset (0x0044)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RO	0x0	param This is the upper 32 bits of the 64 bit arbitrary information corresponding to the current command passed through the cpu mailbox

CPU_MB_CTRL

Address: Operational Base + offset (0x0048)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	RO	0x0000	cmd This register contains the cpu mailbox command from the ESM. When the ESM writes this register the host receives an MB_MSG interrupt

CPU_MB_OWN

Address: Operational Base + offset (0x004C)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	W1C	0x0	own This indicates the ownership of the CPU mailbox. It is set when the ESM writes a mailbox command to the CPU_MB_CTRL register. It is cleared by the host writing a "1" to this register 1'b0: Not-owned 1'b1: Owned

OOB_STAT

Address: Operational Base + offset (0x005C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	stat This register communicates out-of-band information to the host. When the register is written by the ESM, an OOB interrupt is generated.

ERR_STAT

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	stat This register communicates back to the host that a serious error condition has occured. When the register is written by the ESM, an ERR interrupt is generated. An update on the hardware diagnostic port is also triggered.

USER_NOTIFY

Address: Operational Base + offset (0x0064)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:0	WO	0x0000	idx A write of this register with a "1" in any bit position will cause the corresponding USER_x interrupt to be sent to the other processor. A write value of zero is not permitted. 16'h0: Inactive 16'h1: Active

VERSION_0

Address: Operational Base + offset (0x0070)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	epn Project Number encoded in BCD
15:8	RO	0x00	reserved
7:4	RO	0x0	major Major release version number
3:0	RO	0x0	minor Minor release version number

26.4.4 TRNG Registers Summary

Name	Offset	Size	Reset Value	Description
CTRL	0x0000	W	0x00000000	This register causes the TRNG to execute one of a number of actions. There are 3 commands available
STAT	0x0004	W	0x00070000	The NONCE_MODE field indicates that the engine is currently waiting for the host to load a nonce
MODE	0x0008	W	0x00000000	This register is used to set the length of the PRNG output register
SMODE	0x000C	W	0x000A0000	This register is used to enable or disable certain mission-mode run-time features within the core

Name	Offset	Size	Reset Value	Description
IE	0x0010	W	0x00000000	This register is used to enable or disable interrupts within the TRNG
ISTAT	0x0014	W	0x00000000	This register allows the user to monitor the interrupt and/or status contributions of the TRNG
COREKIT_REL	0x0018	W	0x00000000	Contains the coreKit release information
FEATURES	0x001C	W	0x00000000	Contains the build-time parameter enumerations
RAND0	0x0020	W	0x00000000	The RAND0 register is part of the RANDx register set
RAND1	0x0024	W	0x00000000	The RAND1 register is part of the RANDx register set
RAND2	0x0028	W	0x00000000	The RAND2 register is part of the RANDx register set
RAND3	0x002C	W	0x00000000	The RAND3 register is part of the RANDx register set
RAND4	0x0030	W	0x00000000	The RAND4 register is part of the RANDx register set
RAND5	0x0034	W	0x00000000	The RAND5 register is part of the RANDx register set
RAND6	0x0038	W	0x00000000	The RAND6 register is part of the RANDx register set
RAND7	0x003C	W	0x00000000	The RAND7 register is part of the RANDx register set
SEED0	0x0040	W	0x00000000	The SEED0 register is part of the SEEDx register set
SEED1	0x0044	W	0x00000000	The SEED1 register is part of the SEEDx register set
SEED2	0x0048	W	0x00000000	The SEED2 register is part of the SEEDx register set
SEED3	0x004C	W	0x00000000	The SEED3 register is part of the SEEDx register set
SEED4	0x0050	W	0x00000000	The SEED4 register is part of the SEEDx register set
SEED5	0x0054	W	0x00000000	The SEED5 register is part of the SEEDx register set
SEED6	0x0058	W	0x00000000	The SEED6 register is part of the SEEDx register set
SEED7	0x005C	W	0x00000000	The SEED7 register is part of the SEEDx register set
AUTO_RQSTS	0x0060	W	0x00000000	This register allows the TRNG to generate a reseed reminder alarm
AUTO_AGE	0x0064	W	0x00000000	This register allows the TRNG to generate a reseed reminder alarm
TIME_TO_SEED	0x006C	W	0x00000000	This register contains the number of clock cycles taken to generate the last new random seed
BUILD_CFG0	0x00F0	W	0x00000000	Contains the build-time parameter settings

26.4.6 HDCP2.3 MMU Registers Summary

Name	Offset	Size	Reset Value	Description
DTE_ADDR	0x0000	W	0x00000000	MMU current page Table addressIt is only can be written when MMU state is disable or page fault or mmu enable stall state
STATUS	0x0004	W	0x00000018	MMU status register
COMMAND	0x0008	W	0x00000000	MMU command register
PAGE_FAULT_ADDR	0x000C	W	0x00000000	MMU logical address of last page fault
ZAP_ONE_LINE	0x0010	W	0x00000000	MMU Zap cache line register
INT_RAWSTAT	0x0014	W	0x00000000	MMU raw interrupt status register
INT_CLEAR	0x0018	W	0x00000000	MMU raw interrupt status register
INT_MASK	0x001C	W	0x00000000	MMU raw interrupt status register
INT_STATUS	0x0020	W	0x00000000	MMU raw interrupt status register
AUTO_GATING	0x0024	W	0x00000001	mmu auto gating

*Notes:Size:**B**- Byte (8 bits) access, **HW**- Half WORD (16 bits) access, **W**-WORD (32 bits) access, **DW**-Double WORD (64 bits) access*

26.4.7 HDCP2.3 MMU Detail Registers Description

DTE_ADDR

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:0	RW	0x00000000	mmu_dte_addr mmu dte base addr , the address must be 4kb aligned

STATUS

Address: Operational Base + offset (0x0004)

Bit	Attr	Reset Value	Description
31:11	RO	0x000000	reserved
10:6	RO	0x00	page_fault_bus_id Index of master reponsible for last page fault
5	RO	0x0	page_fault_is_write The direction of access for last page fault: 0 = Read 1 = Write
4	RO	0x1	replay_buffer_empty The MMU replay buffer is empty
3	RO	0x1	mmu_idle The MMU is idle when accesses are being translated and there are no unfinished translated accesses.
2	RO	0x0	stail_active MMU stall mode currently enabled. The mode is enabled by command
1	RO	0x0	page_fault_active MMU page fault mode currently enabled . The mode is enabled by command.

Bit	Attr	Reset Value	Description
0	RO	0x0	paging_enabled Paging is enabled

COMMAND

Address: Operational Base + offset (0x0008)

Bit	Attr	Reset Value	Description
31:3	RO	0x00000000	reserved
2:0	WO	0x0	mmu_cmd MMU_CMD. This can be: 0: MMU_ENABLE_PAGING 1: MMU_DISABLE_PAGING 2: MMU_ENABLE_STALL 3: MMU_DISABLE_STALL 4: MMU_ZAP_CACHE 5: MMU_PAGE_FAULT_DONE 6: MMU_FORCE_RESET

PAGE_FAULT_ADDR

Address: Operational Base + offset (0x000C)

Bit	Attr	Reset Value	Description
31:0	RO	0x00000000	page_fault_addr address of last page fault

ZAP_ONE_LINE

Address: Operational Base + offset (0x0010)

Bit	Attr	Reset Value	Description
31:0	WO	0x00000000	mmu_zap_one_line address to be invalidated from the page table cache

INT_RAWSTAT

Address: Operational Base + offset (0x0014)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RW	0x0	read_bus_error read bus error
0	RW	0x0	page_fault page fault

INT_CLEAR

Address: Operational Base + offset (0x0018)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	WO	0x0	read_bus_error read bus error
0	WO	0x0	page_fault page fault

INT_MASK

Address: Operational Base + offset (0x001C)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved

Bit	Attr	Reset Value	Description
1	RW	0x0	read_bus_error read bus error enable an interrupt source if the corresponding mask bit is set to 1
0	RW	0x0	page_fault page fault enable an interrupt source if the corresponding mask bit is set to 1

INT_STATUS
Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:2	RO	0x00000000	reserved
1	RO	0x0	read_bus_error read bus error
0	RO	0x0	page_fault page fault

AUTO_GATING
Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:1	RO	0x00000000	reserved
0	RW	0x1	mmu_auto_gating when it is 1'b1, the mmu will auto gating itself.

26.5 Interface Description

There is no Interface signal Description.

26.6 Application Notes

26.6.1 Host Application Software

The ESM package contains a series of tools and a run-time library as bellow:

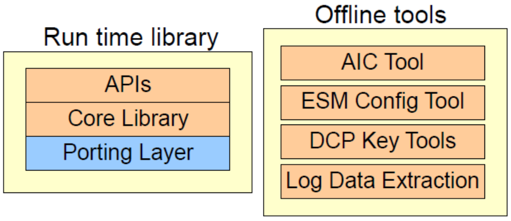

Fig. 26-7 ESM software

26.6.2 Run Time Library

This library is provided as source code and is used by the host application processor to control the ESM.
Setting the configurable options of the ESM is not provided through APIs for security reasons. It is instead embedded into the ESM’s Image as part of the process of building a deployable image.
The APIs provide a minimal interface to the ESM, which include the following:

- Load/Initialize firmware image
- Start authentication to secure a link
- Terminate an authenticated link
- Collect logging data
- Get/Set pairing information
- Update SRM data
- Status updates

Sample code is provided and demonstrates how to use the various APIs. In addition, a software API reference guide is included and provides details on the API calls and their parameters.

26.6.3 Offline Tools

There are three separate offline tools that are required to build a deployable image for the ESM as shown in Figure ESM Image tool flow and one tool for logging information. All of these tools are developed to run on a 32 bit Linux system.

26.6.4 Configuration Tool

The troot_base_config_interface tool is used to convert the various configuration files into a data blob to be used by the aictool which creates the encrypted ESM firmware. There are a number of different configuration files which the tools reads, with each configuration file containing a mix of factory configured parameters, and user-adjustable parameters.

This tool also requires the firmware.aic file in order to generate the data blob.

User Parameters for Configuration Files

The following table indicates which parameters in the configuration files are user-adjustable and other non-described parameters should not be changed. A basic description of the parameter is included below, see the configuration file's comments for a more complete description.

Table 26-7 Configuration files

File Name	Parameter	Description
troot_base_config.cfg	[LOGGING_MODE]	Logging on/off
	[LOGGING_LEVEL]	Sets the verbosity of the output log messages.
	[RESEED_TIMEOUT]	Specifies the time the ESM will wait for the TRNG to supply a new nonce before reporting an error
	[RESEED_AUTO_INTERVAL]	By default the ESM will periodically query the TRNG for a new nonce at the period specified.
	[CPU_FREQ]	Sets the frequency of the esm_clk input. Mandatory to change.
troot_HDCPmgr_TX.cfg	[SRM_VERSION]	Denotes whether the SRM is to be checked or not and the minimum version number permitted.
troot_HDCPTX.cfg	[I2C_FREQ]	(HDMI) Sets the default I2C frequency.can be changed via an API.
	[I2C_USE_SHORT_READ]	(HDMI) Sets whether the interface uses short reads for status requests.can be changed via an API.
	[CEE_BSOD]	(HDMI) Sets the 24 bit fixed pattern value output by the ESM. See the description following this table for more details.
	[AUTO_START]	Sets the default startup state of the Autostart feature
	[HDCP_TIMEOUTS]	Sets whether the ESM enforces the HDCP timeout periods. Should be enabled only for testing and/or debugging.
	[CEE_FRAME_CNT_DEBUG]	(HDMI) The ESM emits periodic log

File Name	Parameter	Description
		messages once authenticated, based on the number of VSYNC pulses counted by this parameter.
	[PAIRING_ENABLED]	Sets whether pairing will be enabled or not
	[MAX_PAIRING_DEVICES]	Sets the maximum number of paired devices supported per port. Note the external R/W memory requirements increase based on this setting, and the number of TX ports in your design.
	[MEM_PAIRING_SIZE]	Sets the amount of R/W memory the pairing data will occupy.
	[CAPABLE_BYPASS_TIME]	(HDMI) Sets the maximum amount of time the ESM will enable low value content after a capability check before switching back to a fixed pattern output. See HLC_HDCPTX_SetCapability in the API guide.
	[LVC_TIMEOUT]	(HDMI) Sets the maximum amount of time the ESM will enable low value content without a capability check. See HLC_HDCPTX_EnableLowValueContent in the API guide.
	[LVC_EXPIRED_CNT]	(HDMI) Sets the maximum number of LVC timeouts permitted.

The [CEE_BSOD] is a 32 bit decimal value which parameter represents fixed data output on the TMDS data bus if the ESM encounters an authentication issue or detects attempts have been made to tamper with it. The value is only relevant for ports configured for HDMI. This 32 bit value is output as follows:

Table 26-8 ESM BSOD Output Mapping

BSOD Bit Positions	HDMI Controller TMDS Data Channel
[7:0]	O_tmds_ch0 [7:0]
[15:8]	O_tmds_ch1 [7:0]
[23:16]	O_tmds_ch2 [7:0]
[32:24]	Not used

26.6.5 HDCP Key Tools

This tool (HDCP keys) is used to create a DCP key data file, which is required to build the encrypted DCP data blob needed for creating the encrypted ESM firmware. The tool reads a configuration file that contains the RX or TX key information from DCP in clear text and outputs a structured data file for the configuration interface tool to encrypt with the appropriate secret keys.

The tools can also accept the DCP published key files themselves.

26.6.6 AIC Tool

The tool is used to create the encrypted ESM firmware. To build the encrypted firmware, you must first create the data files for the DCP keys and the configuration. These files, along with an input configuration file for this tool are used to build an image that can be used by the ESM. In addition to specifying the Platform and Device Unique Keys in the configuration file, there are additional keys that also must be specified as noted below.

Content Randomization

There are two separate values in the firmware.aic file, IK and IVc (128 bits and 96 bits respectively), which you must randomly generate to create a new encrypted ESM firmware image. Failure to do this puts secret data in the ESM firmware at risk of being compromised.

26.6.7 Log Data Extraction

The logging information from the ESM is output in a proprietary format. This tool is used to produce readable output of captured logging data content.

The Host Library contains a core library component which includes all the functions necessary to use the ESM. The library is built using portable C code and uses various abstraction functions to allow for migration to different platforms. Before using the ESM in your system you must properly implement the abstraction components specific to your platform.

There are two distinct abstraction components used by the Host Library, the System Abstraction Layer and the Host Library Driver (HLD) component. The System Abstraction Layer (or Common Component) defines system level functions used by the Host Library, such as malloc, memcpy, etc.

These functions are linked into the Host Library when it is built.

The Host Library Driver (HLD) component establishes a communication between the library and the physical ESM hardware, including managing the memory required for the ESM Image and the read/write area. This is a run-time plug-in module that is defined in your application and specified as a parameter to the ESM initialization function.

The figure below illustrates the abstraction components used by the Host Library package. This figure demonstrates one example where there are three separate ESMs in the system, requiring (typically) three separate HLD instantiations.consult the ESM Host Library API guide for more details on the HLD implementation.

26.6.8 Host Library

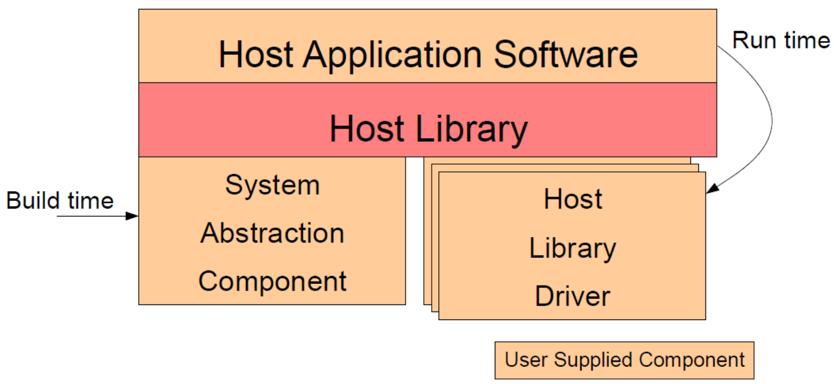

Fig. 26-8 Host Library Layers

The Host Library provides a number of sample applications using the ESM with the library. The applications demonstrate using the library in a User Space Linux application:

- Repeater/Converter (Linux) [Planned in later releases – not currently available]
- Transmitter (Linux)

All the sample applications demonstrate API usage, loading the ESM firmware, and running a specific ESM application.
The sample applications provided as a Linux User Space application communicate to the ESM hardware through a Linux Kernel driver which is implemented as a Host Library Driver (HLD) plug-in.

```

├── host_library    Host Library source code and includes
└── samples         Sample applications and driver applications
```

Fig. 26-9 Development Tree Overview

Transmitter
There is a sample transmitter applications provided in the samples folder:
HDCP_TX.c is a Linux based example and utilizes file IO and threads.
Linux OS
Sample applications are targeted for a Linux User Space application environment. In order to use them a custom kernel driver is used and the HLD plug-in for the host library was made to call IOCTLs which mapped to the appropriate interfaces in the kernel driver module to access the ESM.
To build for this platform run the makefile from the esm_host_lib folder:

    make samples

The implementation of the platform specific APIs (for the Linux example) are in the following files:
./host_library/cal/system/sample_platform/elliptic_common.c
./host_library/cal/system/sample_platform/elliptic_log.c
./host_library/include/elliptic_platform_specific_system_type.h
./host_library/include/elliptic_platform_specific_system.h
You can change these implementations as needed for your specific platform.
Debugging Suggestions
The host library driver interface is relatively straightforward to implement as the host library itself takes care of the required protocols to communicate with the ESM. The detailed HPI interface and command protocols are considered proprietary information, however, the information presented below can be followed if you are having difficulty getting the ESM operating in your environment.

26.6.9 TRNG operation

The TRNG is a self-seeding True Random Number Generator. It generates random data that is statistically equivalent to a uniformly distributed random data stream. The circuit includes a seed generator which creates a non-deterministic random value to seed an internal Pseudo Random Number Generator (PRNG). The output is the random number.
The TRNG generates random data that is statistically equivalent to a uniformly distributed random data stream. The circuit includes an oscillating rings based seed generator which creates non-deterministic random noise to seed a noise whitener circuit. The output of the noise whitener is a random number. The TRNG block is shown in the figure below.

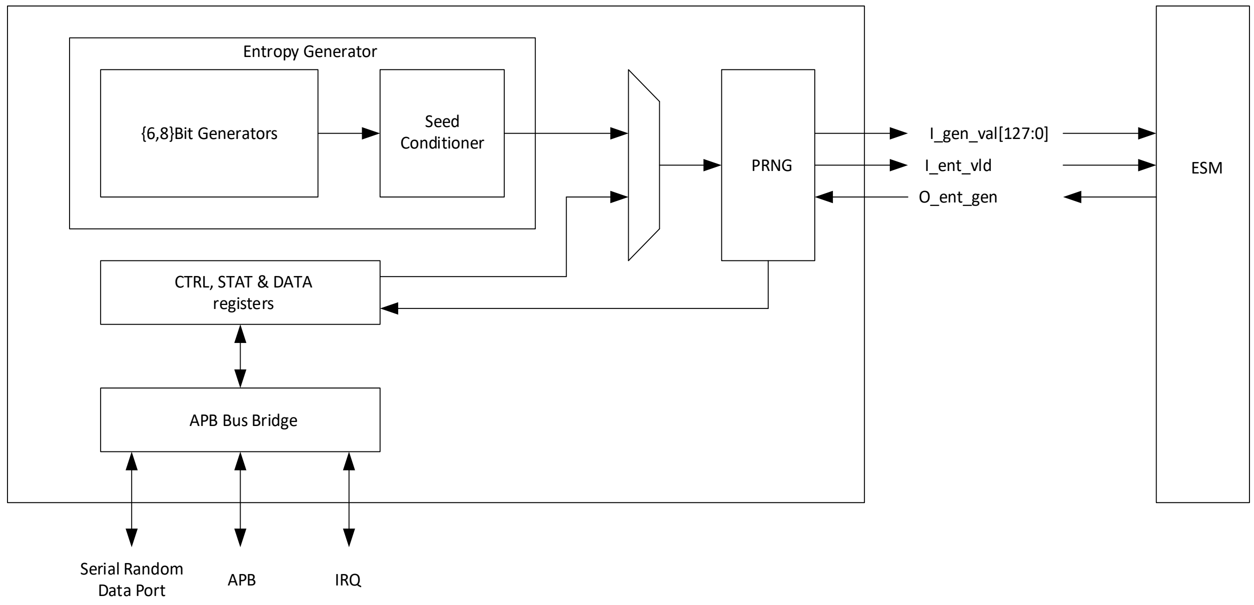

Fig. 26-10 Simplified block diagram of TRNG

(1)Reseed operations

The TRNG can be reseeded using its internal random seed generator or through a host-supplied nonce seed.

Whenever any of the reseed operations is executed, the reseed reminder alarm counters are automatically reinitialized from their respective reload registers (if they are non-zero). In addition, the O_ctrl_reminder alarm signal is also cleared as well. There are different ways to initiate the random seed.

Table 26-9 Polling mode cmd for random seed initial operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x0[2:0]	cmd	0x0	0x2	start the random reseed sequence running
Wait 0x14[1]bit is 1'b1. This bit is seed_done indication signal.				
0x14[1]	seed_done	0x0	0x1	Configure to acknowledge and clear the flag

The second mode for random seed initial operation is interrupt mode.

Table 26-10 Interrupt mode cmd for random seed initial operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x10[31]	glbl_en	0x0	0x1	Configure global interrupt enable
0x10[1]	seed_done_en	0x0	0x1	Enable seed_done interrupt
0x0[2:0]	cmd	0x0	0x2	start the random reseed sequence running
Wait 0x14[1]bit is 1'b1. This bit is seed_done indication signal.				
0x14[1]	seed_done	0x0	0x1	Configure to acknowledge and clear the flag

The third mode for random seed initial operation is through I_ctrl_reseed port.

Table 26-11 I_ctrl_reseed port for random seed initial operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0xfd5a8000+ 0x8[9]	I_ctrl_seed	0x0	0x1	start the random reseed sequence running

SFR Address	SFR Name	Default Value	Setting Value	Description
Read the O_ctrl_reseeding(0xfd5a8000+0x34[22]), if it is 1'b1, it indicates that the TRNG has completed the reseeding operation.				

The I_ctrl_reseed port is primarily intended to be used in instantiations where there is no host register interface to manage the internal TRNG workings. It is not typically recommended that both the I_ctrl_reseed port and the host register interface be used in the same design.
The host must wait until any on-going rand_generation operation has completed before issuing a nonce seed operation. This can be monitored through the STAT register. In detail, execute the following sequence to load a nonce seed.

Table 26-12 TRNG nonce reseed operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0xc[2]	nonce_mode	0x0	0x1	Set the reseed mode to nonce
Wait 0x4[2]bit is 1'b1. This bit is nonce_mode indication signal.				
0x40[31:0]	seed0	0x0		Configure seed0 register
0x44[31:0]	seed1	0x0		Configure seed1 register
0x48[31:0]	seed2	0x0		Configure seed2 register
0x4c[31:0]	seed3	0x0		Configure seed3 register
0x50[31:0]	seed4	0x0		Configure seed4 register
0x54[31:0]	seed5	0x0		Configure seed5 register
0x58[31:0]	seed6	0x0		Configure seed6 register
0x5c[31:0]	seed7	0x0		Configure seed7 register
0x0[2:0]	cmd	0x0	0x3	Execute the load nonce sequence
0xc[2]	nonce_mode	0x0	0x0	Configure to return the core to normal operation

(2)Random number generation operations
To request the TRNG to generate a new random number, the host must write a 1 to the CMD field in the CTRL register(0x0[2:0]). The TRNG must have been seeded by one of the seed mechanisms before executing these sequences.
This is polling mode for random number generation operations.

Table 26-13 Polling mode for random number generation operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x0[2:0]	cmd	0x0	0x1	start the random number generation process
Wait 0x14[0]bit is 1'b1. This bit is rand_rdy signal, it indicates has finished random number generation.				
0x14[0]	rand_rdy	0x0	0x1	Configure to acknowledge and clear the flag
Read the random data from RAND0 (0x20) through RAND3 (0x2c).				

This is interrupt mode for random number generation operations.

Table 26-14 Interrupt mode for random number generation operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x10[31]	glbl_en	0x0	0x1	Configure global interrupt enable

SFR Address	SFR Name	Default Value	Setting Value	Description
0x10[0]	rand_rdy_en	0x0	0x1	Configure rand_rdy interrupt enable
0x0[2:0]	cmd	0x0	0x1	start the random number generation process
Wait 0x14[0]bit is 1'b1. This bit is rand_rdy signal, it indicates has finish random number generation.				
0x14[0]	rand_rdy	0x0	0x1	Configure to acknowledge and clear the flag
Read the random data from RAND0 (0x20) through RAND3(0x2c).				

(3)ESM cmd for generating new random data operations
The cmd of ESM for generating a new random data I_gen_val[127:0] is shown below.
step1.clear all the irq state

```
address =
ELP_ESM_ENT_ADDR_BASE(0x80020900)+ELP_PROT_ENT_IRQ_STAT_REG(0x4);
wr_data = 0xffffffff;
_mailbox_poke(address, wr_data);
```

step2. set up irq enable

```
address = ELP_ESM_ENT_ADDR_BASE(0x80020900)+ELP_PROT_ENT_IRQ_EN_REG(0x0);
wr_data = 0x1;
_mailbox_poke(address, wr_data);
```

step3. register the IRQ with the firmware

```
irq_bit_num = TROOT_TB_CMD_CPU_ENT_IRQ;//22
address=
ELP_ESM_ENT_ADDR_BASE(0x80020900) + ELP_PROT_ENT_IRQ_STAT_REG(0x4);
_mailbox_put(TROOT_TB_CMD_IRQ_REGISTER, irq_bit_num, address);
_mailbox_get(TROOT_TB_CMD_IRQ_REGISTER_RESP, 0, 0, chk_data, chk1_data, 1, 1);
//TROOT_TB_CMD_IRQ_REGISTER = 131
//TROOT_TB_CMD_IRQ_REGISTER_RESP = 131
```

step4. make sure we can request a nonce

```
address = ELP_ESM_ENT_ADDR_BASE(0x80020900)+ELP_PROT_ENT_STAT_REG(0x14);
chk_data = 0x1;
_mailbox_peek(address, chk_data, rd_data, 1);
```

step5. request the nonce

```
address = ELP_ESM_ENT_ADDR_BASE(0x80020900)+ELP_PROT_ENT_CTRL_REG(0x10);
wr_data = 0x1;
_mailbox_poke(address, wr_data);
```

Chapter 27 HDMI TX/eDP Combo PHY

27.1 Overview

This chapter describes an overview of HDMI TX/eDP Combo PHY. HDMI TX/eDP Combo PHY is a PHY hard macro to support HDMI TX and eDP interfaces. Combo transmit-PHY for HDMI2.1 TMDS Link, FRL Link, eDP Link.Maximum data rate of 12Gbps (HDMI2.1 FRL) and minimum data rate of 250Mbps (HDMI2.1 TMDS). For the convenience of writing, we also name HDMI TX/eDP Combo PHY as HDPTX PHY.

- HDMI2.1
  - AC coupled voltage mode drivers for HDMI2.1 TMDS links
  - Supports all the data rates in FRL: 3, 6, 8, 10 and 12Gbps
  - Supports Single Ref-clock input and multiple TMDS/Pixel clock frequencies
  - Supports Pixel clock input (25MHz to 594MHz) with TMDS multiplication
  - Supports 3 TAP FFE support for FRL mode
  - Single ended and common mode ARC support
  - Supports 20/40 bits parallel data interface for HDMI 2.0 operation
  - Supports 18/36 bits parallel data interface for HDMI 2.1 operation
  - Supports symbol clock output with configurable divider option for link operation
  - Supports Pixel clock output for link operation
  - Supports 4 lane Fixed Rate Link operation with 3Gbps, 6Gbps, 8Gbps, 10Gbps and 12Gbps rates
  - Supports 24MHz reference clock
  - Supports channel swap function for HDMI 2.0 back compatible operation
- eDP
  - Supports RBR (1.62Gbps per lane), HBR (2.7Gbps per lane) and HBR2 (5.4Gbps per lane) data rates
  - Supports training table with swing-level 0-3 and pre-emphasis-level 0-3
  - Supports AUX function as required by DP PHY implementing TX main link
  - Supports x1, x2 and x4 configurations
  - Supports 24MHz reference clock

27.2 Block Diagram

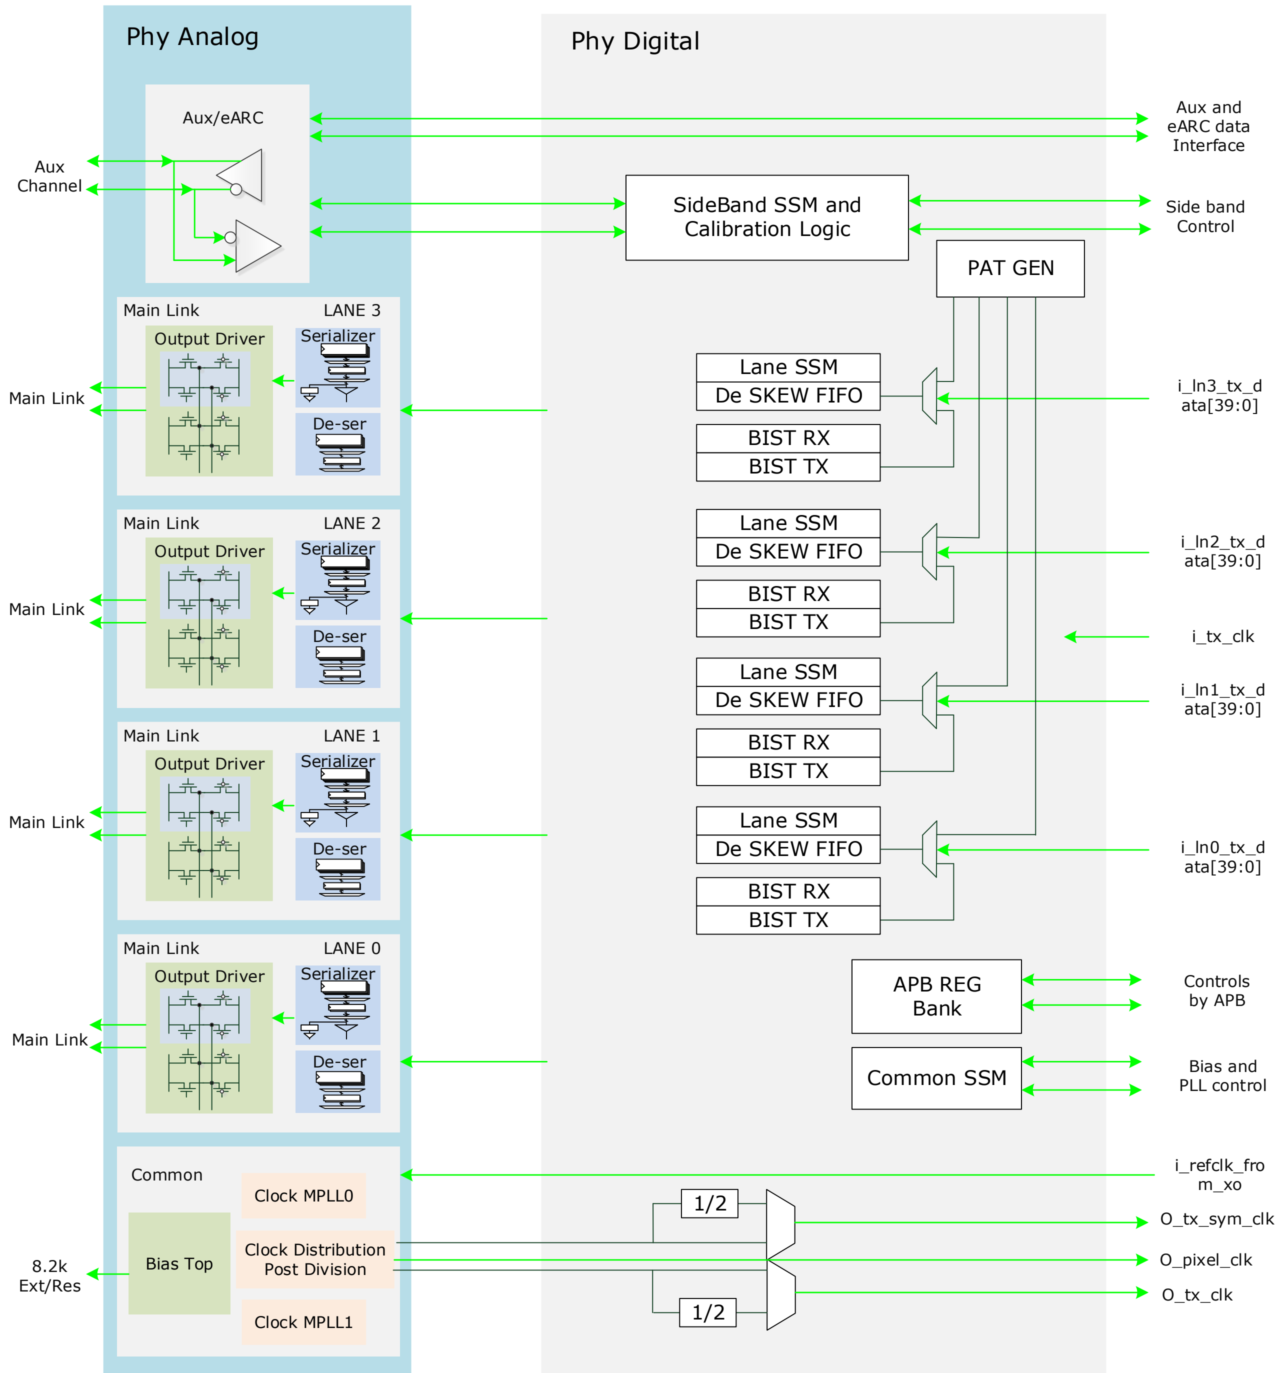

Fig. 27-1 Block diagram of HDMI TX/eDP Combo PHY

Above figure shows the block diagram of HDMI TX/eDP Combo PHY. It comprises of one CMN, four lanes of transmitter, one sideband that supports AUX channel for eDP and one PHY digital. The common block consists of one Band Gap, one Bias generation block and one PLL.

27.3 Function Description

27.3.1 PHY Analog

HDMI TX/eDP Combo PHY comprises of a PHY analog and PHY digital. The PHY consists of: One CMN block, a sideband block to support AUX for DP and ARC HDMI and Four Transmit lanes.

27.3.1.1 CMN

The CMN consists of a band-gap reference (BGR), bias generator and PLL. The BGR circuit generates high-accuracy reference voltage of 820mV across PVT variation. A bias generator makes two kinds of current, external-and internal-resistor (RMRES)-referred current, and these currents are distributed to each block in CMN and lanes. The external resistor-referred (REXT) current is generated using an 8.2KΩ resistor which is connected between the rext

pad and ground outside the chip. On the other hand, the internal resistor-referred current is generated using internally integrated replica resistor to compensate resistance error across PVT variation. The PLL in the CMN synthesizes high-speed clock, which is used for TX serializer, from a reference clock. The reference clock can be selected from three clock sources; crystal oscillator, SoC PLL's output reference clock.
The following are the main features of the PLL:
Supports LC PLL for 5 ~ 6GHz clock.
Supports sigma-delta modulated fractional divider.
Automatic Frequency Calibrated (AFC) oscillator setting for the desired frequency of operation Programmable charge pump current and loop filter resistance allowing for wide range of programmable loop bandwidth and peaking.

27.3.1.2 TRANSMITTER

The TX comprises serializer, driver, common-mode (CM). The driver generates baud-rate voltage waveform on TX output pads, ln01/1/2/3_txdp/n, with 3-tap FIR filter function. The main driver has hybrid structure, by combining voltage-and current-mode driver in parallel, to achieve both a small power consumption and large voltage swing. The voltage-mode driver is activated in default, but the current mode driver is optional to improve the TX output swing.
The driver also supports 3-tap FIR filter to suppress one pre and one post-cursor according to the HDMI2.1 FRL specification. The driver has the resolution of 1/36 in controlling amplitude and filter ratio, and maximum ratio of pre-shoot and de-emphasis are 15/36 and 8/36, respectively.

27.3.1.3 Side Band block

The side block consists of a termination block, a push-pull voltage buffer, a lower speed receiver and a PWM receiver. These blocks work in AC coupled AUX-RXTX.

27.3.1.3.1 Push Pull Voltage buffer (AUX Driver)

A push voltage buffer has been used to have very slow slew (5 to 30ns) on the line during transmission. The transmitter can be configured to drive wither common mode data or differential mode data on the line. During reception mode the buffer hold the line in common mode. This driver is also responsible for boundary scan driver.

27.3.1.3.2 Termination

The side-band is always terminated to 50 Ohms internally. The common mode of the termination is set by the push-pull voltage buffer described above. The termination block is designed such that same calibration code of main link transmitter can be used.

27.3.1.3.3 A lower speed receiver (AUX Receiver)

The lower speed receiver is responsible to receive 1Mbps differential AUX data. In ARC mode this listens to only sbdp line. This receiver has a pad interface which practically works as differential line to common mode voltage generation just by adding the voltage waveforms at sbdp and sbdn line. The following figure depicts the usage of pad interface and data multiplexing.

27.3.2 HDMI/eDP Combo PHY Source Power States

This section describes the PHY power states. It describes the four power states for PHY. ON state is the normal operational state or mission mode for the PHY. The allowed power state transitions are described in the following figure. For all power state transitions, ensure that the MAC/SoC does not initiate any operational sequence or further power state transition until the PHY indicates that the initial state transition is completed.

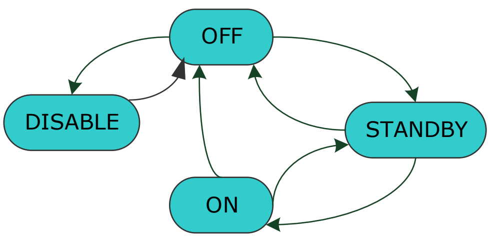

Fig. 27-2 PHY Power state transition flow diagram

Table 27-1 HDMI TX/eDP Combo PHY Power States

State	Description	Exit Latency Duration
OFF	***Reset state of PHY. All the blocks will be in power down mode.*** This is PHY reset mode but serial lines are weakly held to common mode to provide a current path during transient if SINK is connected to high voltage termination (HDMI) or board pull up (eDP) supply is coming up. Reference clock supplied to PHY may be turned off.	-
DISABLE	***Low power saving mode with low recovery time latency*** This is lowest power modes of PHY-Analog. When reduced or no lanes are used by SoC by APB configuration the PHY-Analog can be set to.	-
STANDBY	***Clock ready state*** The common block is brought and calibration for all required analog blocks are completed in this state. Some LANES can be in DISABLE state. Remaining active LANES are waiting for the LINK Layer/SoC to send parallel data. All the interface clock is ready and o_phy_rdy, o_phy_clk_rdy and o_sb_rdy is asserted high. The serial lines are held in common mode. This state is very important for the AC coupled system to charge the common mode of the line.	>200us
ON	***Normal operation mode***	-

27.4 Register Description

27.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

27.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
HDPTXPHY_CMN_REG0000	0x0000	W	0x00000004	CMN Register
HDPTXPHY_CMN_REG0008	0x0020	W	0x00000000	CMN Register

27.4.3 Detail Registers Description

HDPTXPHY_CMN_REG0000

Address: Operational Base + offset (0x0000)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	ovrd_bgr_en Override enable for bgr_en.
6	RW	0x0	bgr_en BGR enable 1'b0: Disable 1'b1: Enable
5	RW	0x0	ovrd_bgr_lpf_bypass Override enable for bgr_lpf_bypass.
4	RW	0x0	bgr_lpf_bypass BGR LPF bypass to reduce BGR settle time 1'b0: LPF enable 1'b1: LPF bypass
3:2	RW	0x1	ana_bgr_820m_sel BGR 820mV selection (for current bias) 2'b00: 780mV 2'b01: 820mV 2'b10: 860mV 2'b11: 900mV
1	RW	0x0	ana_bgr_clk_en BGR chopper clock enable 1'b0: Disable 1'b1: Enable
0	RW	0x0	ana_bgr_ladder_en BGR output voltage selection 1'b0: BGR output 1'b1: Resistor ladder output

HDPTXPHY_CMN_REG0008

Address: Operational Base + offset (0x0020)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	ovrd_lcpll_en Override enable for lcpll_en.
6	RW	0x0	lcpll_en LC PLL enable 1'b0: Disable 1'b1: Enable
5	RW	0x0	ana_lcpll_bea_con_clk_out_en Enable LCPLL beacon clock output
4	RW	0x0	ana_lcpll_lcv_co_mode_en Enable LCVCO mode
3	RW	0x0	ovrd_lcpll_afc_init_rstn Override enable for lcpll_afc_init_rstn
2	RW	0x0	lcpll_afc_init_rstn PLL AFC initial reset. When initial reset is asserted, the previous AFC result is reset. When initial reset is released, AFC starts from the initial AFC code given in i_rx_cdr_afc_sel_logic [3:0]. 1'b0: Reset 1'b1: Released
1	RW	0x0	ovrd_lcpll_afc_rstn Override enable for lcpll_afc_rstn
0	RW	0x0	lcpll_afc_rstn PLL AFC reset. When AFC reset is asserted, the previous AFC result is held. When AFC reset is released, AFC starts from the previous AFC code stored in internal memory. 1'b0: Reset 1'b1: Released

HDPTXPHY_CMN_REG0009

Address: Operational Base + offset (0x0024)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RW	0x0	ana_lcpll_pi_afc_clk_div2_en PLL AFC clock frequency selection 1'b0: fVCO 1'b1: fVCO/2
4	RW	0x0	ana_lcpll_afc_bsel PLL AFC code manual selection enables 1'b0: AFC result 1'b1: Manual selection
3	RW	0x1	ana_lcpll_afc_en PLL AFC enable; if enabled, VCO frequency is automatically calibrated. If disabled, VCO starts to oscillate with fixed AFC code of i_pll_man_bsel_m and _l. 1'b0: Disable 1'b1: Enable
2	RW	0x1	ana_lcpll_afc_from_pre_code PLL AFC option in restart case 1'b0: Restart from initial AFC code 1'b1: Restart from previous AFC code

Bit	Attr	Reset Value	Description
1:0	RW	0x0	ana_lcpll_afc_man_bsel_l Manual PLL AFC code selection (LSB)

HDPTXPHY_CMN_REG000A
Address: Operational Base + offset (0x0028)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:4	RW	0x8	ana_lcpll_afc_man_bsel_m Manual PLL AFC code selection (MSB)
3:0	RW	0x3	ana_lcpll_afc_stb_num Number of reference clock cycle to check VCO stabilization during PLL AFC start

HDPTXPHY_CMN_REG000B
Address: Operational Base + offset (0x002C)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3:1	RW	0x3	ana_lcpll_afc_tol_num PLL VCO stabilization tolerance; VCO is considered as settled-down if |counter difference|<i_pll_afc_tol during i_pll_afc_stb_num
0	RW	0x0	ana_lcpll_afc_vci_force PLL control voltage force for open-loop test purpose 1'b0: Released 1'b1: Forced

HDPTXPHY_CMN_REG0020
Address: Operational Base + offset (0x0080)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	ana_lcpll_pms_mdiv PLL main divider setting Divider value = Setting code

HDPTXPHY_CMN_REG0021
Address: Operational Base + offset (0x0084)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	ana_lcpll_pms_mdiv_afc PLL main divider setting for AFC counter Divider value = Setting code

HDPTXPHY_CMN_REG0025
Address: Operational Base + offset (0x0094)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	ana_lcpll_iqdiv_bypass VCO clock bypass IQ divider enable.
5	RW	0x0	ovrd_lcpll_pms_iqdiv_rstn Override enable for lcpll_pms_iqdiv_rstn
4	RW	0x0	lcpll_pms_iqdiv_rstn IQ divider resetn
3	RW	0x0	ovrd_lcpll_ref_chopper_clk_div_rstn Override enable for lcpll_ref_chopper_clk_div_rstn

Bit	Attr	Reset Value	Description
2	RW	0x0	lcpll_ref_chopper_clk_div_rstn Chopper clk divider reset 1'b0: Reset 1'b1: Released
1:0	RW	0x0	ana_lcpll_ref_bypass_clk_sel PLL Bypass clock selection 2'b00: XO 2'b01: IO 2'b10: PIXEL or LC_OUT_CLK 2'b11: System PLL clock

HDPTXPHY_CMN_REG0028

Address: Operational Base + offset (0x00A0)

Bit	Attr	Reset Value	Description
31:5	RO	0x0000000	reserved
4	RW	0x0	ovrd_lcpll_sdm_rstn ovrd_lcpll_sdm_rstn
3	RW	0x0	lcpll_sdm_rstn PLL SDM reset 1'b0: Reset 1'b1: Released
2	RW	0x0	ana_lcpll_sdc_fractional_en Fractional clock divide in SDM clock generation 1'b0: Integer division 1'b1: Fractional division
1	RW	0x0	ovrd_lcpll_sdc_rstn Override enable for lcpll_sdc_rstn
0	RW	0x0	lcpll_sdc_rstn PLL SDM clock generation (SDC) reset 1'b0: Reset 1'b1: Release

HDPTXPHY_CMN_REG002D

Address: Operational Base + offset (0x00B4)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x0	ana_lcpll_sdm_ph_num_sel PLL PI input clock phase number 1'b0: 8-phase 1'b1: 4-phase
5:4	RW	0x0	ana_lcpll_sdm_pi_step PLL phase interpolstor step 2'b00: 1-step (16-phase) 2'b01: 2-step (8-phase) 2'b1x: 0.5-step
3:1	RW	0x0	ana_lcpll_sdc_n PLL SDC divide-ratio selection (MC_val=0 N, MC_val=1 N-1) 3'b000: /4/3 3'b001: /5/4 3'b010: /6/5 3'b100: /7/6 3'b101: /8/7 3'b110: /9/8

Bit	Attr	Reset Value	Description
0	RW	0x0	ana_lcpll_sdc_n2 PLL SDC divide-ratio selection 1'b0: No additional/2 1'b1: Additional/2

HDPTXPHY_CMN_REG002E

Address: Operational Base + offset (0x00B8)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x00	ana_lcpll_sdc_numerator Numerator of SDC (Max 65)

HDPTXPHY_CMN_REG002F

Address: Operational Base + offset (0x00BC)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:2	RW	0x01	ana_lcpll_sdc_denominator Denominator of SDC (Max 65)
1	RW	0x0	ovrd_lcpll_sdc_ndiv_rstn Override enable for lcpll_sdc_ndiv_rstn
0	RW	0x0	lcpll_sdc_ndiv_rstn SDC NDIV Resetn.

HDPTXPHY_CMN_REG003C

Address: Operational Base + offset (0x00F0)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x00	ana_lcpll_reserved PLL Reserved pins

HDPTXPHY_CMN_REG003D

Address: Operational Base + offset (0x00F4)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	ovrd_ropll_en Override enable for ropll_en.
6	RW	0x1	ropll_en RO PLL enable 1'b0: Disable 1'b1: Enable
5	RW	0x0	ana_ropll_beacon_clk_out_en Enable ROPLL beacon clock output.
4	RW	0x0	ana_ropll_lcvco_mode_en Enable LCVCO mode.
3	RW	0x0	ovrd_ropll_afc_init_rstn Override enable for ropll_afc_init_rstn.
2	RW	0x0	ropll_afc_init_rstn PLL AFC initial reset. When initial reset is asserted, the previous AFC result is reset. When initial reset is released. AFC starts from the initial AFC code given in i_rx_cdr_afc_sel_logic[3:0]. 1'b0: Reset 1'b1: Released
1	RW	0x0	ovrd_ropll_afc_rstn Override enable for ropll_afc_rstn.

Bit	Attr	Reset Value	Description
0	RW	0x0	ropll_afc_rstn PLL AFC reset. When AFC reset is asserted, the previous AFC result is held. When AFC reset is released, AFC starts from the previous AFC code stored in internal memory. 1'b0: Reset 1'b1: Released

HDPTXPHY_CMN_REG004E

Address: Operational Base + offset (0x0138)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	ana_ropll_fld_non_continuous_mode Check frequency lock detection of PLL 1'b0: Once 1'b1: Continuously
6	RW	0x0	ana_ropll_fld_slow_bypass PLL slow frequency lock detection bypass 1'b0: No bypass 1'b1: Bypass
5	RW	0x1	ana_ropll_pi_en PLL phase interpolator enable 1'b0: Disable 1'b1: Enable
4:1	RW	0xa	ana_ropll_pi_str PLL phase interpolator input buffer strength control for Gen3 and Gen4 (for 8GHz VCO) 4'b0000: Min. strength .... 4'b1111: Max. strength
0	RW	0x0	ana_ropll_100m_clk_en Enable 100M clock.

HDPTXPHY_CMN_REG0051

Address: Operational Base + offset (0x0144)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x7d	ropll_pms_mdiv_rbr [rbr] PLL main divider setting Divider value = Setting code

HDPTXPHY_CMN_REG0053

Address: Operational Base + offset (0x014C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x7d	ropll_pms_mdiv_hbr2 [hbr2] PLL main divider setting Divider value = Setting code

HDPTXPHY_CMN_REG0055

Address: Operational Base + offset (0x0154)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved

Bit	Attr	Reset Value	Description
7:0	RW	0x7d	ropll_pms_mdiv_afc_rbr [rbr] PLL main divider setting for AFC counter Divider value = Setting code

HDPTXPHY_CMN_REG005A
Address: Operational Base + offset (0x0168)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:4	RW	0x3	ropll_pms_sdiv_rbr [rbr] PLL post divider setting (N-1, except /7) 3'b000: /1 3'b001: /2 3'b010: /3 3'b011: /4 3'b100: /5 3'b101: /6 3'b110: X 3'b111: /8
3:0	RW	0x3	ropll_pms_sdiv_hbr [hbr]PLL post divider setting (N-1, except /7) 3'b000: /1 3'b001: /2 3'b010: /3 3'b011: /4 3'b100: /5 3'b101: /6 3'b110: X 3'b111: /8

HDPTXPHY_CMN_REG005C
Address: Operational Base + offset (0x0170)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7	RW	0x0	ana_ropll_iqdiv_bypass VCO clock bypass IQ divider enable.
6	RW	0x0	ovrd_ropll_pms_iqdiv_rstn Override enable for ropll_pms_iqdiv_rstn.
5	RW	0x1	ropll_pms_iqdiv_rstn IO divider resetn.
4:3	RW	0x0	ana_ropll_ref_bypass_clk_sel PLL Bypass clock selection. 2'b00: X0 2'b01: IO 2'b10: PIXEL or LC_OUT_CLK 2'b11: System PLL clock
2	RW	0x1	ana_ropll_ref_chopper_clk_en Chopper clk enable 1'b0: Disable 1'b1: Enable
1	RW	0x0	ovrd_ropll_ref_chopper_clk_div_rstn Override enable for ropll_ref_chopper_clk_div_rstn.
0	RW	0x1	ropll_ref_chopper_clk_div_rstn Chopper clk divider reset 1'b0: Reset 1'b1: Released

HDPTXPHY_CMN_REG005E

Address: Operational Base + offset (0x0178)

Bit	Attr	Reset Value	Description
31:7	RO	0x0000000	reserved
6	RW	0x1	ana_ropll_sdm_en PLL SDM enable 1'b0: Disable 1'b1: Enable
5	RW	0x0	ovrd_ropll_sdm_rstn Override enable for ropll_sdm_rstn.
4	RW	0x0	ropll_sdm_rstn PLL SDM reset 1'b0: Reset 1'b1: Released
3	RW	0x1	ropll_sdc_fractional_en_rbr [rbr]Fractional clock divide in SDM clock generation 1'b0: Integer division 1'b1: Fractional division
2	RW	0x1	ropll_sdc_fractional_en_hbr [hbr]Fractional clock divide in SDM clock generation 1'b0: Integer division 1'b1: Fractional division
1	RW	0x1	ropll_sdc_fractional_en_hbr2 [hbr2] Fractional clock divide in SDM clock generation 1'b0: Integer division 1'b1: Fractional division
0	RW	0x1	ropll_sdc_fractional_en_hbr3 [hbr3] Fractional clock divide in SDM clock generation 1'b0: Integer division 1'b1: Fractional division

HDPTXPHY_CMN_REG0060

Address: Operational Base + offset (0x0180)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x4e	ropll_sdm_denominator_rbr [rbr] Denominator of SDM (Max. 255) Constraint: i_pll_sdm_lc > |signed i_pll_sdm_ki_pll_ssc_fm_deviationi_pll_ssc_fm_freq-14

HDPTXPHY_CMN_REG0063

Address: Operational Base + offset (0x018C)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x4e	ropll_sdm_denominator_hbr3 [hbr3] Denominator of SDM (Max. 255) Constraint: i_pll_sdm_lc > |signed i_pll_sdm_ki_pll_ssc_fm_deviation - i_pll_ssc_fm_freq-1|

HDPTXPHY_CMN_REG0064

Address: Operational Base + offset (0x0190)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved

Bit	Attr	Reset Value	Description
3	RW	0x1	ropll_sdm_numerator_sign_rbr [rbr] Sign of SDM numerator 1'b0: Positive 1'b1: Negative
2	RW	0x1	ropll_sdm_numerator_sign_hbr [hbr]Sign of SDM numerator 1'b0: Positive 1'b1: Negative
1	RW	0x1	ropll_sdm_numerator_sign_hbr2 [hbr2] Sign of SDM numerator 1'b0: Positive 1'b1: Negative
0	RW	0x1	ropll_sdm_numerator_sign_hbr3 [hbr3] Sign of SDM numerator 1'b0: Positive 1'b1: Negative

HDPTXPHY_CMN_REG0065
Address: Operational Base + offset (0x0194)

Bit	Attr	Reset Value	Description
31:8	RO	0x000000	reserved
7:0	RW	0x14	ropll_sdm_numerator_rbr [rbr] Numerator of SDM with i_pll_sdm_k_sign (-255~255).

HDPTXPHY_CMN_REG0069
Address: Operational Base + offset (0x01A4)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5	RW	0x0	ana_ropll_sdm_ph_num_sel PLL PI input clock phase number 1'b0: 8-phase 1'b1: 4-phase
4:3	RW	0x0	ana_ropll_sdm_pi_step PLL phase interpolstor step 2'b00: 1-step (16-phase) 2'b01: 2-step (8-phase) 2'b1x: 0.5-step
2:0	RW	0x2	ropll_sdc_n_rbr [rbr] PLL SDC divide-ratio selection 3'b000: /3 3'b001: /4 3'b010: /5 3'b011: /6 3'b100: /7 3'b101: /8

HDPTXPHY_CMN_REG006C
Address: Operational Base + offset (0x01B0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x13	ropll_sdc_numerator_rbr [rbr] Numerator of SDC (Max 65)

HDPTXPHY_CMN_REG0070
Address: Operational Base + offset (0x01C0)

Bit	Attr	Reset Value	Description
31:6	RO	0x0000000	reserved
5:0	RW	0x18	ropll_sdc_denominator_rbr [rbr] Denominator of SDC (Max 65)

HDPTXPHY_CMN_REG0074

Address: Operational Base + offset (0x01D0)

Bit	Attr	Reset Value	Description
31:4	RO	0x0000000	reserved
3	RW	0x0	ovrd_ropll_sdc_ndiv_rstn Override enable for ropll_sdc_ndiv_rstn

27.6 Application Notes

27.6.1 SFR Settings for HDMI mode

This table shows how to set SFR in HDMI mode. The "Setting Value" column has settings for TMDS 40 bits mode with lane 3 as clock lane. Please follow the description column to set for 18/20/36 bits mode, FRL mode and clock lane change.

Table 27-5 DP 40bit mode with RBR rate SFR Setting

SFR Address	SFR Name	Default Value	Setting Value	Description
0x0800[2]	protocol_sel	0x0	0x1	0: DP mode 1: HDMI mode
0x025C[1]	dig_clk_sel	0x0	0x1	1'b0: Select LCPLL reference clock mux output (LCPLL alone mode and Cascade mode) 1'b1: Select ROPLL reference clock mux output (ROPLL alone mode)
0x0C28[4]	ln0_ana_tx_jeq_en	0x0	0x1	Transmitter setting
0x1028[4]	ln1_ana_tx_jeq_en	0x0	0x1	Transmitter setting
0x1428[4]	ln2_ana_tx_jeq_en	0x0	0x1	Transmitter setting

0x0218[0]	ana_pll_pcg_clk_en	0x0	0x1	0x0: Disables pixel clock generation 0x1: Enables pixel clock generation
0x081C[3:0]	lane_en	0x0	0xF	lane_en bit0: 0x0 – Disables the lane 0 0x1 – Enables the lane 0 lane_en bit1: 0x0 – Disables the lane 1 0x1 – Enables the lane 1 lane_en bit2: 0x0 – Disables the lane 2 0x1 – Enables the lane 2 lane_en bit3: 0x0 – Disables the lane 3 0x1 – Enables the lane 3 Only one lane can be disabled based on HDMI protocol, that too in FRL 3Gbps and 6Gbps rates only.

27.6.2 Programming Sequence for HDMI eARC mode operation

Below are the list registers to be configured to keep the sideband in eARC mode. The differential mode receive clk is available on o_earc_dmac_rxclk and data is availabel on o_earc_dmac_rxdata. The enable for differential mode receiver is i_earc_dmac_en. The common mode transmits enable is i_earc_tx_mode and receive enable i_earc_rx_mode. The input data for common mode transmit is i_aux_earc_txdata. The output data of common mode receivee is o_earc_cmdc_rxdata.

Table 27-6 Programming Sequence for HDMI eARC mode operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x025C[1]	dig_clk_sel	0x0	As Required	1'b0: Select LCPLL reference clock mux output (LCPLL alone mode and Cascade mode) 1'b1: Select ROPLL reference clock mux output (ROPLL alone mode)
0x044C[5:4]	sb_rx_rcal_opt_code	0x0	0x1	This is use to select finale rcal code after rcal enable goes low and rcal done goes high 00: o_rcal_code = tune_code 01: o_rcal_code = i_sfr_rcal_code 10: o_rcal_code = tune_code + i_sfr_rcal_code (i_sfr_sb_rx_rterm_ctrl) 11: o_rcal_code = tune_code i_sfr_rcal_code (i_sfr_sb_rx_rterm_ctrl)

SFR Address	SFR Name	Default Value	Setting Value	Description
0x0470[3:0]	sb_afc_stb_num	0x0	0x4	OSC stable number for initial time... it use to configure number of times vco generate stable count to go for stable frequency comparison state
0x046C[3:0]	sb_afc_tol	0x0	0x3	OSC stable tolerance… This is the tolarance for vco count that can be taken to make sure vco generating stable frequency
0x0424[3:0]	ana_sb_dmrx_afc_div_ratio	0x0	0x5	This controls the post division after oscillator. 0, 6 and 7 are not valid codes. 1: divide by 16 2: divide by 8 3: divide by 4 4: divide by 2 5: divide by 1 (default)
0x0480[0]	sb_eARC_afc_en	0x0	0x1	0: AFC disable, 1: AFC enable
0x0480[1]	sb_eARC_en	0x0	0x1	Enable eARC mode for HDMI
0x046C[4]	sb_earc_sig_det_bypass	0x0	0x1	This sfr use to bypass signal detect logic
0x047C[7:2]	sb_pwm_afc_ctrl	0x0	0xC	This is the sfr which use for selecting pwm afc calibration code depending on its MSB MSB = 1 then MSB -1 to 0 bits value taken as calibration code for pwm afc MSB=0 then afc code is internally generated from afc module logic if AFC _EN =1
0x047C[1]	sb_rcal_rstn	0x0	0x1	Sideband resister calibration enable signal If 1'b0 resister calibration disable If 1'b1 resister calibration enable

0x0454[5:3]	sb_ready_delay_time	0x0	0x2	This sfr is the select line to set count count wrt refclock cycle to set sb ready signal after all calibration completed
				3'b000: delay_time = 9'd0; // 0
				3'b001: delay_time = 9'd13; // 0.5us
				for 25MHz refclk

SFR Address	SFR Name	Default Value	Setting Value	Description

				3'b010: delay_time = 9'd25; // 1us for 25MHz refclk
				3'b011: delay_time = 9'd50; // 2us for 25MHz refclk
				3'b100: delay_time = 9'd75; // 3us for 25MHz refclk
				3'b101: delay_time = 9'd125; // 5us for 25MHz refclk
				3'b110: delay_time = 9'd250; // 10us
				for 25MHz refclk
				3'b111: delay_time = 9'd500; // 20us
				for 25MHz refclk
				default: delay_time = 9'd25; // 1us for 25MHz refclk

0x044C[3:0]	sb_rx_rterm_ctrl	0x0	0x3	This is the code to be added in the tune code to generate finale rcal code depends on the value of i_sfr_sb_rx_rcal_opt_code
0x0408[3:0]	ana_sb_rxterm_offsp	0x0	0x3	For i_sb_rescal_tune<2:0> = 3, the table for both OffsetP and N looks like 0000: 50 Ohms 0001: 48.4 Ohms 0011: 46.9 Ohms 0111: 45.5 Ohms 1111: 44.2 Ohms
0x040C[6:3]	ana_sb_rxterm_offsn	0x0	0x3	For i_sb_rescal_tune<2:0> = 3, the table for both OffsetP and N looks like 0000: 50 Ohms 0001: 48.4 Ohms 0011: 46.9 Ohms 0111: 45.5 Ohms 1111: 44.2 Ohms
0x0464[7:0]	sb_tg_cnt_run_no_7_0	0x0	0x3	This is the refclock count cycle during which rec clock counter run This count should be such that time duration with refclock good enough to get requird rec clock count (i_sfr_sb_tg_cnt_run_no * reference clock cycle period) <=

SFR Address	SFR Name	Default Value	Setting Value	Description
				(i_sfr_sb_tg_earc_dmrx_recvrd_clk_cn t* recover clock period)
0x0460[7:0]	sb_tg_earc_dmrx_recvrd_clk_cnt	0x0	0xA	This is the target count the rec clk should give for specifide refclock cycle This count should be 10, 20 or 40 (i_sfr_sb_tg_cnt_run_no * reference clock cycle period) <= (i_sfr_sb_tg_earc_dmrx_recvrd_clk_cn t* recover clock period)
0x0478[7:0]	sb_tg_osc_cnt_max	0x0	0x5	This is the maximum target count from vco to be received for one ref clock cycle to to get 2.5GHz pll clock Refclock: count required 24MHz: 8’d106 25MHz: 8’d 101 26MHz: 8’d 98 27MHz: 8’d 94 45MHz: 8’d 57 54MHz: 8’d 48
0x0474[7:0]	sb_tg_osc_cnt_min	0x0	0x3	This is the minimum target count from vco to be received for one ref clock cycle to to get 2.5GHz pll clock Refclock: count required 24MHz: 8’d 103 25MHz: 8’d 99 26MHz: 8’d 95 27MHz: 8’d 92 45MHz: 8’d 55 54MHz: 8’d 46

0x048C[4]	sb_ready	0x0	0x1	SFR override value for sideband ready

27.6.3 EDP TX PHY Application

"SFR Address" in the tables below means that Comb TX PHY's address.

27.6.3.1 Start-Up Sequence for PHY

The Power-Up sequence as the table below.

Table 27-7 Programming Sequence for DP Start-Up operation

Power-Up Sequence
Power up and clock is valid
Reset PHY and reset init_rstn, cmn_rstn and lane_rstn by writing PMU1CRU_SOFTRST_CON03[15]=1'b1, PMU1CRU_SOFTRST_CON04[0]=1'b1, PMU1CRU_SOFTRST_CON04[1]=1'b1
Release APB reset of PHY
Write internal registers thought APB. Configure AUX and Main Link register in this stage. Detail configuration can be found in the following chapters.
Write HDPTXPHY_GRF_CON0[6:5]=2'b11, bias_en=1, bgr_en=1
Wait 10us
Write PMU1CRU_SOFTRST_CON03[15]=1'b0, release init_rstn
Wait 10us
Write HDPTXPHY_GRF_CON0[7]=1'b1, pll_en=1
Wait 10us
PMU1CRU_SOFTRST_CON04[0]=1'b0, release cmn_rstn

Power-Up Sequence
Wait o_pll_lock_done, read <HDPTXPHY_GRF_STATUS0> (Please see HDPTXPHY_GRF for base and offset address) until bit3 o_pll_lock_done=1.
Wait 10us
PMU1CRU_SOFTRST_CON04[1]=1'b0, release lane_rstn
Wait o_phy_rdy, read <HDPTXPHY_GRF_STATUS0> until bit1 o_phy_rdy=1.
The PHY's configuration is ready, the controller can send data.

27.6.3.2 PHY AUX Setting

Below are the registers to be configured to bring up sideband in aux mode. Please set AUX as the sequence in the table below.

Table 27-8 Programming Sequence for DP AUX mode operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0x044C[5:4]	sb_rx_rcal_opt_code	0x0	0x1	This is use to select finale rcal code after rcal enable goes low and rcal done goes high 2'b00: o_rcal_code = tune_code 2'b01: o_rcal_code = i_sfr_rcal_code 2'b10: o_rcal_code = tune_code + i_sfr_rcal_code (i_sfr_sb_rx_rterm_ctrl) 2'b11: o_rcal_code = tune_code - i_sfr_rcal_code (i_sfr_sb_rx_rterm_ctrl)
0x044C[3:0]	sb_rx_rterm_ctrl	0x0	0x3	This is the code to be added in the tune code to generate finale rcal code depends on the value of i_sfr_sb_rx_rcal_opt_code
0x0450[5:3]	sb_tg_sb_en_delay_time	0x0	0x2	This sfr is the select line to set count wrt refclock cycle to set sb enable after rcal done goes high 3'b000: delay_time = 9'd0; 0us for 25MHz refclk 3'b001: delay_time = 9'd13; 0.5us for 25MHz refclk 3'b010: delay_time = 9'd25; 1us for 25MHz refclk 3'b011: delay_time = 9'd50; 2us for 25MHz refclk 3'b100: delay_time = 9'd75; 3us for 25MHz refclk 3'b101: delay_time = 9'd125; 5us for 25MHz refclk 3'b110: delay_time = 9'd250; 10us for 25MHz refclk 3'b111: delay_time = 9'd500;

SFR Address	SFR Name	Default Value	Setting Value	Description
				20us for 25MHz refclk default: delay_time = 9'd25; 1us for 25MHz refclk
0x0450[2:0]	sb_tg_rxterm_en_delay_time	0x0	0x2	This sfr is the select line to set count wrt refclock cycle to set rxterm enable after sb enable goes high 3'b000: delay_time = 9'd0; 0us for 25MHz refclk 3'b001: delay_time = 9'd13; 0.5us for 25MHz refclk 3'b010: delay_time = 9'd25; 1us for 25MHz refclk 3'b011: delay_time = 9'd50; 2us for 25MHz refclk 3'b100: delay_time = 9'd75; 3us for 25MHz refclk 3'b101: delay_time = 9'd125; 5us for 25MHz refclk 3'b110: delay_time = 9'd250; 10us for 25MHz refclk 3'b111: delay_time = 9'd500; 20us for 25MHz refclk default: delay_time = 9'd25; 1us for 25MHz refclk
0x0454[5:3]	sb_ready_delay_time	0x0	0x2	This sfr is the select line to set count count wrt refclock cycle to set sb ready signal after all calibration completed 3'b000: delay_time = 9'd0; 0us for 25MHz refclk 3'b001: delay_time = 9'd13; 0.5us for 25MHz refclk 3'b010: delay_time = 9'd25; 1us for 25MHz refclk 3'b011: delay_time = 9'd50; 2us for 25MHz refclk 3'b100: delay_time = 9'd75; 3us for 25MHz refclk 3'b101: delay_time = 9'd125; 5us for 25MHz refclk 3'b110: delay_time = 9'd250; 10us for 25MHz refclk 3'b111: delay_time = 9'd500; 20us for 25MHz refclk default: delay_time = 9'd25;

SFR Address	SFR Name	Default Value	Setting Value	Description
				1us for 25MHz refclk
0x0454[2:0]	sb_tg_osc_en_delay_time	0x0	0x2	This sfr is the select line to set count count wrt refclock cycle to set oscillator enable after vreg sequence completed 3'b000: delay_time = 9'd0; 0us for 25MHz refclk 3'b001: delay_time = 9'd13; 0.5us for 25MHz refclk 3'b010: delay_time = 9'd25; 1us for 25MHz refclk 3'b011: delay_time = 9'd50; 2us for 25MHz refclk 3'b100: delay_time = 9'd75; 3us for 25MHz refclk 3'b101: delay_time = 9'd125; 5us for 25MHz refclk 3'b110: delay_time = 9'd250; 10us for 25MHz refclk 3'b111: delay_time = 9'd500; 20us for 25MHz refclk default: delay_time = 9'd25; 1us for 25MHz refclk
0x0458[6:4]	sb_tg_osc_en_to_afc_rstn_delay_time	0x0	0x2	This sfr is the select line to set count wrt refclock cycle to release reset to afc calibration module after oscillator osc enable signal set. 3'b000: delay_time = 9'd0; 0us for 25MHz refclk 3'b001: delay_time = 9'd13; 0.5us for 25MHz refclk 3'b010: delay_time = 9'd25; 1us for 25MHz refclk 3'b011: delay_time = 9'd50; 2us for 25MHz refclk 3'b100: delay_time = 9'd75; 3us for 25MHz refclk 3'b101: delay_time = 9'd125; 5us for 25MHz refclk 3'b110: delay_time = 9'd250; 10us for 25MHz refclk 3'b111: delay_time = 9'd500; 20us for 25MHz refclk default: delay_time = 9'd25; 1us for 25MHz refclk

SFR Address	SFR Name	Default Value	Setting Value	Description

0x045C[3:0]	sb_tg_pll_cd_vreg_fast_pulse_time	0x0	0x4	This sfr is the select line to set number of clock cycle for which vreg bypass signal go high
				4'b0000:
				tg_sb_pll_cd_vreg_fast_pulse_time = 14'd25;
				1us for 25MHz refclk

				500us for 25MHz refclk
				default:
				tg_sb_pll_cd_vreg_fast_pulse_time = 14'd250;

0x0460[7:0]	sb_tg_earc_dmrx_recvrd_clk_cnt	0x0	0xA	This is the target count the rec clk should give for specifide refclock cycle This count should be 10, 20 or 40 (i_sfr_sb_tg_cnt_run_no * reference clock cycle period) <= (i_sfr_sb_tg_earc_dmrx_recvrd_clk_cnt* recover clock period
0x0464[7:0]	sb_tg_cnt_run_no_7_0	0x0	0x3	This is the refclock count cycle during which rec clock counter run This count should be such that time duration with refclock good enough to get requird rec clock count (i_sfr_sb_tg_cnt_run_no * reference clock cycle period) <= (i_sfr_sb_tg_earc_dmrx_recvrd_clk_cnt* recover clock period)

SFR Address	SFR Name	Default Value	Setting Value	Description
0x046C[4]	sb_earc_sig_det_bypass	0x0	0x1	This sfr use to bypass signal detect logic
0x046C[3:0]	sb_afc_tol	0x0	0x3	OSC stable tolerance. This is the tolarance for vco count that can be taken to make sure vco generating stable frequency
0x0470[3:0]	sb_afc_stb_num	0x0	0x4	OSC stable number for initial time.it use to configure number of times vco generate stable count to go for stable frequency comparison state
0x0474[7:0]	sb_tg_osc_cnt_min	0x0	0x67	This is the minimum target count from vco to be received for one ref clock cycle to to get 2.5GHz PLL clock Refclock: count required 24MHz: 8’d103 25MHz: 8’d99 26MHz: 8’d95 27MHz: 8’d92 45MHz: 8’d55 54MHz: 8’d46
0x0478[7:0]	sb_tg_osc_cnt_max	0x0	0x6A	This is the maximum target count from vco to be received for one ref clock cycle to to get 2.5GHz pll clock Refclock: count required 24MHz: 8’d106 25MHz: 8’d101 26MHz: 8’d98 27MHz: 8’d94 45MHz: 8’d57 54MHz: 8’d48
0x047C[7:2]	sb_pwm_afc_ctrl	0x0	0x5	This is the sfr which use for selecting pwm afc calibration code depending on its MSB MSB = 1 then MSB-1 to 0 bits value taken as calibration code for pwm afc MSB = 0 then afc code is internally generated from afc module logic if AFC _EN =1
0x0434[4]	ana_sb_dmrx_lpbk_data	0x0	0x1	The loopback data from register; the duty cycle of the data have to be more than 53% or less than 47%.

SFR Address	SFR Name	Default Value	Setting Value	Description
0x0440[1]	ana_sb_vreg_out_sel	0x0	0x1	It bypasses the LDO with VDD.
0x0440[0]	ana_sb_vreg_ref_sel	0x0	0x1	Used as power saving mode
0x043C[3:0]	ana_sb_vreg_gain_ctrl	0x1	0x0	Controls the feedback gain of the LDO. 4’b0000: 1.00 4’b0001: 1.03 4’b0010: 1.04 4’b0011: 1.05 4’b0100: 1.06 4’b0101: 1.09 4’b0110: 1.12 4’b0111: 1.15
0x0408[3:0]	ana_sb_rxterm_offsp	0x0	0x3	For i_sb_rescal_tune<2:0> = 3, the table for both OffsetP and N looks like 4’b0000: 50 Ohms 4’b0001: 48.4 Ohms 4’b0011: 46.9 Ohms 4’b0111: 45.5 Ohms 4’b1111: 44.2 Ohms
0x040C[6:3]	ana_sb_rxterm_offsn	0x0	0x3	For i_sb_rescal_tune<2:0> = 3, the table for both OffsetP and N looks like 4’b0000: 50 Ohms 4’b0001: 48.4 Ohms 4’b0011: 46.9 Ohms 4’b0111: 45.5 Ohms 4’b1111: 44.2 Ohms
0x047C[1]	sb_rcal_rstn	0x0	0x1	Sideband resister calibration enable signal If 1'b0 resister calibration disable If 1'b1 resister calibration enable
0x0410[0]	sb_aux_en	0x0	0x1	AUX Enable This is ovrd for sb_aux_en_in 1’b0: Disable 1’b1: Enable
0x0480[7]	sb_aux_en_in	0x0	0x1	AUX Enable 1’b0: Disable 1’b1: Enable
0x040C[1]	ovrd_sb_rx_rescal_done	0x0	0x1	Enable SFR override for rescal done
0x0410[5]	ovrd_sb_en	0x0	0x1	Enable SFR override for sideband enable

SFR Address	SFR Name	Default Value	Setting Value	Description
0x0408[5]	ovrd_sb_rxterm_en	0x0	0x1	Enable SFR override for sideband rx termination enable
0x043C[7]	ovrd_sb_vreg_en	0x0	0x1	Enable SFR override for sideband vreg enable
0x0410[1]	ovrd_sb_aux_en	0x0	0x1	Enable SFR override for sideband aux enable
0x048C[5]	ovrd_sb_ready	0x0	0x1	Enable SFR override for sideband ready
Bring up Bias/BGR, deassert init_rstn, cmn_rstn if not done already and wait for 1000us				
0x040C[0]	sb_rx_rescal_done	0x0	0x1	SFR override value for rescal done
Wat for 100us				
0x0410[4]	sb_en	0x0	0x1	SFR override value for sideband enable
Wait for 100us				
0x0408[4]	sb_rxterm_en	0x0	0x1	SFR override value for sideband rx termination enable
Wait for 10us				
0x043C[6]	sb_vreg_en	0x0	0x1	SFR override value for sideband vreg enable
Wait for 10us				
0x0410[0]	sb_aux_en	0x0	0x1	SFR override value for sideband aux enable
Wait for 100us				
0x048C[4]	sb_ready	0x0	0x1	

27.6.3.3 PHY Main Link Setting

Below are the registers to be configured to set RBR/HBR/HBR2 rates. Please set link rate as the sequence in the table below. For the different setting of RBR/HBR/HBR2 rates and 1/2/4 lane, please see the table below.

Table 27-9 DP mode Setting

SFR Address	SFR Name	Default Value	Setting Value	Description
0x0800[2]	protocol_sel	0x0	0x0	DP mode
0x025C[1]	dig_clk_sel	0x0	0x1	1'b0: Select LCPLL reference clock mux output (LCPLL alone mode and Cascade mode) 1'b1: Select ROPLL reference clock mux output (ROPLL alone mode)

if RBR:

27.6.3.5 PHY Change Setting Flow

For RBR/HBR/HBR2 rates, the registers 0x0254[1:0], 0x0144, 0x0148, 0x014c, 0x0154, 0x0158, 0x015c, 0x0168, 0x016c, 0x0180, 0x0184, 0x0188, 0x0190, 0x0194, 0x0198, 0x019c, 0x01b0, 0x01b4, 0x01b8, 0x01c0, 0x01c4, 0x01c8 should be set correctly. For 1/2/4 lane, the registers 0x081C[3:0] should be set correctly. All the register above can be seen in chapter PHY Main Link Setting. Please look for it for the details.

If want to change PHY's setting, please power down the PHY according to chapter PHY Power-Off Setting. After PHY is power-off, change the SFR settings and bring up PHY as chapter Start-Up Sequence for PHY.

27.6.3.6 PHY Voltage-Swing and Pre-Emphasis setting

The Voltage-Swing and Pre-Emphasis can be adjusted in this table.

Table 27-11 Voltage Swing and Pre-emphasis Level

	Pre-emphasis level 0	**Pre-emphasis level1**	**Pre-emphasis level 2**	**Pre-emphasis level 3**
Voltage swing level 0	lane_reg0303=0x22 lane_reg0304=0x10	lane_reg0303=0x25 lane_reg0304=0x13	lane_reg0303=0x29 lane_reg0304=0x17	lane_reg0303=0x2d lane_reg0304=0x1c

Chapter 28 HDMI RX PHY

28.1 Overview

HDMI RX PHY supports the following features:

- Single-port HDMI 2.0 RX PHY, 4 lanes, no sideband channels
- Data rate support in HDMI 2.0 mode
  - 6Gbps down to 3.4Gbps
- Data rate support in HDMI 1.4 mode
  - 3.4Gbps down to 250Mbps
- True-color (24 bit) and deep-color (30) color resolution modes
- Up to 4k at 30/50/60/120 Hz HDTV display resolutions
- Input clock
  - Wide range of discrete input reference clock (100, 54, 50, 48, 27, 25, 24MHz)
  - 85-150MHz input clock from TMDSCLK lane for HDMI 2.0 operation
  - 25-340MHz input clock from TMDSCLK lane for HDMI 1.4 operation
- Custom LDO: 3.3V to 1.8V
- Flip-chip package support
- Poly-orientation: North-South Orientation
- Internal Built-in Self-Test (BIST) for production testing
- JTAG interface for configuration
- IO continuity test included
- Includes analog embedded IO
- 3.3V termination included internally on HDMI 2.0 RX PHY
- No 5V stress support targeted
- Adaptive and configurable RX CTLE and DFE
  - Automatic equalization
- Support to HDMI 2.0 CTS

28.2 Block Diagram

HDMI_RX PHY has two main sub_block: Protocol Coding Sublayer (PCS) and Physical Media Attachment (PMA). HDMI_RX PHY block diagram is shown below.

Each lane module (raw_pcs_lane) contains Finite State Machines (FSM) to execute the power-up calibration and run-time adaptation algorithms. The algorithms are stored in a register bank located in a common module (raw_pcs_cmn). The design includes two register access arbiters. The memory arbiter is used for accessing the register bank whereas the control register arbiter is used to access all other registers in the PCS and the PMA. This mechanism provides efficient use of the registers and state machines within each lane where each lane can independently execute a different portion of the algorithm while reducing the register access bottleneck. All control registers in the PCS and PMA can be externally accessed using JTAG or CR parallel interfaces, with only one interface at any given time.

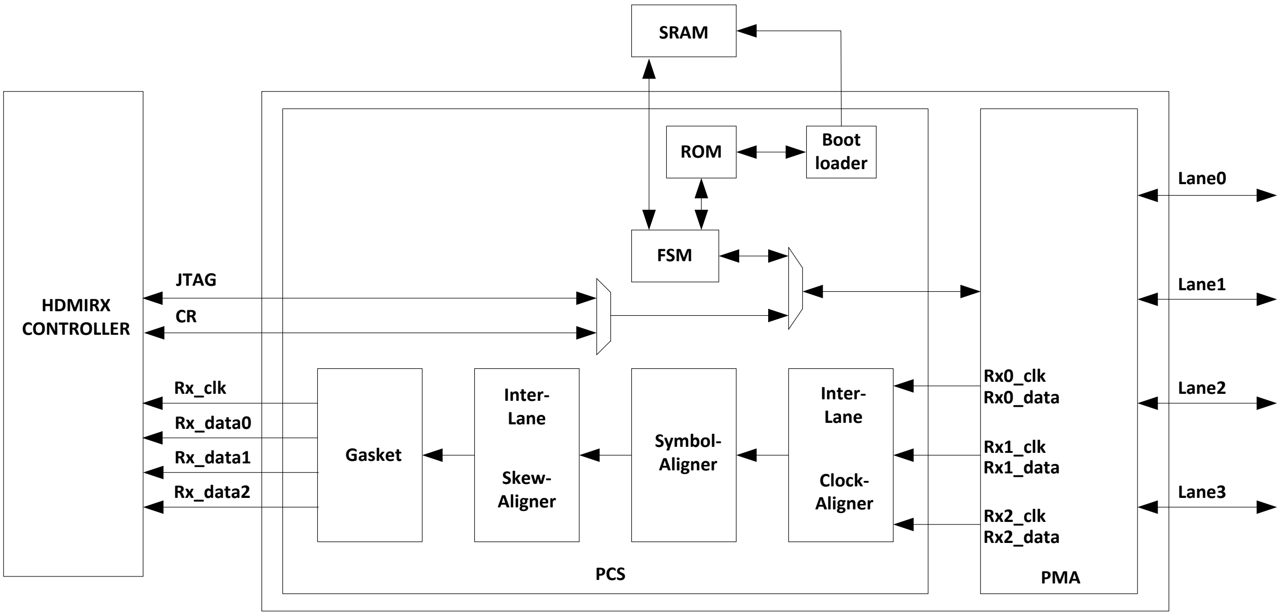

Fig. 28-1 HDMI_RX PHY diagram

HDMI_RX PHY PMA block diagram is shown below.

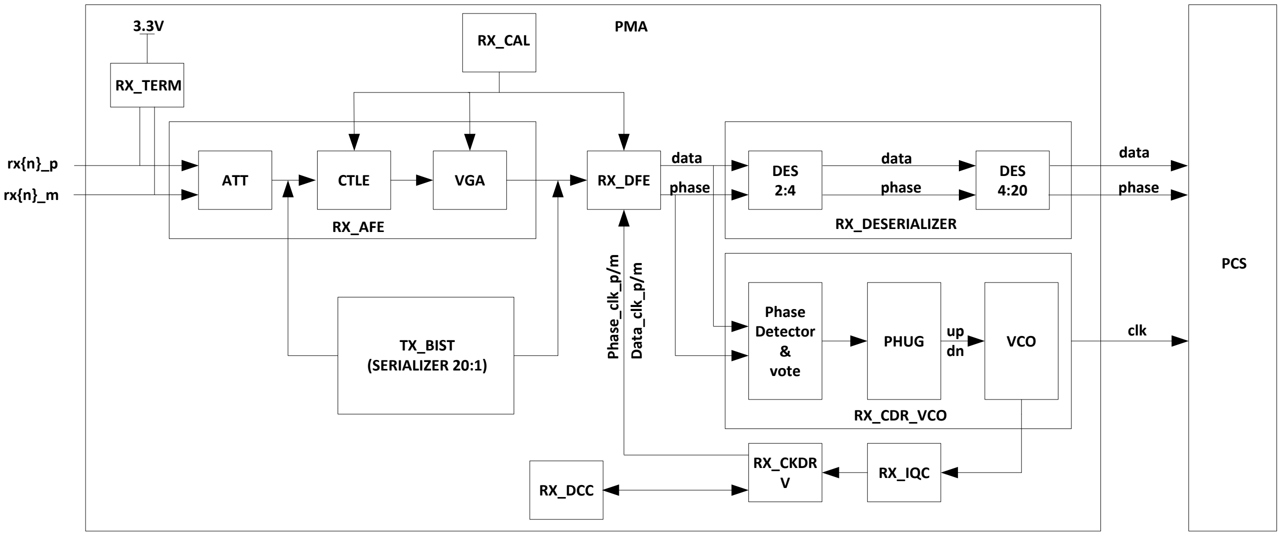

Fig. 28-2 HDMI_RX PHY single lane PMA diagram

The PMA receives differential serial data from a pair of external pads. Receiver characteristics, such as equalization and termination, are user-controllable. A continuous-time linear equalizer (CTLE) is first used to compensate for channel loss. A decision feedback equalizer (DFE) is also implemented after the CTLE to further equalize the signal for high-speed data rates. A clock and data recovery (CDR) circuit is implemented, which recovers the clock from the data. A dedicated VCO is implemented as the source of the recovering clock. The CDR loop adjusts the VCO clock frequency and phase until the frequency matches incoming data and the phase is aligned with incoming data. This recovered clock is used to retime received data and send it to the deserializer, which produces parallel data and a parallel data clock for the relevant PCS lane.

28.3 Function Description

HDMI_RX PHY has two main sub_block: Protocol Coding Sublayer (PCS) and Physical Media Attachment (PMA).

28.3.1 RX AFE

The analog front end (AFE) circuitry receives and terminates off-chip data signal, controls the signal level, and equalizes the signal by way of a linear equalizer. The AFE comprises three major blocks: the termination, an attenuator, and a CTLE VGA. The termination block is a programmable resistance that provides a constant 50 Ω termination over corners. The attenuator and VGA is responsible for attenuating the incoming signal to acceptable levels so the CTLE and DFE can maintain linearity in the case of short link. The CTLE provides high-

frequency signal boosting from 0dB to 12dB, along with programmable gain.
(1) Termination(TERM)
The TERM block is tuned to 50 Ω by the PHY using an off-chip reference resistor. The termination is fixed to AC coupled mode termination, and in this mode there is a single-ended 50 Ω termination to ground on each of RXP and RXM.
(2) Attenuator(ATT)
The ATT block is responsible for attenuating the incoming signal to acceptable levels in order that the subsequent CTLE and DFE circuits maintain linearity over all channels. Attenuation is controlled by the two MSBs of rxX_eq_afe_gain[3:0](X=0, 1, 2, 3).
(3) Continuous time-linear equalizer(CTLE)
The CTLE block provides high-frequency boost used to equalize the frequency dependent loss in a channel. The CTLE block has programmable boost level and gain provided by rxX_eq_ctle_boost[4:0] and the two LSBs of rxX_eq_afe_gain[3:0](X=0, 1, 2, 3).

28.3.2 RX DFE

The second equalizer in the RX is the Decision Feedback Equalizer (DFE). The output of the AFE is sent to a 2-tap adaptive DFE, which incorporates offset-compensated samplers. The output of the DFE is deserialized and sent to the core along with the recovered clock.
The DFE can be disabled by the following control signals:
(1) The rxX_ana_adaptation_en signal
(2) The LANEN_DIG_ANA_RX_CTL_OVRD_OUT.RX_ANA_ADAPTATION_EN register bit can be de-asserted to disable DFE adaptation. In this case, the DFE error-sampling path and related clock path are all disabled to save power.
(3) The LANEN_DIG_ANA_RX_CTL_OVRD_OUT.RX_ANA_DFE_TAPS_EN register bit can be used to reset the DFE taps to 1’b0 and, therefore, disable the DFE functionality.

28.3.3 RX CDR

The clock and data recovery (CDR) circuit is implemented as a second-order digital loop. The loop includes a proportional path and an integral path. To reduce proportional path latency, the proportional path is implemented separately from the integral path, with much higher speed. The proportional path and integral path outputs control a dedicated voltage-controlled oscillator (VCO), which generates an RX clock aligned with incoming data. CDR is shown in figure below.

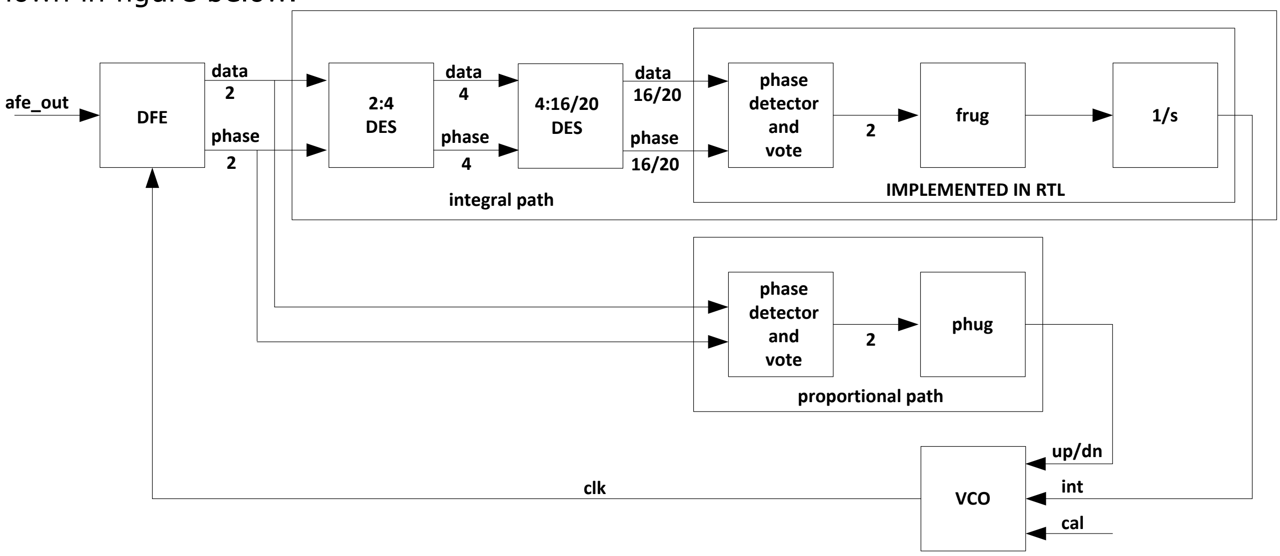

Fig. 28-3 HDMI_RX PHY CDR diagram

28.3.4 RX Deserialization

The deserializer converts serial data from RX and sends the data to the Soft IP as parallel data. The deserializer qualifies serial input data from the AFE using the high-speed serial recovered clock, and deserializes the data using the low-speed parallel recovered clock. The deserializer forwards the deserialized data to the receiver's Soft IP channel. The deserializer supports a 20 bit interface.

28.3.5 RX Internal Eye Monitor

Provided with the PHY is an internal eye monitor, which can provide data to produce a plot of time and voltage axis using internal DFT hooks built into the AFE. The eye monitor is non-destructive and can be run in parallel with live traffic. This procedure can be used to characterize the input RX eye margin as seen after the ATT and CTLE.

28.3.6 RX Equalization and Adaptation

The PHY supports receiver equalization, adaptation of receiver equalization parameters, and requests for updating Source side TxFFE settings. The PHY adapts RX AFE parameters, DFE coefficients, and remote TX equalization in two steps—startup adaptation and mission mode adaptation.

(1) startup adaptation

Startup adaptation starts when the RX is powered up with data received and with CDR locked. First, AFE gain, including ATT and GAIN parameters, are adapted based on a measurement of the average eye opening. Then, the CTLE BOOST is adapted using correlations. After CTLE is adapted, DFE tap coefficients are adapted using correlations.

(2) mission mode adaptation

The goal of mission mode adaptation is to continuously fine-tune the system. For AFE parameters (such as gain control) during mission mode adaptation, CTLE boosting is not changed unless the eye opening exceeds some preset range. Also during mission mode adaptation, DFE coefficients are adapted continuously by the least mean squares (LMS) algorithm.

28.3.7 Test Transmitter

This IP contains a test transmitter for at-speed testing of the RX data-path. This test TX contains a serializer that runs on a reference clock from the VCO of the adjacent lane and serializes the parallel data generated from a pattern generator.

28.3.8 RX Inter Lane Clock Aligner

HDMIRX PHY PMA will output 3 independent lane data stream, every data stream with its lane clock. In inter lane clock aligner module, every lane data stream will write into one data_fifo reg which is 160 bit with its lane clock. And it will use the lane0 clock to read this data_fifo reg, so all these three lane data stream will align to lane0 clock.

28.3.9 RX Symbol Aligner

This module aligns each data lane in 10 bit unit. In the PMA may sample the data bit which is not alignment with 10 bit, but in fixed data phase, so this module will extract 10 bit boundary and align it in 10 bit unit.

In the first stage, the HDMITX will send
10'h2ab: 10'b1010101011(channel0),
10'h0ab: 10'b0010101011(channel1),
10'h354: 10'b1101010100(channel2),
and it is send in LSB first, so RX will receive
10'b1101010101(10'h355, channel0),
10'b1101010100(10'h354, channel1),
10'b0010101011(10'h0ab, channel2).

The first 9 MSB bit is 9'b110101010 or 9'b001010101, and 9'b001010101 is the inversion of 9'b110101010. So the detection comma is 9'b001010101 and its inversion. If the RX extract these detection comma in lane data stream and it will record this pointer in the lane data stream, and output the 10 bit unit with this boundary.

28.3.10 Inter Lane Skew Aligner

This module will align different data lane, which is based on lane0. HDMITX will send 10'h2ab(channel0), 10'h0ab(channel1), 10'h354(channel2), and this module will find these three channel boundary with these comma's inversion, and align them across these three channels.

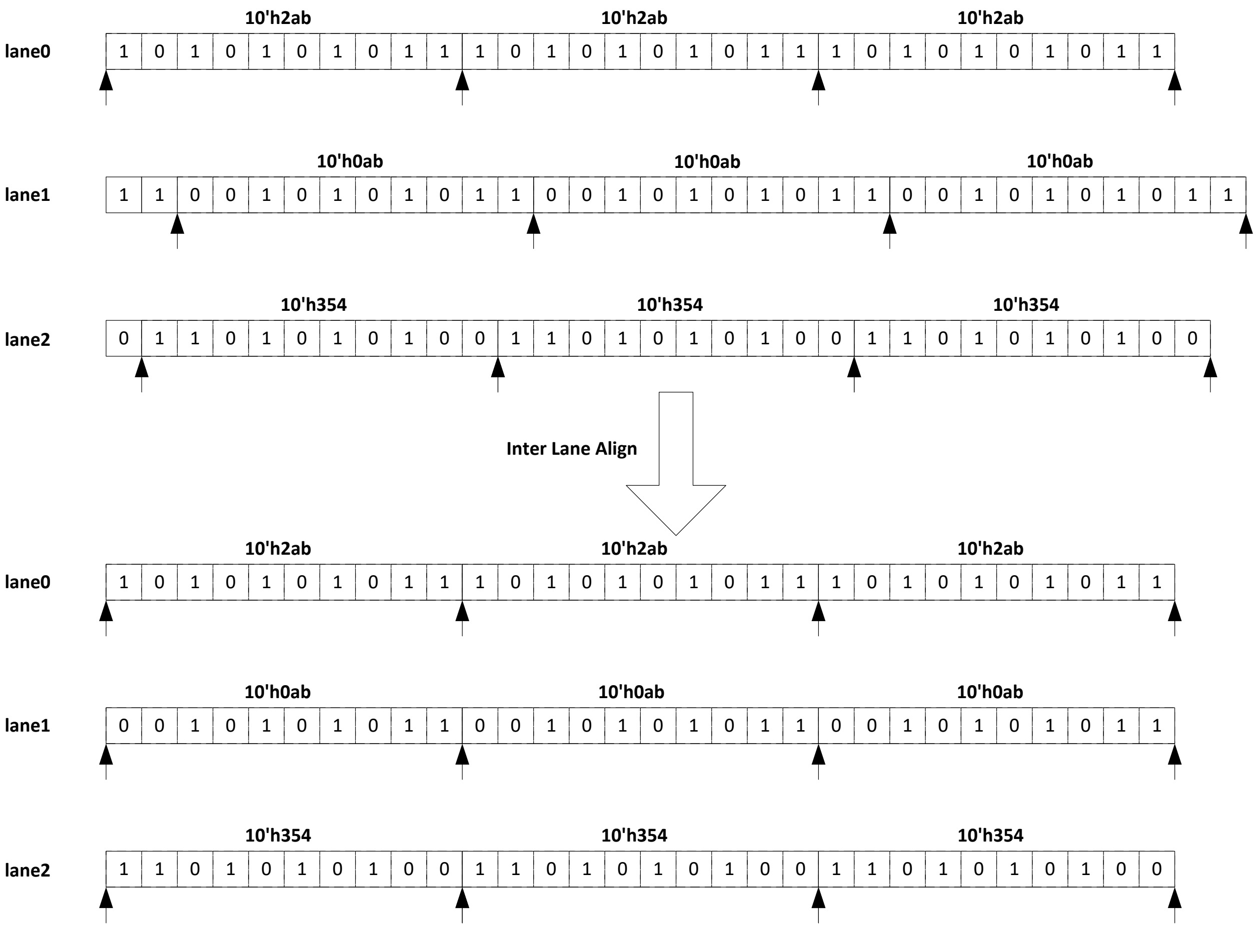

Fig. 28-4 Inter lane skew aligner

28.3.11 RX Gasket

This module will invert each lane data, and pad two 20 bit data into one 40 bit data and output.

The clock will be divided by two and output as the final clock corresponding 40 bit valid data.

28.4 Register Description

28.4.1 Internal Address Mapping

Slave address can be divided into different length for different usage, which is shown as follows.

28.4.2 Registers Summary

Name	Offset	Size	Reset Value	Description
SUP_DIG_IDCODE_LO	0x0000	W	0x000034CD	Low 16 bits of IDCODE
SUP_DIG_IDCODE_HI	0x0001	W	0x00003C42	High 16 bits of IDCODE
SUP_DIG_REFCLK_OVRD_IN	0x0002	W	0x00000700	Override values for incoming REFCLK and RESET controls from ASIC

31:16	RO	0x0000	reserved
15	RO	0x0	reserved_15_15 Reserved for future use
14	RO	0x0	rx_dig_det0vn_en Value to ASIC for rx_dig_det0Vn_en
13	RO	0x0	rx_dig_det0vp_en Value to ASIC for rx_dig_det0Vp_en
12	RO	0x0	res_ack_out Value to ASIC for res_ack_out_i

Bit	Attr	Reset Value	Description
11	RO	0x0	res_ack_in Value from ASIC for res_req_in
10	RO	0x0	res_req_out Value to ASIC for res_ack_out_i
9	RO	0x0	res_req_in Value from ASIC for res_req_in
8	RO	0x0	rtune_ack Value to ASIC for rtune_ack_i
7	RO	0x0	rtune_req Value from ASIC for rtune_req
6	RO	0x0	test_powerdown Value from ASIC for test_powerdown
5	RO	0x0	test_burnin Value from ASIC for test_burnin
4	RO	0x0	reserved_4 Reserved_4
3	RO	0x0	reserved_3 Reserved_3
2	RO	0x0	reserved_2 Reserved_2
1	RO	0x0	ref_clk_en Value from ASIC for ref_clk_en
0	RO	0x0	phy_reset Value from ASIC for phy_reset

SUP_DIG_LVL_ASIC_IN
Address: Operational Base + offset (0x001A)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:5	RO	0x000	reserved_15_5 Reserved for future use
4:0	RO	0x00	rx_vref_ctrl Value from ASIC for rx_vref_ctrl

SUP_DIG_BANDGAP_ASIC_IN
Address: Operational Base + offset (0x001B)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:1	RO	0x0000	reserved_15_1 Reserved for future use
0	RO	0x0	bg_en Value from ASIC for bg_en

SUP_DIG_CLK_RST_BG_PWRUP_TIME_0
Address: Operational Base + offset (0x0038)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:10	RO	0x00	reserved_15_10 Reserved for future use
9	RW	0x0	fast_bg_wait Enable fast BG times (simulation only)
8:0	RW	0x082	bg_sup_en_time Power up time (in ref_range cycles) for bandgap in SUP (spec >=5us)

SUP_DIG_CLK_RST_BG_PWRUP_TIME_1
Address: Operational Base + offset (0x0039)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:10	RO	0x00	reserved_15_10 Reserved for future use
9:0	RW	0x208	bg_lane_en_time Power up time (in ref_range cycles) for bandgap in LANE (spec >= 20us)

SUP_DIG_ANA_CREGS_ANA_RTUNE_OVRD_IN
Address: Operational Base + offset (0x004A)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RO	0x00	reserved_15_8 Reserved for future use
7	RW	0x0	rt_en_frcon Local rtune block enable control, force rtune block on, if asserted
6	RW	0x0	reserved Reserved
5	RW	0x0	rt_dac_mode_1_ RT_DAC_MODE[1]
4	RW	0x0	rt_dac_mode_0_ For 0 NOP, 1 DAC drives atb_s_p or atb_s_m
3	RW	0x0	rt_dac_chop For 0 atb_s_m, for 1 atb_s_p
2	RW	0x0	rt_atb Rtune ATB mode control. Combines with rt_ana_mode[1:0] to perform different functions
1	RW	0x0	rt_sel_atbp Rtune ATB input select: RT_SEL_ATBP function 1'b1: Select atb_s_p 1'b0: Select atb_s_m
0	RW	0x0	rt_sel_atbf Rtune ATB input select: RT_SEL_ATBF function 1'b1: Select gd as input 1'b0: Select atb_s_p/m as input

SUP_DIG_ANA_CREGS_ANA_ATB_IN
Address: Operational Base + offset (0x004B)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RO	0x00	reserved_15_8 Reserved for future use
7	RW	0x0	sup_ana_ovl_osc_disable4test_int Force the output of protection oscillator
6	RW	0x0	atb_switch_6 Connect atb_s_p to atb_s_m, if asserted
5	RW	0x0	atb_switch_5 Connect atb_s_p to vph, if asserted
4	RW	0x0	atb_switch_4 Connect atb_s_p to gd, if asserted
3	RW	0x0	atb_switch_3 Connect atb_s_p to vp, if asserted

Bit	Attr	Reset Value	Description

0	RW	0x0	clk_sense_write_clk Clock input used to latch analog clock sense mode control registers. Falling edge - latching

SUP_DIG_RTUNE_DEBUG

Address: Operational Base + offset (0x0060)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	rx21_go Enable RX21 tune to continue in manual tune mode when type is RX21 tune. When in non RX21 manual tune mode, this bit must be 0. When in RX21 manual tune mode and after RX21 manual tune is triggered, if the read only register SUP.RTUNE_STAT.DTB_RTUNE equals to 2'b01, it is required to first release the tune related asynchronous override on analog/digital interface then turn this bit RX21_GO from low to high to continue RX21 manual tune which also indicates that this bit needs to be low when triggering RX21 manual tune.
14:5	RW	0x000	value Value to use when triggering SET_VAL field only the 6 LSB's are used when setting RX cal values
4:3	RW	0x0	type Type of manual tuning or register read/write to execute 2'b00: ADC, or read/write rt_value 2'b01: None 2'b10: EARC tune, or read/write earc_cal_val (10 bits) 2'b11: RX21 tune, or read/write rx21_cal_val (10 bits) or resref detect (no affect when triggering SET_VAL field)
2	RW	0x0	set_val Set value Write to a 1 to manually write the register specified by the TYPE field to the value in the VALUE field
1	RW	0x0	man_tune Write to a 1 to do a manual tuning specified by TYPE field starting a manual tune while a tune is currently running can cause unpredictable results. For use only when you know what the part is doing (w.r.t. resistor tuning)

Bit	Attr	Reset Value	Description

0	RW	0x0	force_state_change Enable force FSM to change state

HDMIPCS_DIG_CTRL_PATH_MAIN_FSM_ADAPT_REF_FOM

Address: Operational Base + offset (0x20C7)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15:8	RO	0x00	reserved_15_8 Reserved for future use
7:0	RW	0x80	adapt_ref_fom Minimum reference FOM needed for successful LTP (reset value to be updated in pcs_raw_macros)

HDMIPCS_DIG_CTRL_PATH_MAIN_FSM_HDMI_STATUS

Address: Operational Base + offset (0x20C8)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RO	0x0	byte_misalign_in_fsmdone Indicates value of byte_misalign_in_fsmdone

Bit	Attr	Reset Value	Description
14	RO	0x0	frl_fast_relock Indicates value of frl_fast_relock
13	RO	0x0	power_seq_complete Indicates value of power_seq_complete
12	RO	0x0	readapt_en_cur Indicates currently active readapt_en
11	RO	0x0	phy_mode_cur Indicates currently active PHY mode
10	RO	0x0	frl_lane_num_cur Indicates currently active FRL lane mode (3/4)
9:8	RO	0x0	frl_bit_rate_cur Indicates currently active FRL bit ratee
7	RO	0x0	tmds_clock_ratio_cur Indicates currently active TMDS mode status
6	RO	0x0	rxdata_width_cur Indicates currently active rxdata width configuration
5	RO	0x0	stress_int Indicates overload detection in one of the lanes
4	RO	0x0	lane_needs_pwrdn Indicates change in pddq or hdmi_disable or source has indicated rate change
3	RO	0x0	ext_config_change Indicates either frl_rate has changed or tmds_clock_ratio or rxdata_width
2	RO	0x0	hdmi_config_change Indicates either external configuration has changed or clock_stable has changed
1	RO	0x0	cdr_is_locked Indicates successful valid from all active lanes after complete powerup
0	RO	0x0	data_valid_int Internal rxdata_valid indicates successful byte alignment and skew alignment

HDMIPCS_DIG_CTRL_PATH_MAIN_FSM_FFE_STATUS
Address: Operational Base + offset (0x20C9)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RO	0x0	reserved_15_15 Reserved for future use
14:13	RO	0x0	ln3_best_ffe_setting Indicates target ffe setting for lane 3, if try_all_ffe is '0'
12:11	RO	0x0	ln2_best_ffe_setting Indicates target ffe setting for lane 2, if try_all_ffe is '0'
10:9	RO	0x0	ln1_best_ffe_setting Indicates target ffe setting for lane 1, if try_all_ffe is '0'
8:7	RO	0x0	ln0_best_ffe_setting Indicates target ffe setting for lane 0, if try_all_ffe is '0'
6	RO	0x0	program_ln3_to_best_ffe Indicates FSM has tried all the ffe settings and is programming lane 3 TX to the best ffe configuration
5	RO	0x0	program_ln2_to_best_ffe Indicates FSM has tried all the ffe settings and is programming lane 2 TX to the best ffe configuration

Bit	Attr	Reset Value	Description
4	RO	0x0	program_ln1_to_best_ffe Indicates FSM has tried all the ffe settings and is programming lane 1 TX to the best ffe configuration
3	RO	0x0	program_ln0_to_best_ffe Indicates FSM has tried all the ffe settings and is programming lane 0 TX to the best ffe configuration
2	RO	0x0	try_all_ffe Indicates that main_FSM is just checking the fom and lock status for all available ffe settings
1:0	RO	0x0	ffe_levels_tried Number of ffe levels which are tried during first run

HDMIPCS_DIG_CTRL_PATH_MAIN_FSM_POWER_STATUS

Address: Operational Base + offset (0x20CA)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RO	0x0	reserved_15_15 Reserved for future use
14	RO	0x0	fifo_en If asserted indicates FSM has enabled PCS data path
13	RO	0x0	rx3_adapt_req If asserted indicates FSM has requested adaptation for lane 3
12	RO	0x0	rx2_adapt_req If asserted indicates FSM has requested adaptation for lane 2
11	RO	0x0	rx1_adapt_req If asserted indicates FSM has requested adaptation for lane 1
10	RO	0x0	rx0_adapt_req If asserted indicates FSM has requested adaptation for lane 0
9:8	RO	0x0	rx3_pstate If '00' indicates FSM has requested lane 3 to full power up
7:6	RO	0x0	rx0_pstate If '00' indicates FSM has requested lane 0/1/2 to full power up
5	RO	0x0	cmu_en If asserted indicates TMDS receiver is enabled and clock measurement unit is active
4	RO	0x0	ref_clk_en If asserted indicates ref_clk and cr clk is enabled
3	RO	0x0	hdmi_disable_cur If asserted indicates HDMI is still disabled and only bg is running
2	RO	0x0	bg_done If asserted indicates bandgap is stable and enabled
1	RO	0x0	bg_en If asserted indicates bandgap is requested to be enabled
0	RO	0x0	pddq_cur If asserted indicates HDMI is in lowest power state with everything disabled

HDMIPCS_DIG_CTRL_PATH_MAIN_FSM_MISC_STATUS

SUPX_DIG_RTUNE_DEBUG

Address: Operational Base + offset (0x8060)

Bit	Attr	Reset Value	Description
31:16	RO	0x0000	reserved
15	RW	0x0	rx21_go Enable RX21 tune to continue in manual tune mode when TYPE is RX21 tune. When in non RX21 manual tune mode, this bit must be 0. When in RX21 manual tune mode and after RX21 manual tune is triggered, if the read only register SUP.RTUNE_STAT.DTB_RTUNE equals to 2'b01, it is required to first release the rtune related asynchronous override on analog/digital interface then turn this bit RX21_GO from low to high to continue RX21 manual tune which also indicates that this bit needs to be low when triggering RX21 manual tune.
14:5	RW	0x000	value Value to use when triggering SET_VAL field only the 6 LSB's are used when setting RX cal values
4:3	RW	0x0	type Type of manual tuning or register read/write to execute 2'b00: ADC, or read/write rt_value 2'b01: None 2'b10: EARC tune, or read/write earc_cal_val (10 bits) 2'b11: RX21 tune, or read/write rx21_cal_val (10 bits) or resref detect (no affect when triggering SET_VAL field)
2	RW	0x0	set_val Set value Write to a 1 to manually write the register specified by the TYPE field to the value in the VALUE field
1	RW	0x0	man_tune Write to a 1 to do a manual tuning specified by TYPE field starting a manual tune while a tune is currently running can cause unpredictable results. For use only when you know what the part is doing (w.r.t. resistor tuning)
0	RW	0x0	flip_comp Invert analog comparator output

0x0	0	0	0	reset write enable
0x1	0	0	1	
0x0	0	0	0	
0x0	0	0	0	default state

HDMIRX controller has one cr_para interface to configure HDMIRX PHY, and driver can configure the HDMIRX controller register to configure HDMIRX PHY.

Table 28-3 HDMIRX PHY power up configuration operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0xc0[0]	phy_reset	0x1	0x1	Reset HDMIRX PHY
Wait for 100us				
0xc0[0]	phy_reset	0x1	0x0	Release HDMIRX PHY reset
0xe0[1:0]	phycreg_cr_para_selection_mode	0x0	0x3	This signal control the selection between the PHY JTAG and cr_para interface. The driver select the cr_para interface here.
Read the [10]bit of SYS_GRF_SOC_STATUS1(0x384, The GRF base address is 0XFD58C000), until this bit is 1'b1. This signal sram_init_done indicates the HDMIRX PHY SRAM initial done.				
Write the [1]bit of SYS_GRF_SOC_CON1(0x304), configure 1'b1. This signal is HDMIRX PHY sram_ext_ld_done signal, it is the handshake signal with sram_init_done signal				

SFR Address	SFR Name	Default Value	Setting Value	Description
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x20c7	Configure the first write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x0	Configure the first write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the first wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the second write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the second write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the second wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the third write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x3	Configure the third write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the third wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 4th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the 4th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				

SFR Address	SFR Name	Default Value	Setting Value	Description
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 4th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 5th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the 5th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 5th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 6th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x3	Configure the 6th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 6th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 7th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the 7th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 7th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 8th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x0	Configure the 8th write data

SFR Address	SFR Name	Default Value	Setting Value	Description
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 8th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 9th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x1	Configure the 9th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 9th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 10th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x0	Configure the 10th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 10th wdata finish
0xc0[1]	phy_pddq	0x1	0x0	Configure PHY pddq 1’b0, and HDMIRX PHY begins to enable its reference voltage generator and performs termination calibration.
Read 0xc8[0] bit, it is pddq_ack, read this register bit, wait and until it is 1’b0. It indicates pddq finish.				
0xc0[8]	phy_hdmi_disable	0x1	0x0	Configure PHY hdmi_disable 1’b0, and HDMIRX PHY begins to enter initialization sequence, and PHY begins to power up circuit calibrations.

SFR Address	SFR Name	Default Value	Setting Value	Description
Read 0xc8[1] bit, it is hdmi_disable_ack, read this register bit, wait and until it is 1’b0. It indicates power up finish.				
0xc0[11:9]	reffreq_sel	0x0	0x0	Select HDMIRX PHY cr_para_clk frequency. Default value is 24M. 3’b000: 24M 3’b001: 25M 3’b010: 27M 3’b011: 48M 3’b100: 50M 3’b101: 54M 3’b110: 100M
0xc0[15]	rxdata_width	0x0	0x1	Configure the rxdata width. 1’b0 is 20 bit valid, 1’b1 is 40 bit valid. And this version is quad pixel, so it is 40 bit valid.
Read 0x58c[1] bit, it is scdc_tmdsbitclkratio, before the HDMITX sends >= 3.4Gbps channel video, and it will be configured 1’b1 by the DDC bus.				
0xc0[16]	tmds_clk_ratio	0x0	0x0	If the HDMIRX PHY channel bit rate is >= 3.4Gbps, for example 4k resolution, tmds_clk_ration must be configured 1’b1.

28.6.1.2 HDMIRX PHY Power down sequence

The figure below is HDMIRX PHY power down timing diagram.

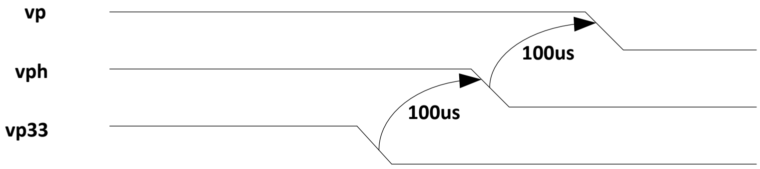

Fig. 28-6 HDMIRX PHY power down sequence

VPH, VP, VPDIG, and VP33TERM are power supply inputs of the PMA Hard Macro in the PHY. Vpdig is the core supply for the Soft IP part.

28.6.1.3 HDMIRX PHY Clock Sense mode

Analog Front End of HDMI RX PHY supports clock sense mode feature which allows to reduce power consumption of the PHY in suspend mode and monitor TMDS clock lines for any activity to wake up the system. In clock sense mode only reduced number of analog blocks is enabled – LDO, clock_sense block, termination and input protection.

In order to minimize current consumption even more vp/vpdig (core supply) can be powered down. To enable such option all AFE blocks used in close sense mode are supplied from 3.3V/1.8V domain. Output of the clock sense block is connected to dedicated clock_sense bump/pin and its level should be monitored by customer power management unit to wake up HDMIRX PHY subsystem once TMDS clock lane activity is detected. Since there might be no vp/vp_dig (core supply) available in clock sense mode it is necessary to store configuration of blocks used during clock sense mode in analog registers supplied from 1.8V/3.3V domain. The figure below shows the clock sense mode diagram.

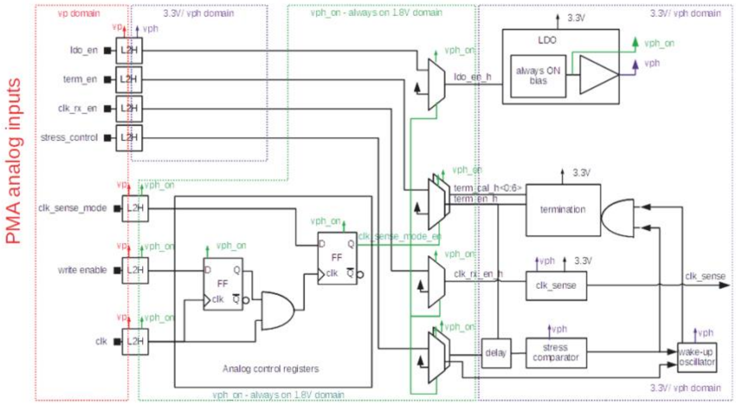

Fig. 28-7 HDMIRX PHY clock sense mode diagram

The figure below shows the HDMIRX PHY clock sense mode configuration sequence.

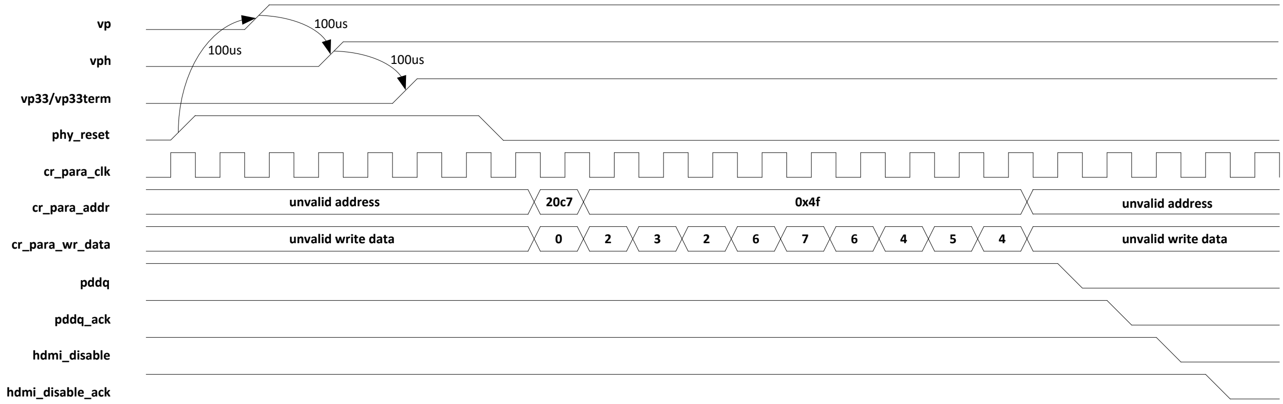

Fig. 28-8 HDMIRX PHY clock sense mode configuration sequence

The table below is the HDMIRX PHY clock sense mode configuration sequence map.

Table 28-4 HDMIRX PHY clock sense mode configuration sequence map

0X4F value	clk_sense_mode	clk_sense_write_en	clk_sense_write_clk	Description
0x2	0	1	0	set write enable
0x3	0	1	1	
0x2	0	1	0	
0x6	1	1	0	set clock sense
0x7	1	1	1	
0x6	1	1	0	
0x4	1	0	0	reset write enable
0x5	1	0	1	
0x4	1	0	0	
0x0	0	0	0	default state

Driver can configure the HDMIRX controller register to configure HDMIRX PHY, which in clock sense mode.

Table 28-5 HDMIRX PHY clk sense mode power up configuration operation

SFR Address	SFR Name	Default Value	Setting Value	Description
0xc0[0]	phy_reset	0x1	0x1	Reset HDMIRX PHY
Wait for 100us				
0xc0[0]	phy_reset	0x1	0x0	Release HDMIRX PHY reset

SFR Address	SFR Name	Default Value	Setting Value	Description
0xe0[1:0]	phycreg_cr_para_selection_mode	0x0	0x3	This signal control the selection between the PHY JTAG and cr_para interface. The driver select the cr_para interface here.
Read the [10]bit of SYS_GRF_SOC_STATUS1(0x384, The GRF base address is 0XFD58C000), until this bit is 1’b1. This signal sram_init_done indicates the HDMIRX PHY SRAM initial done.				
Write the [1]bit of SYS_GRF_SOC_CON1(0x304), configure 1’b1. This signal is HDMIRX PHY sram_ext_ld_done signal, it is the handshake signal with sram_init_done signal				
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x20c7	Configure the first write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x0	Configure the first write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the first wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the second write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the second write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the second wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the third write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x3	Configure the third write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				

SFR Address	SFR Name	Default Value	Setting Value	Description
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the third wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 4th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x2	Configure the 4th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 4th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 5th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x6	Configure the 5th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 5th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 6th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x7	Configure the 6th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1'b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 6th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 7th write address

SFR Address	SFR Name	Default Value	Setting Value	Description
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x6	Configure the 7th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 7th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 8th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x4	Configure the 8th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 8th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 9th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x5	Configure the 9th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 9th wdata finish
0xe4[15:0]	phycreg_cr_para_addr	0x0	0x4f	Configure the 10th write address
0xe8[15:0]	phycreg_cr_para_wdata	0x0	0x4	Configure the 10th write data
0xf0[1]	phycreg_cr_para_write_p	0x0	0x1	Configure the write enable(it is just one cycle pulse)
Read the 0x5030[10] bit, it is phycreg_cr_write_done_irq status, read this register and wait this signal until it is 1’b1.				

SFR Address	SFR Name	Default Value	Setting Value	Description
0x5038[10]	phycreg_cr_write_done_clear	0x0	0x1	Clear the phycreg_cr_write_done_irq status, and the 10th wdata finish
0xc0[1]	phy_pddq	0x1	0x0	Configure PHY pddq 1'b0, and HDMIRX PHY begins to enable its reference voltage generator and performs termination calibration.
Read 0xc8[0] bit, it is pddq_ack, read this register bit, wait and until it is 1'b0. It indicates pddq finish.				
0xc0[8]	phy_hdmi_disable	0x1	0x0	Configure PHY hdmi_disable 1'b0, and HDMIRX PHY begins to enter initialization sequence, and PHY begins to power up circuit calibrations.
Read 0xc8[1] bit, it is hdmi_disable_ack, read this register bit, wait and until it is 1'b0. It indicates power up finish.				
0xc0[11:9]	reffreq_sel	0x0	0x0	Select HDMIRX PHY cr_para_clk frequency. Default value is 24M. 3'b000: 24M 3'b001: 25M 3'b010: 27M 3'b011: 48M 3'b100: 50M 3'b101: 54M 3'b110: 100M
0xc0[15]	rxdata_width	0x0	0x1	Configure the rxdata width. 1'b0 is 20 bit valid, 1'b1 is 40 bit valid. And this version is quad pixel, so it is 40 bit valid.
Read 0x58c[1] bit, it is scdc_tmdsbitclkratio, before the HDMITX sends >= 3.4Gbps channel video, and it will be configured 1'b1 by the DDC bus.				
0xc0[16]	tmds_clk_ratio	0x0	0x0	If the HDMIRX PHY channel bit rate is >= 3.4Gbps, for example 4k resolution, tmds_clk_ration must be configured 1'b1.

28.6.1.4 RX Data Path

The RX data-path is active when the main FSM either observes a stable clock on the TMDSCLK in HDMI1.4/20 modes. When data-path is enabled, Hard macro block asserts rxX_valid (per lane, X=0, 1, 2) when a predetermined bit-locking timer expires. Thereafter, the data on all the active lanes (lane0, lane1, lane2) is aligned on a single clock, symbol

alignment is performed, inter-lane skew is corrected and valid data is provided at the rxX_data[39:0](X=0, 1, 2) ports. The validity of the data is indicated by asserting rxdata_valid port.
The 40 bit valid data is shown in diagram below.

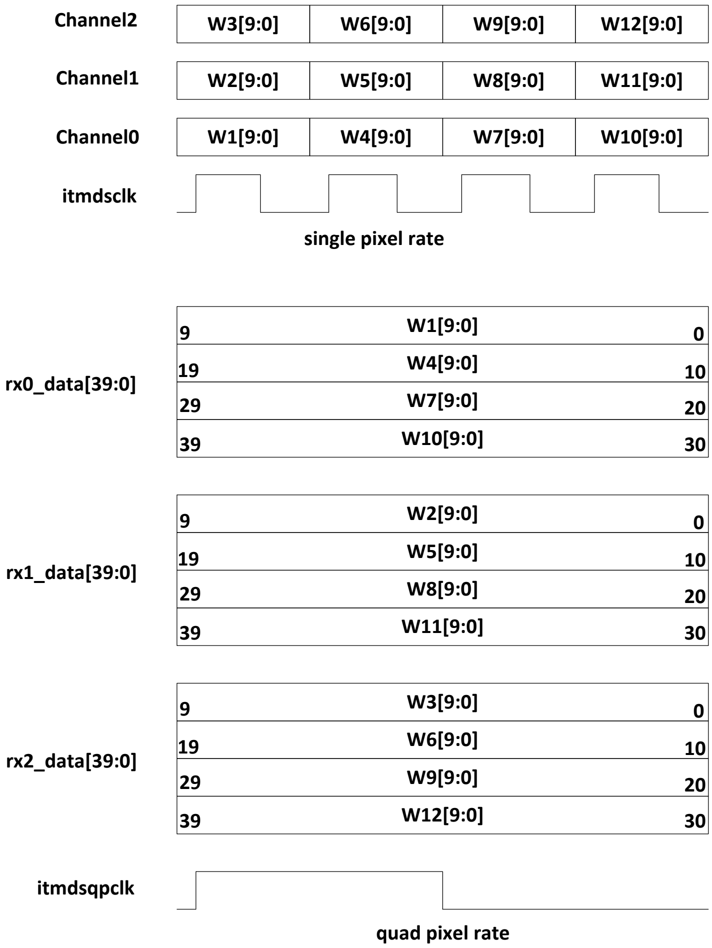

Fig. 28-9 HDMIRX PHY output quad pixel rate diagram

28.6.1.5 External SRAM

The raw PCS stores the instruction code to execute the calibration and adaptation algorithms. In order to minimize the area of the raw PCS, this pre-optimized and pre-validated code is stored in the form of hard-coded look up table. An external SRAM must be included for the purpose of updating the IP firmware. This provides flexibility for future and post-silicon product enhancements.
After de-assertion of phy_reset, the boot loader in the raw PCS loads the code from the internal look up table to the external SRAM and asserts output signal: sram_init_done(SYS_GRF_SOC_STATUS1[27], 0x384). After initialization of SRAM, user can change the SRAM contents (or access any PHY register) using either the JTAG or the CR Parallel Interface by addressing the SRAM address space in the register map. After external access to the SRAM (or any other PHY register) is complete, input sram_ext_ld_done (SYS_GRF_SOC_CON1[1], 0x304) should be set high, allowing the FSM in the raw PCS to start executing the code from SRAM.
Figure below shows the timing diagram of SRAM initialization and loading.

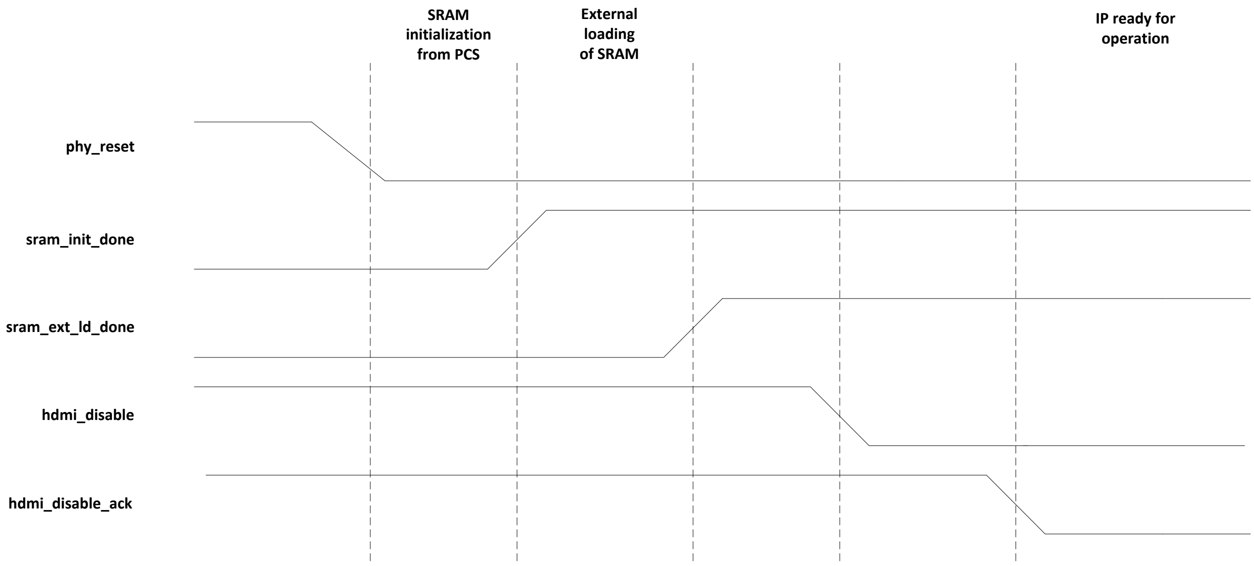

Fig. 28-10 HDMIRX PHY SRAM initialization and loading sequence

Before assertion of sram_init_done, the boot loader controls the SRAM interface. The firmware program is read from the ROM and written to SRAM.
When the boot loader is complete(sram_init_done is asserted), The cr_para interface can be used to access all register/ROM/SRAM in the HDMIRX PHY before firmware starts executing instructions. This access is controlled by internal memory arbiter.
Wait for at least 1 cr_para clock after the final external SRAM access before asserting sram_ext_ld_done signal. This is to ensure the final external SRAM access has been completed.
